Of the 1,278 proved fields in the Gulf of Mexico, 1,276 were discovered prior to 2009. A listing of reserve data for proved fields is provided. Data included in the listing are Field name, Year, Field discovery year, Proved reserves (Oil , Gas , BOE), Historical cumulative production (Oil , Gas , BOE), Remaining proved reserves (Oil , Gas , BOE).

In the comparison of data from previous reports, the total number of fields will be different from those contained in this historical listing. Field determinations which are reported monthly, account for most of this difference. As field combinations occur, some fields are deleted from the listings; however, data associated with the deleted fields are added with the data of the fields to which they were combined. In some cases fields once proved in the past may have expired and are no longer considered to be proved.

All reserve estimates are presented by field as of December 31, for every year a proved reserve estimate was reported. Due to adjustments and corrections to production data submitted by Gulf of Mexico OCS operators, the difference between field historical cumulative production for successive years does not always equal the annual production for the latter year.

Field name	Year	Field disc year	Original Proved reserves			Historical Cumulative Production			Proved reserves		
			Oil (bbl)	Gas (Mcf)	BOE (bbl)	Oil (bbl)	Gas (Mcf)	BOE (bbl)	Oil (bbl)	Gas (Mcf)	BOE (bbl)

The year of discovery assigned to a field is the year in which the first well encountering significant hydrocarbons reached total depth. This year may differ from the year in which the field discovery was announced.

Proved oil and gas reserves are those quantities of hydrocarbons that can be estimated with reasonable certainty to be commercially recoverable from known reservoirs and under current economic conditions, operating methods, and government regulations.

Oil data, which include crude oil and condensate, are expressed in millions of barrels (MMbbls) at 60 ºF and 1 atmosphere (14.696 pounds per square inch absolute [psia]). Gas data are expressed in billions of cubic feet (Bcf) at 60 ºF and 15.025 psia (to convert gas volumes to 14.696 psia, multiply by 1.022). For convenience of comparison, gas data are expressed in terms of barrels of oil equivalent (BOE) and added to liquid reserves. The conversion factor used, 5,620 standard cubic feet of gas equals 1 BOE, is based on the average heating values of domestic hydrocarbons. BOE data are expressed in millions of barrels (MMbbls).
