WTG	Wind Turbine Generator
ZVI	Zone of Visual Influence
3D	Three Dimensional

1.0 INTRODUCTION

Environmental Design & Research, Landscape Architecture, Engineering & Environmental Services, D.P.C. (EDR) prepared this Technical Report in support of the Atlantic Shores Construction and Operations Plan (COP) for two offshore wind energy generation Projects, including an Overlap Area that could be used by either Project, within the southern portion of Bureau of Ocean Energy Management (BOEM) Lease Area OCS-A 0499 for renewable energy generation from offshore wind, comprised of up to 200 wind turbine generators (WTG) and associated offshore substations¹. Collectively, these two offshore wind energy generation projects, including the Overlap Area, are referred to herein as the Atlantic Shores Offshore Wind Projects, or the Projects (see Inset 1.1-1). The Lease Area, measuring approximately 159.4 sq mi (413 sq km) will contain the major visible components of the Projects and is henceforth referred to as the Wind Turbine Area (WTA). This VIA assesses the visible components of the Projects which are located within the WTA and include 200 WTGs, one permanent meteorological (MET) tower, four mid-sized offshore substations (OSS), and one large OSS². Separate reports have been completed to assess the visible onshore components of the Atlantic Shores Offshore Wind Project (EDR, 2021a and EDR, 2021b). Components of the Projects that will not result in visible infrastructure during operation such as inter-array cables, the submarine export cable, and onshore interconnection cables are not considered in this VIA.

At its closest point, the WTA is approximately 8.7 mi (14 km) from the New Jersey shoreline (as measured from the northernmost edge of Brigantine City in Atlantic County). The WTA is also 9.4 mi (15.1 km) east of Atlantic City, 16.3 mi (26.2 km) east of Ocean City, 25.3 mi (40.7 km) south of Barnegat Light Borough, and 35.7 mi (57.5 km) northeast of Wildwood (Inset 1.1-1). The purpose of the Visual Impact Assessment (VIA) is to analyze the potential visibility of the proposed Projects and determine the difference in landscape and seascape visual quality with and without the Projects in place. Specifically, the study:

- Describes the appearance of the visible components of the proposed Projects.
- Defines the character and visual quality of the landscapes within the Visual Study Area (VSA).
- Defines the types and sensitivity of viewer groups within the VSA.
- Inventories existing visually sensitive public resources within the VSA.
- Evaluates potential visibility of the Projects within the VSA.
- Identifies key views for visual assessment.
- Illustrates what the Projects will look like from representative key observation points (KOPs).
- Assesses the potential visual impacts associated with the proposed Projects.

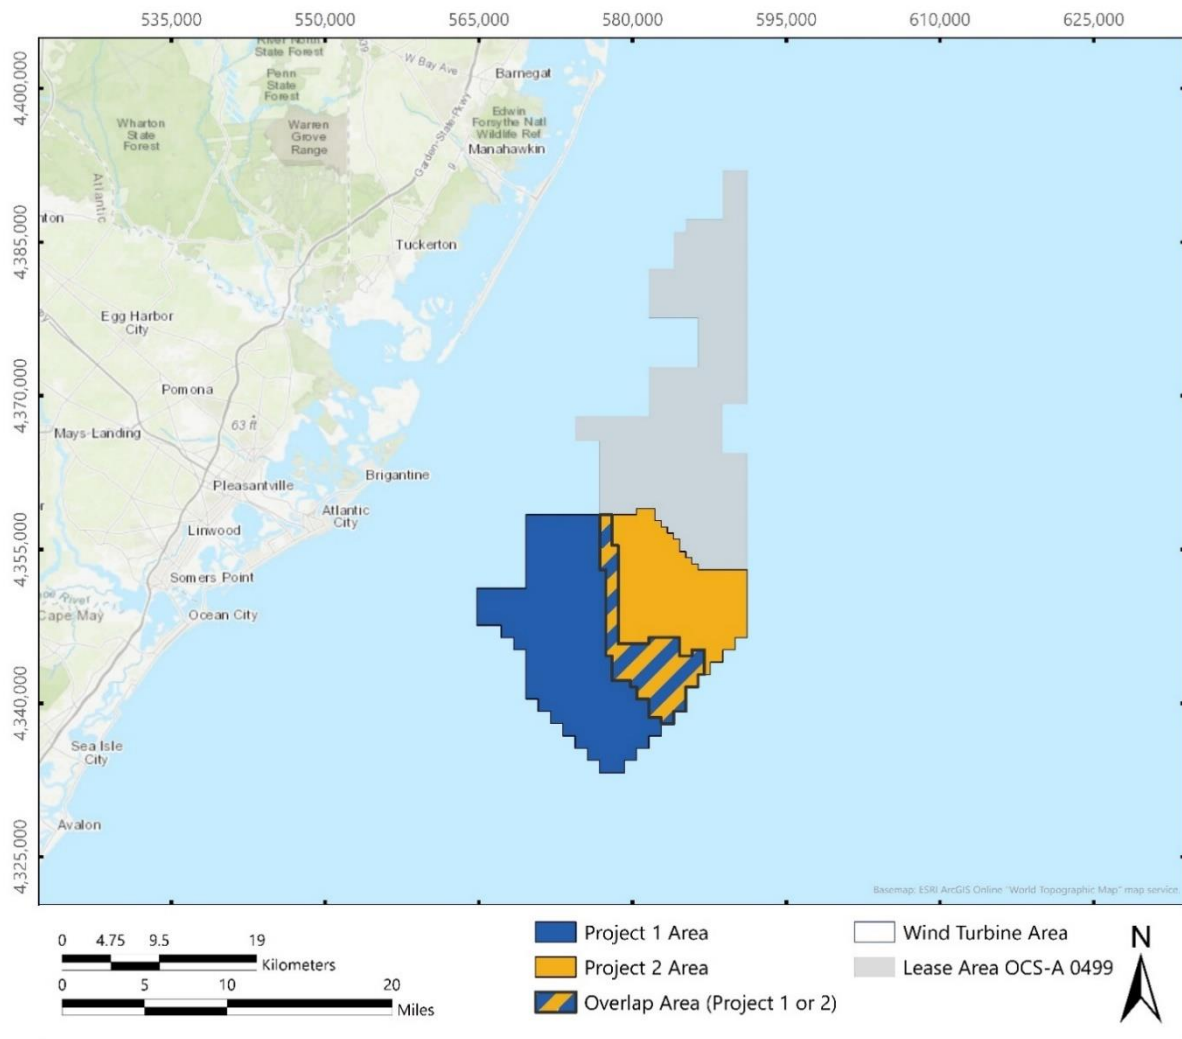

¹ The number of WTGs in Project 1, Project 2, and the associated Overlap Area will not exceed 200 WTG locations. For example, if Project 1 includes 105 WTGs (the minimum) then the Overlap Area would be incorporated into Project 2 which would include the remaining 95 WTGs; and conversely if the Overlap Area is incorporated into Project 1 such that it includes 136 WTGs, then Project 2 would be limited to 64 WTGs. Each Project may also use only part of the Overlap Area.

² The PDE considers up to 10 small OSSs. However, the VIA assumes fewer, larger OSSs located closer to shore.

The VIA was prepared with oversight and input provided by landscape architects, planners, and visual experts experienced in the preparation of VIAs. It is also consistent with the policies, procedures, and guidelines contained in established VIA methodologies (see Literature Cited/References section), and in accordance with the Visual Impact Assessment Study Plan – Offshore (Attachment A) prepared in collaboration with, and accepted by, BOEM.

1.1 Proposed Projects

Atlantic Shores has applied a Project Design Envelope (PDE) approach to describe the facilities and activities associated with the Projects. A PDE is defined as “a reasonable range of project designs” associated with various components of a project (e.g., foundation and WTG options) (BOEM 2018). In accordance with the PDE evaluation approach, the assessment of project effects must include the maximum design case for all project development scenarios. Consistent with BOEM’s Draft Guidance Regarding the Use of a Project Design Envelope in a Construction and Operations Plan (2018), this VIA considers a maximum design case layout. The layout represents the largest geographic footprint that could be occupied by visible structures and, therefore, the largest percentage of the visible horizon from shoreline locations that may be affected by the Projects. The maximum design case components are described below.

Inset 1.1-1 – Regional Location of the Projects

This VIA also evaluates the largest WTG dimensions currently under consideration, which provides a conservative assessment of theoretical WTG visibility from onshore locations. The maximum sized WTG under consideration is represented by a 20-megawatt (MW) turbine, with dimensions as indicated in Inset 1.1-2. WTGs will be aligned in a uniform grid with rows in an east-northeast to west-southwest orientation spaced 1.0 nautical mile (nm) (1.15 mi; 1.9 km) apart, and rows in an approximately north to south orientation spaced 0.6 nm (0.69 mi; 1.1 km) apart (Inset 1.1-2), within an area measuring approximately 159.4 sq mi (413 sq km). The OSS foundations will be located along the same east-northeast rows as the proposed WTGs, with the same 1.15 mi (1 nm) separation distance between the structures. Inset 1.1-1

illustrates the layout considered in this VIA. The dimensions of all components represented in this VIA are shown in Inset 1.1-2, Tables 1.1-1 through 1.1-3.

Inset 1.1-2 Computer Model of Project Components

Table 1.1-1 Proposed WTG Dimensions Envelope

WTG Component/Parameter	Minimum (15 MW)	Maximum (20 MW)
		Considered in VIA
Turbine Height [from Mean Sea Level (MSL)]	889 ft (271 m)	1047 ft (319 m)
Hub Height (from MSL)	495 ft (151 m)	574 ft (175 m)
Air Gap (MSL) to the Bottom of the Blade Tip	76 ft (23 m)	76 ft (23 m)
Base (tower) Diameter (at the bottom)	26 ft (8 m)	33 ft (10 m)
Base (tower) Diameter (at the top)	20 ft (6 m)	28 ft (8.5 m)
Nacelle Dimensions (length x width x height)	72 ft x 46 ft x 30 ft (22 m x 14 m x 9 m)	82 ft x 52 ft x 39 ft (25 m x 16 m x 12 m)
Blade Length	384 ft (117 m)	453 ft (138 m)
Maximum Blade Width	20 ft (6 m)	33 ft (10 m)
Rotor Diameter	787 ft (240 m)	919 ft (280 m)

Table 1.1-2 Proposed Meteorological Tower Dimensions

MET Tower	Dimension
Foundation	Same/Similar to WTG
Deck	50 ft (15 m) x 50 ft (15 m)
Total Number of Units	1
Maximum height of MET Tower (From MSL)	590.6 ft (180 m)

Table 1.1-3 Proposed OSS Dimensions Envelope

OSS Component/Parameter	Maximum Design Scenario	
		Considered in VIA
Energy Capacity	1,200-1,600 MW	600-1,600 MW
Number of OSSs Considered in the Array	4	5
Maximum dimension of topside (LxWxH)	295 ft x 164 ft x 131 ft (90 m x 50 m x 40 m)	213 ft x 148 ft x 115 ft (65 m x 45 m x 35 m)
Maximum height of OSS topside above MLLW	74 ft (22.6 m) above MSL	

Each WTG will consist of four major components: the foundation, the tower, the nacelle, and the rotor (Inset 1.1-3). The height of the hub height (height from the water's surface to the center of the rotor) will be approximately 574 feet (175 m) above mean sea level (AMSL). The nacelle sits atop the tower, and the rotor hub is mounted to the nacelle. Assuming a maximum 919 feet (280 m) rotor diameter, the total WTG height (i.e., height AMSL at the highest blade tip position) will be approximately 1,047 feet (319 m).

Foundation: For the purpose of this VIA, it was assumed that each of the WTGs will be supported by a monopile foundation secured with a single steel pile driven into the sea floor. The monopile foundation at MSL is a 39.4-foot (12 m) diameter tubular steel structure, upon which the tower transition will be mounted. The foundation will extend above the water surface, and the exposed portion of the foundation will be

yellow in color (RAL 1023).. A boat landing and hoist will be affixed to the foundation with a stairway connecting the landing to a railed deck at the base of the tower.

Tower: The towers used for the Projects are tapered hollow steel structures manufactured in three sections. The assembled towers have a diameter of approximately 33 feet (10 m) at the base and 28 feet (8.5 m) at the top. Two amber U.S. Coast Guard (USCG) navigation lights will be mounted on the deck at the base of each tower. Additionally, the tower will be equipped with a minimum of three low intensity (L-810) red flashing aviation obstruction warning lights (AOWL) at the approximate mid-section of the tower which will operate during nighttime hours only. In accordance with the BOEM and Federal Aviation Administration (FAA) obstruction marking standards, the tower will be painted white (RAL 9010).

Nacelle: The main mechanical components of the WTG are housed in the nacelle. These components include the drive train, generator, and transformer. For the purpose of this study, the nacelle is assumed to have maximum dimensions of approximately 82 feet (25 m) long, 52 feet (16 m) wide, and 39 feet (12 m) in height. Two AOWL are proposed to be located on top of the nacelle, in accordance with BOEM and FAA guidelines. These will be medium intensity, flashing red lights (L-864) that are operated only at night, and will be synchronized with the L-810 lights located at the mid-tower position, and described above. It is assumed that the nacelle will be the same color as the tower and will not include any obvious lettering, logos, or other exterior markings. Where applicable, the lighting parameters presented in the VIA follow the current BOEM guidance for the lighting and marking of WTGs in order to evaluate the potential nighttime visual impacts associated with the Projects. However, lighting requirements may change based on final BOEM/FAA recommendations. The nacelle will be painted white (RAL 9010).

Rotor: A rotor assembly is mounted on the nacelle to operate upwind of the tower. The rotor consists of three composite blades, each approximately 453 feet (138 m) in length. The three-bladed rotor assembly will be light grey to white in color (consistent with the tower) and will have a maximum diameter of 919 feet (280 m). The rotor blades are rotated along their axis, or “pitched”, to enable them to operate efficiently at varying wind speeds. The rotor can spin at varying speeds, but typically rotates at a rate around 10 revolutions per minute (RPM). The rotor assembly will be white (RAL 9010).

The OSSs will be enclosed structures. Currently, three OSS options are under consideration. Depending on the final OSS design there will be up to 10 small OSSs, up to five medium, or up to four large OSSs. In order to illustrate the range of sizing options, this VIA considers both the medium and large OSS options with the medium measuring up to 213 feet long by 148 feet wide and a height of 115 feet (65m x 45m x 35m), and the large measuring up to 295 feet long by 164 feet wide and a height of 131 feet (90 m x 50 m x 40 m). Transition from OSS foundation to OSS topside is expected to occur at approximately 74 feet (22.6 m) AMSL for both OSS options included in the VIA. For the purpose of this VIA, it is assumed that OSSs will be mounted on an 8-legged piled jacket foundation painted yellow (RAL 1023). A diagram illustrating the appearance and dimensions of the WTG and OSS evaluated in this study are presented in Insets 1.1-2 and 1.1-3.

The MET tower is proposed to be installed at one of four potential locations. The VIA considers one of the locations that is positioned closest to shore and positioned between the WTG rows. The MET tower will be constructed on a foundation very similar to those used to support the WTGs. The tower itself is a four sided structure constructed of tubular steel painted light grey (RAL 7016). The foundation will be yellow (RAL 1023). The MET tower will include several stations at various heights containing measurement equipment such as anemometers, hygrometers, and precipitation sensors. It is anticipated that the MET tower will be a relatively minor visual component of the WTA, but it is illustrated in the visual simulations when visible.

Inset 1.1-3 – Diagram of the Wind Turbine Generator Components

1.2 Existing Visual Character

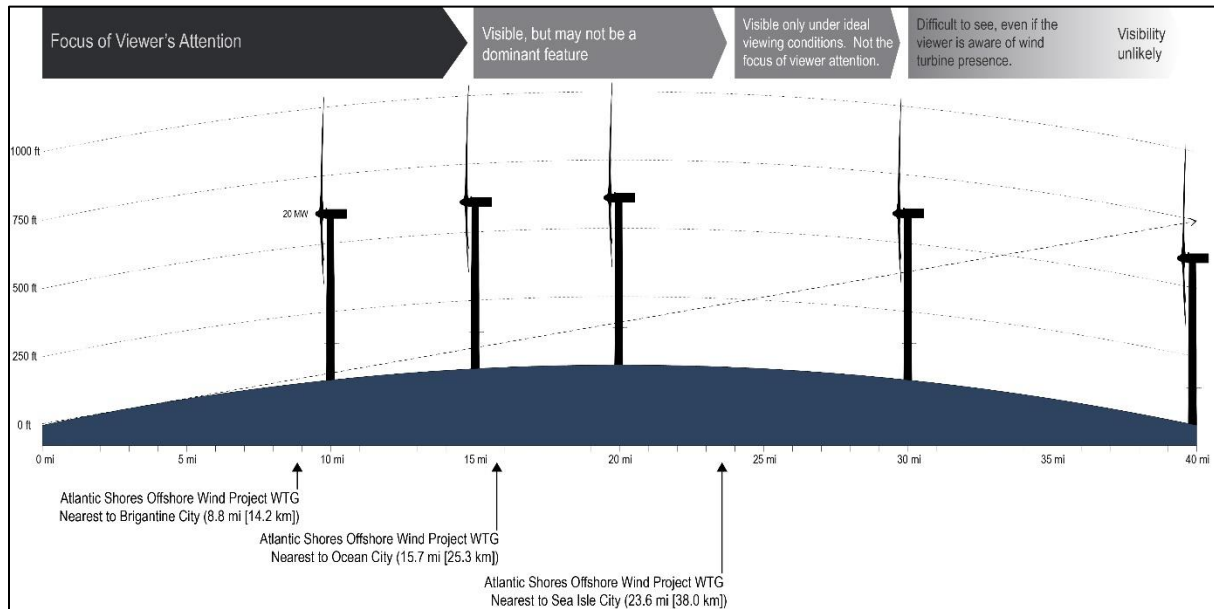

The existing visual character includes the identification of a visual study area (VSA), establishment of distance zones, definition of viewer and user groups, a landscape inventory and identification of character areas, and the identification of visually sensitive resources (VSRs). Additionally, the definition of the existing landscape character relies on the establishment of zones of visual influence (ZVI) which identifies the geographic areas of potential visibility of the Projects. This important step focuses the VIA on locations in which the Projects will be visible and therefore, may present potential visual impacts. Each of these steps and analyses draw from established visual assessment methodologies which have been adapted by EDR to suit the unique circumstances associated with offshore wind projects. The unique circumstances considered

for offshore wind farms include the development of very large VSAs which encompass large land areas and a multitude of landscape types and viewers. The methods employed for each analysis and inventory are described below.

Definition of the Visual Study Area and Zone of Visual Influence

Currently, a standard VSA for offshore wind farms has not been expressly defined in regulatory guidance documents. However, *Information Guidelines for a Renewable Energy Construction and Operations Plan* (COP) (BOEM, 2020) indicates that visual impacts should be evaluated using photo simulations from locations within “the onshore viewshed from which renewable energy structures, whether located offshore or onshore, would be visible.”

This statement suggests that the VSA should include all areas with any degree of potential visibility of the Projects. The first step in defining the maximum extent of WTG visibility in an offshore setting is to determine the likely physical threshold based on the screening effect of the curvature of the earth and visual acuity of the human eye. Observations of constructed offshore wind facilities are also useful in determining WTG visibility diminishment thresholds, but these studies have only been conducted on projects with smaller WTGs. For example, EDR completed observations of the operational Block Island Wind Farm (BIWF) which utilizes five WTGs with a maximum height of 589 feet (458 feet lower than the WTGs associated with the Projects). These observations suggest that based on this smaller technology, the WTGs will generally become completely screened by curvature of the earth and/or atmospheric perspective at a distance between 35 and 40 miles, depending on the elevation of the viewer. A study completed in Europe, *Offshore Wind Turbine Visibility and Visual Impact Threshold Distances* (Sullivan, et al., 2013) concluded that offshore wind facilities were judged to be a major focus of visual attention at distances up to 10 mi (16 km); were noticeable to casual observers at distances of almost 18 mi (29 km); and were visible with extended or concentrated viewing at distances beyond 25 mi (40 km) (Sullivan et al., 2013). Again, the Projects consider WTGs that are significantly taller than those included in this study and a calibration of this study is not appropriate given the fact it is based on observation and does not include any specific occupational statistics. However, these studies are still relevant in that the most influential limiting factor in WTG visibility from open coastal locations is atmospheric perspective. Moisture and atmospheric particles will always have a significant influence on visibility over the ocean regardless of the size of the technology. However, it is anticipated that when viewed under clear weather conditions, the visual prominence of larger WTGs will extend over a greater distance and could be the focus of viewer attention beyond 10 miles. However, considering the technology under consideration for the Projects, it is anticipated that visibility from beach level will include a portion of the WTG blades at a distance of 40 miles (64 km) (see Inset 1.2-1). As such, it is anticipated that a 40-mile visual study area is a conservative study area for the Projects. This is also supported by standard human visual acuity thresholds. Assuming a maximum resolution of the human eye is conservatively 28 seconds of an arc or 0.008 angular degrees (Deering, 2019) at 40 miles, human vision can resolve an object that is approximately 30 feet in diameter. The WTGs considered in this VIA have a maximum blade width of 33 feet, suggesting that at a distance of 40 miles, they would be near the maximum threshold of potential visibility and would not result in impacts to onshore resources.

Inset 1.2-1 Turbine Visibility

Based on the research described above, it is anticipated that visibility of the proposed WTGs will diminish completely at a distance of 40 miles (64 km) from ground-level vantage points. However, the VSA identified for the Projects was expanded to include the Cape May Lighthouse since this is a prominent, elevated structure and includes a frequently visited viewing platform which offers commanding views of the landscape and ocean. Therefore, the VSA was defined as the area extending 45.1 miles (72 km) from the WTA.

This VSA includes approximately 6,657.0 square miles (17,241.5 sq. km) of open ocean, 2,196.3 square miles (5,688.5 sq. km) of land (including inland water bodies), and over 130.7 linear miles (210.3 linear km) of ocean shoreline in New Jersey. The VSA includes all or portions of 89 municipalities in New Jersey. The location and extent of the VSA is illustrated in Figure 1.2-1.

Figure 1.2-1 Visual Study Area and Zone of Visual Influence

(1 Pages)

Zone of Visual Influence (ZVI)

Within this VSA, a relatively small portion of onshore locations would actually have open views that would include some portion of the WTGs and OSSs. To accurately define an inclusive and reasonable ZVI within the VSA, EDR identified the potential geographic areas of visibility by running a preliminary light detection and ranging (lidar) viewshed analysis within the VSA. The viewshed model considered vegetation, buildings/structures, topography, and the curvature of the earth in order to delineate those areas that may have potential views of the highest portions of the WTGs (i.e., blade tips in the upright position). The viewshed analysis results indicated that up to 288.2 square miles or 13.1 percent of the land area within the VSA, could have potential views of the Projects from ground-level vantage points. Generally, the areas of potential Project visibility occur along the majority of the eastward facing shoreline defined by the barrier islands. In areas where the barrier islands lack intensive development, large areas of visibility occur within the inland bays, the adjacent western shore, and throughout portions of the marshes and river deltas west of Great Bay, west of Beach Haven and Great Egg Harbor, West of Ocean City. For the purposes of the VIA, this area was defined as the ZVI and represented the areas in which further analysis was warranted to determine the degree of Project visibility and visual impact. The location and extent of the ZVI is illustrated in Figure 1.2-1. A comprehensive description of the viewshed analysis used to define the ZVI is provided in Section 3.1.

1.2.1 Distance Zones

Three distinct distance zones were defined for the VSA. Based on the Bureau of Land Management (BLM) *Best Management Practices for Reducing Visual Impacts of Renewable Energy Facilities on BLM-Administered Lands* (BLM, 2013) these zones include the Foreground-Middle Ground (0-5 miles), Background (5-15 miles), and Seldom Seen (>15 miles). However, it was determined that when considering views of offshore WTGs, Seldom Seen may not be an accurate representation for views beyond 15 miles (since studies show offshore WTGs to be visible out to 25 miles). Therefore, the name of this zone has been changed to "Extended Background". It is important to note that all Foreground-Middle Ground views within the VSA would only be available to those travelling on the open ocean in commercial vessels, passenger boats, or pleasure craft. Consistent with BLM guidance, distance zones for this VIA are described as follows:

- Foreground-Middle Ground: 0 to 5 miles. Within the foreground (0.5 mile), a viewer is able to perceive details of an object with clarity. Surface textures, small features, and full intensity and value of color can be seen on foreground objects. Beyond the foreground (0.5-5miles) a viewer can perceive individual structures and trees but not in great detail. This is the zone where the parts of the landscape start to join together; individual hills become a range, individual trees merge into a forest, and buildings appear as simple geometric forms. Colors will be clearly distinguishable but will have a bluish cast and a softer tone than those in the foreground. Contrast in color and texture among landscape/seascape elements will also be reduced. On the ocean, the majority of discernable features occur within the Foreground-Middle Ground Zone due to the effects of curvature of the earth and due to the fact that nearshore activities tend to be concentrated within this zone.
- Background: 5 to 15 miles. The background defines the broader regional landscape/seascape within which a view occurs. Within this distance zone, the landscape and features on the ocean are simplified; only broad landforms are discernible. Atmospheric conditions often render objects on the landscape/seascape an overall bluish color and they tend to appear unclear causing the objects

to begin to blend with the background colors, giving them a fuzzy appearance. Objects on the ocean, such as boats, buoys, and platforms may become completely screened by curvature of the earth at distances greater than 5 miles. In less frequent circumstances, larger features on the ocean horizon may exhibit the “mirage effect” in which images of the viewed objects appear displaced (floating above the water’s surface) and can become very difficult to identify. At these distances, texture has generally disappeared, and color has flattened, but large patterns of vegetation are discernible. Silhouettes of one land mass set against another and/or the skyline are often the dominant visual characteristics in the background. Where landscape features are visible beyond the ocean surface (such as islands and peninsulas), they typically contribute to scenic quality by providing a softened backdrop for foreground-middle ground features, an attractive vista, or a distant focal point.

- **Extended Background:** Over 15 miles. At distances beyond 15 miles curvature of the earth becomes a significant factor in visibility, and those objects that are visible become less prominent in the overall landscape and seascape due to their relative size, occupation of the horizon, and deterioration of visibility due to atmospheric perspective³. For casual viewers, the Projects may be difficult to discern under less than ideal viewing conditions. During high humidity, fog, and other weather events, visibility at these distances may be significantly diminished or completely eliminated.

1.2.2 Viewer/User Groups

The population potentially affected by the Projects are referred to as viewer/user groups. This VIA identifies four broad categories of users that are likely to experience changes within the landscape and seascape with varying sensitivities. However, invariably there will be overlap within each user group and individuals within a user group may have a wide range of opinions and preferences regarding proposed landscape and seascape changes. Despite a wide range of landscape exposure for each user group, the broad categories presented below describe the types of users that are most likely to be exposed to the Projects. Their sensitivity to visual change, while a personal attribute, is influenced by their activity, duration of view, and exposure to changes in the landscape or seascape. An assessment of potential impacts to viewers is discussed in Section 3.2.1.3.

Local Residents

Local residents include people who live, work, participate in recreation activities, and travel within the VSA. They generally view the landscape from their yards, homes, local roads, places of recreation, and employment. Residents are typically concentrated in the inland/beachfront residential areas, and village and town centers, but often enjoy the local beaches, inland bays, forests, and the numerous outdoor recreational resources within the VSA. Except when involved in local travel or recreation, residents are likely to be stationary and have frequent or prolonged views of the landscape. Local residents are also likely to have the greatest awareness of changes to the landscape due to the repeated, long-duration exposure to the landscape and seascape in which they live. This is particularly true for residents that live near the ocean or those that have the opportunity to experience the coastal landscape on a regular basis. While their activity and sensitivity to change in the landscape and seascape may vary, local residents are likely to have greatest

³ Atmospheric perspective refers to the effect the atmosphere has on the appearance of an object as viewed from a distance.

personal investment in their community and the surrounding landscape, and therefore have the greatest sensitivity to visual change.

Through Travelers

Travelers passing through the VSA view the landscape from motor vehicles on their way to other destinations. Through travelers are typically moving, have a relatively narrow field of view oriented along the axis of the roadway, and are destination oriented. Drivers on major roads in the area such as Garden State Parkway and the Atlantic City Expressway will generally be focused on the road and traffic conditions but will have the opportunity to observe roadside scenery. Passengers in moving vehicles will have greater opportunities for prolonged off-road views than drivers, and therefore may be more aware of the quality of surrounding scenery. Through travelers who are not residents of the area or vacationers are less likely to be particularly sensitive to visual change. However, along this portion of the Atlantic Coast, through travel occurs relatively infrequently due to fact that most of the major highways found within the VSA lead to and from the coastal communities. Occasionally, through travelers may also take advantage of the ferry from Cape May, New Jersey to Lewes, Delaware. Passengers on the ferries are likely to have a higher sensitivity to visual change since the viewer is not driving and can be fully engaged with the scenery and surroundings.

Tourists/Vacationers

Tourists and Vacationers consist of out-of-town vacationers and seasonal/weekend residents who come to the area for the purpose of experiencing its scenic and recreational resources. These viewers include sightseers, families on vacation, casino visitors, and weekend/seasonal homeowners. They may view the landscape on their way to a destination (i.e., on a roadway or boat) or from the destination itself. Some, such as weekend and seasonal homeowners, may spend extended time in the area. Atlantic City hosts a large number of tourists [116 million tourists annually (Tourism Economics, 2019)] who partake in resort activities such as gambling, dining, and nightlife. Often this category of tourist may spend relatively little time outdoors and as little as 24 hours in the VSA. Other vacationers are typically involved in a variety of outdoor activities, including bird watching, bicycling, swimming, recreational boating, fishing, and more passive recreational activities (such as picnicking, beachcombing, kite flying, or walking). Recreational users are generally considered to have relatively high sensitivity to aesthetic quality and landscape character. They will often have continuous views of landscape features over relatively long periods of time, and scenic quality generally enhances the quality of any outdoor recreational activity even though these individuals may not be specifically involved in sight-seeing. Therefore, this view/user group may be particularly sensitive to visual change. Vacation homeowners, tourists, and recreational users will be concentrated in and around the ocean shoreline, but also use interior portions of the VSA and public lands on the mainland.

Fishing Community

The fishing community is represented by recreation and commercial fishermen who work in and experience the coastal and open ocean environment on a regular basis. The commercial fishing community typically engages in focused activity associated with various methods of catching fish and shellfish, including setting gear such as longlines, trawl nets, and pots or traps. Inshore fishing is restricted to the bays, coves, beaches, and waters along the coast. Offshore fishing occurs many miles offshore along the outer continental shelf, including the Lease Area. The recreational fishing community is active in both inshore and offshore settings. Despite the focused activity associated with harvesting seafood, the fishing community is particularly sensitive to changes to the visual seascape since there is often nothing in their immediate environment

except for open ocean and horizon. The fishing community can have prolonged visual exposure to the seascape and coastal environment, in which fleets spend hours to days setting gear and harvesting fish.

1.2.3 Landscape Inventory

The landscape inventory portion of this VIA defines a broad regional landscape character in terms of the general physiographic setting of the entire VSA. The physiographic setting is then broken into subcategories largely driven by geographic location, but also visual character. As with many coastal locations, there is a distinct character shift as one travels inland from the coast. As such, the VSA is broadly defined by the barrier islands, mainland, inland bay landscapes, as well as the open ocean/seascape. Each of these broad regions includes a diverse range of specific visual components that define the visual character of the VSA. These landscape types, or areas of homogenous visual character are defined as Character Areas. The regional and local landscape character is described below.

Regional Character Areas

Broadly defined, the VSA is entirely contained within the New Jersey Outer Coastal Plain, a subregion of the Embayed Portion of the Coastal Plain Physiographic Province. This region covers 4,667 square miles of New Jersey. It is roughly bounded by Trenton to Monmouth Junction in the north, the Delaware River and Delaware Bay on the west, and the Atlantic Ocean to the east (Dalton, 2003). The region is generally defined by excessively drained sandy soils, with relatively low fertility, giving rise to the distinctive pinelands forests, which thrive in these conditions. The Outer Coastal Plain watershed, influenced by the gradual decline in elevation approaching the ocean drains into the back barrier coastal lagoons and directly into the New York Bight Province of the Atlantic Ocean (USFWS, 1997). Topography within this province consists of gradual sloping terrain from the uplands to a relatively flat level plain near the inland lagoons and the shoreline. Elevations within the Outer Coastal Plain (within the VSA) range from below sea level to approximately 223 ft. (68 m).

Assessment of Seascape, Landscape, and Visual Impacts (SLVIA) of Offshore Wind Energy Developments on the Outer Continental Shelf of the United States (Sullivan, 2021) provides guidance on the definition of landscape, seascape, and ocean character areas (LCA, SCA, and OCA) which broadly characterize the VSA in terms of common components, mainly influenced by the land/water interface. The LCA includes inland areas that do not interface directly with the ocean and therefore, ocean views are not a major character defining feature. SCAs are defined as coastal areas in which there is intervisibility between land and sea and ocean views are a significant component of the character defining features. The OCA is defined by an open expanse of water and secondary SCA and LCA features that may be visible from the water. The OCA is also the character area that contains the offshore project components

According to the 2016 U.S. Geological Survey (USGS) National Landcover Dataset (NLCD) the landward VSA primarily consists of forested land (55.2%) which includes woody wetlands and evergreen, deciduous, and mixed forests. Other prominent landcover types include high, medium, and low intensity development (11.9%), and open water associated with inland and coastal bays (10.3%). The landward study area can be further delineated into mainland, barrier island, and inland bays. Each of these regional landscape types are described below and listed in Table 1.2-1.

Table 1.2-1 Regional Landscapes

Regional Landscape	Total Area within VSA (square miles)	Total Area Within the ZVI (square miles)	Percent of Regional Landscape with Potential Turbine Visibility
Ocean	6,653.7	6,543.0	98.3
Inland Bay	164.3	131.3	79.9
Barrier Island	95.1	46.6	49.0
Mainland	1,939.6	112.1	5.8

Ocean Character Area

The OCA is defined by the Atlantic Ocean and includes the Hudson Shelf Valley and portions of Delaware Bay. The viewshed analysis results suggest that approximately 98.3 percent of this regional landscape occurs within the ZVI. The OCA is characterized by broad expanses of open water and depending on weather conditions, the texture of the ocean surface can range from smooth to choppy, and its color can range from blue, to silver, to dark gray. The ocean in this area is a working water landscape that supports regular and repeated activity, including recreational and commercial fishing, commercial shipping, ferry transportation, pleasure boating and sailing, and associated maritime activities. These activities are typically visible from the mainland and barrier islands when occurring in nearshore areas and features such as jetties, buoys, channel markers, and warning lights are common features near ports and bay entrances.

Inland Bays

Open water associated with the inland bay portion of the VSA primarily includes the barrier island back bays such as Great Egg Harbor Bay, Great Bay, Absecon Bay, Barnegat Bay, and the rivers that feed them (Great Egg Harbor River and Mullica River). The viewshed analysis results suggest that approximately 79.9 percent of this regional landscape occurs within the ZVI. The open water rivers and bays support emergent wetland salt marshes which are the primary landcover along the mainland coast and are represented by state WMAs such as Tuckahoe, Cape May Coastal Wetland, Absecon, Great Bay Boulevard, and Manahawkin.

