Date: September 10, 2008

**Hurricane Gustav/Hurricane Ike Activity Statistics Update:
September 10, 2008**

Minerals Management Service monitors activities for both storms through its Continuity of Operations Plan.

NEW ORLEANS — In preparation for Hurricane Ike, offshore oil and gas operators in the Gulf of Mexico have stopped re-boarding platforms and rigs following Hurricane Gustav and are maintaining the evacuated status to protect against harm. The Minerals Management Service (MMS) continues to monitor activities for both hurricanes through its Continuity of Operations Plan team. This team will be activated until operations return to normal.

Based on data from offshore operator reports submitted as of 11:30 a.m. CDT today, personnel have been evacuated from a total of 452 production platforms, equivalent to 63.0 % of the 717 manned platforms in the Gulf of Mexico. Production platforms are the structures located offshore from which oil and natural gas are produced. These structures remain in the same location throughout a project's duration unlike drilling rigs which typically move from location to location.

Personnel from 81 rigs have also been evacuated; this is equivalent to 66.9 % of the 121 rigs currently operating in the Gulf. Rigs can include several types of self-contained offshore drilling facilities including jackups, submersibles and semisubmersibles.

From the operators' reports, it is estimated that approximately 95.9 % of the oil production in the Gulf has been shut-in. Estimated current oil production from the Gulf of Mexico is 1.3 million barrels of oil per day. It is also estimated that approximately 73.1 % of the natural gas production in the Gulf has been shut-in. Estimated current natural gas production from the Gulf of Mexico is 7.4 billion cubic feet of gas per day.

As part of the evacuation process, personnel activate the shut-in procedure, which can also be accomplished from a remote location. This involves closing the safety valves located below the surface of the ocean to prevent the release of oil or gas. During Hurricanes Katrina and Rita, the shut-in valves functioned 100 percent of the time, efficiently closing in production from wells and resulting in no major spills from the Outer Continental Shelf. Shutting-in oil and gas production is a standard procedure conducted by industry for safety and environmental reasons.

The production percentages are calculated using information submitted by offshore operators in daily reports. Shut-in production information included in these reports is based on what the operator expected to produce that day. The shut-in production figures therefore are estimates, which the MMS compares to historical production reports to ensure the estimates follow a logical pattern.

After the hurricane has passed, facilities will be inspected. Once all standard checks have been completed, production from undamaged facilities will be brought back on line immediately. Facilities sustaining damage may take longer to bring back on line. The MMS will continue to update the evacuation and shut-in statistics at 1:00 p.m. CDT each day until these statistics are no longer significant.

Districts	Lake Jackson	Lake Charles	Lafayette	Houma	New Orleans	Total
Platforms Evacuated	73	96	100	84	99	452
Rigs Evacuated	9	13	14	27	18	81

Oil, BOPD Shut-in	58,972	23,519	142,863	433,645	587,596	1,246,595
Gas, MMCF/D Shut-in	461	325	935	733	2,951	5,405

This survey information is reflective of 67 companies' reports as of 11:30 a.m. CST.