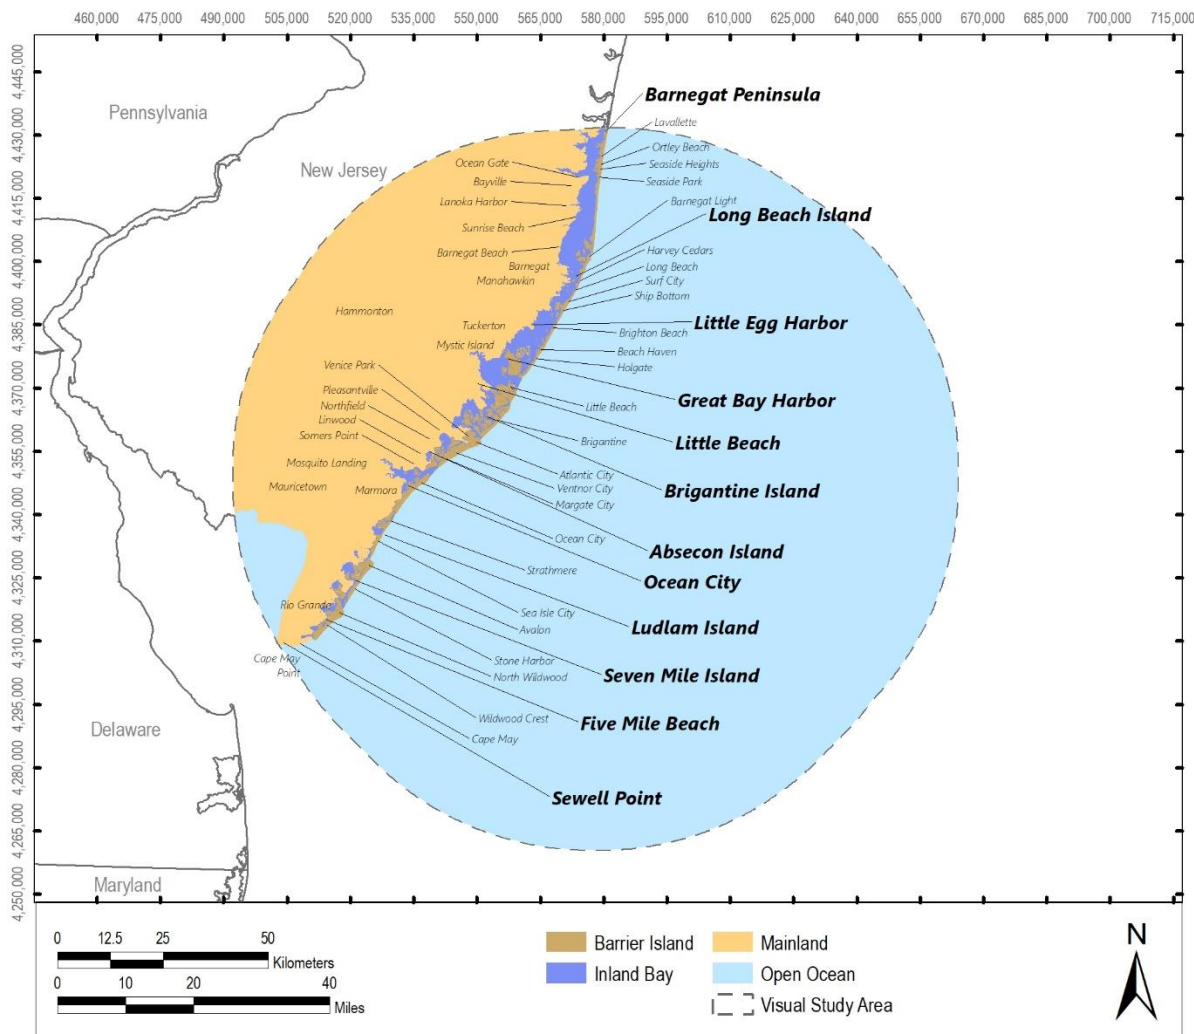

Barrier Islands

Barrier islands make up the majority of the eastern portion of the landward VSA and include the Barnegat Peninsula, Long Beach Island, Little Beach, Brigantine Island, Absecon Island, Ocean City, Ludlam Island, Seven Mile Island, Five Mile Beach, and Cape Island. These areas typically define the majority of the SCA within the VSA. The viewshed analysis suggests that approximately 49 percent of this regional landscape occurs within the ZVI. According to the NLCD, the Barrier Islands are primarily made up of emergent wetlands (34%), open water (23%), and low, medium, and high intensity developed land (32%). The remaining areas are typically transitional cover types such as, woody wetlands, scrub/scrub, forest, and

barren land which all occur in very discrete areas throughout the barrier islands. Analysis of the lidar topographic data suggests that elevation within the barrier beaches and islands is relatively flat, and ranges from below sea level to a maximum of approximately 39 ft (12 m) AMSL which occurs on the vegetated dunes in the Borough of Avalon in the southern portion of the VSA. It should be noted that significant efforts are underway to stabilize dunes along the barrier island coast and elevations may fluctuate based on the progression of dune nourishment and storm event destruction. However, elevations generally average approximately 2 ft (0.6 m) regardless of the variable dune topography. Vegetation on the barrier beaches and islands is typically characterized by a mix of scrub forest, grassy dunes, and salt marshes. Developed areas generally include seasonal and year-round homes, villages, roads, boardwalks, and marinas. The barrier island beaches have variable levels of development ranging from large cities with high-rises (Atlantic City on Absecon Island) to small beach communities with vacation homes (Lavallette Borough on Barnegat Peninsula) to undeveloped dune landscapes, beaches, and marshland, including Island Beach State Park, North Brigantine Natural Area, Corson's Inlet State Park, Cape May Coastal Wetlands Wildlife Management Area (WMA), and Edwin B. Forsythe National Wildlife Refuge (NWR).

Mainland

The New Jersey mainland area covers approximately 1,940 sq mi (5277 sq km) and makes up the entire western portion of the VSA. Generally, the Mainland contains all of the LCAs; however, some SCAs occur where the mainland has a direct interface with the ocean. The viewshed analysis suggests that approximately 5.8 percent of this regional landscape occurs within the ZVI. It extends from Asbury Park in the north to Hammonton in the west and Cape May to the south. In inland bay portion of the VSA borders most of the eastern side of the mainland. According to the NLCD, the mainland is primarily composed of forest (62%), developed land (19%), and emergent wetlands (8%). The remaining 11% is relatively evenly distributed between pasture/cultivated crop land, barren land, open water, scrub/shrub, and herbaceous cover which are generally scattered throughout the VSA in small pockets. Within the mainland portion of the study area, elevations range from sea level along the coast to a high point of 226 feet (69 m) AMSL which occurs in the northwestern portion of the VSA at Colliers Mills WMA in Jackson Township, Ocean County. Generally, elevations average approximately 59 ft (18 m) throughout the mainland portion of the VSA with lower elevations occurring near the inland bay and ocean coast. The mainland portion of the VSA is intensively developed on both sides of the Garden State Parkway. The development begins as a narrow band surrounding the highway in the southern portion of the VSA which becomes more expansive in the northern portion of the VSA. Beyond these more densely developed areas forested areas associated with the pine barrens ecosystem are the dominant land cover. In the western portion of the mainland, low intensity development, such as large lot residential use (often times in proximity to cultivated cropland) are interspersed amongst the forested areas. More significant expanses of cultivated cropland are found along the western edge of the VSA with the highest concentration in Hammonton Town and surrounding communities.

Inset 1.2-2 – Regional Landscape Definition

Character Areas

Landscape and/or seascape types, referred to in this report as character areas, are defined based on the similarity of visual features, such as landform, vegetation, water, and land use patterns. While regional landscapes are likely to exhibit diversity across a larger area, character areas should demonstrate a fairly homogenous visual character. Defining and delineating the landscape/seascape types found in the ZVI provides a useful framework for the analysis of existing visual resources and viewer settings.

EDR defined 18 distinct character areas within the ZVI, as listed in Table 1.2-2. The definition of these character areas is consistent with the approach taken in various visual assessment guidance methodologies (Smardon et al., 1988; U.S. Department of Agriculture [USDA] Forest Service, 1995; U.S. Department of

Transportation [USDOT] Federal Highway Administration, 1981; U.S. Department of Interior [USDOI] Bureau of Land Management, 1980) as well as the current BOEM SLVIA guidance document (Sullivan, 2021).

The process of mapping the character areas was based on land use/land cover designations within the New Jersey Department of Environmental Protection (NJDEP) Land Use/Land Cover 2015 (2019 Update) dataset. The designations within this highly granular dataset were grouped and generalized based on common characteristics and adjacency in order to approximate the spatial extent of each character area within the VSA. For example, various types of forest were grouped together into the Forest character area along with small pockets of differing land uses within forested areas (provided they did not match the characteristics of any other character area). The Town/Village Center character area was not readily identifiable based on this dataset alone and was instead delineated based on zoning data for Atlantic, Cape May, Monmouth, and Ocean Counties. The Residential Beachfront and Bayfront Residential character areas were identified based on their land use designation in combination with their location within 100 feet of qualifying features such as ocean, beach, dunes, bays, or salt marshes. The Atlantic City character area was defined based on geographic location and the presence of specific development types such as large high-rise buildings, dense development, and grided streets, as identified on aerial imagery. The process of delineating and refining all character area boundaries also relied upon review of aerial imagery, street-view photography, and fieldwork data. During final review of character area mapping (which focused on the ZVI), manual corrections were made in locations where the previously described process did not result in the appropriate character area designation. The resulting map is illustrated in Figure 1.2-2 (Sheets 1-7), along with representative photos of each character area provided as part of the character area descriptions below.

The general landscape character, land use, viewer/user groups, and types of views available from each of the character areas that occur within the ZVI are described below. It is important to note that many of these character areas also have an integral seascape component (i.e., views of the ocean) that is a major contributing factor to the visual composition and scenic quality of the character area. Use of these character areas to assist in defining the baseline scenic quality for the VSA and ZVI is an appropriate methodology for projects located offshore but visible from onshore character areas.

Table 1.2-2 Character Area Visibility Analysis

Character Area	Classification	Total Area within VSA (square miles)	Total Area Within the ZVI (square miles)	Percent of Character Area with Potential Turbine Visibility
Ocean	OCA	6,657.8	6,545.6	98.3
Undeveloped Bay	OCA	209.1	155.7	74.4
Residential Beachfront	SCA	8.2	6.3	76.5
Salt Marsh	SCA/LCA	214.7	112.0	52.1
Commercial Beachfront	SCA	1.4	0.9	68.7

Character Area	Classification	Total Area within VSA (square miles)	Total Area Within the ZVI (square miles)	Percent of Character Area with Potential Turbine Visibility
Undeveloped Beach	SCA	7.9	4.1	51.2
Atlantic City	SCA	3.1	0.2	6.9
Industrial	LCA	37.8	2.6	6.8
Bayfront Residential	LCA	3.3	0.2	6.1
Dredged Lagoon	LCA/SCA	14.3	0.5	3.3
Limited Access Highway	LCA	9.6	0.3	3.6
Recreation	LCA/SCA	20.2	0.6	3.2
Inland Open Water	LCA/SCA	26.6	0.7	2.6
Commercial Strip Development	LCA	29.5	0.4	1.5
Inland Residential	LCA	223.8	1.1	0.5
Town/Village Center	LCA	2.6	0.0	0.3
Forest	LCA	1,273.1	2.1	0.2
Agriculture	LCA	110.2	<0.1	<0.1

Figure 1.2-2 Character Areas Within the Visual Study Area

(6 Pages)

Ocean**Inset 1.2-3 – Examples of the Ocean Character Area**

Within the ZVI, this zone includes the open water of the Atlantic Ocean off the coast of New Jersey and portions of Delaware Bay. The defining characteristic of this character area is the presence of open water as a dominant foreground element in all directions. The open expanse of water can be relatively calm and flat or may occasionally include rolling swells and white caps. Human-made features in the water are limited but may include occasional jetties, buoys, and boats. Views into this character area cross the open water and often extend to the horizon. Views from within this character area toward shore contain various components of other character areas including undeveloped beach associated with oceanfront parks and natural areas, and human-made features associated with Residential Beachfront and oceanfront commercial zones. These can include buildings, boardwalks, amusement parks, and city skylines, particularly those associated with Atlantic City and Ocean City. The open water character area may also include views of character areas occurring further inland, including forested areas and salt marsh. The visibility, breadth, and detail of these features generally corresponds to the viewer's distance from shore. Features such as the Atlantic City's high-rises would likely be visible from significant distances within the open water character area, but visibility of lower profile features such as beaches and forest would likely diminish completely once a few miles offshore. Human activity on the water can be extensive, especially near major ports, inlets, navigation channels, and in proximity to marinas during the recreation season. This activity includes pleasure boating, merchant shipping, commercial and recreational fishing, and various water sports. Activity beyond the nearshore is typically concentrated within the designated shipping lanes located between 4 and 10 miles offshore. It is important to note that the Ocean character area can be a significant contributor to the scenic quality of adjacent SCAs such as undeveloped beach and shoreline residential. Additionally, the proposed action takes place entirely within the Ocean character area. As such, the contribution of this character area to adjacent character areas and the potential change resulting from the Projects is an important aspect of the VIA.

Undeveloped Beach

Inset 1.2-4 – Examples of the Undeveloped Beach Character Area

This character area is characterized by shoreline areas with minimal development and includes rolling, vegetated dunes which lead to an open sandy beach that slopes gently to the water line. In some instances, human-made features such as break walls, or stone jetties extend from the beach out into the ocean, but the remainder of the landscape generally lacks evidence of development. The undeveloped beaches within the ZVI are located on both barrier islands and islands within the back bays. Undeveloped beaches include Island Beach State Park on Barnegat Peninsula, portions of the Edwin B. Forsythe NWR such as Holgate Nature Conservatory and Short Island (also known as Pullen Island), North Brigantine State Natural Area, Corson's Inlet State Park, Stone Harbor Point, Cape May NWR, and Malibu Beach WMA. The defining characteristic of this character area is an unobstructed, water-level view up and down the shoreline and across open water as one looks out to sea, with minimal to no encroachment of human-made structures or infrastructure in the foreground view. Views from undeveloped beaches may also overlook inlets with visibility of neighboring islands. Some of the beaches (e.g., Island Beach State Park) are maintained by state or federal agencies, and therefore may include some human-made elements, including signage, fencing, and paved areas. However, these items are mainly clustered around public access points and are often screened by coastal dunes. Viewer activity in this area is primarily recreational, and includes swimming, sun-bathing, birdwatching, wildlife observation, walking, beachcombing, fishing, and surfing. The Undeveloped Beach character area provides opportunities for uninterrupted views of the Ocean character area backed by vegetated dunes which minimize the opportunity for inland views. These views over the Ocean character area include 180 degrees or more of uninterrupted ocean, generally extending to the horizon, and are a defining characteristic of the Undeveloped Beach. During the summer season, these views will often include a large number of beach goers and associated beach and ocean activity. However, the undeveloped beaches tend to be less crowded than the Commercial Beachfront character area, or the Atlantic City character area, described below. As such, viewers within the Undeveloped Beach character area have greater opportunities for views without distracting foreground features. Most users of this character area consider the Ocean the character defining element of the beach and the focus of their activities typically relies on the presence of the ocean and ocean views.

Undeveloped Bay**Inset 1.2-5 – Examples of the Undeveloped Bay Character Area**

Within the ZVI, this character area includes the expansive bodies of water west of the barrier islands and is characterized by an expanse of open water primarily bordered by the Salt Marsh, Dredged Lagoon, Bayfront Residential, and Forest character areas. The Undeveloped Bay character area hosts a diversity of wildlife which often animates the open water and shoreline. The Undeveloped Bay character area typically flows through protected ecological areas such as the Absecon WMA, Cape May NWR, Edwin B Forsythe NWR, Manahawkin WMA, and Great Bay Boulevard WMA. Views from and into the bay are typically framed by the primarily developed barrier islands, natural islands within the bay, or mainland landforms in the distance. These visible landforms may include human-made features such as housing developments, high rise buildings (Atlantic City), lighthouses, bridges, water towers, and utility/communication towers. The waters within this character area receive significant use by motorized and nonmotorized recreational boats, which are generally concentrated within the managed navigation channels of the bays. Areas outside the channels generally have a lower intensity of human activity. Views from within the Undeveloped Bay character area are generally panoramic and extend long distances, out to and sometimes beyond the barrier islands that separate the bays from Ocean character area. Views to the Ocean character area are generally interrupted by development, sand dunes, or vegetation on the intervening barrier islands. At inlet locations in the Undeveloped Bay character area views to the Ocean VA are typically framed by barrier islands. However, as one travels inland on the bays, vegetation within the salt marsh, barrier island development, and even vegetated sand dunes can limit outward visibility due to the lack of elevated vantage points within the bays.

Residential Beachfront

Inset 1.2-6 – Examples of the Residential Beachfront Character Area

This character area is characterized by year-round and seasonal homes, inns and hotels, and some large multi-unit buildings situated along the ocean shoreline. The defining characteristic of this zone is a broad, often elevated view (particularly from multi-story residences) of the ocean from a residential setting, with direct access to an adjacent beach. It is common for these residences and buildings to be separated from the beach by dunes, characterized by gently undulating sand features dominated by dune grasses and low shrubs in variable stages of succession. Wooden slat sand fencing is often present in this setting to protect the dunes from migration. Homes within this zone tend to be two to three-stories and are typically larger than the nearby homes further inland. However, smaller oceanfront beach cottages occur in older communities such as Beach Haven and Sea Isle City. Housing stock in this zone covers a wide range of styles including shingled cottage cape, Victorian, and modern. Structures in this character area are universally situated and designed to take advantage of beach access and ocean views. Common beachfront architectural elements include decks, awnings, skylights, extensive window banks, complex rooflines, and fencing that separates properties. Properties separated from the beach by dunes and/or vegetation typically include boardwalk or sand paths to the beach, which traverse the dunes. Landforms in this character area are level to gently undulating, and surrounding vegetation includes a mix of coastal scrub, dunes, and maintained residential landscaping. Large trees are generally lacking. Typical user activity within this zone includes a combination of residential and recreational activities, such as home and yard maintenance, local travel, sight-seeing, and beach recreation by members of the public. By its very nature, this character area has open panoramic views of the Atlantic Ocean, primarily from the upper floors of the homes, where balconies and rooftop decks are often situated specifically to take advantage of the ocean views. However, the dunes as well as the often continuous line of shorefront structures limit ground-level views to the ocean. Regardless, the ocean is an integral and defining feature of this character area, through a variety of senses including sight, sound and smell.

Bayfront Residential

Inset 1.2-7 – Examples of the Bayfront Residential Character Area

This character area occurs in conjunction with naturally occurring bays, rivers, and coves. It is characterized by seasonal and year-round residences which are situated along the waterfront. The character area is often bordered by an adjacent Salt Marsh character area, or the waterfront at the edge of the neighborhood street grid. This zone is commonly found on the northwest side of the barrier islands, or on the mainland along salt marshes, bays, or the rivers that feed them. The Bayfront Residential character area frequently appears as suburban residential development from the street, incorporating homes and lawns stitched together with sidewalks, street trees, and neighborhood roads. Glimpses of bays or rivers may be available between densely situated homes. Housing types include single family homes, duplexes, and town homes. Often the residential neighborhoods are flanked by sandy beaches, marinas, and/or break-walls. The bay-facing side of properties in this character area are designed to maximize water usage and views by incorporating decks, porches, docks, boat lifts, and other boating facilities. This character area is visually separated from the Ocean by the barrier islands which are typically dominated by the Residential Beachfront, Undeveloped Beach, Commercial Beachfront, or Atlantic City character areas. Often, oceanfront development becomes a significant feature in the views from the Bayfront Residential character area. These views are typical from within the Bayfront Residential character area along the western shore of Absecon Bay, Reeds Bay, and Lakes Bay. However, where the shoreline is not dominated by development (west of Little Egg Harbor and north of Great Bay), extensive outward views across the bays or rivers can be available from within this character area and often extend over the Undeveloped Bay and occasionally beyond the barrier island dunes to the Ocean. Along with typical residential activities, user activity in this zone includes boating, and recreation activities such as fishing and nature viewing.

Dredged Lagoon

Inset 1.2-8 – Examples of the Dredged Lagoon Character Area

This character area typically occurs in conjunction with the Undeveloped Bay or Salt Marsh character areas and is characterized by residential neighborhoods with seasonal and year-round homes situated along an artificial dredged waterway. Marinas associated with the housing developments are sometimes included in this character area. Neighborhoods in this character area are arranged along a tight, well-organized grid of local streets and water channels that run between the backyards of adjacent residences. Individual homes have private docks along these channels which provide access to the adjacent waterway. The separation of land created by water channels and roadways ending in cul-de-sacs allows individual streets to function as discrete neighborhoods, which together, comprise a larger residential community. Consequently, communities within this zone have a more spacious and spread-out character when compared to the neighboring landlocked subdivisions within the ZVI. Depending on a residence's position within the zone, outward views across open expanses of water may be available, but in general views from this character area are screened or tightly framed by nearby residences and moored boats. Properties on the periphery have more extensive views of the bay, salt marsh, and occasionally the ocean beyond the intervening barrier islands. However, outward water-level views from the dredged channels are generally completely screened by the structures that line the channels. Examples of the Dredged Lagoon character area within the ZVI include developments in Beach Haven West, Sunrise Beach, and Windsor Park. Typical user activities in this character area include residential activities, boating, and fishing.

Inland Residential**Inset 1.2-9 – Examples of the Inland Residential Character Area**

The Inland Residential character area includes residential development located inland of the Oceanfront and Bayfront Residential character areas. This zone is characterized by low-, medium-, and high-density residential neighborhoods which occur throughout the VSA and ZVI. Development patterns in this character area include quaint walkable neighborhoods with sidewalks along streets which typically run perpendicular to the ocean or bays and abut the Oceanfront, Bayfront Residential, or Dredged Lagoon character areas. This character area also includes sprawling suburban subdivisions which primarily occur within the mainland portions of the VSA, where the presence of the ocean and bays becomes less apparent due to the screening provided by adjoining Forest, Village/Town Center, and Commercial Strip Development character areas. While residential structures such as homes and apartments are the main building type in this character area, schools and school grounds, and occasional commercial structures within a neighborhood may also be included. The common visual characteristics of this character area include relatively closely situated homes and limited outward views. Home types within this character area include single and multifamily residences which vary in size, age, and style. Although outward views from this character area are typically restricted by vegetation and buildings/structures within and surrounding the neighborhood, where this character area occurs closer to the Ocean, views down residential roadway corridors with minimal vegetation may extend to adjacent dunes, and/or the ocean and bays. Typical user activities in this character area include home and yard use/maintenance and local travel.

Town/Village Center

Inset 1.2-10 – Examples of the Town/Village Center Character Area

The Town/Village Center character area includes well-defined town/village center areas which occur in small pockets on the barrier islands and larger villages on the mainland. This zone is characterized by moderate- to high-density residential and commercial development occurring along a main street or cluster of mixed use blocks. This human-scale development features ample street trees, detailed streetscape treatments, massed commercial properties featuring vibrant window displays, and public amenities such as benches, water features, and public art. Examples of this character area within the ZVI include town center areas within Sea Isle City and the City of Brigantine. Buildings within the town centers include churches, town halls, libraries, and large mixed use properties. They are generally surrounded by residential buildings which increase in density near the ocean and bay shorelines. In popular beach towns, tightly spaced commercial buildings and structures that cater to seasonal visitors and/or tourists may be the dominant feature within the Village/Town Center character area. Buildings are generally 2 to 3 stories in height and are organized along a grid which focuses views along the streets. Vegetation within this zone is typically limited to regularly placed street trees and successional vegetation associated with vacant land parcels. The landscape is dominated by human-made elements, including buildings, cars, pavement (roads, parking lots, and sidewalks), light posts, and other infrastructure. Long-distance outward views are generally only available along the outskirts of Village/Town Center character area, and these views are usually at least partially screened by existing buildings/structures and/or vegetation. Most of the well-defined Village/Town Center areas within the VSA on mainland New Jersey occur at historic centers of commerce in former villages now consolidated into larger towns with more sprawling commercial and residential development along the periphery. These inland examples of the Town/Village Center character area do not typically occur within the ZVI. However, the aforementioned beach communities in Sea Isle City, Margate City, Ventnor City, and Brigantine occur on the barrier islands and may have discrete, tightly framed outward views toward the ocean. Users within the Town/Village Center character area typically include residents and tourists shopping, dining, and sightseeing. During the summer months, these areas can become crowded with tourists, as the commercial offerings typical of this character area draw tourists and vacationers from nearby beaches and neighborhoods.

Commercial Strip Development

Inset 1.2-11 – Examples of the Commercial Strip Development Character Area

This character area typically occurs inland but may be connected to the waterfront by way of the Oceanfront Commercial character area or Residential Beachfront character area. It includes strip commercial development located along wide boulevards, around the edges of village centers, and sporadically throughout the VSA. The visual character of this character area is generally defined by modern, unadorned strip or stand-alone building stock, on-site parking, and circulation patterns favoring vehicular modes of transportation. Vegetation is limited to landscaped grounds, sparse street tree plantings, and narrow grassy medians and tree plantings within and adjacent to paved areas. Properties within this zone typically include retail businesses, restaurants, convenience stores, automobile dealers, shopping centers, malls, and office buildings. Outdoor commercial uses such as marinas and amusement parks may also be categorized within this character area. Foreground and middle ground views often appear cluttered when multiple properties utilize large, colorful signage along roadways. Views can also look stark, for example, when a series of stand-alone office buildings are set deep into parking lots. Examples of this character area within the ZVI can be found on the mainland in proximity to the Garden State Parkway as it crosses through the VSA and on the barrier island communities of Seaside Heights Borough, Ship Bottom Borough, Beach Haven Borough, Brigantine City, Margate City, or Wildwood Crest Borough. This character area is typically bordered by the Inland Residential and Town/Village Center character areas. The presence of commercial structures, visual clutter, and the neighboring developed character areas generally eliminates the opportunity for outward views from within this character area. However, when the Commercial strip Development character area borders the Residential Beachfront character area, discrete, tightly framed outward views may be available from streets oriented toward the ocean. Users within this zone generally include residents and tourists involved in destination driven activities such as dining or shopping.

Atlantic City

Inset 1.2-12 – Examples of the Atlantic City Character Area

The Atlantic City character area occurs on Absecon Island within Atlantic City, primarily east of Albany Avenue (US Route 40). This character area is defined by an eclectic mix of large casino/hotel properties, single family homes, multi-family residential complexes, large and small commercial properties, traditional mixed use downtown structures, and vacant lots. A wide range of urban uses are present in a variety of conditions. Traditional or expected city center patterns of development are frequently interrupted by urban renewal demolition, poorly maintained structures, or new construction. There is a general gradient in which casinos located closer to the boardwalk and beach, are backed by large chain hotels and motels, mixed use commercial, then residential townhouses and apartments finally giving way to small lot single-family residences. However, casinos and affiliated tourist accommodations/attractions such as hotels, shopping, and amusement areas are scattered throughout this character area. The resulting scene is visually complicated as multiple land uses and building styles are observable from almost any viewpoint within the city, a condition exacerbated by a high concentration of vacant lots scattered throughout the zone. Human activity is high, especially on the boardwalk and beaches which act as frontage to the large casinos. Large crowds primarily reflect casino visitors, tourists, and those employed to maintain this industry (including a variety of staff and maintenance workers). Activity within this character area primarily involves city residents conducting the routines of daily living. Outward views from this character area are available from the bayfront shoreline looking out toward the Salt Marsh or Undeveloped Bay character areas, upper stories of the taller hotel, casino, or apartment complex properties looking out toward the Ocean. Views within this character area are typical of a city center developed primarily in the late 19th and early 20th century and heavily affected by the policies and practices of Urban Renewal. This translates to 2-3 story mixed use structures with commercial businesses at street level and apartments above on major transit corridors. Tightly spaced two or three family homes occur on the minor cross-streets interspersed with 1950s style public housing, modern infill, and vacant lots. On the outskirts of this dense urban area, single family residences provide a transition to a more suburban development pattern. Within the interior areas of the Atlantic City character area outward views are restricted by the dense urban development and typically do

not extend beyond the immediate foreground. Views toward the ocean are entirely blocked by the presence of high-rise buildings which crowd the waterfront.

Limited Access Highway

Inset 1.2-13 – Examples of the Limited Access Highway Character Area

The Limited Access Highway character area includes primary, high-volume vehicular travel corridors that briefly enter the ZVI and are dominated by automobiles, pavement, guardrails, and signs. Within the ZVI, this zone is represented by fragments of State Route 444/Garden State Parkway and the Atlantic City Expressway. Views from within this character area are generally focused on the roadway and associated traffic. Travel is at moderate to high speed, and outward peripheral views are fleeting. The surrounding scenery is variable but dominated by adjacent buildings/structures and trees, with limited elevated long-distance views available. When this character area passes through the Undeveloped Bay character area via bridges, views of the bays, marshes and surrounding character areas become available, along with long-distance views in the direction of the ocean.

Forest

Inset 1.2-14 – Examples of the Forest Character Area

The Forest character area contains tracts of forestland which occur sporadically throughout the ZVI. Within this character area two primary forest types are represented; the New Jersey Pine Barrens (including the Atlantic Coastal pine barrens ecosystem) and the coastal scrub (maritime) forests which typically occur in association with the Salt Marsh character area and provide a transition into the pine barrens. The New Jersey Pine Barrens typically include pitch pine and scrub oak forests. The forest understory is made-up of mixed shrubs, saplings, and herbaceous vegetation including orchids and other unique plant species. Due to environmental protections or lack of development suitability, these forest areas typically occur between inland residential areas and the Undeveloped Bay character area. The Forest character area also frequently coincides with protected lands such as the Tuckahoe WMA and Manahawkin WMA which occur within a small portion of the ZVI. Larger tracts of forestland with public access points typically include maintained recreation areas, such as state parks or nature preserves such as Island Beach State Park in Seaside Park. Scattered residences, local roads, small fields, and wetlands may occur within this zone but are subordinate to the visual dominance of the surrounding forest. Landform within this zone is relatively flat, although gently rolling topography is present in places. Notable areas of forest land within the ZVI include portions of the Swan Bay WMA, Stafford Forge WMA, and Bass River State Forest. The maritime forest is characterized by dense woody and herbaceous vegetation, typically less than 20 feet in height, providing a transition between bayfront salt marshes and taller inland forests. Long-distance views within the Forest character area are generally partially to fully screened by the forest overstory. When present, outward views typically occur on the periphery of the Forest character area. This is particularly true where the Forest character area abuts emergent wetlands or open water associated with the Undeveloped Bay or Salt Marsh character areas where the vegetation becomes more stunted and sparse. Occasional observation towers situated within the Manahawkin WMA also provide opportunities for sweeping views from above the treetops over the bays and to the ocean. Users within the Forest character area include recreationalists and tourists who enjoy activities including hiking, fishing, birdwatching, hunting, and sightseeing.

Salt Marsh

Inset 1.2-15 – Examples of the Salt Marsh Character Area

This character area is characterized by coastal ponds and marshes that are connected to inlets or bays with one or more relatively narrow channels allowing tidal water to periodically flood portions of the character area. This character area occurs commonly along the bayside coastlines of the mainland and barrier islands throughout the VSA. Within the ZVI this character area is represented by the Great Bay Boulevard, Absecon, Upper Barnegat Bay, and Cape May Wetlands WMAs, and portions of the Cape May and Edwin B. Forsythe NWRs. These areas are typically characterized by an expanse of low-growing herbaceous wetland vegetation interspersed with pockets of open water. Because these areas are subject to the influence of tides, they can include exposed mud banks and flats along their edges at low tide. The Salt Marsh character area also hosts some coastal scrub vegetation and is frequently bordered by the Forest character area. This transition zone may include infrequent woody shrubs and stunted trees on small upland patches. Views from within the Salt Marsh character area beyond these transition zones often offer sweeping views across the Undeveloped Bay character area. Often these views are interrupted by the barrier island development associated with Atlantic City, Beach Haven Crest, and Margate City in the middle ground or background. However, when the barrier island lacks development in areas such as the Edwin B. Forsythe NWR and Little Beach, the Salt Marsh character area may have views beyond the barrier islands and occasionally out into the ocean. Recreational activity in the form of boating, fishing (including clamming and crabbing), hunting and wildlife observation is common within the Salt Marsh character area. However, these sensitive environments do not offer developed recreational amenities.

Commercial Beachfront

Inset 1.2-16 – Examples of the Commercial Beachfront Character Area

This character area typically occurs in the major beach towns on the coast within the VSA. It consists of a wooden boardwalk or walkway, ocean piers, and commercial development bordering a shoreline beach or ocean. Commercial uses include adventure/amusement piers, recreation centers such as the Ocean City Music Pier and commercial structures such as snack shops or bars. Structures in this character area range in size from small single story snack shops to multi-story municipal structures or piers. Use and activity in this character area is similar to that which occurs in the Commercial strip Development character area, although in this case the businesses treat the boardwalk as street frontage to accommodate pedestrian rather than vehicular access. The type and intensity of activities in this character area are largely influenced by tourism and are seasonal in nature. These areas are used heavily during the late spring and summer months, and minimally or not at all during the fall and winter. Topography is typically level along the boardwalk, with beaches that slope gently downward toward the shoreline. Vegetation may be present in the form of ornamental shrubs, but mostly consists of dune grass along the edge of the adjacent beaches. The availability of open views toward the ocean varies within this character area. In some areas, views will be screened by dunes or framed by commercial structures, piers, jetties, signs, and other human-made structures. However, in other areas, such as along the sandy shorelines or looking out from a pier, viewers will be afforded open views of neighboring piers, sandy beaches, and the ocean. One side of this character area is always connected to the Open Ocean character area, with surrounding landscape on the inland side typically within the Commercial Strip Development character area, but also at times including the Recreation, Residential Beachfront, or Inland Residential character areas. The boardwalk area in Atlantic City has a prominent commercial component that not only lines the inland beach front, but also extends across beaches and over the ocean in the form of large adventure piers/amusement parks containing midway areas and a variety of carnival rides accented by flashing and colorful light features. Beaches in this area during the tourist season (Memorial Day to Labor Day) are heavily trafficked with a near constant presence of crowds bringing with them a variety of colorful beach equipment such as beach umbrellas, chairs, towels, and a need for trash receptacles, lifeguard chairs, and maintenance equipment storage sheds. Individual beaches not separated by dunes often blend together due to the high and continuous volume of users,

however, some locations are dedicated to specific activities such as beach volleyball or extensions of hotel bars. These locations generally offer views to the horizon, but these views are frequently interrupted by the presence of large structures and piers that extend up to 800 feet into the ocean, eliminating major portions of the horizon from view.

Examples of this character area within the ZVI include The Atlantic City Boardwalk, Wildwood City Boardwalk, Ocean City Boardwalk, Seaside Heights Boardwalk, and Point Pleasant Beach Borough Boardwalk.

Agriculture

Inset 1.2-17 – Examples of the Agriculture Character Area

This character area is a minor component of the VSA which is primarily found inland, outside of the ZVI. Locations of this character area within the ZVI include small areas within Galloway Township and Hamilton Township. Larger pockets of this character area located on the western edge of the VSA in Buena Vista, Hammonton, Tabernacle, and Plumsted Townships are not within the ZVI. Outside of these large areas, instances of this character area include smaller farm lots scattered throughout the VSA. This zone is characterized by flat stretches of field which provide open views of crops, hedgerows, livestock, farm buildings, equipment, and homes. Crops include blueberries, corn, and a variety of vegetables. Orchards and equestrian facilities are also common. These areas are viewed by farmers and farm staff working the land, families who inhabit adjacent residences, and drivers and passengers traveling on roads that cross through this character area. The Agriculture character area is most commonly adjacent to the Inland Residential and Forest character areas, which frame or limit outward views depending on their spatial relationship.

Recreation

Inset 1.2-18 – Examples of the Recreation Character Area

The Recreation character area encompasses a range of areas intended primarily for outdoor leisure and play. On the mainland, these areas include golf courses, sports fields, athletic complexes, campgrounds, and inland beaches. On the barrier islands these areas include community parks, small athletic complexes their parking areas, and other developed areas within state parks. This character area typically contains landscaped or human-made features which support recreational activities; however, the visual character of these features varies widely. Golf courses, viewed by golfers or adjacent residents, feature long, sweeping views of contoured lawns, water features, and sand traps, intentionally framed by forest edge. By contrast, barrier island parks and athletic complexes are viewed by a variety of residents and tourists who use or pass by the site. These areas tend to be more visually cluttered with parking lots, baseball diamonds, tennis and basketball courts, restroom facilities, benches, pavilions, gardens, bike racks, and other auxiliary park structures. Within the ZVI this character area is most commonly represented by shoreline recreation on barrier islands, locations associated with state park structures at elevations rising above the surrounding dunes and beach, and in locations where a recreation area may be situated at the end of a street oriented toward the Projects. On the mainland within the ZVI this character area is most commonly located adjacent to the Undeveloped or Salt Marsh character areas to provide views overlooking the bay. Views from this character area either look out the ocean or bay, or into a densely developed adjacent character area such as Commercial Beachfront, Town/Village Center, Residential Beachfront or Bayfront Residential.

Inland Open Water

Inset 1.2-19 – Examples of the Inland Open Water Character Area

This character area occurs throughout the mainland portion of the VSA. Its dominant visual feature is an open expanse of flat water that is enclosed by a vegetated shoreline. The shorelines are typically dominated by deciduous and coniferous trees but are occasionally interrupted by human-made features, such as homes, boat launches, bridges, and roads. Human activity on these waterbodies and along the shoreline includes boating, kayaking, fishing, and swimming. Shoreline trees define the visible background in most views from inland lakes and ponds. Several waterbodies associated with active or reclaimed extraction mines are also included within this character area. Given their inland locations and extensive vegetative screening, views of the ocean from this character area are rare. As such, very few inland waterbodies within the VSA also occur in the ZVI. Exceptions include the Atlantic City Reservoir, Hawkins Creek, and several tributaries draining into the extensive network of bays though out the VSA.

Industrial/Developed**Inset 1.2-20 – Examples of the Industrial/Developed Character Area**

The Industrial/Developed character area includes developed landscapes defined by a variety of utilitarian functions, which are visually linked by a stark, severe aesthetic. Elements commonly found in this zone include expansive open areas, pavement, utility structures and buildings, screening or security fencing, machinery, equipment, and raw materials. Land uses include airports, military grounds, mines, power stations, industrial parks, warehouses, self-storage facilities, municipal maintenance lots and transit stations. This character area is found throughout the VSA at a variety of scales. On the barrier islands, the Industrial/Developed character area is present on very small sites on the interior or bay side of the islands in the form of power stations, maintenance lots, parking areas, and small airports including Ocean City Municipal Airport and Bader Field Airport. Views from this character area can be extensive when the sites are large, open, and adjacent to the Salt Marsh or Undeveloped Bay character area, as in the case of airports. However, it is more typical for views from the Industrial/Developed character area on the barrier islands to be limited because the sites are small, fenced, and adjacent to densely developed character areas such as Inland Residential or Commercial Strip Development. This condition is exemplified by municipal maintenance lots and small industrial businesses and materials storage lots. The USCG Training Center on Cape May is the singular instance of an Industrial/Developed site with available views of the Ocean character area.

On the mainland, the Industrial/Developed character area is found throughout the VSA on larger sites. Substantial instances of this character area include the Monmouth Executive Airport, Joint Military Base McGuire-Dix in Lakehurst, Atlantic City International Airport, Dun Rite Sand & Gravel Mine, Lakewood Industrial Park, Woodbine Municipal Airport, and Cape May County Airport. These large sites are most commonly adjacent to the Forest character area, which buffers their loud, unsightly, or otherwise intrusive nature from neighboring properties. Open industrial sites offer extensive views within themselves, but the views usually extend only to the property's edge, which is typically bordered by dense forest vegetation. Smaller instances of this character area are scattered throughout the mainland and include recycling centers, active and abandoned mine sites, industrial parks, transit stations, military training centers, self-storage

facilities, and industrial fabrication, warehouse, and distribution facilities. These sites are typically screened by Forest character area, except in cases when they are adjacent to the Commercial Strip Development character area as a component of a regional commercial center.

In general, views into and across the Industrial/Developed character area are interrupted by fencing, trees, and brush, although infrequent glimpses of the stark and utilitarian interior may appear through periodic gaps in the perimeter buffer. Human activity in this zone is limited to training or work by employees of the various military operations or business enterprises. It also includes commuting when the character area takes the form of a transit station or parking area.

1.2.4 Visually Sensitive Resources

Visually sensitive resources (VSRs) include resources that have been identified in publicly available documents and GIS databases provided by national, state, or local governments, organizations, and/or Native American tribes as important sites which are afforded some level of recognition or protection. Avoiding or minimizing impacts to these resources is an important consideration in the planning stages of a project. For the VIA, a desktop inventory of visually sensitive resources was prepared for the entire VSA. Additional resources were also identified through consultation with BOEM, NJDEP, Project stakeholders and during the field verification process. These resources were identified, and requisite GIS layers were compiled into a database for documentation and mapping purposes. A GIS analysis was then conducted to determine how many of these resources occur within the ZVI and would require further evaluation. Attachment C lists all identified VSRs that occur within the VSA and those within the ZVI (as determined by the lidar viewshed analysis). A summary of the results of this GIS analysis for VSRs occurring within the ZVI is presented in Table 1.2-2, below.

Table 1.2-2 Visually Sensitive Resources Within the ZVI

Type of Resource	Source	Occurrences of Resource Within ZVI
National Historic Landmarks	National Park Service Public Database	2
Properties Listed on the National or State Registers of Historic Places	National Park Service Public Database	15
Properties Determined Eligible for National or State Registers of Historic Places		43
National Natural Landmarks	National Park Service Public Database	1
State/Local Designated Scenic Areas and Overlooks	NA	0
Scenic Area of Local Significance	NA	0
State Designated Scenic Overlooks	NA	0
National Wildlife Refuges	U.S. Fish and Wildlife Service Public Database	2

Type of Resource	Source	Occurrences of Resource Within ZVI
State Wildlife Management Areas	NJDEP Division of Fish & Wildlife - Wildlife Management Areas	16
National Parks	NA	0
State Parks	NJDEP Bureau of GIS	3
State Nature and Historic Preserve Areas	NJDEP Bureau of GIS	12
National Forests	NA	0
State Forests	NJDEP Bureau of GIS	3
National Recreation Areas and/or Seashores	NA	0
State Beaches	NA	0
National or State Designated Wild, Scenic, or Recreational Rivers	National Wild and Scenic Rivers System	1
Highways Designated or Eligible as Scenic	NJ Scenic Byways Program	1
National Historic/Recreation/Heritage Trails	NJDEP Bureau of GIS	1
State Fishing and Boating Access Sites	NJDEP Bureau of GIS	9
Lighthouses (not NRHP-Listed or State Historic-Listed)	NJDEP Bureau of GIS	1
Public Beaches	Municipal Document Review	35
Environmental Justice Areas (State and Federal)	EDR EJA Analysis	86
Ferry Routes (Occur across multiple states)	NA	0
Seaports (Commercial Maritime Facilities)	NA	0
Other State Land with Public Access	NA	0
Total		231

The locations of the visually sensitive resources are illustrated in Figure 1.2-3 at the conclusion of this section. Brief descriptions of the types of visually sensitive resources that occur with the ZVI are presented below:

Historic Sites and National Historic Landmarks

Authorized by the National Historic Preservation Act of 1966 (NHPA), the National Register of Historic Places (NRHP) is maintained by the National Park Service (NPS) as part of a national program to coordinate efforts to identify, evaluate, and protect historic and archeological resources. According to the NPS website, the NRHP is the official list of designated historic places worthy of preservation, and National Historic Landmarks (NHL) are historic places that hold historic significance and are designated by the Secretary of

the Interior. The New Jersey State Register of Historic Places (SRHP) is maintained by the State Historic Preservation Office (SHPO) and includes resources that the state has determined are worthy of preservation, but which have either not been determined eligible for inclusion or have not been evaluated for listing in the NRHP. A *Historic Resources Visual Effects Analysis* (HRVEA) prepared for the Projects (EDR, 2021) contains additional details on S/NRHP and NHL properties and districts within the VSA.

Within the ZVI, EDR identified 43 historic districts and individual properties listed or eligible for listing on the S/NRHP and two properties or districts listed as National Historic Landmarks (NHL). These properties include historic districts, homes, lighthouses, churches, and government buildings (see also EDR, 2021). The two NHL sites include the Atlantic City Convention Hall in Atlantic City and Lucy the Margate Elephant in Margate City. The resources occur approximately 11.4 mi and 14.4 mi from the Projects, respectively.

National Natural Landmarks

The National Natural Landmarks (NNL) Program identifies sites that contain outstanding biological and geological resources and encourages the conservation of these areas (NPS, 2021). Manahawkin Bottomland Hardwood Forest is the only designated NNL within the ZVI and is located approximately 21.0 miles from the Projects.

National Wildlife Refuges

The National Wildlife Refuge (NWR) System, managed by the U.S. Fish and Wildlife Service (USFWS), is a system of public lands and waters set aside to conserve the nation's fish, wildlife, and plants (USFWS, 2021). Two NWRs occur within the ZVI. The Edwin B. Forsythe NWR is located along the northern coast of New Jersey, approximately 9.2 miles from the nearest proposed WTG. The Cape May NWR, located in southern New Jersey, is located 22.9 miles from the Projects.

State Wildlife Management Areas

There are 16 State Wildlife Management Areas (WMAs) within the ZVI. These state-owned lands are managed to provide wildlife habitat and accommodate wildlife-related recreation (hunting, bird watching, etc.). The closest WMA to the WTGs is the Absecon WMA, located along the central New Jersey coast, approximately 10.3 miles from the nearest proposed WTG.

State Parks

Three State Parks occur within the ZVI. Corson's Inlet State Park is located along the southern New Jersey Coast, approximately 21.3 miles from the Projects. This oceanfront park offers hiking, fishing, crabbing, boating, and sunbathing (NJDEP, 2020). Island Beach State Park and Barnegat Lighthouse State Park are both located along New Jersey's northern coast at approximately 26.9 miles and 27.2 miles, respectively, from the nearest WTG. Island Beach State Park is a 10-mile-long barrier island between the Atlantic Ocean and Barnegat Bay that offers swimming, picnicking, bicycling, horseback riding, sailboarding, surfing, scuba diving, and hunting (NJDEP, 2020b). Just to the south is Barnegat Lighthouse State Park, which features the Barnegat Lighthouse, as well as recreational opportunities such as hiking trails, fishing, wildlife viewing, and picnicking (NJDEP, 2020c).

State Nature Preserves

Twelve State Nature Preserves occur within the ZVI. The closest nature preserve to the Projects is North Brigantine State Natural Area, located approximately 8.9 miles from the nearest proposed WTG. The natural

area is located on the central New Jersey coast and is part of the longest stretch of undeveloped barrier island beach in the state. It provides shorebird habitat, coastal dunes, and rare species habitat. The natural area also provides recreational opportunities such as walking, wildlife viewing, sunbathing, and fishing (NJDEP, 2018).

State Forests

Three State Forests occur within the ZVI. Bass River State Forest, located approximately 18.0 miles from the nearest WTG, is the closest State Forest to the Projects. The forest provides recreational opportunities such as hiking, picnicking, camping, and hunting, as well as swimming, fishing, boating, and canoeing on Lake Absegami (NJDEP, 2020d). Wharton State Forest is located approximately 23.7 miles at its closest point from the Projects. The forest is the largest single tract of land within the New Jersey State Park System, totaling 122,880 acres, and includes rivers and streams for canoeing, hiking trails, unpaved roads for mountain biking and horseback riding, and lakes, ponds, and fields for wildlife viewing (NJDEP, 2020e). Belleplain State Forest is located approximately 26.7 miles from the Projects. The forest was established for recreation, wildlife management, timber production, and water conservation and includes Lake Nummy, a popular swimming, boating, and fishing area (NJDEP, 2020f).

National or State Designated Wild, Scenic, or Recreational Rivers

The National Wild and Scenic Rivers System was created by the Wild and Scenic Rivers Act of 1968 to preserve certain rivers with outstanding natural, cultural, and recreational values in a free-flowing condition. Congressionally designated wild and scenic rivers are managed by the Department of Agriculture (Forest Service) or Department of the Interior (Bureau of Land Management, Fish & Wildlife Services, National Park Service). Within the ZVI there is one such designated resource, the Great Egg Harbor Wild and Scenic River, located approximately 19.6 miles at its closest point from the Projects.

Highways Designated or Eligible as Scenic

One Scenic Byway, the Southern Pinelands Natural Heritage Trail, is located within the ZVI approximately 16.7 miles at its closest point from the Projects. The state-designated scenic byway is a 130-mile route located in the Pinelands National Reserve in southern New Jersey (NJDOT, 2018).

National Trails

The New Jersey Coastal Heritage Trail was established by federal legislation under Public Law 100-515 in 1988 to promote awareness, stewardship, and protection of natural and cultural resources along 300 miles of New Jersey's Atlantic coast and Delaware Bay. The trail is managed in cooperation by the National Park Service, the State of New Jersey, and many other public and private organizations. The trail is divided into five regions and links significant natural and cultural sites, with a focus on maritime history, coastal habitats, wildlife migration, historic settlements, and relaxation and inspiration (NPS, 2012). The destinations along the trail have been identified in other VSR categories.

State Fishing and Boating Access

Within the ZVI, there are nine state-owned and/or -managed fishing and boating access sites. The majority of these sites provide access to the bays and sounds of the Atlantic Ocean, and all are at least 11.5 miles from the Projects.

Lighthouses

There are two lighthouses that are not designated NRHP historic sites within the ZVI. The closest, Tucker's Island Lighthouse is approximately 17.8 miles from the nearest proposed WTG. Sea Girt Lighthouse is located approximately 52.8 miles from the Projects.

Public Beaches

There are 36 public beaches within the ZVI (in addition to the previously mentioned State Beaches). The nearest of these beaches, Atlantic City Beach, is approximately 10.4 miles from the nearest proposed WTG.

Environmental Justice Areas

Implemented in 1994 by Executive Order 12898 - Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations has a purpose of directing attention to a project's environmental and human health effects on minority and low-income populations. While this order addresses actions undertaken by federal agencies, states have additionally identified parameters to define Environmental Justice areas at the state level to mitigate the potential for disproportionately high and adverse human health of environmental impacts on minority, low-income, and/or Indian tribes and indigenous communities and populations from state actions. There are 87 Environmental Justice Areas identified within the ZVI, the closest (340010101052) is located in Atlantic City, approximately 9.9 miles from the nearest WTG.

Although not formally inventoried, it should be noted that the ZVI also includes other public resources that could be considered regionally or locally significant or sensitive due to the type or intensity of land use they receive. These include local park and recreational facilities, campgrounds, golf courses, local nature preserves, tourist attractions, fish and game clubs, schools, churches, cemeteries, areas of concentrated human settlement, and heavily traveled roads. Ocean bays and sounds within the ZVI could also be considered sensitive visual resources. These areas provide recreational opportunities, such as boating, fishing, kayaking, cruising, swimming, and wildlife viewing, and historic villages along these bays offer waterfront dining, shopping, and other tourist attractions and accommodations.

1.2.5 Local Plan Review

Local comprehensive plans, recreation and open space plans, and conservation plans may also identify important visual/aesthetic resources defined by communities. To address potential visual resources identified in these local and state planning documents, EDR first identified municipalities that have greater than 0.5 sq mi within the ZVI and then quantified the percent of potential visibility within each. For those municipalities that have greater than 5 percent of their land area within the ZVI, each of the applicable plans were consulted to determine the existence of resources important to those communities. Appendix B2 includes an inventory of each municipality that includes greater than 5 percent ZVI presence as well as an overview of the types of resources identified in these plans.

Table 1.2-4, below, lists the municipalities that were identified using the criteria listed above.

Table 1.2-4 Municipalities With Greater Than Five Percent ZVI Content

Municipality or County	Total Area (sq miles)	Area Within ZVI (sq miles)	Percent Area within ZVI(%)	Identified Planning Document(s)
Atlantic County				
Atlantic County	610.3	101.7	16.7	Atlantic County, New Jersey Master Plan (2018) Atlantic County, New Jersey Open Space and Recreation Plan (2018)
Absecon, City of	7.2	2.9	40.6	2016 Reexamination Report (2017)

(8 pages)

2.0 ASSESSMENT METHODOLOGY

At the time this study was prepared BOEM had not yet released its guidelines for visual impact assessment for projects under its jurisdiction (BOEM, 2021). The VIA procedures used for this study draw from methodologies developed by various state and federal agencies, including the BLM (1980), USFS (1974), USDOT Federal Highway Administration (1981), the U.S. Army Corps of Engineers (USACE) (Smardon et al., 1988) and the New York State Department of Environmental Conservation (not dated). Methodologies employed to inventory visual resources, analyze the potential viewshed associated with the Projects (i.e., the ZVI), and prepare visual simulations are also generally consistent with European and Canadian guidance developed specifically for onshore and offshore wind farms (University of New Castle, 2002; Enviro Consulting, 2005; Horner & MacLennan and Envision, 2006, Ministry of Forests, Lands, and Natural Resource Operations, 2016).

EDR developed a document titled *Visual Impact Assessment Procedure Atlantic Shores Offshore Wind, LLC* which outlines the assessment procedure included in this VIA. This document was provided to BOEM, NJDEP, and several other permitting agencies and stakeholders for comment. Beginning in May of 2020, EDR and Atlantic Shores entered discussions with BOEM's visual subject matter expert to ensure the VIA procedure would be acceptable to the lead permitting agencies. This comment period extended to January 2021 and resulted in a mutually agreeable procedure for assessing the potential visual impacts associated with the Projects. The procedure document is included in Attachment A of this VIA.

The specific techniques used to assess potential visibility of the Projects and visual impacts are described in the following section.

2.1 Visibility Assessment Methodology

In order to identify and inventory those locations within the VSA where it may be possible to view the proposed WTGs from ground-level vantage points an assessment of potential visibility of the Projects was completed. This visibility assessment included the following two levels of analysis:

1. Viewshed analysis, which is a desktop procedure designed to identify geographic areas of potential visibility of the Projects, and
2. Field verification, which included several visual experts visiting the VSA to determine the validity of the viewshed analysis results, document views from within the ZVI, and confirm the character area boundaries and characteristics.

2.2 Viewshed Analysis

A viewshed analysis was conducted to determine the possible extent of visibility of the Projects (ZVI) within the VSA. This analysis relies on lidar data, the development parameters of the Projects, and the physical limits of visibility to determine areas of potential Project visibility. The viewshed analysis developed for this VIA was based upon a highly detailed digital surface model (DSM) of the VSA generated from lidar data⁴, which includes the elevations of land features, buildings, trees, and other objects large enough to be

⁴ Lidar data availability varies throughout the VSA, requiring the use of more than one data source. The following four lidar datasets were incorporated into the DSM: NOAA 2014, USGS 2015, Cumberland County 2008, and American Recovery and Reinvestment Act (ARRA) 2010.

resolved by lidar technology (Inset 2.1-1). A bare-earth digital elevation model (DEM), representing topography only, was also created in order to make corrections to the DSM and to the initial viewshed result (see discussion below). The DSM and DEM were both created with a horizontal resolution of 9.8 ft (3 m) to allow direct comparison of ground elevation with the elevation of surface features (such as buildings and vegetation).

Transmission lines and road-side utility lines that are reflected in the lidar data are mis-represented in the initial DSM as solid walls/screening features. In order to correct this inaccuracy, DSM elevation values within transmission line corridors and within 50 ft (15 m) of road centerlines were replaced with DEM bare earth elevation values. To account for some small lidar data gaps, USGS 10-meter resolution DEM and NLCD data were used to complete the DSM lidar model. The DSM was then used as a base layer for the viewshed analysis, which was conducted using ESRI ArcPRO® software.

The analysis of potential visibility of the Projects within the VSA was based on 200 points representing the WTG locations currently under consideration (using latitude and longitude coordinates provided by Atlantic Shores), an assumed maximum blade tip height of 1,047 feet (319 m), and an assumed viewer height of 6 feet (1.83 m). This maximum blade tip height was used to define the maximum area of potential visibility, also referred to as the ZVI. An additional viewshed analysis was completed to assess the potential visibility of the AOWL (FAA lights) on the nacelle at a height of 607 feet (185 m).

Once the initial viewshed analysis was complete, a conditional statement was used within ArcGIS® to set visibility to zero in locations where the DSM elevation exceeded the bare earth (DEM) elevation by 6 feet or more, indicating the presence of vegetation or structures that exceed viewer height. This was done because: 1) without this adjustment in locations where trees or structures are present in the DSM the viewshed would reflect visibility from the treetops or building roofs, which is not the intent of this analysis; and 2) ground-level vantage points within buildings or areas of vegetation exceeding 6 feet in height will generally be screened from views of the Projects. The resulting viewshed analysis provides an exceptionally accurate prediction of visibility of the Projects from onshore resources. However, changes to vegetation (such as growth or clearing) earthwork, and the addition or removal of structures since the lidar data were collected may result in minor visibility discrepancies.

Inset 2.1-1 Raw Lidar Point Cloud (top), Colored Point Cloud (center), Processed DSM (bottom)

2.2.1 Field Verification

Potential visibility of the Projects was evaluated in the field between July and September of 2020. The purpose of this exercise was to verify the existence of direct lines of sight to the water in the direction of the proposed Projects from representative KOPs and other sites with potential visibility of the Projects, as

indicated by viewshed analysis. Field review was also used to obtain photographs from selected KOPs for subsequent use in the development of visual simulations. Fieldwork was completed under a range of sky conditions (overcast to clear), but during the KOP photography visibility was recorded as being 10 miles or greater in all instances.

At each of the KOPs, EDR's field crew selected an appropriate photo location based on the availability of an open view toward the WTA, appropriate composition, lighting, and, if possible, the inclusion of distinctive foreground features that allow recognition of the viewpoint by the public. In some cases, photos were taken from multiple viewpoints at a single KOP to cover a range of compositions and perspectives. At each viewpoint, a series of overlapping photos extending from 180 to 200 degrees of the visible seascape and landscape were obtained in five-degree increments. A tripod-mounted, full frame digital single lens reflex (SLR) camera with a resolution of 30.4 megapixels and a 50-millimeter lens was used for all photos. This focal length is the standard used in VIAs because it most closely approximates normal human perception of spatial relationships and scale in the landscape. Additionally, high-resolution video was taken at each of the simulated KOPs for use in video animations demonstrating the WTGs and environment in motion.

For views lacking background alignment features (i.e., identifiable landscape features with known locations), the field crew utilized global positioning system (GPS) equipment with sub-meter accuracy to document the location of each KOP and foreground reference features (e.g., buildings, fences, flag poles) visible in the photos. Where such features were lacking, temporary stakes or flagging were installed, and their locations documented. Precise locations of these features allow accurate camera alignment during the development of visual simulations. It also assures that the resulting simulations have a high degree of accuracy in terms of WTG location and perceived size relative to other landscape features.

Attachment D includes a list and photolog depicting each KOP visited during field review for the Projects. It should be noted that all KOPs are named utilizing the initials of the legal municipal boundary in which they occur. For example, AC04 represents the fourth KOP collected in the City of Atlantic City.

2.3 Visual Impact Assessment Methodology

With the ZVI established, data collected during the inventory process was then used to determine the visual impact of the proposed WTGs on the seascape, landscapes, and viewers within the ZVI. This assessment involved selecting representative KOPs within the ZVI, creating computer models of the proposed WTGs, and preparing computer-assisted visual simulations of the proposed Projects. These simulations were then used to characterize the type and extent of visual impact resulting from construction and operation of the Projects.

The visual impact associated with the Projects was evaluated using a variation of the VIA procedure outlined in the *USACE Visual Resources Assessment Procedure (VRAP)* (Smardon et al., 1988). However, given the nature of offshore wind projects, which largely occur outside of the location where the Projects are being viewed, the VRAP methodology has been modified by EDR in consultation with BOEM. The VRAP Process and modifications applied within this VIA are described in detail below.

2.3.1 Character Area Scenic Quality Rating

In this study, the scenic quality of the character areas was evaluated using a modified version of USACE Visual Resources Assessment Procedure (VRAP) (Smardon et al., 1988). The VRAP is a two-step process, the first of which establishes an assessment framework by defining areas of similar landscape character

(character areas) within the ZVI and evaluating their scenic quality and sensitivity to visual impact. Referred to as the Management Classification System (MCS) procedure in the VRAP, this first step was revised based on BOEM comments to remove the classification and threshold for impact associated with them. The revised version uses the scoring system and forms based on those provided in the VRAP Manual (Smardon et al., 1988), and the evaluation assigned each character area a specific scenic quality rating based on quantitative scoring of various landscape elements/features.

The aesthetic quality of each of the character areas defined within the ZVI was evaluated by a panel of four visual professionals (see resumes in Appendix F). Each panel member was given access to digital files including the following information:

- Representative photos of each of the defined character areas (see Figure 1.2-2).
- Narrative descriptions of each of the defined character areas (see Section 1.2.3).
- Maps illustrating the ZVI, the location of the Projects, and character areas (see Figure 1.2-2).
- Rating forms (modified Form 4) from the USACE VRAP Manual (see Appendix G).
- Rating panel guidance, including definition of terms (see Appendix G).
- Google Earth Placemarks identifying representative character area locations within the VSA.

In addition, all panel members participated in a meeting (by conference call) to review the information provided to them, receive additional information on the location, extent, and description of the character areas (from team members who had been on-site), and instructions on completing the evaluation forms they had been provided.

Within each character area, the visual quality of six landscape components (landform, water resources, vegetation, land use, user activity, and special considerations) was evaluated by each rating panel member and given a numerical score on a scale of 1-9 (see Appendix G for rating forms used in the VIA). The resulting scores were then converted back to a 1-3 scale to remain consistent with the scoring values established in the VRAP Manual. The complete set of rating panel forms used for the scenic quality rating is provided in Appendix G.

The numerical scores from each evaluator were totaled and averaged to generate a composite rating for each character area. The composite rating placed each character area into one of five classifications as described in Table 2.2-1, below.

Table 2.2-1 Character Area Scenic Quality Classifications

Scenic Quality Classification	Description
Preserved	These areas are considered to be unique and to have the most distinct visual quality in the region. They often include significant views of the ocean, and the ocean is a significant contributor to the scenic quality of the view. Human development is minimal or subtle and does not detract from the scenic quality. These views and locations are highly valued and may be protected by federal and state policies and laws (Score of 17 or more).
Retained	These areas are regionally recognized as having distinct visual quality and likely include significant to secondary views of the ocean and seascape which also contribute significantly to scenic quality. Human development may be apparent, and some degree of modified landscape/seascape is expected (Score of 14 to 16).
Partially Retained	These areas are locally valued for above average visual quality. These areas may include views of the ocean and seascape, but human development and landscape modification is apparent and expected (Score of 11 to 13).
Modified	These areas are not noted for their distinct qualities and are often considered to be of average visual quality. Views of the ocean and seascape are partially screened or hampered by development and modification to the landscape (Score of 8 to 10).
Impaired	These areas are noted for their minimal visual quality and are often considered heavily modified by human development. Views of the ocean and seascape are secondary or non-existent (Score of less than 8).

2.3.2 Character Area Scenic Quality Rating Results

The scenic quality of each character area within the ZVI, as determined by the rating panel using the rating procedure, is presented in Table 3.2-1, below. The completed rating forms are included in Appendix D.

Table 3.2-1 Character Area Scenic Quality Assessment Results

Character Area	Rating Panel Members					Scenic Quality
	KC	JG	KV	SB	Average	
Commercial Strip Development	7.5	8.2	8.2	5.3	7	Impaired
Industrial/Developed	6.7	5.0	6.3	4.8	6	Impaired
Limited Access Highway	10.0	9.0	9.0	8.0	9	Modified
Agriculture	10.5	11.2	10.2	10.0	10	Modified
Inland Open Water	10.3	11.7	11.7	8.2	10	Modified
Ocean	11.3	14.7	14.0	9.3	12	Partially Retained
Bayfront Residential	13.0	14.0	11.3	11.0	12	Partially Retained
Dredged Lagoon	11.3	13.0	9.7	10.3	11	Partially Retained
Inland Residential	11.8	12.2	10.2	9.7	11	Partially Retained
Town/Village Center	13.2	14.8	10.2	13	13	Partially Retained

Character Area	Rating Panel Members					Scenic Quality
	KC	JG	KV	SB	Average	
Atlantic City	10.3	13.0	11.3	11.7	12	Partially Retained
Forest	11.8	11.8	13.2	12.0	12	Partially Retained
Commercial Beachfront	10.3	10.7	10.0	13.3	11	Partially Retained
Recreation	11.0	10.0	11.3	12.5	11	Partially Retained
Undeveloped Beach	12.7	16.7	15.0	13.3	14	Retained
Undeveloped Bay	14.0	16.0	14.3	12.0	14	Retained
Ocean Front Residential	13.3	15.3	12.0	13.7	14	Retained
Salt Marsh	14.7	15.0	14.3	11.7	14	Retained

As summarized in Table 3.2-1 the average score of four rating panel members for Undeveloped Beach, Undeveloped Bay, Salt Marsh, and Residential Beachfront were consistent with a Retained landscape/seascape. Retained landscapes and seascapes are regionally recognized as having distinct visual quality. Human development may be apparent in these areas and some degree of modified landscape/seascape is expected. These areas are assumed to have relatively high susceptibility to visual change due to the intactness of the existing landscape/seascape and lack of discordant elements.

Nine character areas, including Town/Village Center, Open Water/Ocean, Bayfront Residential, Forest, Atlantic City, Recreation, Dredged Lagoon, Commercial Beachfront, and Inland Residential character areas received average scores between 11 and 13, which is consistent with a Partially Retained landscapes. These areas are locally valued for above average visual quality. They may include views of the ocean and seascape, but human development and landscape modification is apparent and expected. These landscapes/seascapes may also be significant contributors to scenic quality when viewed from within other LSZs.

Three character areas, including Agriculture, Inland Open Water, and Limited Access Highway received scenic quality scores of 9 to 10 indicating a modified landscape. These areas typically have minimal visual quality and can tolerate substantial visual change. Views of the ocean and seascape are typically observed from moving vehicles and partially screened or influenced by development and heavy modification to the landscape.

Two character areas, including Commercial/Strip Development and Industrial/Developed received scenic quality scores of 6 and 7, indicating an impaired landscape. These areas typically have minimal visual quality and can tolerate substantial visual change. These areas are often heavily modified by human development and views of the ocean and seascape are secondary or non-existent.

Understanding the existing scenic quality classification of the various character areas found within the ZVI provides context that will help inform the degree of visual change anticipated as a result of the Projects. To characterize the degree of potential impacts to these character areas, the VIA will next select representative KOPs within the character areas and determine the degree of visual change with the operational Projects in place. Although specific KOP photosimulations cannot characterize the impact to an entire character area, they provide a useful framework to establish potential trends in viewing distance, lighting direction (time of

day), and viewing angles that may influence the character of broad geographic areas within the ZVI. A discussion of these potential impacts to the character areas is discussed in section 3.2.2.

2.3.3 Selection of Key Observation Points

EDR identified specific viewpoints prior to, and during, the field verification process as representative KOPs with the potential for development of visual simulations. In addition, Atlantic Shores, LLC and EDR had discussions with various agencies and stakeholders prior to and throughout field verification. This included the NJDEP, BOEM, and several local stakeholders. The representative KOPs identified through this process, noted as selected KOP or candidate KOP, are listed in Attachment D.

Based on the consultation described above, the photos captured during field verification, and a review of data regarding viewer activity and sensitive public resources, EDR selected a total of 22 unique KOP locations within the ZVI for the development of the visual simulations. The KOPs were selected based upon the following criteria:

- They were identified as KOPs by federal, state, local, or tribal officials/agencies as important visual resources, either in prior studies or through direct consultation.
- They provide clear, unobstructed views toward the WTA (as determined through field verification).
- They illustrate the most open views available from historic sites, designated scenic areas, and other VSRs within the ZVI.
- They are representative of a larger group of candidate KOPs of the same type or in the same geographic area.
- They illustrate typical views from character areas where views of the WTGs are most likely to be available.
- They illustrate typical views of the proposed Projects that will be available to representative viewer/user groups within the ZVI.
- They illustrate typical views from a variety of geographic locations and under different lighting conditions to illustrate the range of visual change that could occur with the Projects in place.

Additional KOP selection criteria are provided in Table 2.2-2. Locations of the selected KOPs are shown in Figure 2.2-1. Information regarding each of these selected KOPs is summarized in Table 2.2-3.

Table 2.2-2 KOP Selection Criteria

KOP	Selection Criteria
SPB01	This KOP was selected due to the presence of a popular beach and boardwalk and proximity to an eligible historic resource (see VSRs). This KOP was also recommended by the Atlantic Shores Community Liaisons and identified during consultation.
LAT01	This nationally recognized resource was selected to provide a unique perspective from a residential area. It also covers the inland ZVI, views multiple character areas, and represents infrequent visibility from representative LCAs.
BT01	This KOP was selected to represent visibility from an undeveloped beach within the ZVI.

KOP	Selection Criteria
BLB02	The Barnegat Lighthouse KOP was recommended by BOEM for inclusion in the VIA. This represents an elevated view from a prominent NRHP property.
LBT03	This KOP represents a heavily utilized residential beachfront and aims to address visual impacts concerns raised by The LBI Coalition for Wind Without Impact.
SBB01	This KOP was selected to show a representation from the Ship Bottom Borough from within the Residential Beachfront Character Area.
BRT01	This state recognized resource was selected to provide a unique perspective from an inland location. It provides an illustration of potential visual impacts from a representative LCA, which typically have minimal visibility.
BHB01	This KOP was identified through desktop assessment and subsequent field review. This heavily used beach is adjacent to an NRL Historic District and is representative of commercial and high-intensity Residential Beachfront areas.
BHB02	This KOP was requested by a citizens group on Long Beach Island
BHB03	This KOP was requested by a citizens group on Long Beach Island
LBT04	This KOP was requested by a citizens group on Long Beach Island
LEHT02	This state recognized resource was selected to provide a representative view for local residents. It was ultimately selected after three separate site visits and discussions with visitors. This location could be considered a local "secret spot" for fishing and relaxing away from the summer crowds. It also provides an illustration of potential visual impacts from a representative LCA, which have fewer opportunities for views toward the WTA when compared to the coastline.
GT01	This view from Edwin B. Forsythe National Wildlife Refuge was selected to provide an inland view from an elevated vantage point. This view was selected to address BOEM comments regarding a scarcity of inland KOPs.
BC02	This KOP represents a State recognized resource that is frequently used by locals and repeat visitors who want to escape the crowded beaches to the north and south. It is also one of the nearest land-based viewing opportunities of the Projects. The location was desktop identified by EDR and verified by the Atlantic Shores Community Liaisons.
AC04	This KOP represents an elevated view from the Casino District. This resource is of high importance to Atlantic City. The location was field identified by EDR. The location was desktop identified by EDR and verified by the Atlantic Shores Community Liaisons.
AC02	This KOP is representative of a National Historic Landmark in Atlantic City. The location was desktop identified by EDR and verified in the field. The location was identified by BOEM in the 2012 Evaluation of Visual Impact on Cultural Resources/Historic Properties: North Atlantic, Mid-Atlantic, South Atlantic, and Florida Straits
MC02	This KOP is representative of a National Historic Landmark in Margate City. The location was identified by BOEM in the 2012 Evaluation of Visual Impact on Cultural Resources/Historic Properties: North Atlantic, Mid-Atlantic, South Atlantic, and Florida Straits
EMC01	This KOP from Tuckahoe Wildlife Management Area was selected to help validate the viewshed analysis results from an inland KOP with partial visibility. This view was also selected to address BOEM comments regarding a scarcity of inland KOPs.
OC04	This KOP was selected to provide geographic representation from Ocean City, a popular tourism destination.
OC01	This KOP from Corson's Inlet State Park provides additional geographic coverage of the coast within the ZVI. The view also provides a long-distance view similar to OC04, but in front-lit lighting conditions.

KOP	Selection Criteria
SIC02	This KOP was field identified. The field team originally identified Sea Isle Beach during desktop assessment and chose to complete photography from the elevated vantage point after observing pedestrian and bicyclists crossing the bridge.
LT02	Cape May Lighthouse was a desktop identified KOP based on EDRs extensive experience in the MidAtlantic Region. This KOP was chosen to potentially illustrate reasonably foreseeable future development and to assist the VIA to help establish visual thresholds for the 20 MW WTG.

2.3.4 Represented Viewer Groups in KOP Selection

The following describes the variability of viewer groups and viewer activities encompassed by the KOPs selected for visual simulations. Appendix E2 lists the individual KOPs and viewer groups represented. Section 3.2.1.3 describes the potential impacts to viewers from the selected KOPs.

Nine of the selected KOPs, including Island Beach State Park (BT01), Seaside Park Borough Boardwalk (SPB01), Beach at Long Beach Island Arts Foundation (LBT03), Beach Haven Historic District (BHB01, BHB02, and BHB03), North Brigantine Natural Area (BC02), Jim Whelan Boardwalk Hall (AC02), Corson's Inlet State Park (OC01), and Ship Bottom Borough Municipal Beach (SBB01) represent residents, tourists, and fishermen. Each of these viewers have ample opportunity for easterly views toward the Projects. Activities include sightseeing, sunbathing, and shore fishing which all involve long-duration, repeated exposure views to the east, over the open ocean. Other activities such as active recreation on the beach result in short-term or even fleeting views over the water. Where applicable, several viewers also engage in boardwalk activities such as walking, dining, and shopping. In these instances, views may be fleeting and occasional where breaks in the dunes offer outward views, but viewers are generally oriented in a north to south direction, parallel to the shoreline.

One KOP from Edwin B. Forsythe NWR at the Woodmansee Estate (LAT01) specifically addresses visibility from a residential neighborhood which has unique viewing circumstances. The Woodmansee Estate does not typically attract tourists or recreation users due to the lack of public amenities for parking. However, the residents of the Woodmansee Estate bordering the Edwin B. Forsythe NWR have opportunities for views over the inland bay and toward the ocean to the south. Views from within this area are typically long duration, stationary, and repeated suggesting an elevated level of viewer sensitivity. This location may also represent numerous boaters that use the inland bay channels to travel to and from the ocean. These viewers are expected to have short duration and often fleeting views while travelling within the designated channels running north to south.

Two KOPs from Bass River State Forest (BRT01) and Tuckahoe Wildlife Management Area (EMC01) will be most frequently used by residents and tourists who come to this location for a variety of activities, including hiking, camping, picnicking, and wildlife viewing (particularly bird watching). However, this KOP is not centered around the hub of accommodated activities which are generally contained to the forested areas north of the KOP. Therefore, this KOP represents a potential view that would be seen by more active recreationalists engaged in bird watching, hiking, or skiing. Views across the backwater bays are limited from within the main state forest and therefore views toward the Projects would be minimal from these locations. This particular KOP is most likely to represent occasional, short duration views oriented in an east-west direction.

An additional KOP taken from Edwin B. Forsythe NWR (GT01) provides an elevated view from a viewing platform situated near a pull-off on Wildlife Drive. This location is most likely used by residents and tourists that are specifically interested in viewing migrating and foraging birds in the marshlands and ponds below. It is also likely that tourists come upon the tower unintentionally and have interest in an elevated view of the area. Bird enthusiasts and ornithologists that visit this location will be engaged in viewing specific activities wherever they occur and likely in all directions. It is also likely they will be viewing the landscape and seascape with the use of visual aids such as binoculars so the viewers may have a heightened awareness of distant elements in the seascape and landscape.

Great Bay Boulevard WMA/Rutgers Field Station (LEHT02) represents typical views experienced by residents, tourists, and fishermen. This location is accessed by an informal parking area and woodland trail that ends at this inland beach. No amenities are provided for users of this space, but visitors (typically local residents) use it frequently for shoreline fishing. The viewers that use this space will generally be focused on views to the southeast and south where the Atlantic City skyline is prominent in the background. Views toward the ocean are generally of long-duration and repeated in nature.

The Ocean Casino Resort Sky Garden (AC04) represents typical elevated views experienced residents and tourists that frequent the numerous resources along the Atlantic City coast. Generally, the sky deck is used as a viewing platform and event space for the Ocean Casino Resort which hosts dining, gambling, and sightseeing activities, but may also represent the type of view expected from numerous hotel balconies along the coastline. Viewers that approach this elevated location are typically viewing due east as well as north and south to observe activity on the boardwalk below. These views can be described as occasional and relatively long duration with concentrated viewing over the ocean.

The views from Barnegat Lighthouse (BLB02), Lucy the Margate Elephant (MC02) and Cape May Lighthouse (LT02) provide representative views from specific tourist destinations and from which there are no similar public vantage points nearby. Although vastly different elevations, these KOPs represent places where people go to see a view and to explore a very specific place. MC02 has a much more focused viewshed to the east, while Cape May Lighthouse (LT02) has an intermittent panorama spanning 360 degrees and including views of the Delmarva peninsula and Delaware bay. Barnegat Lighthouse (BLB02) provides a panorama view of Island Beach, Barnegat Bay, and Long Beach Island. Although, very different views, the user intent and experience are similar. These types of views are generally occasional and of relatively short duration, but the views are experienced by a vast number of tourists throughout the year.

The KOP from Gillian's Wonderland Pier (OC04) provides a unique vantage point that includes residents and tourists who engage in a wide variety of activities, including passive and active recreation at the amusement park and on the beach, shopping, and dining on the boardwalk. These types of activities are likely to result in occasional fleeting views toward the ocean due to the north and south orientation to the water. Conversely, sunbathers, shoreline fishermen, and sightseers are likely to focus their gaze over the ocean to the east more regularly. Although, the abundant activity on the boardwalk and amusement park are also likely to draw viewer attention frequently during the busiest times of the season.

The KOP from Townsend's Inlet Bridge (SIC02) is a representative view that would be typically experienced by people travelling in cars, running, walking, or riding bikes. This bridge provides an elevated vantage point that is typically fleeting and short duration in nature. Given the high volume of traffic that travels this route, it is not particularly inviting for prolonged viewing. However, nearby beaches below the bridge provide opportunities for sunbathing, passive and active recreation, and shoreline fishing.

Table 2.2-3 KOPs Selected for Visual Simulations

KOP	KOP Name	Location	Latitude, Longitude (WGS 84)	Character Area	Distance to The Projects (Miles/km)
SPB01	Seaside Park Borough Boardwalk	Seaside Park Borough, Ocean County, New Jersey	39.93533° N, 74.07164° W	Commercial Beachfront	39/62.8
LAT01	Edwin B. Forsythe NWR at the Woodmansee Estate	Lacey Township, Ocean County, New Jersey	39.83711° N, 74.15082° W	Dredged Lagoon	32.2/51.8
BT01	Island Beach State Park	Berkeley Township, Ocean County, New Jersey	39.80805° N, 74.08997° W	Undeveloped Beach	30.3/48.7

2.3.5 Photosimulations

The photosimulations were developed by constructing a 3D computer model of the proposed WTGs, Project layout, and OSSs based on design specifications and coordinates provided by Atlantic Shores. The 3D model included 20 MW WTGs, which is the largest technology under consideration for the Projects. Details regarding the WTG and OSS dimensions and a diagram of the 3D model are included in Section 1.1.

Photographic Alignment Process

To create the visual simulations, the location, bearing, and camera data used to photograph each KOP are entered into a georeferenced 3D workspace to create a virtual camera matching the exact specifications of the field camera. At this point, the GPS survey data collected in the field (Section 2.2.1) are entered into the 3D workspace to establish foreground reference points with known locations. These data were superimposed over photographs as seen through the virtual camera from each of the viewpoints, and minor camera changes (height, roll, bearing) were made as necessary to align all known reference points within the view. In addition, the existing built and natural environment present in the view is constructed in the 3D workspace using aerial photographs, lidar data, and DEM data. This alignment process ensures that Projects are shown in proportion, perspective, and proper relation to the existing landscape elements in the view. Consequently, the alignment, elevation, dimensions, and scale of the modeled components associated with the Projects are accurate and true in their relationship to other landscape elements in each photograph.

Wind Farm Model

The next step involves positioning the WTG layout in each of the aligned views at the appropriate distance in front of, at, or below the horizon (depending on the distance from the viewer). This was done by first determining the distance to the horizon (ocean/sky interface) visible in the photograph. This is accomplished by entering the viewer position and elevation into the Haversine Formula, which uses the radius of the earth (corrected for refraction)⁵ to calculate the mathematical distance to the horizon (D), or the point at which the sky meets the water (see Inset 2.3-1, below). This distance is then used to draw a horizontal line (virtual horizon) in the 3D model representing the mathematical horizon line, which is visible through the virtual camera. The virtual horizon is then precisely aligned to the visible horizon (D) in the photograph by making minor adjustments to the virtual camera target on the vertical axis. With the virtual horizon aligned to the photographed horizon, the positions of the individual WTGs are placed relative to this horizon line. The Haversine Formula was then used to determine each turbine's position, relative to the horizon (X). For example, if the WTG appears in front of the horizon, the returned value is zero and the WTG will be placed at the horizon. If the WTG appears behind the visible horizon, the returned value will be a negative number (-X). This value was then applied to the turbine's vertical position in the model so that it appears below the visible horizon at the -X value.

⁵ Refraction values assume "typical" viewing conditions and do not account for atmospheric anomalies such as the mirage effect which is typically rare and of short duration but may temporarily increase turbine visibility.

Inset 2.3-1 Curvature of the Earth and Refraction Diagram

Daytime Environmental Conditions

After the model was created, the proposed exterior color/finish of the WTGs was added, and the appropriate sun angle was simulated based on the specific date, time, and location at which each photo was taken. This information allows the computer to accurately illustrate highlights, shading, and shadows for each individual component associated with the Projects is shown in the view. All simulations show the WTGs with rotors oriented toward the viewer, to illustrate the largest potentially visible surface area of the Projects. The simulations illustrate the Projects using a standard 50 mm camera lens which presents an approximately 40-degree horizontal field of view and a 27-degree vertical field of view. As mentioned previously, this is the standard focal length used in VIAs, because it most closely approximates normal human perception of spatial relationships and scale in the landscape. As mentioned in Section 2.3.1, the selection of KOPs was partly based on the availability of a clear, unobstructed view of the proposed Projects. However, even under the clearest possible day, atmospheric perspective (diminishment caused by moisture and particulate matter in the atmosphere) will reduce the visibility of the WTGs and OSSs. Therefore, to account for this visibility diminishment, slight hazing was applied to the simulations to account for the atmospheric conditions present in the existing conditions photograph. To accomplish this, a “z-depth” was created for each of the simulations which simulates the diminishment of visibility over distance. This step is an important consideration for the realism of the visual simulations. However, it should also be noted that the conditions presented in the visual simulations illustrate exceptionally clear conditions, and therefore the applied hazing was generally minimal. It is also worth noting that visibility over 10 miles, as illustrated in the simulations, is not the typical viewing condition within the VSA. Further discussion of atmospheric conditions and their effect on visibility is included in Section 2.5.4. See Table 2.3-2 for a breakdown of the KOPs by time of day, lighting conditions, and simulation type.

Nighttime Environmental Conditions

To prepare nighttime simulations, EDR obtained data on the proposed AOWL from the *FAA Advisory Circular 70/7460-1M*, and the *Draft Proposed Guidelines for Providing Information on Lighting and Marking of Structures Supporting Renewable Energy Development* (BOEM, 2019) which set guidelines for the lighting of WTGs (FAA, 2020). In addition, EDR documented views of the operational BIWF to determine the appearance of the warning lights at night at distances beyond 20 miles. Computer modeling and camera alignment for the nighttime photos were conducted in the same manner described for the daytime simulations. However, modifications of the nighttime photos (e.g., compositing foreground and background images obtained using different shutter speeds) were required in some cases to create a realistic representation of a nighttime view. These modifications included the reduction of “hotspots” which can be caused by the

cameras inability to accurately expose a light source in a very dark scene. Under very dark conditions, the center of a light source may appear light red to white, depending on the camera distance relative to the light source. However, actual observations of the lights suggest that they appear uniform across the entire source of light. To account for this, a lower exposure photograph was taken to represent the lights at each viewpoint. These lights were then transposed to the properly exposed night scene.

It was assumed that all lights would flash in a synchronized manner, as currently set forth by FAA guidelines. Nighttime simulations therefore show all WTGs with their lights on illustrating maximum illumination. However, Section 3.3 discusses technology being considered by Atlantic Shores to reduce the overall activation time of the AOWL. Due to the effects of the curvature of the earth and refraction, USCG navigation lights on the WTGs were only considered in views that had a direct line of sight to the deck at the WTG base, which is approximately where the USCG lights would be located. The complete set of photographic simulations developed for this VIA is provided in Attachment E. See Table 2.3-2 for a breakdown of the KOPs by time of day, lighting conditions, and simulation type.

Video Simulations

As discussed in Section 2.2.1, during the field review EDR recorded 60 seconds of video to capture the motion and sound present at each KOP. EDR then used this footage to produce animated simulations for five KOPs using the same viewpoint alignment process described above for the still simulations. However, rather than rendering a single frame representing a single point in time, multiple frames were rendered while the 3D turbine blades were in motion. Each individual rendering of the WTGs was placed in sequence to give the impression of blade rotation. Additionally, the aviation obstruction lights were animated to flash at a rate of 30 flashes per minute for the nighttime video simulation. The 3D renderings of the Projects were then superimposed over the baseline video. Changes to environmental variables such as sunrise were accomplished by adjusting the color, hue, and saturation of the video to achieve the desired lighting condition for the corresponding time of day. To simulate the path of the sun in each scene, a digital lighting system that replicated the sun was placed into the scene and animated to follow the azimuth and altitude of the sun throughout the day. Links to the video simulations are provided below in Table 2.3-1.

Panorama Simulations

In order to illustrate the full human field of view, panorama simulations representing a 124 degree by 55 degree field of view were produced from three KOPs. These are included in Attachment E1. The panorama simulations should be printed at full size and viewed according to the instructions on the simulation. See Table 2.3-2 for a breakdown of the KOPs by time of day, lighting conditions, and simulation type.

2.3.6 Visual Impact Assessment Procedure

The visual impacts associated with the Projects were evaluated using a modified version of the VIA procedure outlined in the USACE VRAP (Smardon et. Al., 1988).

This evaluation is based on a comparison of existing photographs and visual simulations from each KOP to quantify the potential visual effects resulting from the Projects using a modified scoring system provided in the VRAP Manual (Smardon et al., 1988). The following section describes this assessment procedure and how it was used to complete the following assessments:

- Establish the *baseline scenic quality* of each KOP by quantitatively evaluating the baseline (existing) scenic quality of the existing view.

- Using the same procedure, evaluate the KOPs with the Projects in place (proposed view) to determine the *VIA score*.

- Compare the existing and proposed views to describe the overall visual effect of the Projects.

- Evaluate *compatibility and contrast* resulting from the Projects by determining the degree of compatibility, scale contrast, and spatial dominance at each KOP.

- Determine the *visibility threshold level* (VTL) from each of the KOPs.

The process used to complete each of these procedures is described in detail, below.

Visual Impact Evaluation

The VIA uses representative KOPs within each of the landward LSZs in the ZVI to determine the Project's potential visual impact. This evaluation is based on a comparison of existing photographs and visual simulations from each KOP to quantify the effect of the Project using forms and a scoring system based on those included in the VRAP Manual (Smardon et al., 1988).

The same panel of four visual professionals that completed the assessment for the LCs also conducted the VIA procedure. Panel members were provided with digital files of the existing conditions photos and simulations of the proposed Projects for each of the selected KOPs, along with supporting information, including the following:

- Rating panel guidance, including definition of terms (see Attachment G).
- Narrative descriptions and maps of each of the defined character areas (see Section 1.2.3).
- Maps illustrating the ZVI and the location of the Projects (see Figure 3.3-1).
- Google Earth Placemarks identifying each KOP within the VSA.
- Existing conditions photos and simulations of the proposed Projects for each of the selected KOPs along with viewing instructions (see Attachment E).
- The distance and direction of the Projects from each of the selected KOPs, and the LCAs/SCAs, viewer groups, viewer activities, and sensitive resources represented by each viewpoint
- Panoramas illustrating the full field, VSRs, character area, distance to the Projects, and the portions of the Projects visible from each KOP (see Attachment E).
- Rating forms to be used for KOP familiarization, SQC scoring, and Visual Impact Assessment (VIA) scoring (modified versions of the USACE VRAP Forms 4 and 6, Attachment G).

The rating panel members viewed the existing conditions photos and visual simulations on screen from a distance of approximately 20 to 22 inches⁶. Each of the images presented to the panel for rating contained a graphic scale measuring one inch long. The rating panel members were instructed to use a measuring device to ensure this scale bar was accurate thus ensuring the proper scale of the simulation. In addition, due to the distance and scale of the Projects in many of the visual simulations, the panel members were instructed to zoom into the visual simulations to a maximum of 150 percent if necessary to locate and view the Projects. The rating panel members then evaluated the before and after views from each KOP and assigned each view quantitative sensitivity ratings. The ratings were based on a 9-point scale representing the scenic contribution of each of six landscape components (landform, water resources, vegetation, land use, user activity, and special considerations) with and without the Projects in place. This 9-point scale specifically represents the following evaluation criteria:

- **Minimal (1-3):** Something that may be looked upon as a liability in the area; meaning it basically lacks any positive aesthetic attributes and may actually diminish the visual quality of surrounding areas.

⁶ The simulations require a high-definition monitor measuring no less than 24 inches of useable area measured on a diagonal.

- **Average (4-6):** Something that is common in the area and not known for its uniqueness, but rather is representative of the typical landscape of the area.
- **Distinct (7-9):** Something that is considered unique and is an asset to the area. It is typically recognized as a visual/aesthetic asset and may have many positive attributes. Diversity and variety are characteristics in such a resource.

Although not all are explicitly addressed on the evaluation form, the rating panel was directed to consider the following landscape, viewer, and project-related factors in their evaluation of the scenic quality and the visual impact associated with the Projects:

- **Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes. These factors are included in the VRAP methodology and will be rated quantitatively for the existing and proposed view.
- **Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact. Line, form, color, and texture are directly applied to the landscape and seascape composition ratings described above. These factors will be assessed both quantitatively and qualitatively on the rating forms.
- **Focal Point:** Certain natural or human-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape. Focal points in the existing view and how those may be affected by the Projects will be described on the rating form.
- **Order:** Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape or seascape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment. The Project's effect on order will be addressed in the rating panel comments.
- **Scenic or Recreational Value:** Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource. Formally designated scenic or recreational designations will be

identified for the panel members. and the panel will be asked to comment on the projects potential effect or scenic or recreational resources.

- **Duration of View:** Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact. Background information for each KOP will contain a description of the user experience in terms of regional visibility and the availability of ocean views from each location. The rating panel will be asked to comment on the duration and frequency of the view presented for each KOP.
- **Atmospheric Conditions:** Clouds, precipitation, haze, and other ambient air-related conditions which affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of landscape/seascape and project components and the design elements of form, line, color, texture, and scale. Rating panel members will be asked to comment on the conditions presented in each view, as well as how visibility of the Projects may be less or greater under conditions different from those illustrated in the selected visual simulation.
- **Lighting Direction:** Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape/seascape and project elements. Rating panel members will be asked to characterize each view as illustrating one of three possible lighting conditions (front lit, side lit, and backlit) and comment on potential conditions that may increase or decrease visibility of the Projects.
- **Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing landscape/seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors. Project scale contrast will be assessed through quantitative scores built into the VRAP procedure.
- **Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint. The spatial dominance presented by the Projects will be assessed through quantitative scores built into the VRAP procedure.
- **Visual Clutter:** Numerous unrelated built elements occurring within a view can create visual clutter, which generally has an adverse effect on scenic quality. If present, visual clutter, both existing and as a result of the proposed Projects will be assessed qualitatively in the rating panel comments.
- **Movement:** Moving project components can attract viewer attention. Rating panel members will be asked to comment on existing elements in the view that may draw viewer attention as well as a potential increase in noticeability of the Projects resulting from the rotation of the turbine blades.

Following the panel's evaluation, each panel member's ratings were compiled to determine individual scores for each KOP. The scores were then averaged to determine the overall composite score for each KOP with and without the Project in place. The degree of potential impact is determined through the reduction in the scenic quality (if any) resulting from the Project. A notable reduction in scenic quality is indicated by a score reduction that pushes the KOP into a lower scenic quality definition. The degree to which this reduction is significant is indicated by the delta between the existing and proposed view composite rating. Table 2.2-3 describes the significance of the rating panel delta scores.

Once the scenic quality of the existing view has been established, the same evaluation procedure was applied to the visual simulations of the operational Projects using the same procedure and evaluation criteria described above. Each of the visual impact scores were totaled and averaged across all four rating panel members. This resulted in a VIA score that was directly compared to the existing conditions score to determine the significance of impact. The significance of impact is derived from the delta between the existing view score and VIA score (see Table 2.3-3).

Table 2.3-3 Visual Impact Score Definitions

Score Delta (Proposed minus Existing)	Effect on Scenic Quality	Description of Potential Impact to Scenic Quality
0 to 0.4	Regardless of Scenic Quality Description	Negligible impact to scenic quality. The presence of the SRWF has almost minimal to no impact on landscape, seascape and ocean, and the overall scenic quality is maintained.
0.5 to Minus 1.4	KOP Scenic Quality Description Remains the Same	Negligible impact to scenic quality. The presence of the SRWF minimally impacts the character defining features of the landscape, seascape and ocean, but the overall scenic quality is maintained.
	KOP Scenic Quality Description Changes	Minimal adverse impact to scenic quality. The presence of the SRWF somewhat effects the character defining features of the landscape, seascape and ocean and the overall scenic quality is reduced.
Minus 1.5 to Minus 2.4	KOP Scenic Quality Description Remains the Same	Minimal adverse impact to scenic quality. The presence of the SRWF somewhat effects the character defining features of the landscape, seascape and ocean and the overall scenic quality is reduced.
	KOP Scenic Quality Description Changes	Somewhat significant adverse impact to scenic quality. The presence of the SRWF competes with one or more landscape, seascape, and ocean attributes and results in an overall reduction in scenic quality.
Minus 2.5 to Minus 3.5	KOP Scenic Quality Description Remains the Same	Somewhat significant adverse impact to scenic quality. The presence of the SRWF competes with one or more landscape, seascape, and ocean attributes, but the overall scenic quality remains unchanged.
	KOP Scenic Quality Description Changes	Significant adverse impact to scenic quality. The SRWF begins to dominate certain landscape, seascape and ocean features and results in a reduction in scenic quality.
Greater than Minus 3.5	Regardless of Scenic Quality Description	Significant adverse impact to scenic quality. The SRWF becomes a dominant feature in the landscape, seascape, and ocean and results in a reduction in scenic quality.

To further define the impact producing factors associated with the Projects, the rating panel also evaluated the Projects' compatibility, scale contrast, and spatial dominance effect on water resources, landform,

vegetation, land use, and user activity for each KOP. The rating scale for this evaluation ranged from 1 to 3, as outlined in Table 2.3-4, below.

Table 2.3-4 Factors Influencing Visual Impact

VIA Factor	1	2	3
Compatibility	Compatible	Somewhat Compatible	Not Compatible
Scale Contrast	Minimal	Moderate	Severe
Spatial Dominance	Subordinate	Co-Dominant	Dominant

The rating panel scores were then averaged to determine the extent to which these factors influence the overall magnitude of visual impact.

Visibility Threshold Level

To supplement and validate VIA rating results, rating panel members were asked to determine the Visibility Threshold Level (VTL) applicable to each of the KOPs and the broader regional landscape they represent. *Offshore Wind Turbine Visibility and Visual Impact Threshold Distances* (Sullivan et.al., 2013) lists six VTLs used to rate the visual prominence of several operational offshore wind farms in Europe. The VTL scores and descriptions are presented below in Table 2.3-5.

The complete set of rating panel forms is provided in Attachment G.

Table 2.3-5 Visibility Threshold Level Rating Scale

Visibility Rating	Description
Visibility level 1. Visible only after extended, close viewing; otherwise, invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise, likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections! and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45 degrees from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.

3.0 VISUAL IMPACT ASSESSMENT RESULTS

The results of the visual impact assessment are presented below. Section 3.1 presents the visibility assessment results as indicated by the viewshed analysis and field verification, and Section 3.2 summarizes the visual impact assessment results based on the visual simulations and rating panel review.

3.1 Potential Visibility of the Projects

3.1.1 Viewshed Analyses

Potential visibility of the Projects, as indicated by the viewshed analyses, is illustrated in Figure 3.1-1 and summarized in Tables 3.1-1 through 3.1-4. Within the VSA, the lidar-based viewshed analysis indicates that approximately 13.1 percent of the landward VSA could have potential views of some portion of the Projects, based on the availability of an unobstructed line of sight to the tallest components (WTG blade tips in the upright position, see Table 3.1-1) proposed. This suggests that a majority of the VSA (86.9 percent) will not have any potential views of the Projects. This lack of potential visibility occurs in locations where buildings, structures, and vegetation screen views toward the Projects, but from more distant portions of the VSA curvature of the earth and topographic features also contribute significantly to the lack of visibility. Forest land is the dominant land use, covering approximately 55 percent of the landward VSA, and will significantly reduce potential visibility of the Projects throughout the majority of the inland, mainland areas. In areas of concentrated human settlement, such as the barrier islands, and mainland shorelines, closely situated buildings/structures will also significantly screen outward views. Considering the screening provided by buildings, structures, vegetation, and topography, potential landward visibility of the Projects is largely restricted to the ocean shoreline, salt marshes and inland bays west of the barrier islands. Barrier islands that lack shoreline development typically have large areas of contiguous visibility extending across the inland bays and into the marshy, uninhabited areas associated with the mainland river estuaries.

Table 3.1-1 WTG Blade Tip – Land Area Viewshed Results Summary

Distance from WTA	45.1-Mile Radius VSA (Units in Square Miles)		
	Total Land Area	Land Area with Potential Visibility (ZVI)	Percent with Potential Visibility (%)
0 to 10 Miles	4.6 (11.8 sq. km)	3.8 (9.8 sq. km)	83.1
10 to 20 Miles	266.9 (691.4 sq. km)	155.2 (401.9 sq. km)	58.1
20 to 30 Miles	589.3 (1,526.3 sq. km)	85.7 (222.0 sq. km)	14.5
30 to 40 Miles	845.7 (2,190.3 sq. km)	38.7 (100.1 sq. km)	4.6
40 to 45.1 Miles	489.9 (1,268.8 sq. km)	5.0 (12.8 sq. km)	1.0
Total Landward Study Area	2,196.3 (5,688.5 sq. km)	288.2 (746.6 sq. km)	13.1

Blade Tip Viewshed Analysis Results

Within 10 miles (16 km) of the Projects, the viewshed analysis suggests that 83.1 percent of the landward VSA will have potential visibility of the Projects (See Table 3.1-1). Considering the tallest components of the

Projects, the viewshed analysis indicates that potential visibility of the Projects will be available from the majority of the coastline associated with the coastal barrier island of Brigantine (Figure 3.3-1). This includes contiguous areas of concentrated visibility on the northern tip of the island on North Beach, and portions of North Brigantine. However, heavily vegetated portions of Absecon State WMA and the dune system directly adjacent to the beach will likely be screened from views of the Projects, as indicated by a narrow band extending in a northeasterly direction in the viewshed analysis. South of the Absecon State WMA, within developed portions of Brigantine City the viewshed analysis indicates significant screening resulting from closely situated homes immediately adjacent to the beach. However, potential visibility occurs along roads perpendicular to the shoreline and oriented toward the Projects. These small corridors of visibility occur along the majority of roads in this portion of the VSA and extend between approximately 1,000 ft (305 m) to 3,000 ft (914 m) inland. Generally, these areas are confined to the road rights of way, but occasionally expand outward where open space occurs adjacent to the roads. This condition occurs at the Links at Brigantine Beach Golf Course where discrete corridors of visibility extend from the roads and expand outward across a portion of the fairways.

The backwater bays and salt marshes occurring to the west of the barrier islands and Brigantine Inlet are indicated by the viewshed to have full visibility of the WTG array. This includes portions of Absecon State WMA and the associated uninhabited salt marshes and bays. Detailed results of the viewshed analysis are presented below by distance from the Projects. The viewshed analysis results are illustrated in Figure 3.3-1.

Within 10 to 20 mi (16 to 32 km) of the nearest proposed WTG, viewshed analysis indicates contiguous areas of potential visibility along the immediate barrier island shoreline. Within this zone, 58.1 percent of the landward VSA may have visibility of some portion of the Projects (See Table 3.1-1). However, intense development immediately adjacent to the shoreline largely limits the extent of inland visibility. This condition is particularly apparent in Atlantic City, Ventnor City, Margate City, Long Port, and Ocean City to the west and southwest of the Projects, as well as Beach Haven and Surf City to the Northwest of the Projects. In these locations high density beachfront development, dunes, and vegetation generally restrict visibility to the immediate beach shoreline, and the interior of the barrier islands and back bay shorelines are indicated as being fully screened from view. Notable exceptions occur in the vicinity of undeveloped portions of the barrier islands such as Beach Haven Heights, Island Beach State Park, and Great Egg Harbor Inlet where areas of potential visibility extend across the entire barrier island into the inland bays.

From distances between 20 to 30 miles (32 to 48 km) from the Projects the viewshed analysis indicates that potential visibility will be available from approximately 14.5 percent of the landward VSA (See Table 3.1-1). Again, within this zone, visibility is possible along the immediate barrier beaches in Ocean City, Sea Isle City, and Avalon in the southern portion of the VSA and Surf City, North Beach, Harvey Cedars, and Barnegat Light in the northern portion of the VSA. In these areas intensive beachfront development limits potential visibility of the Projects to the beach, boardwalk, and adjacent dune system. Occasional views occur in open space areas associated with public beach parking lots and parks such as in Southern Ocean City and Barnegat Light, and along roadways oriented toward the Projects and perpendicular to the shoreline which occurs minimally in Ocean City. Similar to other zones, visibility occurs again to the west of the barrier island due to the presence of open water and salt marsh which both lack significant screening features. Significant areas of potential inland bay visibility occur in Sites Sound, Townsend Sound, Ludam Bay, Carson Sound, and Peck Bay in the southern portion of the VSA and Manahawkin Bay in the northern portion of the VSA. Mainland visibility is limited to the immediate inland bay shoreline in most instances. However, exceptions occur in Bass River and Little Egg Harbor Townships where a large area of contiguous visibility is indicated

in a predominantly forested area. Review of online databases and maps suggest that this visibility is the result of low growing forest vegetation associated with the pinelands and actual visibility of the Projects from this area would be very unlikely. The open area associated with the Atlantic City International Airport also includes a large area of ZVI along with the Mullica, Great Egg Harbor, Tuckahoe, and Middle Rivers including the surrounding undeveloped wetlands and marshes. Larger areas of potential inland visibility occur at the Department of Defense Airstrip and munitions depot which has been cleared of vegetation. This facility spans the border between Bass River Township and Little Egg Harbor Township some 10 miles (16 km) inland from the shoreline. Public access to this facility is restricted and therefore, impacts on the general public will not occur in this location. Other small areas of potential visibility occur in locations considerably inland from the shoreline and where public access is restricted. These include the Atlantic City Airport Runway and the top of Manchester Township Landfill.

From distances between 30 to 40 miles (43 to 64 km) potential visibility of the Projects is generally limited to the barrier island shoreline and typically extends as far as the vegetated dunes before diminishing completely within the inland portions of the islands. Within this zone, potential visibility of the Projects was indicated within 4.6 percent of the landward VSA. This visibility primarily occurs along the southern VSA beaches of Stone Harbor, Wildwood, and Diamond Beach and diminishes completely at the jetty north of Cape May Harbor. In the northern portion of the VSA, potential visibility of the Projects occurs along portions of South Seaside Park, Seaside Heights and along undeveloped portions of the beach in the remainder of Berkeley Township. Within the 30 to 40 miles zone large areas of visibility occur beyond the barrier islands in the inland bays and adjacent mainland shoreline. The visibility from inland bay areas is consistent throughout the VSA and include portions of Richardson Sound, Cape May Wetlands, and Great Sound in the Borough of Middle Township in the southern portion of the VSA and Barnegat Bay in the northern portion of the VSA. Mainland visibility within this zone is limited to the immediate inland bay shoreline with the exception of a few very small areas of potential visibility in the vicinity of Coyle Airfield in Woodland Township.

The remainder of the VSA occurring between 40 and 45.1 miles visibility of the WTG blades is theoretically possible from Dover Beaches South and North, and Mantolokin Shores on the barrier islands, portions of Barnegat Bay, Kettle Creek, and Mandalay on the northern inland portion of the VSA. No visibility is indicated in the central inland portion of the VSA within this distance range, but a very small geographic area of visibility occurs on the south coast near the Cape May Inlet. Although not indicated in the viewshed analysis, it is also assumed that Cape May Lighthouse could have theoretical visibility of the WTGs.

Aviation Obstruction Warning Light (FAA) Viewshed Analysis Results

As discussed in Section 2.2, an additional viewshed analysis was completed to assess the potential visibility of the AOWL affixed to the WTG nacelle at a height of 607 feet. The FAA viewshed analysis (Figure 3.1-1) suggests that visibility of the AOWL could be available from approximately 9.4 percent of total land area within the VSA (Table 3.1-2). This reduction in visibility can be attributed to the lower height of the lights (relative to the blade tips) combined with the screening effects of curvature of the earth for more distant areas within the VSA. Generally, the FAA viewshed indicated visibility in a majority of the areas indicated as having blade tip visibility, but the actual footprint of the ZVI in these areas is significantly smaller and typically extend over a smaller portion of the inland bays and the more distant barrier island beachfront. This condition is most apparent in the northern and southern extent of the VSA in which the FAA viewshed visibility ends approximately 3 miles (5 km) short of the blade tip viewshed analysis. In the inland bays and

mainland this same condition is apparent in the vicinity of Cape May where visibility indicated by the FAA viewshed analysis ends 10 miles (16 km) short of the visibility indicated by the blade tip viewshed analysis. Visibility of the AOWLs would not be possible from ground-level views beyond 40 miles.

Table 3.1-2 Aviation Obstruction Light – Land Area Viewshed Results Summary

Distance from WTA	45.1-Mile Radius VSA (Units in Square Miles)		
	Total Land Area	Land Area with Potential Obstruction Light Visibility	Percent with Potential Visibility (%)
0 to 10 Miles	4.6 (11.8 sq. km)	3.6 (9.3 sq. km)	79.0
10 to 20 Miles	266.9 (691.4 sq. km)	140.1 (362.9 sq. km)	52.5
20 to 30 Miles	589.3 (1,526.3 sq. km)	51.0 (132.0 sq. km)	8.6
30 to 40 Miles	845.7 (2,190.3 sq. km)	11.8 (30.5 sq. km)	1.4
40 to 45.1 Miles	489.9 (1,268.8 sq. km)	0.0 (0.0 sq. km)	0.0
Total Landward Study Area	2,196.3 (5,688.5 sq. km)	206.5 (534.8 sq. km)	9.4

In addition to the land area visibility, visibility of the Projects from the open ocean was also considered separately in the viewshed analysis. The blade tip viewshed analysis revealed that up to 98.3 percent of the water surface in the VSA could have some level of potential visibility of the Projects (Table 3.1-3). Areas indicated as screened by the viewshed analysis include Delaware Bay on the west side of Cape May and the northern portion of the VSA where visibility diminishes due to curvature of the earth.

Table 3.1-3 Blade Tip – Water Area Viewshed Results Summary

Distance from WTA	45.1-Mile Radius VSA (Units in Square Miles)		
	Total Water Area	Water Area with Potential Visibility (ZVI)	Percent with Potential Visibility (%)
0 to 10 Miles	957.0 (2,478.6 sq. km)	957.0 (2,478.6 sq. km)	100
10 to 20 Miles	1,164.3 (3,015.5 sq. km)	1,164.3 (3,015.5 sq. km)	100
20 to 30 Miles	1,468.6 (3,803.7 sq. km)	1,468.6 (3,803.7 sq. km)	100
30 to 40 Miles	1,840.1 (4,765.9 sq. km)	1,808.4 (4,683.7 sq. km)	98.3
40 to 45.1 Miles	1,227.0 (3,177.9 sq. km)	1,146.8 (2,970.2 sq. km)	93.5
Total Water Study Area	6,657.0 (17,241.5 sq. km)	6,545.1 (16,951.6 sq. km)	98.3

Based on the height of the AOWL, the FAA viewshed analysis reduced visible areas to approximately 68.3 percent of the water surface (Table 3.1-4). This reduction in visibility can be largely attributed to the curvature of the earth, which will screen views of the lights at distances beyond 35 miles when viewed from water level. The FAA lights will not be visible from the water level beyond 40 miles to the limit of the visual study area.

Table 3.1-4 Aviation Obstruction Light – Water Area Viewshed Results Summary

Distance from WTA	45.1-Mile Radius VSA (Units in Square Miles)		
	Total Water Area	Water Area with Potential Obstruction Light Visibility	Percent with Potential Visibility (%)
0 to 10 Miles	957.0 (2,478.6 sq. km)	957.0 (2,478.6 sq. km)	100
10 to 20 Miles	1,164.3 (3,015.5 sq. km)	1,164.3 (3,015.5 sq. km)	100
20 to 30 Miles	1,468.6 (3,803.7 sq. km)	1,468.6 (3,803.7 sq. km)	100
30 to 40 Miles	1,840.1 (4,765.9 sq.km)	960.0 (2,486.5 sq. km)	52.2
40 to 45.1 Miles	1,227.0 (3,177.9 sq.km)	0.0 (0.0 sq. km)	0.0
Total Water Study Area	6,657.0 (17,241.5 sq. km)	4,549.9 (11,784.3 sq. km)	68.3

The viewshed analysis treats all buildings/structures and vegetation as if they are completely opaque. Therefore, small woodlots and hedgerows are indicated as fully blocking views of the Projects. It is possible that views will be available from forest edges and through thin/sparse forest vegetation. However, these views will typically be at least partially obstructed by branches (even under leaf-off conditions) and would require focused, concentrated attention to see the WTGs. It is likely that at distances beyond 20 miles, even partial screening will be effective in minimizing or eliminating visibility of the Projects. It is also important to note that the lidar data used in this analysis is from multiple years, with the latest being captured between 2008 and 2014. Therefore, the analysis does not reflect any changes that may have occurred since that time. However, any such changes are likely to be minor and could include the addition of new obstructions (new buildings and taller trees) as well as the removal of obstructions (tree cutting).

As mentioned previously, factors such as the acuity of the observer, the effects of distance, the occurrence of overcast and hazy weather conditions, and the white color and slender profile of the WTGs (especially the blades, which make up the top 453 ft [138 m] of each WTG) are not considered in this analysis. Given the narrow dimensions and limited visibility of the WTG blades, a separate analysis was completed to determine geographic areas of visibility of the blades excluding the nacelle and tower portion of the WTG. The results of the analysis suggest that 3.6 percent of the landward VSA (28.4 percent of the ZVI) would only have potential visibility of the WTG blades (see Inset 3.1-1). At distances beyond 35 miles, even if not fully screened by curvature of the earth, the blades will generally be difficult to see due to atmospheric perspective and can even be obscured by surface waves and large ocean swells. Therefore, it is unlikely that the Projects will be readily noticeable in views that only include the WTG blades (i.e., the tower and nacelle is screened from view by curvature of the earth) which, from ground level vantage points occurs beyond 35 miles under generally clear weather conditions (see Section 3.2.2). With these factors considered, areas and duration of actual visibility will likely be more limited than indicated by the viewshed analyses. The areas where only potential WTG blade visibility is indicated include the majority of inland bays and adjacent mainland shoreline between 10 and 45.1 miles from the Projects, including bays west of Atlantic City, Margate City, Ocean City, Sea Isle City, Avalon Borough, Wildwood, North Haven, Ship Bottom, Surf City, Barnegat Light, and Seaside Heights. Additionally, the majority of inland visibility indicated on the viewshed

analysis will only include turbine blades. This includes the major river basins of the Mullica, Great Egg Harbor, and Tuckahoe Rivers and associated wetlands and marshes (see Inset 3.1-1).

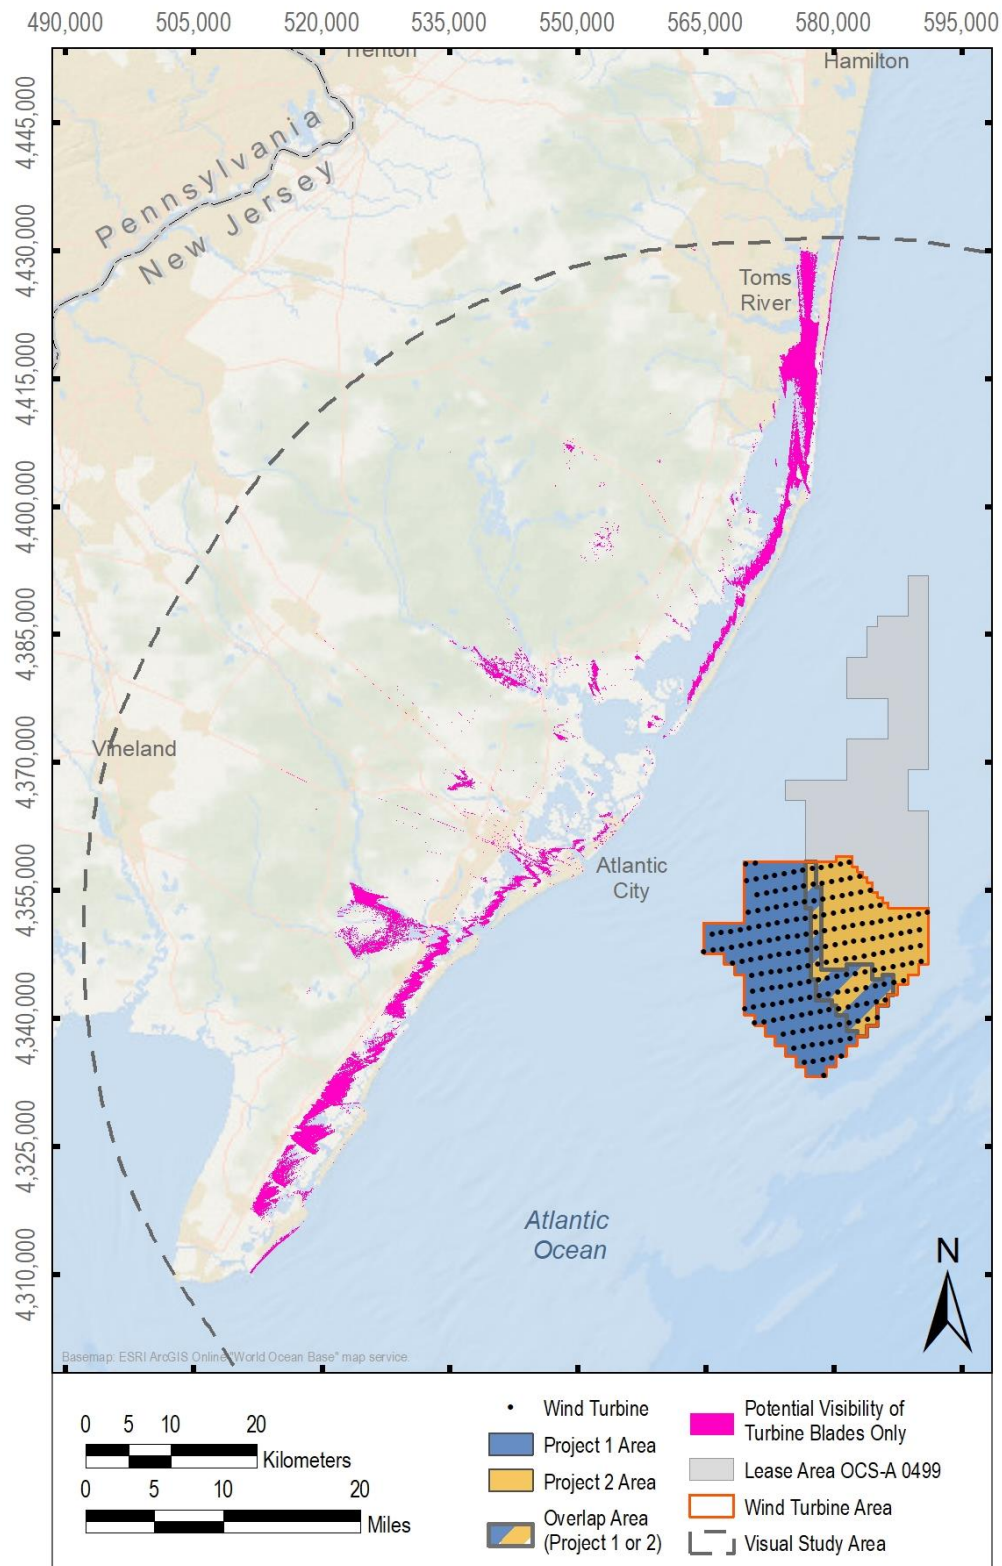

**Inset 3.1-1 – Portions of the ZVI that only include WTG blades**

Figure 3.1-1 Viewshed Analysis Results

(3 Pages)

3.1.2 Field Verification

Field verification was conducted at 66 surveyed KOPs within the ZVI. Results of the viewshed analysis were confirmed from majority of these KOP locations. However, a few of the KOP locations were determined to not have any visibility of the Projects based on subsequent survey alignment of the KOP. In addition, it was determined during field verification that elevated structures that are situated on or near the shoreline would offer views of the Projects in some areas that were not included in the ZVI.

Practically, there are a number of factors that will influence the visibility and visual prominence of the WTGs that are not considered in the viewshed analysis. For example, a KOP from the Tuckahoe WMA (See Attachment D, Page 29) occurs within a very narrow band of visibility of the Projects (as suggested by the viewshed analysis). However, field review and 3D alignment (see Section 2.3.2) of the view revealed that minute portions of a few WTG blade tips appeared amongst background vegetation and the Projects would be indistinguishable from these screening features at this location. Similar results were revealed at the Manahawkin WMA (Attachment D, Page 12). This KOP was photographed and surveyed from an inland salt marsh overlooking the inland bay portion of the VSA. In this location the viewshed analysis suggested large areas of contiguous visibility of the Projects. However, subsequent review of the survey data suggested that WTG visibility was limited to very small portions of the turbine blades amongst a background of intensive development associated with Atlantic City, the Garden State Parkway, and other intervening features. At a distance of 21.6 miles (34.8 km) from the Projects, a casual observer would not be capable of distinguishing the WTGs from this location. As discussed in Section 3.1.1, it was assumed that the turbine blade tips would be very difficult to perceive at distances of 10-45.1 miles. This was confirmed during field review and subsequent 3D alignments. Therefore, while the viewshed analysis provides an exceptionally accurate model of theoretical visibility of the Projects, field review determined that this analysis generally overstates visibility of the Projects, particularly from inland locations. This is particularly the case when the Projects are viewed from distant viewing locations that only include potential visibility of the WTG blade tips.

As mentioned in Section 2.2, the viewshed analysis did not consider potential turbine visibility from human-made elevated positions throughout the VSA. An example would be an observation tower in the Edwin B. Forsythe NWR (Attachment D, Page 85), which offers an elevated view of the barrier islands, ocean, and surrounding landscape. Field review of this KOP, while not contradictory to the viewshed analysis results, suggests that a greater portion of the Projects would be visible as a result of elevated viewer position. The same is true for heavily developed areas within the barrier islands. Particularly in Atlantic City, where several high-rise buildings offer commanding views of the ocean and the Projects. In these instances, it is reasonable to assume that if the viewshed indicates visibility around a tall building, visibility will also occur within or on the building. This condition is illustrated in the KOP from the Ocean Casino Resort (Attachment E, Page 96). While the viewshed analysis suggests the Projects will not be visible from ground level at this location (due to the presence of intervening screening features), field review determined that the Sky Garden on the 11th floor offered an open, elevated view of the Projects. This condition was also observed in Margate City where an elevated view is available from Lucy the Margate Elephant (Attachment D, Page 25). From this location, the viewshed analysis correctly anticipated a lack of ground level views toward the Projects due to screening provided by buildings, infrastructure, and topography associated with the beach dunes. However, from the elevated deck of this NHL, these screening features become less effective, and the ocean came into view.

Despite the anticipated limitations of the viewshed analysis, field verification confirmed that the ZVI provides an accurate and reasonable representation of the areas that could potentially be impacted by the Projects.

Attachment D lists each of the locations visited during field review along with their distance to the Projects.

3.2 Visual Impact Associated with the Projects

3.2.1 Visual Impact Assessment Results

To illustrate anticipated visual changes associated with the proposed Projects, photosimulations from 22 unique KOPs were used to evaluate the Projects appearance within the ZVI. As indicated in Section 2.3.1, these KOPs were selected based on various factors including proximity to identified VSRs, range of geographic location within the ZVI, and stakeholder input. These KOPs were also selected because they provide a clear, unobstructed view toward the Projects from VSRs, and they represent the various character areas, user groups, viewing distances, and lighting conditions that occur within the ZVI. In addition, the selected photos illustrate typical high visibility conditions where the proposed WTGs would not be obscured by atmospheric haze or fog. Consequently, simulations developed from these locations are representative of a conservative worst-case assessment of Project visibility and potential visual impact within the ZVI. As described in Section 2.3.3, review of the visual simulations, along with photos of the existing view, allowed for comparison of the aesthetic character of each view with and without the proposed Project in place. The results of the rating panel evaluation are described below and the rating forms, KOP impact determinations, and simulations are provided in Attachment E.

The simulations are described in detail in Attachment E along with an analysis of the rating panel results. These results are summarized in Table 3.2-1, below. Inset 3.2-2, below illustrates the existing and proposed SQC scores, the visual impact score, VTL, and distance from the Projects for each KOP. A summary of the rating panel results is presented below for daytime and nighttime conditions.

Daytime Visual Impact Results

Rating panel impact scores indicated that the Projects would result in significant visual impacts at 14 of the 22 KOPs under clear viewing conditions. The Project would result in somewhat significant visual impacts at three KOPs, one view would experience minimal visual impacts, and four views would experience negligible visual impacts (see Table 3.2-1 and 3.2-2). The VIA scores ranged from 0.0 to minus 5.4. With the exception of three KOPS, the visual impact scores suggest that as the viewing distance increases, the potential visual impact (as expressed in the VIA score) decreases (see Inset 3.2-1). For example, one of the lowest impact scores of minus 0.1 was from Cape May Point State Park (LT02) which is approximately 45 miles (72 km) from the Projects. The highest score of minus 5.3 was applied to the Centre Street Beach Haven view (BHB01) which represents high contrast conditions from a distance of 13.5 miles. This trend is also expressed in the Visual Threshold Limit (VTL) score. The most distant KOPs received VTL scores between 1 and 2 and the closest KOPs received the highest achievable VTL of 6.

			Proposed	13.3	14.3	12.3	16.0	14.0	Retained			

An exception to this trend occurs at the KOP from Lucy the Margate Elephant (MC02) which is approximately 14 miles (23 km) from the Projects and received a VIA score of minus 2.2, which is lower than scores received at more distant KOPs. This is due to the fact that a portion of the turbine array is screened by existing buildings in the view, and the existing view received a relatively low SQC score (10.8) due to the presence of visual clutter resulting from a buildings, overhead utilities, and other built forms in the view. Additionally, it was noted by the rating panel that the white color of the WTGs did not contrast with these built forms in the foreground of the existing view. The VTL score for this KOP was 5, suggesting that the Projects strongly attract viewer attention. This demonstrates that despite the visual prominence of the WTG's, existing scenic quality strongly influences the potential visual impact level resulting from the Projects.

Another deviation in the distance versus visual impact trend occurs at Bass River State Forest (BRT01) and Tuckahoe WMA (EMC01). From these KOP, the distance to the Projects is approximately 18.5 miles and 25.7 miles, respectively. From BRT01 the impact score is minus 0.3 (indicating negligible impacts) and a VTL of 2 and from EMC01 the impact score was 0.0 with a VTL 1. These scores deviate from KOPs from similar distances such as, Gillian's Wonderland Amusement Park (OC04) which is approximately 17 miles (27 km) from the Projects and received an impact score of minus 3.6 (moderate magnitude of visual change) and a VTL of 5. Additionally, Beach at Long Beach Island Arts Foundation (LBT03) which is 24.9 miles distant and received a visual impact score of 4.2 and a VTL 5. This variation is largely the result of the visual setting associated with inland KOPs. At these mainland KOP, the lower portions of the WTGs are screened by intervening vegetation and structures. As such, the turbine blades and a few nacelles are the only visible components of the Projects in the view. Rating panel members suggested that the WTGs were difficult to see due to the screening features, their narrow blades, and distance from the Projects. The rating panel also noted that although blade movement could draw viewer attention, it would not detract from the foreground and middle ground features in the view. It was also noted that seasonal growth of the salt marsh grasses could result in the Projects being completely obscured.

Fourteen KOPs are expected to result in significant visual impacts under clear, high visibility conditions. These include the following:

Table 3.2-2 – KOPS Anticipated to Experience Significant Impacts During Clear Conditions

KOP ID	Name	Distance (mi)	Distance (km)
BC02	North Brigantine Natural Area	9.0	14.5
AC04	Ocean Casino Resort – Sky Deck	10.5	17.0
AC02	Jim Whelan Boardwalk Hall NHL	11.4	18.4
LEHT02	Great Bay Boulevard WMA/Rutgers Field Station	11.9	19.2
BHB03	Holyoke Avenue	13.0	20.9
BHB02	Centre Street Beach Haven	13.5	21.7
BHB01	Beach Haven Historic District	13.5	21.7
OC04	Gillian's Wonderland Amusement	17.2	27.7
SBB01	Ship Bottom Borough Municipal Beach	19.4	31.1
OC01	Corson's Inlet State Park	21.7	35.0
LBT03	Beach at Long Beach Island Arts Foundation	24.9	40.0
LBT04	Wildlife Refuge on South Long Beach Boulevard in Holgate	27.3	44.0
SIC02	Townsend Inlet Bridge	27.4	44.0

KOP ID	Name	Distance (mi)	Distance (km)
BT01	Island Beach State Park	30.3	48.7

These KOPs are relatively close to the Projects (ranging in distance from 9.0 miles [14.5 km] to 30.3 miles [48.7 km]) and averaged 17.9 miles (28.8 km). These KOPs received visual impact scores ranging from minus 4.2 to minus 5.3. The scenic quality score of these views ranged between partially retained and retained. It is anticipated that the visual impacts presented by the Projects may result in adverse visual impacts to viewers when viewed under clear conditions such as those presented in the visual simulations. This conclusion is generally supported by the VTLs of 3 to 6 assigned to these KOPs. However, it is important to note the potential frequency of the viewing conditions presented in the visual simulations. For example, the KOP from BHB01 was taken during the month of August 2020. A meteorological study of 2019 visibility conditions suggests that this exceptionally clear condition would occur during approximately 5.2% of the month of August. Two variable conditions photosimulations were produced to illustrate more typical viewing conditions in August. The first condition occurred over approximately 19% of the month during which visibility is limited to 18 (29 km) miles. In this photosimulation, the WTGs become very difficult to see. It is anticipated that the visibility under this more representative condition can be characterized by a VTL of 1. The next condition occurred during 15% of the month and represents a maximum visibility distance of 20 (32 km) miles. During this atmospheric condition the simulation illustrates very faint WTGs on the horizon that would likely only be visible if the viewer is scanning the horizon. This visibility condition is characteristic of a VTL of 2. This variability in WTG visibility is expected to occur throughout the entire ZVI, resulting in highly variable impacts depending on atmospheric perspective and lighting conditions. Additional discussion of atmospheric perspective is provided in Section 3.2.3.

The variation in visual impact scores indicates that the degree of visibility of the Projects, lighting conditions, and scenic quality of the existing view can influence the degree of potential visual impact presented by the Projects. Inset 3.2-2, below illustrates the visual impact trend with the KOPs organized from north to south (left to right on the graphic). Generally, this graphic illustrates the trend of increasing scores as the KOPs get closer to the Projects (in the middle of the graph) and then begin to drop again as the KOPs increase in distance to the south of the Projects. As demonstrated in Inset 3.2-2 and described above a few KOPs deviate from the distance/impact trend due to partial screening or particularly high contrast lighting conditions.

A detailed description of each KOP with and without the Projects in place, along with the detailed rating panel results, including spatial dominance and scale contrast factors are presented in Attachment E.

Inset 3.2-1 – Relationship between distance and Visual Impact Rating Score and VTL

Inset 3.2-2 – Summary of Visual Impact Scores and VTL for each KOP.

Nighttime Visual Impact Results

Nighttime visual simulations were produced from a subset of three KOPs used in the production of daytime simulations. The rating panel results are present in Table 3.2-2 below. Each of the nighttime views received a rating score between 11.4 and 11.8 which corresponds with a partially retained landscape. The simulations of the operational Projects received rating panel scores between 7.3 and 7.7, resulting in average decreases between minus 3.8 and minus 4.4, reducing the scenic quality classification to modified or impaired. The rating panel assigned a VTL of 5 for all three KOPs which suggests that the AOWL and navigation lighting could strongly attract viewer attention. Rating panel members commented that light from the AOWL is prominent and will draw viewer attention in a setting that normally appears dark and undeveloped. Further the alternating blinking associated with the navigation lights and AOWL will be distracting to viewers. However, an Aircraft Detection Lighting System (ADLS) would significantly reduce the amount of time the AOWL would be activated by detecting the presence of aircraft. Assuming the use ADLS nighttime visual impacts associated with the aviation obstruction lights would become intermittent and minor (see Section 3.3).

Table 3.2-3 – Nighttime Visual Impact Assessment Rating Panel Results

ID	KOP	Distance to the Projects (Miles/km)	View	Rating Panel Member				Average	Scenic Quality	Delta	Visual Impact	VTL
				KAC	KAV	JMG	SMB					
AC04 Night	Ocean Casino Resort Sky Deck	10.5/16.9	Existing	10.2	10.3	11.5	15.2	11.8	Partially Retained	-4.4	Significant	5
			Proposed	9.5	8.0	6.8	5.2	7.4	Impaired

			Proposed	9.5	9.7	5.2	4.7	7.3	Impaired			
LAT01 Night	Edwin B. Forsythe NWR at the Woodmansee Estate	32.2/51.8	Existing	10.2	12.7	11.3	11.5	11.4	Partially Retained	-3.8	Significant	5
			Proposed	9.8	9.0	5.3	6.5	7.7	Modified			

Impacts to Viewers

Viewers and the activities they are engaged in can be affected by changes in the visual environment. In this case, the proposed action located within the OCA can ultimately result in a change in viewer experience in other character areas, if the Projects are visible and if views of the ocean are an important component of the viewer activity and experience. This VIA assesses the impacts to viewers by defining the viewer activities, viewer experience, and the importance of ocean views at each KOP. Next, the VTL score from the rating panel (see Section 3.2.2.1) is used to determine the degree of visibility and magnitude of visual change associated with the Projects from each KOP. In most cases, the visual simulations illustrate a single weather condition and a single time of day at each KOP. From all KOPs, the single condition illustrated in the visual simulations represents the worst case in terms of atmospheric clarity and, in many cases, the high contrast lighting conditions. To provide a balanced assessment, the frequency and duration of these conditions is noted for three KOPs, including BHB01, AC02, and OC04. In addition, two alternative conditions simulation are included for each of these three KOPs to illustrate the WTGs under more typical/frequently occurring atmospheric conditions. The alternative conditions simulations for the three KOPs provide an illustration of visibility of the Projects during typical atmospheric conditions. It is reasonable to assume that KOPs which occur within similar or greater distance from the Projects, will have similar or more intensive screening, respectively. As such, KOPs with similar viewing conditions are identified in Attachment E.

Seaside Beach Park (SPB01)

Viewers at Seaside Beach Park are engaged in a multitude of activities that include direct but variable experiential interaction with the ocean. For example, some beachgoers were observed in the ocean wading, swimming, and playing along the surf-line, while sunbathers were facing away from the water to maximize their sun exposure. Other beachgoers situated their chairs specifically toward the water and were enjoying views of the ocean and nearshore activity. To these individuals, the ocean (including its sound, smell and/or feel), is an integral part of their experience, whether it is visible or not. Beyond the shoreline dunes, a bustling outdoor bar and restaurant scene was observed. Patrons of these establishments were engaged in social interaction but were often specifically situated to take advantage of views beyond the sand dunes and out to the ocean and horizon. Throughout the height of the summer season, it is likely that large numbers of tourists, vacationers, and residents take advantage of the beach and nearby shops, restaurants, and bars along Ocean Terrace and the boardwalk. During the off-season the number of potential viewers drops sharply, as the population decreases by up to 2000 percent to just 2,200 full time residents (Mansnerus, 1999). During the winter season, the harsh winter weather dramatically reduces the number visitors at the beach and many businesses close their doors for the season. As such, the viewer exposure is significantly reduced in the winter months.

The rating panel determined that even with concentrated viewing, the proposed WTGs are nearly indiscernible at a distance of 39 miles from this KOP. The rating panel scores indicate a VTL of 1, which suggests that the WTGs are at the extreme limit of visibility and are unlikely to be noticed even with concentrated viewing. It is also worth noting that the west-southwesterly view presented in the visual simulation is not a typical primary view for users of this KOP, who are likely to be focused on views directly offshore. Sunset conditions may increase the potential visibility of turbine blades extending above the horizon. However, even under the highest contrast conditions, the proposed WTGs are not anticipated to detract from the viewer experience and will not be obviously visible to casual viewers from this distance. Therefore, the Projects are unlikely to result in a change to the viewer experience at this KOP.

Edwin B. Forsythe NWR at the Woodmansee Estate (LAT01)

Viewers at Edwin B. Forsythe NWR at this location are exclusively made up of residents and visitors to the Woodmansee Estate neighborhood. The homes within the development are situated along a dredged lagoon to take advantage of inland views across the salt marsh and undeveloped bay bordering the development. The view presented in the VIA would only be available to residents on the southernmost and easternmost boundary of the neighborhood. In most cases, the homes on this stretch of road do not have specific outdoor accommodations for views to the south toward the Projects. However, the selected KOP is one of the few exceptions. Near the selected KOP, a few homes have outdoor seating, pools, and decks specifically situated to take advantage of views over the marsh and bay toward the ocean and the Projects.

Under the lighting conditions illustrated in the visual simulation from this KOP, the WTGs were determined to be a VTL 4, which indicates that the Projects could potentially compete with existing landscape elements in the view but would not strongly attract viewer attention. While it was noted that blade movement could potentially attract viewer attention, perception of such movement is unlikely to occur at a distance of 32 miles. Generally, given the fact that residents have the opportunity for stationary focused viewing when outdoors and relaxing, there will be instances when the Projects are noticeable. The degree of WTG visibility is likely to be highly variable, but given the effects of atmospheric perspective, clear views to a distance of

32 miles will be infrequent (see Section 3.2.3) and therefore the WTGs are generally unlikely to affect viewer appreciation of the view from this KOP.

During nighttime conditions, the rating panel assigned a VTL of 5 to the KOP at the Woodmansee Estate. This suggests that the AWOLs associated with the Projects would result in a significant contrast with the existing landscape elements and the night sky and could attract and hold viewer attention. In this instance, the residents would notice a significant change to the night sky when the AWOLs are active during clear weather conditions. This is likely to affect their perception of an undeveloped ocean view and the quality of their experience when outdoors, stationary, and looking toward the ocean at night. However, as with the daytime visual simulation, there are relatively few viewers at this location and atmospheric perspective is likely to minimize the visibility of the AWOLs under typical nighttime viewing conditions (see Section 3.2.3). Additionally, if an Aircraft Detection Lighting System (ADLS) is implemented, nighttime visual impacts associated with the Projects would be essentially eliminated from this KOP (See Section 3.3).

Island Beach State Park (BT01)

The New Jersey State Park Service states that this 10-mile stretch of barrier island state park hosts a variety of water sports, fishing and hunting, trails, and wildlife viewing. During field verification, people were observed sunbathing and walking along the beach. Shore Road, which runs the length of this state park has over 20 individual pull-offs with parking and beach access. Near the entrance of the park, there are two very large parking areas along with the park office and concession area. It is anticipated that these areas are the main hub of activity and likely draw significant crowds of people in the summertime. However, due to the spread out geographic area this park covers and the layout of the small individual parking areas along the main access road, groups of people tend to be spread out over large distances. One can assume the attraction to this area of the park is likely the ability to enjoy the beach in relative solitude.

The simulation from this KOP is oriented due south. While this is not the primary view for people relaxing and looking out over the water, individuals walking south will may see portions of the WTGs on clear days at a distance of 30.3 miles. The rating panel indicated that the WTGs would result in a VTL of 3, which suggests that the Projects can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements. Atmospheric perspective is anticipated to minimize the WTGs contrast during most summer days, but when visible, the Projects could result in a change in the viewer's perception of the ocean as a pristine, undeveloped viewshed, but given the relatively low contrast presented by the turbines and coupled with the fact that this is not a primary view, they are unlikely to impact the value placed on the ocean views. During typical viewing conditions, atmospheric perspective is likely to completely obscure the WTGs at this distance and viewers will be completely unaware of their presence. In fact, the novelty of seeing them on rare occasions might be interesting to some viewers.

Barnegat Lighthouse State Park (BLB02)

Viewers at Barnegat Lighthouse mostly consist of tourists and vacationers who visit this region in droves every summer. Viewers specifically climb this lighthouse to see the seascape and landscape from a rare, elevated perspective. The ocean and views to the ocean horizon are integral to the viewer experience due to the inherent function of lighthouses and the unique view it provides.

Rating panel results indicated a VTL of 2 from this KOP, suggesting that the WTGs are faint, but may be detected by scanning the horizon. At a distance of 27.3 miles, it is likely that during clearer conditions and high contrast lighting, the WTGs could appear more prominent on the horizon, thus increasing their

magnitude of impact. Considering this, the Project could result in a VTL of 4 during very clear conditions. However, it is more likely that this photosimulation represents fairly typical viewing conditions and WTG contrast. The WTGs also occupy a relatively small portion of the view in the location. If the primary view is the ocean, the WTGs will undoubtedly attract viewer attention during clear conditions, but the turbines appear behind a heavily developed portion of the barrier island, so the view would not be considered pristine to begin with. If the primary view is of the barrier islands and developed features within the view, the WTGs may become secondary components in the background and would have minimal impacts on viewers.

Long Beach Island Arts Foundation (LBT03)

The Township of Long Beach is typically known as a family-oriented beach area. Viewers at this KOP are likely to include year-round residents that live nearby, or vacationers that rent properties on the oceanfront or bay side of Long Beach Island. The beaches in this location are known for their lack of large crowds and evoke a more relaxed and solitary beach experience than other locations along the Jersey shore. The neighboring character areas consist mainly of Waterfront Residential and Inland Residential, with minimal commercial retail businesses in the area. People were observed walking along the sparsely populated beach, sunbathing, or socializing in small groups. It is likely that these users accessed the beach from nearby residential properties utilizing dune walks that occur at regular intervals. There are no parking accommodations nearby, making the beach somewhat exclusive to property owners or vacation property renters. For all visitors and residents, the ocean is an important part of the user experience. For some, it offers opportunities for recreation such as surf casting, swimming, and paddleboarding. For others, it is a viewshed that offers a serene and simple view of the open ocean meeting the sky.

The simulation from this KOP is oriented due south. While this is not the primary view for people relaxing and looking out over the water, individuals walking south will see the WTGs on clear days. At a distance of 24.9 miles, the rating panel indicated that the WTGs would result in a VTL of 5, which suggests it could be the major focus of viewer attention during clear viewing conditions. Atmospheric perspective is anticipated to minimize the WTGs contrast during most summer days, but when visible, the Projects could result in a modification of the simple horizon line, resulting in a visual disruption and adding a more complex focal point for some beach users. This could result in a change in the viewer's perception of the ocean as a pristine, undeveloped viewshed and as such, could impact the value they place on this ocean view. Under lower contrast lighting conditions, or if partially obscured by atmospheric perspective, the Projects would result in reduced change to viewer perception. In views looking east, which is the primary field of view that does not include the Projects, the motion of the WTG rotors could attract the viewers' attention, compelling the viewer to look south. However, it is important to note that visibility extending to a distance of 24.9 miles is an exceptionally rare occurrence (see Section 3.2.1.3.5) and does not constitute typical or normal viewing conditions. On a typical humid summer day (when the majority of viewers are present) the turbines are likely to be partially or completely obscured by atmospheric perspective.

Bass River State Forest (BRT01)

Viewers at the Bass River State Forest are likely to be engaged in hiking, picnicking, and wildlife observation. The simulation from this KOP is from a small side trail that extends into the salt marsh before becoming impassible due to wet, boggy conditions. This KOP represents views that would only be experienced by adventurous bird watchers or other nature enthusiasts. The majority of individuals using the state forest would have minimal outward views toward the ocean due to vegetative screening.

The rating panel assigned this view a VTL of 2, which suggests that the WTGs are very faint, but noticeable to viewers scanning the horizon. At 18.5 miles, the WTGs are significantly screened by intervening vegetation and human development on the intervening barrier islands. While viewers at this location are likely to see the turbine blade movement, it will not result in a significant change in the viewer's perception of the landscape due to the obvious presence of human intervention on the horizon. The majority of the WTGs in the simulation are backlit by the sun and appear slightly darker than they would during other times of day. As such, there will be times, such as early and late afternoon, during which the WTGs would be more difficult to see. Additionally, atmospheric perspective is likely to completely obscure the blades during humid days and/or precipitation events.

Beach Haven Historic District (BHB01, BHB02, BHB03, and LBT04)

The beach view illustrated in this visual simulation is experienced by users and viewers that live or vacation along this very popular stretch of beach. The view is slightly elevated due to its position on the dune ramp approaching the beach. This ramp extends from a beach pavilion and comfort station at the top of the dunes to a large parking area. As with many of the popular beaches, user activities range from stationary sunbathing to active recreation such as running, walking, and swimming. Multiple beachfront bars and restaurants also attract visitors throughout the day and into the evening. While the beach and ocean are important experiential components to these activities, ocean views become less prevalent and available while viewers are in shoreline bars and restaurants. Viewers at this KOP are likely to have variable attitudes toward the importance of ocean views, but the ocean is an integral part of their beach experience.

The presence of the WTGs in this view resulted in a VTL of 5 which indicates that they could result in a significant degree of visual contrast with the surrounding seascape/ocean and could be the major focus of viewer attention when visible. For some viewers, engaged in stationary viewing of the ocean horizon, the WTGs may affect the viewer's perception of a pristine, undeveloped ocean horizon and may impact their enjoyment of the ocean views. For others, the WTGs will minimally affect the enjoyment of their activities and may even evoke some degree of visual interest. At a distance of 13.5 miles to the nearest WTG, atmospheric perspective is likely to reduce the visibility and visual contrast experienced by viewers, particularly during the height of the summer season (see Section 3.2.3). However, due to the southern orientation of the view, midday viewing under clear conditions may result in a higher degree of visual contrast due to backlighting of the WTGs. Based on the 2019 meteorological data, the atmospheric conditions represented in this photosimulation (visibility extending to 32 miles) only occurs during approximately 7% of the daylight hours in August. Two additional photosimulations were created to illustrate atmospheric conditions that occur during 15% and 20% of the daylight hours in August to show more typical visibility conditions. During 15% of daylight hours in August visibility extends to a distance of 20 miles and during 20% of daylight hours in August visibility extends to 18 miles. As illustrated in the 15% scenario, only the first few rows of WTGs are faintly visible on the horizon and their prominence is significantly reduced due to a reduction in color contrast and less visible stacking or layering of multiple rows of WTGs. During the 20% scenario, even the nearest WTGs become difficult to see though the atmospheric haze. It is important to note that during these atmospheric condition scenarios, weather conditions on the shore are still perceived as clear and viewers would likely characterize the day as "very clear".

The nighttime view from this location is most likely to be experienced by homeowners and vacationers in rental properties with beach views. The rating panel assigned the nighttime simulation a VTL of 5. This suggests that the AWOLs associated with the Projects would result in a significant contrast with the existing

landscape elements and the night sky and could attract and hold viewer attention. In this instance, the viewers would notice a significant change to the night sky when the AWOLs are active during clear weather conditions. AWOL visibility is likely to be highly variable based on atmospheric conditions. In addition, other light sources associated with homes, businesses, and on very clear nights, Atlantic City will likely compete for viewer attention when viewing in this direction at nighttime. Additionally, if ADLS is implemented (See Section 3.3), nighttime visual impacts associated with the AWOLs would be essentially eliminated from this view and only a very small portion of the navigation lights would be barely visible on clear nights. Due to the relatively low number of navigation lights that occur above the visible horizon from this KOP, it is possible that viewers could mistake the navigation lights for buoys on the water. With ADLS, it is anticipated that the Projects would not result in impacts to viewers at night.

Bay Boulevard WMA/Rutgers Field Station (LEHT02)

Viewers within the Undeveloped Bay and Salt Marsh character area represented by this KOP primarily include residents and other locals that either work at the Rutgers Field Station or fish along a stretch of public beach along the Great Bay ocean estuary. The KOP is also located at a public kayak launch site, so viewers may also engage in recreational kayaking at this location. The site does not have formal parking accommodation and does not appear to be a destination for tourists or visitors to the area. Therefore, the site appears to receive fairly regular, but low volume use. However, this site is also located in proximity to the intracoastal waterway and likely receives significant boater traffic throughout the warm seasons. Of the range of activities occurring at this KOP, the recreational boater and fishermen are likely to have the greatest exposure visual change associated with the Projects. These viewers have opportunities for extended, concentrated viewing of the landscape and seascape and this visual environment is an important component of their recreational experience. Additionally, boaters are typically aware of visual changes since it is an integral part of their navigation on the water. It is important to note that, on clear days, Atlantic City, at a distance of 11.3 miles, is also within the viewshed of this KOP. As such, when Atlantic City is visible, the tall buildings and developed horizon minimize any sense of a pristine ocean viewshed.

The presence of the WTGs in this view resulted in a VTL of 6 which suggest that at a distance of 11.9 miles the WTGs would result in a significant degree of visual contrast with the surrounding seascape/ocean and would be a major focus of viewer attention under the clear conditions illustrated in the simulation. Additionally, VTL 6 suggests that the WTGs occupy a majority of the field of view and viewers would have to turn away from the Projects to eliminate it from their view. During several visits to this site, Atlantic City was used as an indicator of adequate viewing conditions. For example, when Atlantic City is not visible from this location, it is reasonable to conclude that the WTGs will also be obscured by atmospheric perspective. This is supported by the atmospheric conditions analysis photosimulations completed from Beach Haven Historic District which is only 1.6 miles greater in distance from the Projects. Field review also confirmed that these are common and frequent conditions at this location. However, during clear days, as illustrated in the visual simulation, the Projects will likely result in a significant change to the existing view. Some viewers (particularly those engaged in passive activities) may feel the presence of the WTGs impacts their enjoyment of the activities in which they are engaged. Others may perceive the presence of WTGs as an environmental benefit, particularly juxtaposed with the intensive shoreline development associated with Atlantic City.

Edwin B. Forsythe NWR (GT01)

This is an elevated view from a viewing platform situated near a pull-off on Wildlife Drive. This location is most likely used by residents and tourists that are specifically interested in viewing migrating and foraging

birds in the marshlands and ponds below. It is also likely that tourists come upon the tower unintentionally and have interest in an elevated view of the area. Bird enthusiasts and ornithologists that visit this location will be engaged in viewing specific activities wherever they occur and likely in all directions. It is also likely they will be viewing the landscape and seascape with the use of visual aids such as binoculars so the viewers may have a heightened awareness of distant elements in the seascape and landscape.

The clear conditions presented in the photosimulation result in a VTL 4 at a distance of 14.3 miles from the Projects. When viewed over the barrier island development, viewers can better just the scale of the WTGs on the horizon. It is likely that during these clear conditions, the rotating blades of the WTGs will be readily apparent to viewers, but with the presence of heavy development in the view, they will not be viewed without precedent. While the primary view from this location will likely be to the ponds north or south of the tower, the WTGs will catch the attention of birders sweeping the horizon for wildlife. Under more typical viewing conditions, the WTGs are likely to be difficult to decipher beyond the barrier island development. However, as mentioned previously, viewers using visual aids may catch a glimpse of the WTGs nearest shore. The juxtaposition of the WTGs behind the heavily developed barrier island may result in heightened viewer awareness and interest from this location. This is particularly the case for viewers that climb the tower through happenstance. Because the undeveloped ocean is not visible from this location, viewers are unlikely to perceive them as elements on the ocean. In fact, they may question exactly where the turbines are located. Viewers that are sensitive to development in natural settings such as this may feel they diminish the integrity of the view, but it is unlikely to affect their primary activity.

North Brigantine Natural Area (BC02)

This KOP represents a view from the Undeveloped Beach character area, which is a relatively rare occurrence on this stretch of New Jersey coastline. Users at this location are likely to include residents and tourists engaged in beachcombing, running, fishing, and wildlife viewing. Due to the lack of nearby access to parking and comfort stations, the number of visitors at this location is relatively low. However, those with the will to walk, or ability to drive, to this more remote location likely do so to enjoy a quiet, undeveloped beach. For these users the ocean will be an important component of their experience.

The nearest WTG is approximately 9 miles from this location. Due to their proximity to the viewer, the WTGs resulted in a VTL of 6. This reflects their degree of horizon occupation and scale contrast with existing seascape features. While atmospheric perspective may reduce the number of WTGs visible from this location, thus minimizing the perceived visual clutter, viewers will frequently see the nearest rows of turbines. The presence of the WTGs truncates the openness of the view and disrupts the clean ocean/sky horizon line. As such, the WTGs are likely to become the primary focus of viewer attention. While the viewer activities may not be directly affected by the Projects, there will be an experiential change associated with an ocean view that has changed from undeveloped to substantially developed.

Ocean Casino Resort – Sky Garden (AC04)

The Ocean Casino Resort Sky Garden is an outdoor space used exclusively by the patrons of the casino and hotel. During several visits it was apparent that the space is most heavily utilized during special events. Aside from those events, guests occasionally come out to sit at the tables to enjoy a drink and socialize. Even if not actively viewing the ocean horizon, the ocean is still an important aspect of this area due to the sounds and scents of the nearby beach. Viewers also walk to the edge of the glass-fenced garden specifically to take in the elevated ocean view.

At a distance of 10.5 miles, the rating panel scores indicate that the WTGs would result in a VTL of 6, which suggests the WTGs would be the major focus of viewer attention during clear viewing conditions and would be a major source of contrast with the line, form, color, and texture of existing landscape and seascape features in the view. Atmospheric perspective is anticipated to reduce the number of visible WTGs and resulting visual clutter during most summer days (see 3.2.1.3.9), but for users of this space, the Projects would result in a modification of the simple horizon line, resulting in a visual disruption and the addition of more complex focal points. This could result in a change in the viewer's perception of the ocean as a pristine, undeveloped viewshed and could impact the value they place on this view. However, for some viewers in this highly developed setting, the WTGs could be a significant draw and subject of interest. Given the complexity of development along this section of coast, some viewers may not see the baseline condition of the ocean as pristine or undeveloped. For most casino guests, the primary attractions occur indoors where views of the greater Atlantic City environment are not possible, and they may not even venture out to the Sky Garden. Additionally, the visual simulation provides a view that is heavily backlit by the rising sun, representing the highest contrast conditions. Once the sun is higher in the sky, the WTGs are likely to become lighter grey or white in color which would minimize their color contrast with horizon.

At nighttime, the visual simulation from the Ocean Casino Sky Deck received a VTL of 5, suggesting it could become the major focus of viewer attention and contrast with the character of the existing seascape/ocean view. For nighttime viewers, it is important to note the context of the existing nighttime view, which is very bright and heavily modified by lights from surrounding development. As such, it is likely that viewers and users of this space will place less value on the nighttime ocean view as they are unlikely to expect dark skies in this highly developed casino setting. However, a small portion of viewers may place a higher value on the contrast between the dazzling shoreline and the dark ocean horizon. In these cases, the WTG AWOLs would change the viewer's perception of the night sky and could give the sense of a heavily modified ocean view. Additionally, if an Aircraft Detection Lighting System (ADLS) is implemented (See Section 3.3), nighttime visual impacts associated with the AWOLs would be essentially eliminated from this view and only a portion of the navigation lights would be visible on clear nights. Given the proximity of these lights to the ocean surface, it is anticipated that the navigation lights would result in minimal visual prominence but could still attract viewer attention from this elevated view.

Atlantic City Convention Center NHL (AC02)

Viewers along the beach at the Atlantic City Convention Center are engaged in sunbathing, socializing, swimming, wading, and walking. The beach at this location often hosts very large crowds of people engaged in a multitude of activities. For the majority of users, the ocean is an integral part of their experience. Beyond the shoreline, the adjacent boardwalk hosts many activities and presents an overwhelming degree of sensory stimuli, including billboards, large digital screens, music, and a wide array of human activity and

architectural styles. This area of the Atlantic City character area is accepted as a heavily modified seascape and people come to the location to take advantage of its multitude of commercial and social offerings. Throughout the height of the summer season large numbers of tourists, vacationers, and residents take advantage of the beach and nearby shops, restaurants, and bars along the boardwalk. Sixty five percent of visitors who come to Atlantic City come with the express purpose of gambling (27%) or vacationing (38%) and stay for two days or less. Eighty one percent of these visitors frequent the boardwalk near this KOP (Posner, 2013). As such, it is anticipated that this view would be experienced by a large number of visitors during the summer season. In most cases, these viewers accept that this is not a natural or serene landscape and intensive development is a part of the draw and viewer experience. However, for some, the juxtaposition of the largely undeveloped ocean and the highly developed adjacent land uses may contribute to their visual experience.

The WTGs, as viewed at a distance of 11.4 miles from this KOP, dominate the ocean view as indicated by a VTL score of 6. However, the Projects are not completely out of character with the shoreline development, which in this location extends out into the ocean via a large multistory pier, truncating the available ocean horizon and screening a portion of the Projects. At this time of day, during a holiday weekend, the beach would be at its most crowded. Despite this, the presence of the Projects would likely draw viewer attention and may be seen as an extension of the shoreline development by some, and a visual disruption of the horizon by others. The motion of the rotors would likely draw viewer attention despite the intensely developed shoreline. However, the density of WTGs would be significantly reduced during most summer days due to atmospheric perspective. In fact, in 2019 (model year) the availability of views as presented in the visual simulation would only occur over approximately 1.6% of the month of July. Two other conditions are also presented in Attachment E. These simulations illustrate the appearance of the WTGs when visibility is limited to within a distance of 18 and 20 miles. These conditions occurred during 13% and 12% of the month of July, respectively. While the nearest WTGs are still visible on the horizon, under these conditions, the visual clutter associated with stacking and massing is absent, making the Projects appear significantly less dominant.

Lucy the Margate Elephant National Historic Landmark (MC02)

Viewers at this attraction will primarily include tourists and visitors to Atlantic City and Margate City. This famous attraction brings up to 35,000 visitors per year for guided tours, and over 100,000 visit the site annually. The focus of these tours is mainly centered on the interior design elements within the elephant, but the tour typically ends on the howdah, or the uppermost viewing platform. The view from this platform provides an elevated vantage point that allows the viewer to see a relatively narrow enclosed view of the ocean. A view to the ocean is not available from ground level due to closely situated buildings along the street. Viewers tend to take in a brief view, take a photograph, and tour guides typically offer to take group photographs with the ocean as the backdrop. The duration of the view is relatively short, but the frequency may be considered high based on the number of visitors. Generally, visitors to this attraction are focused on the fact that they are inside this massive architectural depiction of an elephant and less concerned about the narrow ocean view.

Rating panel results indicate that the WTGs would result in a VTL of 5 from this location suggesting that they would be a significant draw of viewer attention and would contrast with line, form, color, and texture of features present in the existing view. Given the nature of viewer activity and the composition of the existing view, it is unlikely that the WTGs would result in any diminishment of enjoyment of this resource. However, on clear days there would likely be a change in the perception of an undeveloped ocean horizon.

This is somewhat accentuated by the narrow field of view, flanked on both sides by tall buildings. As mentioned previously, the majority of activities occur inside the elephant where views of the ocean are restricted to small windows representing the eyes of the elephant. However, as illustrated in the video simulation from Huntington Park Margate City (MC03), viewers have the opportunity to experience views with less visual clutter and development. From these locations, the Projects are expected to have a greater impact on users, similar to those described in BHB01.

Tuckahoe WMA (EMC01)

Tuckahoe WMA represent tourists and residents that come to this location while on holiday in the region or as a regular walking and wildlife viewing spot. This view represents those vast, undeveloped inland areas specifically designated as wildlife conservation and recreation land. The primary views are typically highly variable and probably change based on the presence of wildlife or the availability of views of the highly developed barrier island. At a distance of 25.7 miles and due to the fact that the WTGs are partially obscured by vegetation and development, the rating panel members assigned this view a VTL 1 which suggests that the Projects are at the extreme limit of visibility. Viewers, if they notice the WTGs from this location will not likely be affected by the Projects due to the high degree of screening and viewing distance. Atmospheric perspective is also likely to result in even less visibility, resulting in complete obscurity during the majority of summer days.

Gillian's Wonderland Pier (OC04)

Viewers at Gillian's Wonderland Pier will include tourists and vacationers, as well as residents. Typical of a commercial waterfront, this area has a beach separated by recently restored sand dunes, a boardwalk, and commercial storefronts, restaurants, and amusement parks. As such, users will be engaged in a wide variety of activities. Some of these activities such as sunbathing, swimming, and fishing have distinct connections to the ocean which enhances or is essential to the viewer's experience. Activities that take place on the boardwalk and nearby amusement parks are less dependent on the presence of the ocean, but it is still a significant draw to this area. Users will be engaged in focused activities such as shopping, eating, or riding roller coasters which are the strong focus of their attention and leaves little opportunity for viewing the ocean. It is likely that sound and smell from the ocean contribute to their experience while engaged in these activities but is not central to user enjoyment. The users at Gillian's Wonderland recognize that this environment is a heavily manipulated seascape and accept that it could not be mistaken for a pristine or serene setting. However, when users are not engaged in amusement park activities and are standing at the water's edge and looking out to the ocean horizon, the scene can feel more peaceful and undeveloped. For users that engage in concentrated viewing, the ocean may be the most important component of the viewer's experience.

The rating panel scores indicated a VTL of 5 from this KOP, which is approximately 17.2 miles from the nearest WTG. As such, during very clear conditions, the WTGs could be the major focus of attention for viewers concentrating on the ocean view and would contrast with the line, form, color, and of the ocean horizon in the existing view. It is important to note that the waves present in the photosimulation are particularly large and a calmer ocean could reveal more of the Projects. However, the visibility and perceived density of WTGs would be significantly reduced during most summer days due to atmospheric perspective. The 2019 meteorological data suggests that the availability of views to that presented in the visual simulation would only occur over approximately 4.6% of the month of September. Two other conditions are also presented in Attachment E and these simulations illustrate the appearance of the WTGs when visibility is limited to within distances 18 and 20 miles. These conditions occurred during 31% and 27% of

the month of September, respectively. Simulations under these conditions illustrate that all but the closest WTGs are completely obscured from view, and even the visible portions of the Projects are difficult to perceive on the horizon. While visible, it is not anticipated that the WTGs will result in any significant effects on viewer enjoyment of Gillian's Wonderland Pier.

Corson's Inlet State Park (OC01)

Viewers at Corson's Inlet State Park are most likely to include residents and tourists and particularly those that occupy the abundance of beachfront rental homes north of the park. This state park provides minimal parking for users, so it is likely that many people access the park on foot. Viewers will be engaged in typical beach activities primarily including sunbathing or fishing. In both instances, the primary view is likely to be directly east over the water the Project would occupy a small portion of that primary view. During the very clear conditions presented in the photosimulation, the rating panel scores resulted in a VTL 4 which suggests that the WTGs will be obvious to viewers and sufficient in scale to compete with the undeveloped seascape horizon, but not to the degree that it occupies a major portion of the primary view. At a distance of 21.7 miles, the movement of the WTG blades will likely draw viewer attention on clear days. However, during the summer months when most viewer will be affected by the Projects, visibility of the nearest WTGs will be infrequent. When the nearest WTGs are visible, views are not likely to include the entire array (see Section 3.2.3). Given the viewer activity, orientation, and sensitivity at this KOP, during times of turbine visibility, it is possible that the presence of the Projects may affect the viewers perception of the undeveloped ocean horizon due to the presence the man-made elements. For viewers involved in active recreation, the presence of the WTGs is unlikely

Townsend's Inlet Bridge (SIC01)

The Townsend Inlet Bridge is the only direct route to and from Sea Isle Inlet and Avalon, New Jersey. In the summertime recreationalists walk, run, and bike over the bridge from parks on either side. Additionally, the bridge is crossed by over 1,000 cars per day in the offseason and approximately 7,800 vehicles during the summer season (NJDOT, 2018). Drivers on this bridge are likely to be focused on the road and will not have the opportunity for extended ocean viewing. In the height of the summer season, it is possible that traffic may slow or stop allowing for short duration observations of the ocean horizon. Similarly, bikers will be concentrating on negotiating traffic. Although their travel speed is significantly lower than vehicular traffic and allows for some degree of detailed observation, bikers and drivers using the bridge will need to keep their focus on the road and other vehicles. Walkers and runners have greater opportunities to stop and take in views from the two observation platforms located on opposite sides of the bridge. These users are likely to be the most sensitive to changes in the landscape, seascape, and ocean. However, this iconic bridge serves as a gateway between two barrier islands, so the presence of the ocean as a background feature is an important component of any method of travel.

With the Projects in place, the WTGs resulted in a VTL of 5 from this location. At a distance of 27.4 miles, this elevated perspective combined with the morning sun, results in WTG contrast with the line, form, color, and texture of the ocean surface due to the high contrast lighting conditions. Under the conditions illustrated in the photosimulation, the WTGs will likely be recognized by most users, regardless of their mode of transportation. However, the ocean horizon is interrupted on both sides of the inlet by multistory buildings and human development. The WTGs may draw viewer attention due to the rotor movement, but the entire view is animated by human activity in the foreground, which is much more likely to attract and

hold viewer attention. Due to the abundance of vehicular traffic, the viewshed would not be considered serene or undeveloped, but the WTGs could add visual clutter in a place where it did not previously exist. Under exceptionally clear conditions, the presence of the WTGs could detract from the viewer's experience which was a previously undeveloped ocean horizon. However, under more typical weather conditions atmospheric perspective is likely to drastically minimize the visibility of the WTGs at this distance. During typical summer viewing conditions, it is likely the drivers on the bridge would not see the WTGs and stationery or slow-moving observers would likely only perceive a few faint WTGs on the horizon. The reduction in stacking or layering of visible WTGs under these conditions would likely minimize their visual prominence and the impact to viewers would be minimal. This is supported by the typical conditions simulations produced from Gillian's Wonderland Amusement Park (OC04), which indicated minimal visibility of the WTGs and OSSs during typical atmospheric conditions. Since the Townsend Inlet Bridge is just over 10 miles greater in distance from the Projects than OC04, it is anticipated that visibility under typical conditions would conceal an even greater portion of the Projects if not completely obscuring them from view.

Cape May Point State Park (LT02)

Viewers at Cape May Lighthouse mostly consist of tourists and vacationers whose numbers may exceed 100,000 per year. Most visitors climb to the viewing platform of the lighthouse to take in elevated views of the ocean extending across 270 degrees of the horizon. Viewers specifically climb this lighthouse to see the seascape and landscape from a rare, elevated perspective. The ocean and views to the ocean horizon are integral to the viewer experience due to the inherent function of lighthouses and the unique view it provides.

Rating panel results indicated a VTL of 2 from this KOP, suggesting that the WTGs are very small and faint, but may be detected by scanning the horizon. At a distance of 47 miles, this degree of visibility would be extremely rare and atmospheric perspective is likely to completely eliminate WTG visibility, over the majority of the year. As such, it is unlikely that the Projects will result in any impacts to the viewers experience from this resource.

3.2.2 Character Area Visibility

As illustrated in Table 3.2-2, impacts to character areas will be most significant in those portions that occur within the ZVI and the 0-10 mile zone. Notable character areas with significant areas of potential project visibility include the Ocean, Undeveloped Beach, Residential Beachfront, Salt Marsh, Commercial Beachfront, Atlantic City, and Undeveloped Bay. These areas of potential visibility within the various distance zones are described in greater detail below.

Due to the fact that the Projects are being proposed within the Ocean character area and there is a distinct lack of screening features on the water 100% of its area within 30 miles will have views of the WTGs and OSSs. While the Ocean character area within these distance zones is currently pristine and undeveloped, views from within it may contain a heavily manipulated and developed shoreline in some directions. On the other hand, some views bring a sense of vast, openness that would be altered by the presence of the WTGs and OSSs when viewing the ocean from within or beyond the WTA (cruise boats, offshore fisheries, and freight vessels) or from nearshore areas (recreational boaters, jet skiers, and kayakers). Portions of the Ocean character area extending beyond 30 miles, occur outside of the ZVI (3.7%) and would not have visibility of the Projects. The majority of these areas occur near the inlet to Delaware Bay and to the east of the Projects where curvature of the earth eliminates visibility of the WTGs.

Within 10 miles of the Projects, 94% of the Salt Marsh character area could have views of the proposed WTGs and OSSs. This constitutes multiple areas covering a total of approximately 1,087 acres and includes

the large salt marshes in Galloway Township and Brigantine. In most instances, views from these areas are visually disconnected from the ocean by the presence of the barrier islands. From 10-20 miles, there is a considerably larger portion (41,000 acres) of the Salt Marsh character area within the ZVI. The KOP from the Bay Boulevard Rutgers Field Station (LEHT02) provides an example of potential visibility of the Projects from within this character area. This KOP represents one of the most open, unobstructed views from within this character area and the Projects resulted in a VTL 6, suggesting that the presence of the WTGs and OSS could, at times, result in a significant change to the horizon when viewed from within the Salt Marsh character area. Visibility begins to drop significantly in the 20-30 mile zone due to screening provided by the barrier islands to the northwest and southwest of the Projects. This distance range is illustrated in the KOP from Tuckahoe WMA (EMC01) which is 25.7 miles from the Projects and resulted in the VTL 1. In this zone 25,000 acres or 54.6% of the Salt Marsh occurs within the ZVI. Beyond 30 miles, this visibility drops to 4,700 acres and 11.1%.

Similar to the Salt Marsh character area, the Undeveloped Bay character area also has visibility of the Projects from within the 10-mile zone. In this case, 570 acres occurs within the ZVI constituting approximately 98.6% of the Undeveloped Bay within 10 miles. While portions of the bays occurring behind the barrier islands have direct connections to the ocean, the majority of this zone is distinct from the ocean and rarely includes ocean views. However, the turbines extend well above the barrier islands and could become a highly visible component of the seascape during clear conditions. Within 10-20 miles, the portion of Undeveloped Bay within the ZVI drops to 90.8% but makes up a vast 53,000 acres. Lack of visibility in some areas is likely the result of considerable screening provided by foreground vegetation and structures on the barrier islands and adjacent to the bays. In these areas, when views of the Projects are available, portions of the WTA will be screened by these features resulting in a reduced visibility and visual impact. Within 20-30 miles the area of potential visibility is reduced to 25,000 acres and 74.0% and 21,000 acres and 50.8% beyond 30 miles.

The ZVI contains 510 acres or 77.9% of the Undeveloped Beach character area within 10 miles of the Projects. As illustrated in the photosimulations from North Brigantine Natural Area (BC02), Corson's Inlet State Park (OC01), and Edwin B. Forsythe NWR (LBT04), this character area contains some of the closest land-based viewing opportunities of the Projects. The ocean is a significant contributor to the visual character and sense of place of this character area and the presence of the WTGs and OSSs changes the undeveloped character of the ocean horizon by adding large, manmade infrastructure which would be visible from shore during most clear days and some partially obscured days. Within 10-20 miles, the portion of Undeveloped Beach within the ZVI is 73.1% made up of 527 acres. Within 20-30 miles this number drops to 495 acres and 52.7% acres and then increases again to 1,062 acres and 38.6% beyond 30 miles, at which point the Projects are expected to have less influence on visual character due to the visibility diminishing effects of distance, scale, and atmospheric perspective.

One hundred and twenty four acres of land area or 87.4% of the Residential Beachfront character area occur within the ZVI within 10 miles of the Projects. The ocean is a significant contributor to the visual character and sense of place associated with the Residential Beachfront character area. Homes were placed here for the purpose of the oceanfront setting. The presence of the WTGs and OSSs changes the undeveloped character of the ocean horizon by adding large, manmade infrastructure, a portion of which would be visible from shore on clear days. This change to the Ocean character area indirectly alters the character of ocean views from within the Residential Beachfront character area. The majority of these properties within 10 miles of the Projects will experience this change in character during clear viewing conditions. Considering distances from 10 to 20 miles, the area of potential visibility increases to 1,810 acres which makes up 80.6% of Residential Beachfront areas. KOPs from Ship Bottom Borough (SBB01) and three views from Beach Haven Borough (BHB01-03) illustrate typical views from within this distance range and each resulted in potential significant visual impacts resulting from the Projects during optimal viewing conditions. Between 20 and 30 miles, 1,481 acres or 18.9% of the Residential Beachfront areas are indicated as having potential visibility of the Projects. The visual impacts within this distance range are expected to be significant during high-

contrast lighting conditions and clear weather. Beyond 30 miles, 60.8% or 609 acres occur within the ZVI. Within this distance range, the photosimulations generally support the conclusion that the Projects will result in minimal impact to the Residential Beachfront Character Area. This is supported by KOPs from Seaside Beach Park (SPB01), and Cape May Point State Park (LT02).

Visibility from within the Commercial Beachfront character area includes a portion of beachfront in Atlantic City and Ocean City between 10-20 miles, and Wildwood beyond 30 miles. As such, no Commercial Beachfront exists between 0-10 miles and 20-30 miles. Approximately 307 acres or 89.3% of the Atlantic City and Ocean City Commercial Beachfront could have some degree of visibility of the Projects from 10-20 miles distant. This condition is represented in the photosimulation from Atlantic City (AC02) and Ocean City (OC04) in which the impacts were considered significant during clear viewing conditions. This suggests that the Projects have the potential to alter the character of the Commercial Beachfront. However, this character area is typically defined by features that have already drastically altered the seascape environment and are intentionally situated on the shoreline for the purposes of attracting crowds for the purpose of sustaining commercial enterprises. Given the degree of seascape alteration already present, it is not anticipated that the Projects will result in a loss of the sense of place or alteration of character defining features within these areas. Beyond 30 miles Commercial Beachfront visibility occurs in the City of Wildwood. In this case approximately 298 acres or 55.5% of the beachfront may have visibility of the Projects. However, in this distance zone the potential impacts are expected to be negligible to minimal during the majority of lighting and visibility conditions anticipated.

Visibility from the Atlantic City character areas occurs within the 10-20 mile zone and includes 6.9 percent or 138 acres. This area of visibility is generally limited to the beachfront and boardwalk and is illustrated in KOPs from Ocean Casino Resort – Sky Garden (AC04). Atlantic City is a distinct character area in that just beyond the Oceanfront Commercial character area, the area is heavily developed and in areas this development spills out into the ocean for hundreds of feet. This seascape is unlike others within the VSA, and its sense of place is characterized by large, imposing buildings, digital signs in constant motion, and large restaurants. While the Ocean and Commercial Beachfront are important adjacent character areas to viewers, the presence of the WTGs and OSSs does little to alter the character within the thick of Atlantic City. The presence of built elements on the ocean is not without precedent here and the effects produced by additional development would not detract from this area's sense of place.

In addition to the seascape character areas described above, some landscape character areas also had notable visibility of the Projects from inland locations. For example, 68 acres or 24.8% of the Inland Residential character area within 10 miles of the Projects could have visibility of the WTGs and OSSs. This area is mainly concentrated in Brigantine where narrow bands of visibility extend inland along residential streets that are aligned with some portions of the Projects. However, it is anticipated that these views will not include the ocean and would likely only include a portion of the Projects due to tightly framed views constrained by dense residential development. Given the degree of competing foreground development and relatively small portions of the Projects that would be visible, it is not anticipated that the Projects would result in a significant change to the character of the Inland Residential character area. From 10 to 20 miles, the area of potential visibility increases to 492 acres which only consists of 2.3% of Inland Residential areas in this distance zone. Between 20 and 30 miles, less than 1% of Inland Residential areas would have visibility of the Projects. This is likely due to distance and the screening effects of shoreline topography and development. Beyond 30 miles, visibility of the Projects from Inland Residential areas diminishes to less than 0.1%.

The Industrial character area typically contains areas of undeveloped space in the form of parking areas, landfills, and airport runways. These areas are generally surrounded by areas of intensive land use or are in locations that lack significant visual character. Although minimal visibility does occur in this character area, the Projects will not change the visual environment. Within 0-10 miles, there are no industrial areas of

significance. Within 10-20 miles the ZVI occurs within 141 acres or 6%, within 20-30 miles approximately 1,351 acres or 17% occur within the ZVI, and beyond 30 miles, 165 acres or 1.2% of the industrial character area occurs within the ZVI.

There are no Dredged Lagoon character areas within 0-10 miles of the Project. However, between 10-20 miles 182 acres (8.6%) occur within the ZVI. Between 20-30 miles 53 acres (2.2%) occur within the ZVI, and beyond 30 miles, 64 acres (1.4%) occur within the ZVI. The KOP from Edwin B. Forsythe NWR at the Woodmansee Estate (LAT01) provides a view from 32 miles distant. This view resulted in a VTL 4, which suggests that the Projects could be of sufficient scale to contrast with other landscape features in the view. However, given the proportional visibility occurring within this character area, the Projects are unlikely to significantly alter the visual environment associated with this character area. More likely, visibility of the Projects will occur in areas along the boundaries of the densely situated homes and views from within will not have the same opportunities for visibility of the Projects.

Bayfront residential areas have a small area of ZVI occurring between the 0-10 mile range. Four acres or 57% occur within the ZVI and this primarily occurs on the bay side of Brigantine and Chelsea Heights west of Atlantic City. From 10-20 miles, 84 acres (11.7%) occur in the ZVI, from 20-30 miles, 25 acres (4%) occur in the ZVI, and beyond 30 miles 16 acres (2%) of this character area occur within the ZVI. In these area the views toward the Project will be sporadic and typically framed by intensely developed land. The ocean is typically not visible from these areas and the main character defining features are the views over the bays, which are typically looking away from the Projects. Generally, the Projects are not anticipated to significantly alter the character of the Bayfront Residential areas.

The Limited Access Highway character area has occasional views of the Projects while winding through portions of salt marsh and inland bays as they funnel into Atlantic City and the outer beaches. No visibility occurs within 10 miles, but from 10-20 miles 130 acres (12.1%) occur in the ZVI. This drops to 81 acres (3.1%) between 20-30 miles and 7 acres (0.3%) beyond 30 miles. The highway character area is highly variable based on the adjacent character areas through which it runs which can result in highly variable scenic quality and defining features. However, visibility of the Projects from this resource is likely to also include areas of intensive development. As such, it is unlikely that the Project will detract significantly from the features that characterize the Limited Access Highway character area. In some cases, the Projects may even contribute to the views by adding an element of interest juxtaposed with the shoreline development.

With 10 miles of the Projects, one acre (58.1%) of the recreation character area occurs within the ZVI. This includes several parks that occur near Brigantine and Atlantic City. These parks are typically located inland from the shoreline and visibility is generally in the form of narrow bands of viewshed running up the streets adjacent to the park. These areas are unlikely to experience significant changes in character resulting from the Projects. Within 10-20 miles 197 acres (11.1%) of recreation lands occur within the ZVI and from 20-30 miles, 133 acres (2.8%). The view from Barnegat Lighthouse (BLB02) provides an elevated example of visibility from within this character area. At 27 miles, this view received a VTL 2 during overcast conditions which suggests that the Projects could be missed by casual observers. However, during clearer conditions, it is possible that this view could reach a VTL 4. Given the sensitivity associated with many recreation areas situated on the coast, the ocean can be an important character defining feature. Because the ocean is typically seen as pristine and free of development, the Projects could detract from the sense of place at some of these resources. However, as discussed above, the Projects would be visible from a proportionally low number of these resources. Therefore, it is unlikely that the recreation character area will be adversely impacted by the Projects, given the relatively low frequency of visibility.

Inland Open Water character areas do not occur within 10 miles of the Projects. Between 10 and 20 miles 34 acres or 3.8% of the character area may be affected. This increases to 413 acres (9.8%) between 20-30 miles and less than one acre beyond 30 miles. Inland open water is typically associated with recreation

lands, river basins, and less frequently, ponds and lakes. They are often features that contribute to scenic quality of the surrounding character areas when visible. However, the ocean is rarely a significant feature of these views, if visible at all. Often times, these features themselves are the character defining feature and therefore the focus of the view. Because they all occur inland of the seascape, there is a high likelihood that shoreline development will be a significant part of any outward views and therefore, the Projects are unlikely to significantly detract from these resources.

Many of the other inland landscape character areas contained minimal areas of potential visibility of the Projects. Considering the Agriculture character area, none occurs between 0-10 miles. The zones from 10 to 45.1 miles contained only 20 acres of sporadic visibility constitutes less than 0.03% of the land areas that make up this character area. Given that these areas are so far inland, it is likely that any visibility of the Projects will affect the character of agricultural areas. Similarly, Commercial Strip Development, Town/Village Center, and Forested Areas have disproportionally low occurrences in the ZVI. As such these areas will not be affected by the Projects. When visible, the Projects will be viewed amongst foreground features that will be substantially more dominant than the WTGs.

Table 3.2-2 Character Area Visibility by Distance Zone

Character Area (CA)	0-10 Miles		10-20 Miles		20-30 Miles		Greater Than 30 Miles

3.2.3 Other Factors Affecting Visibility and Visual Impact

As discussed in Section 3.2.1, the Projects could result in appreciable visual impacts to several onshore visual resources due to scale contrast, spatial dominance, and compatibility with existing elements in the landscape/seascape. However, it is important to note that most of the visual simulations were photographed during exceptionally clear conditions and in many instances were also backlit by the sun, making the WTGs appear dark against a light, cloudless horizon. While the simulations generally illustrate minimal atmospheric haze and screening, actual visibility of the Projects will be limited by several other factors not specifically illustrated in the visual simulations evaluated in this VIA. As mentioned previously, these include weather conditions, waves on the ocean surface, humidity, and air pollution.

A study completed by the Rutgers School of Environmental and Biological Sciences for the Atlantic Shores Wind Project titled, *Initial Visibility Modeling Study for Offshore Wind for New Jersey's Atlantic Shores Offshore Wind Project* (Attachment H) provides relevant data regarding offshore visibility frequency and trends as influenced by meteorological conditions. Forecast Systems Laboratory (FSL) predictive models were used to determine visibility distance using past meteorological data from Atlantic City International Airport and Ocean City Municipal Airport. The FSL predictive model uses inputs such as temperature, relative humidity, and dew point temperature to determine the potential distance and frequency of specific viewing conditions (Rutgers, 2021). The results of this study are summarized below.

- Initial observations suggest that visibility to a distance of 8 and 10 miles (13 and 16 km) from Atlantic City International Airport occurred over 73% and 89% of daylight hours, respectively, in any given year. These same observations from Ocean City Municipal Airport suggest that visibility frequencies were 6% and 12% lower than those observed at Atlantic City International Airport.
- The higher visibility at Atlantic City International Airport can be attributed to the drier inland air, compared to the more humid coastal air around Ocean City Municipal Airport. Additionally, considering offshore visibility, higher humidity and larger temperature differences between the air and ocean surface cause haziness and marine clouds/fog to occur more frequently offshore.
- Although inland visibility is relatively high, there will be lower visibility when looking offshore toward the Atlantic Shores Lease Area. Between Atlantic City International Airport and the Lease Area, a distance of roughly 25 miles, the percentage of daylight hours with a calculated visibility of 10 or more miles (16+ km) decreases from 78% to 41% based on past meteorological studies.
- Over the ocean, the average visibility in April, May and June ranged from 2.5 to 10 miles (4 to 16 km), which is consistent with lower frequencies above 10 miles in the Ocean City Municipal Airport observations.
- Over the ocean, the average visibility in July and August, (when visibility frequencies over 10 miles in Ocean City are above 75%) ranges from 5 to 12 miles (8 to 19 km).
- The yearly, monthly, and summer average visibility each share a trend of increasing visibility from the morning to the late afternoon. Higher visibility over the land appears to extend out into the ocean throughout the day. This is consistent with warmer temperatures during the day lowering the relative humidity and causing higher visibility.

Based on the results of the Rutgers visibility analysis, it is reasonable to conclude that the VIA presents worst-case visibility conditions in which the entirety of both Projects could be visible when viewed from significant distances. While it is very important to illustrate the greatest potential visibility and visual

prominence to understand greatest potential visual impacts associated with the PDE, the frequency of these conditions is a relevant and mitigating consideration. As shown in Inset 3.2-3, the average frequency of visibility to 10 miles could occur during as little as 41% of daylight hours. As described in Section 2.3.1 and 3.2.1, only one of the visual simulations, and a very small portion of the VSA and ZVI occurs within 10 miles of the Projects. Consequently, during up to 59% of the daylight hours in a given year, it is anticipated that all, or the vast majority of WTGs will not be visible from onshore resources.

As an example, from the closest KOP included in the visual simulations (and the closest onshore location within New Jersey) the nearest WTG is approximately 8.8 miles (14 km) offshore, but the most distant WTG is located approximately 24 miles (39 km) from the KOP. Based on the results of the Rutgers meteorological study, the first row of WTGs would be visible from this KOP over approximately 50% of the year, the first two rows would be visible over approximately 40% of the year, and portions of the nearest four rows could be visible during approximately 25% of the year during daylight hours (see Inset 3.2-3). Under these weather conditions it would likely be difficult to discern WTGs beyond the initial four rows which would substantially decrease the perceived scale contrast, horizon occupation, and overall density of WTGs. The mitigating effects of atmospheric perspective could serve to reduce the potential visual impacts associated with the Projects during significant portions of the year, and during these low visibility periods, would likely eliminate visibility of the Projects entirely from most shoreline locations within the ZVI.

Inset 3.2-3 FSL Visibility Distance/Frequency Comparison of Onshore and Offshore Receptors

Considering the mitigating factors associated with atmospheric perspective, Atlantic Shores intends to supplement this VIA with visual simulations illustrating variable conditions and a detailed meteorological analysis to predict the frequency of each visibility condition. While the VIA and simulations currently

illustrate and analyze the maximum range of potential visual impact throughout the ZVI, the supplement to this analysis will investigate more likely viewer experience and more typical frequency of Project visibility.

Epsilon Associates also analyzed the data collected by Rutgers to characterize visibility over the entire year using the hourly visibility data. The results suggest that from many of the KOPs, atmospheric perspective will have a significant effect on visibility of the Projects from each of the KOPs. The visibility data for 13 of the 22 KOPs was compiled for each of the 12 months in 2019 and then delineated by morning, midday, afternoon, and evening to illustrate how visibility changes throughout the seasons and throughout the day. Cumulatively, these data suggest that January was the month during which visibility was the highest and April had the lowest frequency of visibility of the Projects. These trends are likely due to the presence of higher moisture content in the ambient air during spring resulting from a large air/water temperature differential along with increased events such as rain which are typical during this time. In winter, the air/water differential is still significant, but colder air has less capacity to hold moisture and therefore, less dissipation and refraction of light and the resulting visibility. Monthly Project obscuration from each KOP is presented below in Inset 3.2-4. It is important to note that low visibility conditions do not necessarily suggest poor weather conditions. In fact, this portion of the New Jersey coast has a high percentage of sunny days and visual assessment field observers often encountered bright, sunny conditions with exceptionally low visibility over the water and high visibility over land. These observations are supported by the study completed by Rutgers, which found that between the Atlantic City Airport and the OCS, visibility extending to 10 miles decreases from 78% over land to 41% over water. This significant decrease in visibility is attributable to the temperature difference between the air and ocean water, which results in high moisture content (Rutgers, 2021).

Inset 3.2-4 Percentage of Time the Projects Were Obscured by Atmospheric Perspective From KOPs

This data suggests that the photosimulations and resulting visual impact determinations presented in this VIA provide a very conservative assessment. Field photography specifically targeted high visibility conditions over the water and multiple field photography attempts (during which high visibility and fair weather was predicted) resulted in unsuitable conditions for the photographing a conservative case. In reality, the duration and frequency of Project visibility is expected to be minimal and therefore the visual impacts associated with the Project's should be tempered in anticipation of the mitigating effects of atmospheric perspective. It should be noted that the data collected in 2019 was compared to a 10-year data set to determine if the condition present in 2019 are representative of meteorological norms for the region. This dataset revealed that in fact, 2019 is representative of typical expected weather patterns and is reasonably reliable as a predictor of future conditions in terms of visibility frequency. Additionally, this data is drawn from a ground level visibility measurement device and extremely localized events such as fog may only apply to receptors viewing the water from ground level. The data may not be representative of visibility elevated positions during these events.

3.3 General Mitigation

As currently proposed, the Project introduces a large scale, renewable energy generating development to a largely undeveloped seascape. Even though portions of the shoreline and inland areas within the VSA are highly developed or disturbed, according to the evaluation conducted as part of this study, the Project has the potential to result in adverse visual impacts to some onshore resources occurring within the ZVI.

However, the Project has incorporated several mitigation measures which effectively reduce the potential visual impacts to the greatest extent practicable given the nature of the technology and the geographic areas deemed suitable for offshore wind energy development. The mitigation measures incorporated into the Project design include the following:

- The Project is located in a designated offshore wind developed area that has been identified by BOEM as suitable for development.
- WTGs will have uniform design, rotation speed, height, and rotor diameter, thereby mitigating visual clutter. The white color of the WTGs (required by BOEM) generally blends well with the sky at the horizon, even under clear sky conditions, and eliminates the need for daytime warning lights or red paint marking of the blade tips.
- Atlantic Shores will use ADLS (or a similar system) to limit visual impact pursuant to approval by the FAA and commercial and technical feasibility at the time of FDR/FIR approval.

An analysis was completed by Capitol Airspace titled, *Aircraft Detection Lighting System (ADLS) Efficacy Analysis* to determine the likely activation time of the FAA light if ADLS is implemented. This study reviewed information included in the FAA National Offload Program (NOP), which indicates the location of aircraft based on existing radar systems throughout the country. The NOP data were collected and analyzed to determine when and for how long aircraft traverse the Project airspace during a given year, requiring the aviation obstruction lights to be activated (Capitol Airspace, 2021). The results of this analysis are presented in Table 3.3-1, below.

As illustrated in Table 3.3-1, based on past flight data, the AOWL would be activated for a total of approximately 10.9 hours over a 1-year period. The maximum monthly activation time would occur in November when past flight data suggest activation times would increase to approximately 2 hours and 45 minutes over the entire month. April, May, June, August, and September had the lowest activation frequency with an average activation time of 21 minutes per month. Considering the low frequency of light activation, nighttime visual impacts associated with the aviation obstruction lights would become intermittent and minor.

Table 3.3-1 Typical Monthly Duration of AOL Activation

Month	Nighttime Observed (HHH:MM:SS)	Light System Activated Duration (HH:MM:SS)
January	479:05:44	01:08:24 (0.24%)
February	405:38:51	01:26:57 (0.36%)
March	410:56:29	01:01:29 (0.25%)
April	359:01:19	00:23:44 (0.11%)
May	337:05:53	00:20:34 (0.10%)
June	309:35:09	00:22:24 (0.12%)
July	328:20:35	01:07:35 (0.34%)
August	357:52:21	00:22:54 (0.11%)
September	383:14:51	00:19:04 (0.08%)
October	435:42:32	00:40:48 (0.16%)
November	455:22:55	02:45:37 (0.61%)
December	488:44:19	00:51:46 (0.18%)
TOTAL	4750:40:58	10:51:16 (0.23%)

Table Source: Capitol Airspace, 2021

Additional mitigation measures were also considered. While some of these mitigation considerations could serve to incrementally reduce potential visual impacts associated with the Project, some mitigation options may not be feasible due to regulatory requirements. The feasibility and possible benefits of such measures are described below:

Relocation: Project site and/or individual turbine relocation is not under consideration. The Project is already located offshore in water depths suitable for offshore wind energy development, reflecting the substantial effort that has been expended in identifying suitable wind energy areas on the OCS. It is unlikely that changes to the orientation or arrangement of the turbines could reduce visual impact by eliminating the perception of stacked turbines on the horizon, as this perception will vary from viewpoint to viewpoint within the ZVI. Substantially reducing the perception of WTG stacking would likely require a significant reduction in developable area. It is possible that a reduction in the total number of WTGs could result in a reduction of visual impacts from some of the closest KOPs, but not without adversely affecting the generating capacity of the Project.

Camouflage: Alternate color selection or attempts at camouflaging the WTGs are not effective or feasible in mitigating visual impacts of offshore wind turbines. Under most conditions, the white color of the WTGs generally minimizes contrast with the sky and the yellow foundation is barely perceivable or not visible due to screening provided by atmospheric perspective and/or curvature of the earth. This is demonstrated by simulations prepared under a variety of sky conditions and distances from the Project. Additionally, the white color of the WTGs is necessary to comply with FAA guidance and avoid daytime lighting.

Scale: While a reduction in turbine height could lessen scale contrast, this reduction would have to be considerable before it would be perceived from shoreline viewpoints. In addition, the line, form, and texture of shorter turbines (which contribute to their contrast with the existing seascape) would remain essentially the same, and more WTGs would be required to maintain the Project's generating capacity.

4.0 CONCLUSIONS

An important consideration in visual impact assessment is to avoid the assumption that project visibility automatically equates to an adverse visual impact. The degree of project visibility will vary greatly depending on the distance of the viewer from the project; meteorological conditions; degree of screening from structures, vegetation, and curvature of the earth; visual acuity of the viewer; and the ability of the viewer to recognize the WTGs. Projects that are located offshore, relatively far from the viewing public may go completely unrecognized, due to the fact that their visibility is obscured by atmospheric perspective, and if visible at great distances, are perceived as secondary to the larger visual landscape. Water, trees, lighthouses, and other natural and built features often remain the focus of attention. Results from a study in which offshore wind farms were viewed at various distances and conditions in Europe, suggest that small to moderately sized offshore wind farms may be visible to the unaided eye at distances greater than 26 miles (42 km) (the maximum distance considered in that study). However, these same facilities were determined to be the focus of viewer attention when viewed at distances within 10 miles (16 km), noticeable to casual observers at distances of up to 18 miles (29 km), and only visible after concentrated viewing when viewed from greater than 25 miles (40 km) (Sullivan et. al. 2012). As mentioned previously, the Projects are proposing WTGs that are larger than the turbines evaluated in this study. As such, under clear conditions and strong lighting contrast (i.e., backlit or strongly front lit against a dark sky) the turbines are likely to be noticeable at distances over 30 miles (48 km), but visibility and visual prominence will diminish significantly between 30 miles (48 km) and 40 miles (60 km) as illustrated in the visual simulations. The Edwin B. Forsythe NWR at the Woodmansee Estate (LAT01) is 32 miles (52 km) from the Projects and received a VTL 4, suggesting that the WTGs are plainly visible and would not be missed by casual observers. However, the KOP from Seaside Beach Park (SPB01) which is 39 miles (63 km) from the Projects received a VTL 1, which suggests the WTGs would only be visible after extended, concentrated viewing. As such, the simulations support the conclusion that 40 miles (60 km) is an appropriate VSA, and beyond a distance of 35 miles prominence and visual impact will be negligible.

The following additional conclusions can be drawn from the VIA:

- The viewshed analysis and field verification indicate that the Project has potential visibility from a relatively small portion of the land area within the VSA. The lidar viewshed analysis suggests that views of the WTGs will be available from approximately 12.5 percent of the land area within the VSA, which defines the ZVI. Three percent of the landward VSA (28 percent of the ZVI) will only include views of the turbine blades which is generally the result of partial screening provided by the barrier islands from inland bay and mainland viewing locations. The majority of landward Project visibility (155 sq. mi.) occurs within 10-20 miles (16-32 km) of the Project over uninhabited inland bays. Visibility diminishes significantly between 30 and 40 miles (48-64 km), contributing only 44 sq. mi. to the ZVI. The viewshed analysis also indicated potential visibility along the majority of the eastern shore of the barrier beaches.
- The lidar viewshed suggests that views of the AOWL on the WTGs will be available from approximately 9 percent of the land area within the VSA. This reduction in visibility is largely the result of the lower height of the lights (as compared to the blade tips), combined with the screening effects of curvature of the earth at distance between 30 and 40 miles (48-64 km). The geographic areas that indicated visibility of the AOWL were generally a smaller subset of greater ZVI, particularly over portions of the inland bays and mainland. The FAA viewshed analysis indicated that AOWL

visibility from the barrier islands would completely diminish beyond 35 miles due to curvature of the earth.

- Field verification generally confirmed the results of the viewshed analysis with the exception of a few locations in which it was determined that visibility of the Project, while theoretically possible, would actually be mostly obscured by middle ground and background features. This condition was most often observed from mainland locations where barrier island development and forest vegetation served to substantially screen the majority of the Project. Field verification also confirmed that visibility will be available from some elevated positions outside the ground level ZVI, particularly along the barrier island shore. As discussed in Section 3.1.1, because structures are classified as screening features, the ZVI does not predict visibility from elevated human-made structures. This condition is most prevalent in Atlantic City and Ocean City, but very rare from inland areas. In conclusion, it was determined that the ZVI is an accurate and reasonable representation of the areas in which the Project may be visible, but likely a conservative representation.
- The proposed MET tower is a very minor component of the WTA and did not contribute to the potential visual impacts associated with the WTG array.
- Fourteen KOPs received elevated visual impact scores that resulted significant visual impacts to viewers. These KOPs included North Brigantine Natural Area (BC02), Ocean Casino Resort – Sky Deck (AC04), Jim Whelan Boardwalk Hall NHL (AC02), Great Bay Boulevard WMA/Rutgers Field Station (LEHT02), Holyoke Avenue (BHB03), Centre Street Beach Haven (BHB02, Beach Haven Historic District (BHB01), Gillian’s Wonderland Amusement (OC04), Ship Bottom Borough Municipal Beach (SBB01), Corson’s Inlet State Park (OC01), Beach at Long Beach Island Arts Foundation (LBT03), Wildlife Refuge on South Long Beach Boulevard in Holgate (LBT04), Townsend Inlet Bridge (SIC02), and Island Beach State Park (BT01). These KOPs are relatively close to the Projects (ranging in distance from 9 miles [14 km] to 30.0 miles [48.2 km]) and averaged 17.9 miles. These KOPs received visual impact scores ranging from minus 3.8 to minus 5.3 and VTLs between 3 and 6.
- Elevated impacts can be attributed to the exceptionally clear conditions and high contrast lighting presented in the photosimulations. It is anticipated that, based on the meteorological study completed for the Project by Rutgers University and Epsilon, these lighting and visibility conditions will be relatively rare along this portion of the coast and visual impacts are likely to be substantially reduced during the prevailing atmospheric conditions.
- The Projects would result in somewhat significant visual impacts at three KOPs, including Edwin B. Forsythe NWR at the Woodmansee Estate (LAT01), Lucy the Margate Elephant NHL (MC02), and Barnegat Lighthouse (BLB02). These KOPs range from 14.4 miles (23 km) to 32.2 miles (52 km) and average 24.6 miles (39.6 km) from the Projects. However, it should be noted that the view from BLB02 does not necessarily represent the most conservative case conditions and impact could be higher during clear conditions.
- Rating panel results suggested visual impact scores of minus 3.8 to minus 4.4 for the three nighttime views. The rating panel indicated that the AOWL and navigation lights would become the focus of viewer attention and could change the character of the nighttime skies. However, the implementation of ADLS would eliminate the impact of the AOWL for all by 10.9 hours per year. Given infrequent activation time, it is anticipated that visual impacts associated with the AOWLS would be insignificant.

-
- The meteorological study completed by Epsilon Associates suggests that, based on 2019 data, all of the turbines would not be visible the majority of the time. In the months of May, June, and August during the height of the tourism season, no turbines would be visible during more than 80% of daylight hours. January, the highest visibility month, would have the greatest number of hours with turbine visibility. Still, visibility is only expected to occur during 50% of the daylight hours.

1.0 Introduction

Environmental Design & Research, Landscape Architecture, Engineering & Environmental Services, D.P.C. (EDR) has prepared the follow Visual Impact Assessment (VIA) Protocol in support of the development of the Atlantic Shores Offshore Wind, Project (Atlantic Shores). Atlantic Shores, a 50/50 joint venture (JV) between EDF-RE Offshore Development, LLC (an affiliate of EDF RD) and Shell New Energies US LLC, seeks to construct and operate an offshore wind energy generating facility on the Outer Continental Shelf (OCS) in the Bureau of Ocean Energy Management (BOEM) Lease Area OCS-A 0499 (Lease Area). At its closest point to shore the Lease Area is approximately 9 miles off the coast of Long Beach Township, New Jersey and extends approximately 31 miles in a southerly direction to approximately 18.5 miles off the coast of Ocean City, New Jersey. Figure 2.1-1 illustrates the Lease Area relative to the New Jersey coastline. Development of the Lease Area will include multiple offshore wind turbine generators (WTGs) which will harness kinetic wind energy for electricity production. This electricity will be collected in several offshore substations (OSSs) and will then be transmitted ashore in either New Jersey or New York for delivery to the regional electric grid. The VIA will assess the potential visual impacts associated with the construction and operation of the Project. The VIA will be included in Atlantic Shores' Construction and Operations Plan (COP) for review by BOEM and other state and federal agencies, in addition to stakeholders and other interested parties. A separate VIA Protocol and study will be completed, as necessary, for onshore components proposed by Atlantic Shores to support interconnection with the regional electric grid. Therefore, this protocol only addresses the study approach for the visual assessment associated with the offshore development within the Lease Area. A separate, but related study will be completed to assess the visual effects to onshore historic properties within the area of potential effects (APE) associated with the offshore development. This Historic Resources Visual Effects Analysis (HRVEA) will rely on several aspects of the VIA and will be included as an appendix to the COP. However, the assessment methodology associated with the HRVEA is not included in this document.

2.0 Study Approach

2.1 Definition of the Study Area

The document titled *Guidelines for Information Requirements for a Renewable Energy Construction and Operations Plan (COP)* (BOEM, 2016) indicates that visual impacts should be evaluated using photo simulations from locations within “the onshore viewshed from which renewable energy structures, whether located offshore or onshore, would be visible.”

When defining a visual study area (VSA) it is important to consider the theoretical maximum distance from which a project could potentially be viewed. Theoretical visibility is largely derived from two limiting factors: the curvature of the earth and the ability of an individual to resolve features viewed from significant distances. Theoretical visibility only considers a defined set of known physical constants and does not consider other visibility limitations such as weather/atmospheric conditions. Based on the National Renewable Energy Laboratory (NREL) reference model, near-future WTGs are likely to approach or exceed heights of 900 feet (when the WTG blade tip is in the full upright position). When viewed from typical beach elevations (0-6 feet above mean sea level [AMSL]), an object 900 feet tall would be fully screened by curvature of the earth, at approximately 47 miles offshore.

However, the ability of the human eyes to resolve an object at this distance is diminished even under the most ideal viewing conditions. Considering the widest portion of a typical WTG tower, and assuming a maximum angular resolution of the human eye of 28 arc seconds (0.008 degrees), the WTG tower could not be resolved by an individual with 20/20 vision beyond approximately 39 miles. However, at this distance, curvature of the earth would completely screen the WTG tower and only a portion of the WTG blades would theoretically be visible, thus further decreasing visible distance when considering resolution of the human eye. Considering all factors influencing potential project visibility and the possibility for elevated views from high rise buildings, a VSA of 40 miles is considered appropriate (if not conservative) for the purposes of the VIA. The VSA associated with the Atlantic Shores' Lease Area is illustrated in Figure 2.1-1.

Figure 2.1-1 –Visual Study Area

While theoretical limits of visibility are appropriate when defining the VSA, it is important to consider the environmental variables that limit visibility even on the clearest of days. Studies completed on offshore turbines in Europe concluded the following (Sullivan et. al. 2013):

1. WTGs were considered the major focus of attention within 10 miles.
2. WTGs were noticeable to casual observers at distances of 18 miles and visible with extended or concentrated viewing at distances beyond 25 miles.
3. Turbine blade movement was visible at distances up to 24 miles.
4. Aviation obstruction avoidance lighting was visible at distances greater than 24 miles.

While the largest WTGs considered in the study referenced above were substantially shorter than current models (approximately 500 feet tall with the blade tip in the upright position), it is likely that atmospheric haze was largely responsible for the diminishment of the visibility of the WTGs. This phenomenon will have the same effect, even with increasing WTG dimensions. Image 2.1-2 illustrates the constructed Block Island Wind Farm viewed under clear conditions at a distance of 23.8 miles. As this image illustrates, even when photographed with a large telephoto lens (500 millimeters) the WTGs present limited contrast due to the diminishment of scale and color contrast over distance and the presence of atmospheric haze. When asked their opinion of the turbines from this location, viewers had to be directed and concentrate their focus to see the turbines (EDR, 2016).

Figure 2.1-2 – Telephoto view (500 mm) of the Block Island Wind Farm from 23.8 miles distant.

2.2 Definition of the Zone of Visual Influence

The preliminary viewshed analysis completed for the Project suggests that approximately 13.6% of the landward VSA could potentially have some degree of Project visibility. However, the results also suggest that this visibility does not extend significantly inland due to screening provided by landform, vegetation, and structures. These factors, coupled with the effect of curvature of the earth, typically reduce or eliminate views from inland locations. To gain a better understanding of where visibility may occur within the VSA, a final viewshed analysis will be performed using high-resolution lidar data. Lidar data is collected by aircraft which emit laser light pulses while flying over a region. When this light strikes an object, the signal is returned to a receiving mechanism on the aircraft. Both the time and strength of the returned light provides an indication of the type of material and its vertical distance relative to the aircraft. The resulting lidar datasets consist of billions of points, which provide an extremely detailed elevation dataset for the surface of the earth, including bare ground, buildings, and vegetation. To utilize this data for visibility predictions, Geographic Information Systems (GIS) software is used to convert the lidar point cloud information into a digital surface model (DSM) of the earth, which serves as the base for the viewshed mapping. The DSM is processed to eliminate features on the surface that may falsely indicate screening features such as bridges, transmission lines, and some thin or sparse hedgerows (often found along roads). To evaluate potential visibility, the WTG positions and heights are placed in the viewshed model. The GIS analysis then analyzes every cell in the DSM grid within the VSA to determine if a direct line of sight to proposed WTGs within the Lease Area (WTG blade tips in the upright position) is available. Based on the availability of a direct line of sight, each grid cell is coded as visible or not visible. This analysis is completed for each proposed WTG location, so each grid cell is also assigned a number indicating the number of turbines potentially visible at that location. The analysis results in the identification of all areas of potential visibility throughout the entire VSA. These areas of visibility are henceforth referred to as the zone of visual influence (ZVI) and will represent the areas of analysis considered in the VIA.

2.3 Definition of Landscape Similarity Zones and User Groups

EDR will use aspects of the U.S. Army Corps of Engineers (USACE) Visual Resource Assessment Protocol (VRAP) (Smardon, et. al. 1988) to establish landscape similarity zones (LSZs) within the ZVI. Defining distinct landscape types provides a useful framework for the analysis of a project's potential visual effects. LSZs will be defined based on the similarity of various landscape characteristics including landform, vegetation, water, and land use patterns. The initial desktop exercise will reference aerial photographs, land use/ zoning data, and landcover data in order to delineate the initial LSZ boundaries. Field review of these preliminary desktop delineations will verify the location, character, and boundaries of each LSZ (See Section 2.9). This field review will be completed by the individuals involved in the initial desktop delineations of the LSZs. This exercise not only provides for a verification of the landscape types within the VSA, but also allows for the determination of potentially sensitive viewing locations, view durations, and user types. The VIA will describe the types of views available, along with the types of viewers/users present in each LSZ.

Users of this regional landscape generally fall into one of five categories including, recreational users, tourists, residents [including disadvantaged residents as defined by Environmental Justice Areas (EJA)], travelers/commuters, and the commercial fishing community. Each of these user types may have variable sensitivity to visual change in the landscape or seascape and these will be described and related to specific LSZs for additional context.

2.4 Identification of Publicly Accessible and Designated Visually Sensitive Resources

Visually sensitive resources (VSRs) are an important consideration when evaluating potential visual impacts of a project. These resources generally include specifically designated scenic resources such as State/National Scenic Byways, or scenic overlooks, but also include state and nationally designated historic, environmental, and/or recreational resources. Examples of VSRs that could occur within a VSA are listed in Table 2.5-1.

Table 2.5-1. Visually Sensitive Resource Categories

Traditional Cultural Properties	State Beaches
National/State Historic Districts	Highways Designated or Eligible as Scenic
National/State Historic Sites	National Historic Landmarks
National Natural Landmarks	National Recreation Trails
State-Designated Scenic Areas	State Trails
Scenic Area of Statewide or Local Significance	State Bike Routes
State-Designated Scenic Overlooks	State Fishing and Boating Access
National Wildlife Refuges	State/National Scenic Byways
State Wildlife Management Areas	Lighthouses (not National or State Historic Listed)
State/National Parks	Public Beaches/National Seashores
State Nature and Historic Preserve Areas	Ferry Routes (Occur across multiple states)
State/National Forests	Seaports (Commercial Maritime Facilities)
Environmental Justice Areas	State, Interstate, and US Highways

EDR will consult publicly available GIS resources to determine the location and extend of the VSRs within the VSA and then conduct an analysis to determine which of those resources also occur within the ZVI (i.e., which resources have potential Project visibility). The results of this analysis will support consultations with agencies and stakeholders and inform subsequent field photography and the selection of visual simulation locations (see Section 2.8).

2.5 Viewshed Analysis

In addition to the establishment of the ZVI based on maximum blade tip height, the viewshed analysis will also be used to determine the likely extent of WTG visibility. To complete this, the viewshed analysis will be run at multiple heights to determine how much of the proposed WTGs may be visible within the ZVI. Along with the maximum blade tip height, the heights used for this analysis will include 1) the height of the Federal Aviation Administration (FAA) obstruction warning lights mounted on top of the WTG nacelles, 2) the height of FAA warning lights mounted on the WTG towers, and 3) the height of Coast Guard navigation warning lights mounted on the WTG platform. This information will be used to determine the degree of WTG visibility from onshore VSRs under both daytime and nighttime conditions.

2.6 Other Factors Influencing Project Visibility

As mentioned previously in Section 2.1, weather and atmospheric conditions have a significant influence on the visibility of offshore WTGs. To gain a better understanding of the visibility-influencing factors associated with atmospheric conditions, an analysis of historical weather conditions will be undertaken to determine the frequency and duration of conditions under which Project visibility would or would not be possible. This analysis will be based on information from the National Climatic Data Center (NCDC), which regularly reports visibility conditions out to a distance of 10 miles. This predictive model effectively extends visibility predictions out to 30 miles. The results of this analysis will provide

an estimation of how frequently the Lease Area (or portions of the Lease Area) will be obscured from view due to weather conditions during daytime and nighttime periods within a typical year.

2.7 Identification of Key Observation Points

Key observation points (KOPs) are locations that will eventually serve as representative views for the production of visual simulations (see Section 2.9). When selecting KOPs, it is important to insure they provide representative views of the Project and the character of the LSZs within the ZVI. The primary selection criteria include the following:

1. Project visibility is indicated by the viewshed analysis (i.e., the KOP occurs within the ZVI).
2. The KOP occurs adjacent to a VSR of National significance.
3. The KOP occurs at or adjacent to a VSR of State significance.
4. The KOPs represent a variety of LSZs and viewer types occurring within the ZVI.
5. The KOPs represent popular/important tourism destinations and residential areas (including disadvantaged neighborhoods).
6. The KOPs represent variable lighting/sky conditions and distances (including inland locations), directions, and viewing angles of the WTGs.
7. The KOPs represent a variety of wind directions (thus turbine directions) including the most prevalent condition present during the field review and a condition in which the turbines are facing the viewer position.
8. The KOPs reflect input from stakeholders and agencies.

This VIA Protocol serves as the initiation of consultation with agencies and stakeholders regarding the selection of KOPs, and therefore does not yet include input from the various consulting parties. However, to initiate this process, representative examples of candidate KOPs are listed in Appendix A. These KOP examples were selected based on the eight aforementioned criteria, along with a variety of GIS desktop analyses that were used to identify VSRs and areas of high public use. It is anticipated that a more complete list of KOPs will be developed once the ZVI has been defined and through consultation with the agencies and stakeholders.

2.8 Field Photography and Survey

Field photography and survey will involve EDR visual assessment staff travelling to the Project VSA for the purposes of capturing photographs from each of the selected KOPs, verifying the results of the viewshed analysis, and to documenting typical views from representative LSZs within the ZVI.

Photography will involve determining the most open and unobstructed view of the ocean and Lease Area from each selected KOP. At this location, a tripod will be set up and a compass bearing recorded to determine the general direction of the proposed WTGs. A survey position of the tripod will be recorded using a geographic positioning system (GPS) with differential correction. Once the survey position of the tripod has been collected, the position will be uploaded and corrected based on local survey correction beacons. GIS is then used to determine precise bearings to the outside limits and center of the WTG array. These bearings will be loaded into the survey equipment, and stakes will be placed within the field of view approximately 100 to 500 feet from the tripod position. The position of these stakes will be surveyed, and a survey-grade laser range finder will be mounted to the tripod in order to determine the exact distance of the stakes and their bearing from the tripod. Next, a camera will be mounted to the tripod and the focus, exposure,

and white balance will be adjusted to match the conditions as observed. The camera will be a 30 megapixel (6720x4480) full-frame digital single lens reflex camera with a 36 mm by 24 mm sensor, equipped with an unfiltered 50 mm prime lens with a minimum aperture of f/1.8. Once the camera is properly set up, a series of photographs will be taken to cover a 180-degree horizontal field of view and 65-degree vertical field of view. In order to minimize distortion between frames the camera will be offset on the tripod to rotate around the nodal point of the lens. Once the panorama has been recorded, the camera will again be centered on the Project and one-minute of video footage will be recorded in 4K to capture scene dynamics such as wave movement and sound.

Where possible, field photography will include a field of view large enough to include potential future offshore development in order to provide adequate coverage for the eventual consideration of cumulative visual impacts.

Photography will be carefully planned to document optimal viewing conditions, as well as a variety of lighting conditions (including sunrise, morning, noon, afternoon, sunset and night) from the various selected KOPs.

2.9 Visual Simulations

Visual simulations are essentially the photographs obtained from each KOP with the Project superimposed and integrated so that the resulting image accurately illustrates the view that will be available following Project construction. For the Atlantic Shores Offshore Wind Project, three types of simulations will be provided, as indicated in Table 2.10-1.

Table 2.9-1. Types of Visual Simulations

Simulation Type	Field of View Represented	Purpose
Single Frame 50mm	39.6 degrees horizontal by 27 degrees vertical	50 mm single frame simulations are used to replicate a "normal lens" which maintains spatial relationships associated with near and distant objects, thus accurately representing the relative scale of a project. The simulations are generally compact in size (11x17 inches) and can be easily printed for incorporation into a report or viewed digitally on a high-resolution screen.
Panorama Simulations	124 degrees horizontal by 55 degrees vertical	Panorama simulation covering 124x55 degrees are generally representative of the human full field of view. These simulations need to be printed in large format and are difficult to present in a written report or a standard computer monitor
Video Time-Lapse Simulations	39 degrees horizontal by 21 degrees vertical	Time lapse video simulations illustrate blade motion, movement of landscape features, and lighting changes over an extending period. Typically, the time period extends from first light to nighttime in order to illustrate lighting conditions throughout the day and turbine visibility at nighttime. Videos require viewing on a high-resolution screen.

The simulations are created by reconstructing the physical environment in a three-dimensional (3D) computer generated environment (model). The model will include an exact replica of the camera position, direction of view, and camera specifications. To verify the accuracy of the camera placement and direction of view, the field-recorded survey information will also be placed into the model along with current lidar data. In some cases where lidar data is not sufficient for the alignment, an unmanned aerial system (UAS or drone) will be used in the field to provide expanded survey capability and alignment beacons. Once the view and 3D camera are precisely aligned, a to-scale 3D version of the proposed offshore facilities (WTGs and OSSs) will be added to the model. The model will also include an environmental system which will replicate the atmospheric and lighting conditions present at the time of the photograph based on the date, time of day, and recorded atmospheric conditions. This will ensure proper lighting and shading of the WTGs and OSSs. When adding the 3D model of the offshore facilities to the photograph, curvature of the earth and refraction are accounted for in each view based on the elevation of the camera, distance to the WTGs/OSSs, and conditions recorded in the field. The resulting illustration produced using this methodology is an accurate representation of the proposed operational wind farm.

The VIA will include simulations illustrating variable atmospheric/weather conditions and times of day to illustrate the appearance of the offshore facilities when viewed under these conditions. It is not anticipated that every KOP will include multiple times of day and conditions, rather a subset of representative simulations will be selected after the initial simulations have been completed in order to provide regional examples of variable conditions.

As mentioned in Section 2.8, the EDR intends to capture sufficient photographic and survey data to include reasonably foreseeable future development with the Atlantic Shores and other lease areas within a 40 miles of the Project. Upon completion of the VIA and receipt of the completeness determination, it is anticipated that BOEM will request the development of cumulative visual assessment graphics and visual simulations. These simulations and graphic representations will adequately address stationary views in which multiple facilities appear within a single field of view, views in which the cumulative visibility extends beyond the primary field of view, and sequential views as experienced by viewers moving through the site. Pending further consultation with BOEM, it is also anticipated that the cumulative visual simulations will illustrate the proposed action with and without foreseeable future development. Additionally, the foreseeable future development will be illustrated without the proposed action for comparative purposes.

2.10 Visual Impact Evaluation

The visual impact associated with development of the Lease Area will be evaluated using a variation of the VIA procedure outlined in the USACE VRAP (Smardon et. al., 1988). The VIA uses representative KOPs within each of the affected LSZs in the VSA to determine a Project's visual impact. To ensure that the scoring of one individual or one viewpoint does not skew the results, the VRAP requires that multiple rating panel members (minimum of two) be involved, and that multiple KOPs be evaluated. This evaluation is based on a comparison of existing photos and visual simulations from each KOP to quantify the effect of a project using forms and a scoring system provided in the VRAP Manual (Smardon et al., 1988) as modified by EDR.

For the Atlantic Shores Project, a panel of four qualified landscape architects and planners will conduct a quantitative VIA rating procedure which will determine the existing scenic quality of the view from each KOP viewing location and the scenic quality of the same view with the Project in place. The panel members will be provided with digital files of existing conditions photos and simulations from each KOP, along with a viewpoint information page that provides a viewpoint location map, contextual photographs illustrating the full field of view, a summary of VSRs present. The distance and direction of the nearest WTG from each KOP, the LSZ, and viewer groups represented by each viewpoint will also be provided to the panel, along with the rating forms to be used for the visual impact assessment (a simplified version of Form 6 from the USACE VRAP). In addition, the rating panel members will be directed to examine contextual maps of the KOP location, review panorama photographs, and complete a Google Earth tour of the KOP and surrounding landscape as one would approach the individual KOP locations. The rating panel members will then evaluate the before and after views from each KOP and will assign each view quantitative aesthetic quality ratings. The ratings will be based on the visual quality of each of six landscape components (landform, water resources, vegetation, land use, user activity, and special considerations). As mentioned above, VRAP Form 6 (Viewpoint Assessment) will be modified to: 1) create separate forms for the evaluation of the existing view and the view with the proposed Project in place, 2) provide clarity in evaluating Project compatibility, scale contrast, and spatial dominance, and 3) delete items that do not contribute to the assignment of a numerical VIA score to the viewpoint. A standard three-point rating system used in the VRAP does not always allow for sufficient differentiation among ratings for either existing visual quality or the magnitude of visual impact. Consequently, the panel members will be allowed to rate the images on an expanded scale of 1 to 9. These scores will then be converted back to the scale used on the original Form 6 to remain consistent with the VRAP scoring and threshold values.

The following landscape/seascape factors will be considered in the rating, and where applicable, their presence in the view or influence on the view will be expressed in the visual impact rating.

- **Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes. These factors are included in the VRAP methodology and will be rated quantitatively for the existing and proposed view.
- **Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of

an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact. Line, form, color, and texture are directly applied to the landscape and seascape composition ratings described above. These factors will be assessed both quantitatively and qualitatively on the rating forms.

- **Focal Point:** Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape. Focal points in the existing view and how those may be affected by the Project will be described on the rating form.
- **Order:** Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape or seascape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment. The Project's effect on order will be addressed in the rating panel comments.
- **Scenic or Recreational Value:** Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource. Formally designated scenic or recreational designations will be identified for the panel members, and the panel will be asked to comment on the projects potential effect on scenic or recreational resources.
- **Duration of View:** Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact. Background information for, each KOP will contain a description of the user experience in terms of regional visibility and the availability of ocean views from each location. The rating panel will be asked to comment on the duration and frequency of the view presented for each KOP.
- **Atmospheric Conditions:** Clouds, precipitation, haze, and other ambient air-related conditions which affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of landscape/seascape and project components and the design elements of form, line, color, texture, and scale. Rating panel members will be asked to comment on the conditions presented in each view,

as well as how Project visibility may be less or greater under conditions different from those illustrated in the selected visual simulation.

- **Lighting Direction:** Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape/seascape and project elements. Rating panel members will be asked to characterize each view as illustrating one of three possible lighting conditions (front lit, side lit, and backlit) and comment on potential conditions that may increase or decrease Project visibility.

Project Scale: The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing landscape/seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors. Project scale contrast will be assessed through quantitative scores built into the VRAP procedure.

- **Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint. The Project's spatial dominance will be assessed through quantitative scores built into the VRAP procedure.
- **Visual Clutter:** Numerous unrelated built elements occurring within a view can create visual clutter, which generally has an adverse effect on scenic quality. If present, visual clutter, both existing and as a result of the proposed Project will be assessed qualitatively in the rating panel comments.
- **Movement:** Moving project components can attract viewer attention. Rating panel members will be asked to comment on existing elements in the view that may draw viewer attention as well as a potential increase in noticeability of the Project resulting from the rotation of the turbine blades.

The VRAP procedure would normally require adherence to the Management Classification System (MCS) to establish a Visual impact threshold score for each LSZ within the VSA. However, given the nature of offshore wind projects, which occur outside of the LSZs where the Project is being viewed, and to avoid elevating this threshold by considering the sensitivity of the LSZ as a whole, the methodology has been adapted to apply this management classification to the individual KOPs. Once the panel has completed the evaluation, their individual ratings will be averaged to generate a composite rating for each viewpoint for both the existing and proposed conditions photographs. Based on the average scores of the existing and proposed views, each KOP will be assigned a management classification that defines its aesthetic quality and capacity to absorb physical alterations to the seascape. These classifications are defined in Table 2.4-2.

Table 2.10-1. Scenic Quality Classifications

Preservation Class	These views are considered to be unique and to have the most distinct visual quality in the region. They are highly valued and are often protected by federal and state policies and laws. These areas may include significant natural areas, portions of wild and scenic rivers, historic sites and districts, and similar situations where changes to existing visual resources are restricted. While limited project activity is not precluded, it should not be readily evident (Score of 17 or more).
Retention Class	These views are regionally recognized as having distinct visual quality but may not be institutionally protected. Project activity may be evident but should not attract attention (Score of 14 to 16).
Partial Retention Class	These views are locally valued for above average visual quality but are rarely protected by institutional policies. Project activity may be evident and begin to attract attention. Structures, operations, and use activities associated with the project should remain subordinate to the existing visual resources (Score of 11 to 13).
Modification Class	These views are not noted for their distinct qualities and are often considered to be of average visual quality. Project activity may attract attention and dominate the existing visual resources. Structures, operations, and use activities may display characteristics of form, line, color, texture, scale, and composition that differ from those of the existing visual resources. However, the project should exhibit good design and visual compatibility with its surroundings (Score of 9 to 10).
Rehabilitation Class	These views are noted for their minimal visual quality and are often considered blighted areas. Project activity in these areas should improve the existing undesirable visual resources. Structures, operations, and use activities should exhibit good design and display characteristics of form, line, color, texture, scale, and composition that contribute to making the area compatible with the visual character of adjacent higher quality landscapes (Score of less than 8).

To evaluate the overall visual impact from each KOP, the composite before and after scores for view will be compared to determine the average difference between the ratings of the existing and proposed views. For each KOP, the impact ratings will be compared to the thresholds established for that view to determine whether impacts exceed the allowable thresholds for the existing conditions classification. According to the VRAP methodology, the threshold for acceptable impact for each of these classifications are as follows:

- Preservation Class – 0
- Retention Class – No lower than minus 2
- Partial Retention Class – No lower than minus 5
- Modification Class – No lower than minus 6
- Rehabilitation Class – Greater than 0 (i.e., project should only improve visual quality)

To supplement and validate VRAP results, rating panel members will be asked to determine the Visibility Threshold Level (VTL) applicable to each of the KOPs and the broader regional landscape they represent. *Offshore Wind Turbine Visibility and Visual Impact Threshold Distances* (Sullivan et al., 2013) lists six VTLs used to rate the visual prominence of several operational offshore wind farms in Europe. These visibility ratings and the associated VRAP scale are presented below in Table 2.10-2.

Table 2.10-2 Visibility Threshold Level Rating Scale

Visibility Rating	Description
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45 degrees from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.

Following completion of the evaluation, the VIA scores and the completed evaluation forms will be reviewed to determine the basis for the documented visual impact. In addition, a detailed description of the evaluation will be included for each KOP, including a summary of the panel members comments and scoring related to spatial dominance, scale contrast, compatibility with the landscape/seascape, and VTL. The inclusion of these elements will provide an evaluation of the potential magnitude of visual change resulting from the Project at each KOP. In order to evaluate variable visibility and atmospheric conditions, evaluators will be asked to described specific conditions under which the Project may result in increased or reduced visual impacts (i.e. sunrise, sunset, blade movement, overcast, foggy conditions, etc.). Individual panel members scores will also be discussed to identify and describe any panel variability or consistency in the perceived type or level of visual impact. Panel variability will also be discussed

collectively across all KOPs in order to identify any consistent outliers in the analysis and the justification for the variability.

The VRAP evaluation methodology is considered advantageous because it: 1) provides an assessment of the sensitivity of identified LSZs and viewer groups to visual change, 2) documents the basis for conclusions regarding visual impact in an objective, quantifiable manner, and 3) allows for independent review and replication of the evaluation. The modifications to the methodology made by EDR allow a large number of viewpoints to be evaluated in a reasonable amount of time without “burn-out” of the rating panel.

The completed visual impact forms will be included in the VIA along with graphical representations of the results, such as a summary of the spatial dominance, scale contrast, and project compatibility as compared to viewer sensitivity, distance from the Project, and other factors affecting Project visibility and landscape/seascape sensitivity to visual change.

2.11 Procedural Intent

The visual impact assessment procedure outlined in this report meets or exceeds standard methodologies and industry practices for determining the impacts to visually sensitive resources resulting from the construction and operation of offshore wind farms (see Literature Cited/References section). The intent of this document is to solicit input from the regulatory agencies and consulting parties on the procedures outlined and preliminary recommendations for KOPs for consideration in the VIA. Therefore, it is anticipated that this document will be revised, as necessary, to reflect the input provided.

MUNICIPAL DOCUMENT REVIEW

Municipality or County	Total Area (sq miles)	Area Within ZVI (sq miles)	Percent Area within ZVI(%)	Identified Planning Document(s)	Scenic Objectives	Climate Resiliency	Project Compatibility
Atlantic County							
Atlantic County	610.3	101.7	16.7	Atlantic County, New Jersey Master Plan (2018) Atlantic County, New Jersey Open Space and Recreation Plan (2018)	The Master Plan includes a goal to preserve and protect resources, environmentally sensitive areas, particularly watersheds, recharge areas, threatened and endangered species habitat, scenic view sheds, and other valuable features. The Pine Barrens Byway, which includes a variety of historic and scenic sites is partially located within the county. There are no specific provisions of additional planned locations to preserve and protect scenic view sheds from within the community or the ocean/beach areas. The Open Space and Recreation Plan includes goals and objectives that are to be consistent with the state-wide Master Plan open space goals. This plan provides no specific provisions of planned locations to preserve and protect scenic view sheds from within the community or the ocean/beach areas.	The Master Plan includes sustainability goals as a result of impacts from flooding and sea level rise. The first is to ensure that all development is resistant to natural effects such as storms, flooding, and drought. All future projects should be designed for future resiliency and sustainability taking into account the expected lifespan of the project and sea level rise impacts over the duration. Specific to the Barrier Island Region, the goal of this plan is to ensure that all rehabilitation and new construction occurs in a sustainable and resilient manner that accounts for sea level rise, nuisance flooding, and potential flooding from storm events. The plan includes a similar goal for the Back Bay Region. The Open Space and Recreation Plan includes the objective that all future land acquisition should prioritize protecting the population and property from natural disasters including sea level rise and increased flooding.	The Projects are compatible with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the
Absecon, City of	7.2	2.9	40.6	2016 Reexamination Report (2017)	Objectives or problems identified from previous plans and reports that relate to scenic or visual quality include the need to develop and implement programs and regulatory controls to protect scenic resources. The residential structures along the Shore Road Corridor and adjacent streets are specifically referenced. Efforts taken since 2005 to address protect scenic resources that are identified include a renovation to Howlett Hall. No recommendations for future goals or objectives are made for protection of scenic resources. However, the plan introduces recommendations for historic preservation, which include streetscape improvements and additional historical signage to promote local history and culture, and zoning measures to preserve the architectural character of the Shore Road Corridor. Provisions pertaining the visual quality in this report mostly address aesthetic standards, as expressed through streetscape and architectural standards. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.	Includes establishment of a Green Team Advisory Committee to encourage sustainability and sustainable development and to develop policies and practices to fulfill the principles of protecting visual and scenic quality.	The Projects are compatible with sustainability goals as it pertains to protecting communities from sea level rise resulting from climate change. The plan identifies aesthetic goals that pertain to streetscape and architectural standards. These goals may be minimally
Atlantic City	15.9	9.5	60	Atlantic City Master Plan (2008) Master Plan Reexamination Report (2016)	The Atlantic City Master Plan (2008): Identifies several provisions pertaining to visual quality or scenic resources, the majority of which occur in the Open Space and Recreation or Conservation Elements. An objective to “Preserve and protect open space areas that have scenic views and/or important historical, cultural significance and exceptional ecological value” is identified in the Open Space and Recreation Element. This Element also identifies Gardner’s Basin Maritime Park as having scenic quality in the statement “...the Park offers an alternative to the resort’s casino industry by allowing non-gambling visitors to seek quiet respite in the City’s most scenic park by simply sitting by the water’s edge, dining, taking in a boat ride or visiting the Aquarium”. The Conservation Element describes the scenic value of wetlands and marshes in the statement “The flat landscape of tidal marshes provide grand scenic views of Atlantic City’s spectacular urban skyline, thus enhancing the tourist experience”. The land use section also identifies a development strategy that could create a “view corridor” extending from Melrose Park south to the Atlantic Ocean, and an improvement to the fishing pier located on West End Avenue that could enhance “beautiful views over the preserved wetlands” from this location. Although these resources are identified as being scenic for the outward views that they offer, no provisions are made to protect or preserve these views. Provisions pertaining the visual quality in this report mostly address aesthetic standards, as expressed through streetscape, architectural standards, and preservation of historic structures.	Atlantic City Master Plan (2008): The City identifies provisions to mitigate and control flooding.	The Projects are compatible with sustainability goals as it pertains to protecting communities from sea level rise resulting from climate change. The plan identifies aesthetic goals that pertain to streetscape and architectural standards. These goals may be minimally impacted by the Projects.
Brigantine, City of	10.7	7.4	68.7	2016 Master Plan Re-examination Report (2016)	An objective identified from the previous planning documents includes an objective to “ <i>implement programs and regulatory controls designed to protect the scenic resources of the community</i> ”. Previous actions taken to address this objective include zoning control include building height restrictions and setbacks. A “2016 follow-up” within this section of the report identifies public concern for access to scenic resources: “Another aspect of the planning process has been the desire expressed by local residents for scenic views and resources to be protected and accessible to all. The development of the waterfronts, in particular the back bay areas has provided limited public access to street ends and points of access to the bay visually in many locations.” It also identifies that there is “...an ongoing concern about visual access and scenic corridors on the Island, and there is a continuing desire to renovate some of the less desirable views...” and a need to promote and preserve access to the Bay and Atlantic Ocean. A general goal “to promote a desirable visual environment through creative development techniques and good civic design and arrangements” is made created in the 2016 General Goals and Objectives Statement section. Provisions are made in subsequent sections to respond to this objective and improve the visual environment through changes to building setbacks, height restrictions, and similar measures. However, no additional measures intended to protect or enhance visual access and protecting scenic corridors are proposed.	The Resilience Plan Element has become a part of the master plan since two major storm events in 2011 and 2012. The reexamination of the Master Plan includes the Resiliency Action Plan that incorporates actions to protect against flooding, extreme storm events, and sea level rise.	The Projects are compatible with sustainability goals as it pertains to protecting communities from sea level rise resulting from climate change. The plan identifies aesthetic goals that pertain to streetscape and architectural standards. These goals may be minimally impacted by the Projects.
Corbin City	9	5.2	58	None identified.			

Municipality or County	Total Area (sq miles)	Area Within ZVI (sq miles)	Percent Area within ZVI(%)	Identified Planning Document(s)	Scenic Objectives	Climate Resiliency	Project Compatibility
Egg Harbor Township	75.5	13	17.2	Egg Harbor Township Master Plan (2002) Master Plan Reexamination Report (2017)	Chapter 10, Conservation Element and the River Management plan identify a portion of the Great Egg Harbor River (GEHR) and its tributaries as a scenic resource in the following statement: "The Great Egg Harbor River and its tributaries contain an abundance of scenic landscapes – lakes, streams, pristine forest areas, and cedar / hardwood swamps. The Pinelands Comprehensive Management Plan designates the lower and middle portions of the river and its tributaries as scenic corridors of "special significance" within the Pinelands." It identifies the need to incorporate resource protection measures and proposes the creation of a River Conservation (RC) overlay zoning district and the establishment of a land use plan that protects river resources. Several possible recommendations for this zoning district are identified, including "adopt design guidelines that include recommendations for... minimizing the visual impacts of development as seen from the River". The River Management Plan provides a model ordinance for what future RC overlay district could consist of. This includes land use controls, including vegetation buffer requirements, setback and building height requirements, and prohibited land uses. As of the 2017 Reexamination Report, there was no progress in implementing the proposed River Conservation (RC) zone overlay, therefore it is still a recommendation in the zoning section of this plan. No specific provisions or review process that specifically requires minimization of visual impact beyond restrictions is identified.	A goal of the Master Plan is to discourage development in flood hazard areas, wetland areas, areas with soils having poor drainage characteristics, and environmentally sensitive areas. The updated recommendations in the Reexamination Report include resiliency recommendations to reduce the effects of rising sea level and flooding.	The Projects are compatibale with climate resiliency goals as it pertains to protecting communities from sea level rise resulting from climate change. As demonstrated in the VIA, the visual effects associated with the Projects could affect scenic resource protection efforts that have and may be put forth by the community.
Estell Manor	55.2	6.7	12.2	None identified.			
Galloway Township	111.2	47.7	42.9	Master Plan Reexamination Report (2020)	An objective identified from the previous planning documents is to preserve and protect open space areas having scenic views and/or important historical, cultural or agricultural significance. Another identified objective is to maintain continuous networks of open spaces along streams, scenic areas and critical environmental areas. The plan, however, provides no recommended changes or further initiatives in regard to these objectives that would enhance or protect visual and scenic access.	There were no objectives identified from previous planning documents in regard to mitigating or providing protection from flooding or sea level rise. The reexamination report does not include changes or new provisions to initiate these measures.	The plan does not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the Projects.
Linwood, City of	4.4	1.7	40.2	City of Linwood Master Plan (2002) Master Plan Reexamination Report (2018)	The City of Linwood's goals includes the provision to preserve Linwood's historic, scenic, and recreational assets. However, there is no specific mention of the preservation of outward views from within the community, nor ocean/beach views. There are no provisions in the reexamination report in regard to the preservation of outward views from within the community, nor ocean/beach views.	The Master Plan does not include specific provisions to mitigate or provide protection from flooding or sea level rise. The reexamination plan includes the recommendation to review impacts from storm events and sea level rise in order to develop measures that will enhance resiliency for new construction within the city.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the Projects.
Northfield, City of	3.6	0.5	13.1	City of Northfield Master Plan Re-examination (2008)	The objectives identified from previous planning documents include those that promote a desirable visual environment through creative development techniques which respect the environmental qualities and constraints of the City of particular sites. The report identifies an objective to promote the conservation of historic sites and districts, open space, energy resources, and valuable natural resources in the City to prevent degradation of the environment through improper use of land. There are no provisions in the reexamination report in regard to the preservation of outward views from within the community, nor ocean/beach views.	The objectives identified from previous planning documents include those that secure safety from flood or other manmade disasters.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the

Municipality or County	Total Area (sq miles)	Area Within ZVI (sq miles)	Percent Area within ZVI(%)	Identified Planning Document(s)	Scenic Objectives	Climate Resiliency	Project Compatibility
Pleasantville, City of	7.3	3	41.8	Master Plan Elements (2016)	There are no provisions in the Master Plan in regard to scenic assets or the preservation of outward views from within the community, nor ocean/beach views.	The plan includes narrative that the City will need to evaluate future land use and zoning recommendations that take into account recent storms and the impact of sea level rise	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the Projects
Port Republic, City of	8.6	1.2	13.7	None identified.			
Somers Point, City of	5	1	20.8	Somers Point Master Plan Reexamination (2015)	There are no provisions in the reexamination report in regard to scenic assets or the preservation of outward views from within the community, nor ocean/beach views.	The plan includes significant changes in assumptions, policies, and objectives from previous planning documents. As a result of Superstorm Sandy, the City re-evaluated its policies and objectives regarding flooding and rising sea level. Updated objectives include developing planning strategies and regulations to address flooding and environmental concerns. This lead to the addition of a land use goal that aims to limit development in the floodway and require two feet of freeboard whenever development occurs in a flood zone. The report includes an updated recommendation to maximize the city's resiliency efforts from future sea level rise and storm impacts.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the Projects.
Ventnor City	2.5	0.6	22.5	2016 Master Plan Reexamination (2016)	There are no provisions in the reexamination report in regard to scenic assets or the preservation of outward views from within the community, nor ocean/beach views.	The report identifies the major changes in circumstances since the most recent Master Plan was adopted. Flooding of coastal communities due to sea level rise and the impacts of coastal storms is forecasted to increase due to climate change. Recommended changes to the Master Plan therefore include updating zoning codes to address and promote compliance with flood regulations. The report also includes that the utility and infrastructure goals should add that the siting and design of new facilities should take sea level rise, coastal flooding and erosion into account.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the Projects
Burlington County							
Burlington County	819.7	11.1	1.3	Parks and Open Space Master Plan (2002)	An objective of this plan is to identify and preserve areas of significant scenic beauty. The objective narrative includes that "roads that provide visual or physical access to extraordinary scenic, cultural. Recreational, or natural features will be submitted to the New Jersey Department of Transportation (NJDOT) for designation in accordance with the New Jersey Scenic Byways Program." The plan also recommends that the county staff should work with outside agencies to identify, map, and develop viewsheds and areas of significant beauty. As a part of the county's goal to advance the county's cultural, character and heritage through development of the county park system, the county has plans to erect interpretative signs to promote historic viewsheds. There are no provisions in the Master Plan in regard to scenic assets or the preservation of outward views from ocean/beach views.	The plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plan does not include specific provisions in regard to climate resiliency. As demonstrated in the VIA, the visual effects associated with the Project could affect scenic resource protection efforts put forth by the community.
Bass River Township	78.3	6.8	8.7	None identified.			
Cape May County							

Municipality or County	Total Area (sq miles)	Area Within ZVI (sq miles)	Percent Area within ZVI(%)	Identified Planning Document(s)	Scenic Objectives	Climate Resiliency	Project Compatibility
Cape May County	286	39.3	13.7	Cape May County Open Space and Recreation Plan (Adopted 2005, Amended 2007) 2021 Comprehensive Plan - Editorial Draft (2021)	The Cape May County Open Space and Recreation Plan was prepared to meet the goal of preserving and protecting natural and scenic resources. There are no provisions in the reexamination report in regard to specific scenic assets or the preservation of outward views from within the community, nor ocean/beach views. There are no provisions in the comprehensive plan report in regard to specific scenic assets or the preservation of outward views from within the community, nor ocean/beach views.	The Cape May County Open Space and Recreation Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise. The Cape May County Comprehensive Plan includes goals to promote development and redevelopment in a manner that accounts for anticipated climate change impacts (e.g., sea level rise) and to enhance existing infrastructure to make it more resilient to anticipated climate change impacts.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the
Dennis Township	63.7	5.3	8.3	Natural Resources Inventory (Adopted 2007, Revised 2010) Master Plan - Land Use Plan (Adopted 2009, Revised 2012) Community Forestry Management Plan 2009 - 2014, Updated for 2015-2019 (2014)	While the Natural Resource Inventory lists the scenic assets of the Township, there are no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. The Town of Dennis Land Use Plan includes a goal to retain a scenic landscape edge along all roads to buffer and to maintain the unique scenic attributes of the Township's environment. However, the plan provides no specific policies or scenic assets to protect for outward views from within the community, nor beach/ocean views. The Township of Dennis Forestry Plan provides no specific policies or scenic assets to protect for outward views from within the community, nor beach/ocean views.	While the Natural Resource Inventory explains the potential flooding impacts of sea level rise on the Township, there are no specific goals or objectives to mitigate those impacts. The Town of Dennis Land Use Plan contains no specific goals or objectives to mitigate flooding or sea level rise to enhance the Township's climate resiliency. The Township of Dennis Forestry Plan includes no specific goals or policies to mitigate flooding or sea level rise to enhances the Township's climate resiliency.	The plans do not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views. The overarching goals may be minimally impacted by the Projects.
Middle Township	82.7	12.7	15.3	Natural Resources Inventory (Adopted 2007, Revised 2010) Master Plan Reexamination Report (2010) Master Plan - Land Use Plan Updates (2010)	While the Natural Resource Inventory lists the scenic assets of the Township, there are no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. The Township of Middle Master Plan Reexamination Report includes no specific policies or scenic assets to protect for outward views from within the community, nor beach/ocean views. The Middle Township Master Plan Land Use Update provides no specific policies or scenic assets to protect for outward views from within the community, nor beach/ocean views.	While the Natural Resource Inventory explains the potential flooding impacts of sea level rise on the Township, there are no specific goals or objectives to mitigate those impacts. The Township of Middle Master Plan Reexamination Report includes no specific goals or policies to mitigate flooding or sea level rise to enhance the Township's climate resiliency. The Middle Township Master Plan Land Use Update includes no specific goals or policies to mitigate flooding or sea level rise to enhance the Township's climate resiliency.	The plans do not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
North Wildwood, City of	2.5	0.8	30.5	None identified.			
Ocean City	11.8	4.2	35.8	City of Ocean City Master Plan (Adopted 1988, Revised 2006) Ocean City Open Space & Recreation Plan (2014) Master Plan Reexamination Report (2019)	An objective of the Ocean City Master Plan is to promote a desirable visual environment through creative development techniques with respect to environmental assets and constraints of the overall city and of individual development sites. Another objective is to encourage the preservation and restoration of historically significant buildings and site within the city in order to maintain the heritage of Ocean City for enjoyment of future generations. There are development provisions for accessory structures in the waterfront neighborhoods of the city to preserve waterfront views. The Ocean City Open Space and Recreation Plan includes a conservation goal to preserve and maintain the ecological, historical, visual, recreational and scenic resources of the City. The Plan includes guidelines to acquire sites of special scenic value that should be protected to preserve or enhance the character of the community. The Master Plan Reexamination Report includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	An objective of the Ocean city Master Plan is to secure safety from flood and other natural, man-made disasters. The Ocean City Open Space and Recreation Plan lists an objective to protect natural and environmental resources including floodplains. The Plan includes guidelines to acquire environmentally sensitive sites such as flood plains. Future acquisition of land will aim to improve protection from sea level rise and severe storm events. The Master Plan Reexamination Report includes that the City has identified the most flood-prone neighborhoods on the island and is working with outside engineering experts to design comprehensive plans to mitigate flooding. There is also a study underway to create a living shoreline for improved resilience to tidal flooding.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. As demonstrated in the VIA, the visual effects associated with the Projects could affect scenic resource protection efforts put forth by the community
Sea Isle City	2.8	0.5	17.5	2017 Master Plan Reexamination Report (2017)	While the Master Plan Reexamination Report lists the scenic assets of the City, there are no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Master Plan Reexamination Report includes an updated objective to address storm water resiliency through planning, regulations, and design tools to control flooding as a result of ocean level rise and increased flooding.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.

Municipality or County	Total Area (sq miles)	Area Within ZVI (sq miles)	Percent Area within ZVI(%)	Identified Planning Document(s)	Scenic Objectives	Climate Resiliency	Project Compatibility
Stone Harbor Borough	2.3	0.6	27	Stone Harbor Master Plan (2009) Borough of Stone Harbor Master Plan Reexamination Report (2019)	The Land Use Recommendations of the Master Plan include that as the waterfront districts are redeveloped, protected vistas of the bay waters should be incorporated into new development plans and street ends should resolve in terminating vistas of scenic or remarkable landmarks. The recommendations further include architectural standards to maintain views of the bay and waterfront. The Reexamination Report begins with major problems from previous planning documents, one of which being that the Public Use District marine does not provide a sense of place, both form and function, are not commensurate with the science qualities of its prime waterfront location. A recommended Marina District Master Plan has not been completed.	The Master Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise. The Reexamination Report lists the significant changes in policies and objectives since the most recent planning documents. One of those changes is the Borough's preparedness for flooding due to sea level rise which is enhanced by the adoption of a Flood Damage Prevention Ordinance that will increase the municipalities resiliency to climate change.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. The plan identifies aesthetic goals that pertain to streetscape and architectural standards. These goals may be minimally impacted by the Projects.
Upper Township	68.4	14.2	20.8	Upper Township Master Plan Reexamination Report and Land Use Plan Amendment (2006) Natural Resources Inventory (2006) 2018 Master Plan Reexamination Report (2018) 2020 Master Plan Reexamination Report (2020)	The Master Plan includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. While the Natural Resource Inventory lists the scenic assets of the Township, there are no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. The Reexamination Reports of 2018 and 2020 include no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Master Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise. The Natural Resource Inventory includes no specific provisions to mitigate or provide protection from flooding or sea level rise. The Reexamination Reports of 2018 and 2020 include no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plans do not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
Ocean County							
Ocean County	757.5	133.1	17.6	Conservation Plan Element-Environmental Resources and Recreation Inventory 2009 2011 Comprehensive Master Plan (2011) Open Space, Parks & Recreation Plan (2020)	The Comprehensive Master Plan includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. The Conservation Plan Element's overall goal is to preserve and maintain the ecological, historic, visual, recreational, and scenic resources of the City. However, there areno specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.The Open Space, Parks, and Recreation Plan includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Comprehensive Master Plan includes that the County will develop stormwater management guidelines to reduce flood damage. The Conservation Plan Element includes a recommended objective to study innovative methods of reducing wave damage to the beach due to sea level rise, which would strengthen the County's resiliency. A priority of the Open Space, Parks, and Recreation Plan includes the protection of the costal area for storm resiliency and protection from impacts of sea level rise.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
Barnegat Township	40.3	8.7	21.7	2011 Barnegat Township Master Plan (2011)	The Master Plan includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Master Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plans do not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
Beach Haven Borough	2.3	1.1	47.4	Beach Haven Borough Comprehensive Master Plan (2017)	A goal of the Comprehensive Master Plan withing the Public Access Plan Section is to maintain and continue to promote a visually pleasing aesthetic along the waterfront areas. However, there are no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	An objective of the Comprehensive Master Plan is to support and apply the best available data related to sea-level-rise and storm surge risks for substantial improvements, new developments and community facilities. Another objective of the plan is to participate in planning initiatives aimed at resiliency, mitigation and shoreline stabilization. The resiliency initiatives in the plan include incorporating sea level rise as a hazard in Borough plans.	The Projects are compatibale with sustainability goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
Berkeley Township	54.1	10.4	19.1	Berkeley Township Comprehensive Master Plan (1997) General Reexamination of the Master Plan (2019) Environmental Resources Inventory (2012)	The Township Master Plan and the Reexamination Report include no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. The Township Environmental Resources Inventory includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Township Master Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise. The Reexamination Report includes objective amendments related to resiliency, some of which include to encourage renovations and modifications that are resilient to flood- and storm-related impacts and to encourage regional solutions to flood- and storm-related impacts. The Township Environmental Resources Inventory includes no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plans do not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.

Lacey Township	99.6	15.4	15.5	Master Plan (1991) Master Plan Reexamination Report (2012) Lacey Township Master Plan Updated - Revised Land Use Element (2016)	The Township Master Plan includes a townscape objective that states that any and all elements which could be obtrusive to the boating public should be reviewed and specifically addressed through view studies or simulations prior to receiving approvals. The Township Reexamination Report includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views. The Revised Land Use Element also includes no specific provisions for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Township Master Plan includes an objective to conserve floodplains within the special planning district. The Reexamination Report includes no specific provisions to mitigate or provide protection from flooding or sea level rise. The Revised Land Use Element also includes no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plans do not include specific provisions in regard to climate resiliency. As demonstrated in the VIA, the visual effects associated with the Project could affect scenic resource protection efforts put forth by the
Little Egg Harbor Township	73.9	39	52.8	1999 Master Plan (1999)	The Township Master Plan includes a goal to promote a desirable visual environment through conservation and preservation of valuable natural features. However, it includes no specific provisions or scenic assets for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Township Master Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plans do not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach
Long Beach Township	23.5	17.1	72.6	Master Plan Update (2017)	The Comprehensive Master Plan includes no specific provisions or scenic assets for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Comprehensive Master Plan includes no specific provisions to mitigate or provide protection from flooding or sea level rise.	The plan does not include specific provisions in regard to climate resiliency. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
Ocean Township	31.6	10.3	32.5	Ocean Township Master Plan (1990) 2019 Master Plan Reexamination Report (2019)	The Ocean Township Master Plan includes a conservation goal to identify scenic areas within the Township and provide for their preservation. The Reexamination Report includes no specific provisions or scenic assets for protecting or enhancing the outward views from within the community, nor beach/ocean views.	The Ocean Township Master Plan includes a conservation goal to identify, map, and preserve environmentally sensitive land in the Township, including wetlands, flood plains and other flood prone areas. This goal remains valid in the Reexamination Report and the Township plans to adopt the updated FEMA floodplain maps to inform these decisions.	The Projects are compatibale with climate resiliency goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. As demonstrated in the VIA, the visual effects associated with the Projects could affect scenic resource protection efforts that have and
Stafford Township	54.6	14.8	27	2017 Master Plan Land Use Element (2017)	The Master Plan includes recommended zoning ordinances to regulate accessory structures in residential districts to protect viewsheds. Provisions pertaining the visual quality in this report mostly address aesthetic standards, as expressed through architectural standards. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.	A goal of the Master Plan is to implement more resilient building practices in existing floodplains and more resilient building requirements in areas where Superstorm Sandy had land use impacts. A similar goal of the plan is to improve the resiliency of the Township's coastal area through acquiring at-risk properties to flooding, raise existing residential homes in the floodplain, and implement hazard mitigation techniques including green and grey infrastructure.	The Projects are compatibale with climate resiliency goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor ocean/beach views.
Toms River Township	52.7	4.6	8.7	Natural Resources Inventory (2016) Township of Toms River Master Plan (2017)	The Master Plan Land Use Element includes no specific provisions for the preservation of outward views from within communities, nor ocean/beach views. The Natural Resource Inventory includes no specific provisions for the preservation of outward views from within communities, nor ocean/beach views.	The Master Plan Land Use Element includes recommended sustainability and resiliency objectives, of which the relevant points include, preparing for and mitigating the impacts of flooding from storm events and sea level rise. The Natural Resource inventory includes discussion of provisions that have been implemented in the Township to prepare for and mitigate flooding from storm events and sea level rise.	with climate resiliency goals as it pertains to protecting communities from flooding and sea level rise resulting from climate change. There is no specific mention of the preservation of outward views from within communities, nor

¹ This table includes all inventoried Visually Sensitive Resources (VSRs) with potential visibility of the proposed turbines (resources that overlap the Zone of Visual Influence [ZVI]).

² Key Observation Points (KOP) are listed if they occur within 1,000 feet of a given VSR.

³ For large areas and linear sites, approximate distance to the nearest turbine was measured from the respective area's closest point.

⁴ Turbine visibility is based on the maximum blade tip height of 319 meters and FAA warning light visibility is based on an assumed height of 185 meters.

⁵ The percentage of the mapped resource that overlaps the ZVI. For resources that extend beyond the Visual Study Area (VSA) boundary, this reflects the percentage of the area within the VSA.

representative project experience

Sunrise Wind Project - Evaluate visual impacts, rating panel for wind turbines in outer continental shelf on coast of New York, New Jersey, Connecticut, Rhode Island, and Massachusetts.

Heritage Wind Project, NY - Evaluate visual impacts, rating panel for wind turbines in Barre and Orleans County, New York.

Horseshoe Solar, NY - VIA Report Provided, field survey and viewshed evaluation for a visual impact assessment in Livingston and Monroe County, New York.

Amherst Solar, MA - Visual impacts from solar arrays in a decommissioned golf course in Amherst, Massachusetts.

Plymouth Solar, MA - Screening Planting Plan Mitigate visual impacts from solar arrays in a wooded parcel in Plymouth, Massachusetts.

Revolution Wind Project, MA & RI - Evaluate visual impacts, rating panel for wind turbines in the Atlantic Ocean off the coast of Massachusetts and Rhode Island.

Skipjack Wind Project, MD - Evaluate visual impacts, rating panel for wind turbines in the Atlantic Ocean off the coast of Maryland.

Alle-Cat Wind Project, NY - Evaluate visual impacts, rating panel for wind turbines in Allegany, Cattaraugus and Wyoming Counties, New York.

Canisteo Wind Project, RI - Evaluate visual impacts, rating panel for rating panel for wind turbines in Steuben County, New York.

South Fork Wind Project, NY & RI - Evaluate visual impacts, rating panel for wind turbines in the Atlantic Ocean off the coast of New York and Rhode Island.

employment history

*Principal Landscape Architect, Terraink, Inc., Arlington, MA, 2010 –
Present.*

Instructor, Rhode Island School of Design, Providence, RI, 2014 – 2018.

*Project Manager, Gregory Lombardi Design, Inc., Cambridge, MA, 2008 –
2010.*

*Visiting Professor, Site Design and Grading Seminar; Rhode Island
School of Design*

Project Manager, Shadley Associates, Lexington, MA, 2007 – 2008.

*Project Manager, Visual Expert, EDR Companies, Syracuse, NY, 2003 –
2007.*

*Adjunct Professor, SUNY College of Environmental Science and
Forestry, Syracuse, NY, 2003 – 2007.*

*Landscape Architect, Reisen Design Associates, Cambridge, MA, 1999 –
2003.*

*Landscape Architect, Jacques Whitford Company, Inc., Woburn, MA,
1998 – 1999.*

*Project Manager, Pressley Associates, Inc., Cambridge, MA, 1995 –
1998.*

Baron Wind, NY - Evaluate visual impacts, rating panel for wind turbines in Steuben County, New York.

Timbermill Wind, NC - Evaluate visual impacts, rating panel for wind turbines in Perquimans Chowan Counties, North Carolina.

Lighthouse Wind, NY - Evaluate visual impacts, rating panel for wind turbines in Somerset and Yates Counties, Western New York.

Offshore MD - Evaluate visual impacts, rating panel for wind turbines offshore of Maryland.

Moosehead Lake Recreational Resource Assessment, ME - Investigation coordination of recreational resources in the Moosehead Lake Region, Maine.

Antrim Wind Power, NH - Provided Expert Witness with Court Testimony. Authored a Visual Impact Assessment (VIA) for a 28.8-MW, 9-turbine wind farm project in the Town of Antrim, Hillsborough County, New Hampshire. The VIA described the visible components of the proposed project, defined the visual character of the study area, and inventoried and evaluated existing visual resources. The study also evaluated potential project visibility within the study area, identified key views and assessed visual impacts associated with the proposed wind power project.

Block Island Wind Farm, RI - Evaluated visual impacts for wind turbines and transformer station improvements on Block Island, Rhode Island.

Howard Wind Farm, NY - Evaluated visual impacts for wind turbines in Steuben County, New York.

Allegheny Wind, PA - Evaluated visual impacts for wind turbines in Cambria and Blair Counties, Pennsylvania.

New England East-West Solution (NEEWS) - Evaluated visual impacts for transmission line and transformer station improvements in New England.

Interstate Reliability - Evaluated visual impacts for transmission line and transformer station improvements in NE.

Maxson Hill Road Solar, RI - Mitigate visual impacts from solar arrays in a wooded parcel of Hopkinton, Rhode Island.

Southern Rhode Island Transmission Project – Prior to Terraink, Expert Witness with Court Testimony that was not challenged. Oversaw preparation of the Visual Impact Assessment (VIA) and the Supplemental Tower Hill Tap Line VIA prepared for the proposed upgrade and extension of approximately 26 miles of an existing L-190 115 kilovolt transmission line in southern Rhode Island. Coordinated fieldwork, defined landscape similarity zones and viewer groups, identified sensitive resources/receptors, supervised the development of viewshed maps and visual simulations, participated in the preparation of the VIA report and provided expert witness testimony on visual issues.

Tompkins County Public Safety Communications System - Prior to Terraink, directed preparation of Visual Impact Assessment component of the Draft Environmental Impact Statement (DEIS) prepared for the siting of nine new towers for wireless communications in Tompkins County, New York. Coordinated fieldwork, defined landscape similarity zones and viewer groups, identified sensitive resources/receptors, supervised the development of viewshed maps and visual simulations and participated in the preparation of the VIA report.

New York State Statewide Wireless Network - Prior to Terraink, participated in the preparation of the Generic Visual Impact Assessment (GVIA) report component of the DEIS prepared for the siting of wireless communications towers throughout New York State. Defined landscape similarity zones and viewer groups, identified sensitive resources/receptors, supervised the development of visual simulations and participated in the preparation of the GVIA report.

Visual Impact Assessment, Top Notch Wind Power Project - Prior to Terraink, evaluated visual impacts for Fairfield, Norway and Little Falls in Herkimer County, New York. The VIA report described visible components of the proposed project, defined the visual character of the study area, and inventoried and evaluated visual resources and viewer groups. The study also evaluated potential project visibility within the study area, identified key views and assessed visual impacts associated with the proposed wind power project.

Visual Impact Assessment, Cohocton Wind Power Project - Prior to Terraink, evaluated visual impacts for Visual Impact Assessment (VIA) report for an 82 MW, 41-turbine project proposed in the Town of Cohocton in Steuben County, New York. The VIA report described visible components of the proposed project, defined the visual character of the study area, and inventoried and evaluated visual resources and viewer groups. The study also evaluated potential project visibility within the study area, identified key views and assessed visual impacts associated with the proposed wind power project.

Visual Impact Assessment, Marble River Wind Farm - Prior to Terraink, assessed visual impacts for Visual Impact Assessment (VIA) report from 200 MW, 109-turbine project proposed for a 19,310-acre site in the Town of Clinton and Ellenburg in Clinton County, New York. The VIA report described visible components of the proposed project, defined the visual character of the study area, and inventoried and evaluated visual resources and viewer groups. The study also evaluated potential project visibility within the study area, identified key views and assessed visual impacts associated with the proposed wind power project.

Visual Impact Assessment, Jordanville Wind Power Project - Prior to Terraink, coordinated study and prepared Visual Impact Assessment (VIA) report for a proposed 150 MW 75-turbine project proposed in the Towns of Stark and Warren in Herkimer County, New York. The VIA report described visible components of the proposed project, defined the visual character of the study area, and inventoried and evaluated visual resources and viewer groups. The study also evaluated potential project visibility within the study area, identified key views and assessed visual impacts associated with the proposed wind power project.

Visual Impact Assessment, Dairy Hills Wind Farm - Prior to Terraink, evaluated visual impacts for Visual impact Assessment (VIA) report for a 160 MW, 80-turbine project proposed in the Towns of Castile, Covington, Perry, and Warsaw in Wyoming County, New York. The VIA report described visible components of the proposed project, defined the visual character of the study area, and inventoried and evaluated visual resources and viewer groups. The study also evaluated potential project visibility within the study area, identified key views and assessed visual impacts associated with the proposed wind power project.

representative project experience

Energy Project Visual Impact Assessments - Provided expert visual assessment for Environmental Design Research, PC on the following projects:

- Sunrise Wind, Outer Continental Shelf
- Heritage Wind, Orleans County, NY
- Revolution Wind, Coastal New England
- High Bridge Wind, Chenango County, NY
- Mohawk Solar, Montgomery County, NY
- Bluestone Wind, Broome County, NY
- Allegany, Cattaraugus and Wyoming Counties, NY
- Canisteo Wind, Steuben County, NY
- South Fork Wind Farm, Offshore, Atlantic
- Galloo Island, NY
- Baron Wind, NY
- Timbermill Wind, NC
- Clear River Energy Transmission, RI
- Cassadaga Wind Project, Chautauqua County, NY
- Merrimack Valley Reliability Project, NH & MA
- New England East-West Solution (NEEWS), New England States
- Block Island Wind Project, MA
- Allegany Wind Project, Cattaraugus County, NY
- Rhode Island Reliability Project, RI
- Howard Wind Project, Steuben county, NY
- NY Regional Interconnect, NY
- Dutch Hill Wind Project, Cohocton, NY

Local Waterfront Revitalization Plan, Cazenovia, NY - Preparation of a Waterfront Revitalization Plan for the Village and Town of Cazenovia through funding from the LWRP program. Compiled inventory and analysis, conducted public meetings, designed projects to meet community needs.

Village of Manlius, NY, Main Street Revitalization - Coordination with village board and committee. Design and implementation of streetscape improvements including custom furniture, lighting, paving.

Town of Eaton Park Masterplan, Morrisville, NY - Conceptual drawings, site documentation and cost estimates for Village Park funding proposal.

North Center Street Park, East Syracuse, NY - Conceptual and Design Development Drawings for Village Park, done in conjunction with O'Brien and Gere.

Downtown Revitalization Initiative, Cazenovia, NY - Development of plans and submission for grant funding for several projects in the village. Worked in conjunction with CACDA executive director.

Arise at the Farm, Chittenango, NY - Drainage and planning drawings for working therapeutic horse farm.

Mattituck Laurel Civic Association, Long Island, NY - Led SUNY ESF studio in master plan study for hamlet of Mattituck, addressing traffic issues and connectivity of village center to water. Continuing to consult with community to prioritize and fund projects.

Cazenovia Lake Valuation Study, NY - Study conducted with Richard Smarden, PhD to value the benefit revenue streams to the Cazenovia community associated with the presence of a healthy lake. Methods included literature review, data collection, surveys and real estate comparisons through GIS data bases.

Vineyard Haven Resiliency Planning Study, Martha's Vineyard, MA - Coordinated planning effort with Vineyard Haven interest groups through SUNY ESF studio process. Study focused on resiliency strategies for land planning in the sensitive flood plain areas of Vineyard Haven.

Scajaquada Creek Corridor, Buffalo, NY - Coordinated design and planning effort partnering Buffalo Niagara Waterkeeper's and student designers from SUNY ESF. Project proposed to daylight existing stream, reestablish habitat in an urban setting, and revitalize a post industrial superblock through smart growth redevelopment.

Creekside Playground Design and Project Implementation - Coordinated community planning process for natural playground through SUNY ESF studio process. Presently working as consultant with community to develop plans and coordinate implementation of playground.

Oneida Flats Planning Study, NY - Utilized community participatory methods to include residents and city in master plan visioning process for flooded neighborhood. Included extensive research, analysis and information sharing.

Oneida Rail Trail Conceptual Plan, NY - Studio based design project: Conceptualization of segments of the proposed Oneida Rail Trail. Project included organized community participation.

GoCaz.com, Economic Development Project, Cazenovia, NY - Creation, coordination and implementation of GoCaz.com, a program to promote outdoor recreational activities in and around the Cazenovia area. Project includes grant writing assistance, interactive GIS website, mobile phone adaptation design, trail mapping, signage design, and marketing.

International Boxing Hall of Fame, Canastota, NY - Created a master plan and wrote a grant that was funded through NYS Economic Development Funds for \$1M. Assisted in securing legislation for site to be turned over from NYS Thruway Authority to LDC.

representative project experience

Energy Project Visual Impact Assessments - Prepared Visual Impact Assessments (VIAs) for commercial wind power and power line projects in Upstate New York. The VIAs present the visual character and significant aesthetic resources within a 5, 10 or 40-mile visual study radius. Viewshed analysis, line-of-sight cross sections, field review, and computer-assisted visual simulations were used to evaluate the potential visibility and visual impact of these projects.

- Apex Heritage Wind
- Flint Mine Solar
- Tobacco Valley Solar Farm
- Morris Ridge Solar
- Horseshoe Solar
- Gowanus Bay Repowering Project
- Sunrise Offshore Wind Farm
- Skipjack Wind

Interstate Route 81 Viaduct Project, City of Syracuse, Onondaga County, NY- Part of the EDR team responsible for the development of visual simulations for the replacement of approximately 5 miles of elevated interstate highway.

City of Rome Grant Project Work – Prior work experience – provided professional services including writing signification portions of the grant applications, and creating preliminary graphic maps for the following projects:

- **Round 2 Downtown Revitalization Initiative (DRI):**
 - Downtown Centro transportation center
 - Downtown Wayfinding System Implementation
 - City Hall Programming Enhancements and Public Areas Expansion
 - City Hall Green Enhancement for Year-Round Activity
 - Liberty James Parking Garage Upgrades
 - Liberty George Parking Garage Demolition/ site preparation/ and mixed-use redevelopment
 - Erie Boulevard Streetscape and pedestrian enhancements
- Business Retention and Public Art Fund
- **NYSDOT Transportation Alternatives Program (TAP)**
 - Construction of Phase II of the Mohawk River Trail
- **SMART Walk (Stormwater Management Art Walk)**
 - Green Infrastructure enhancements for stormwater run-off
 - Bicycle, pedestrian and streetscape enhancements
 - Development of public arts plaza

Cayuga County - GML 239-I, m&n Review Committee – *Prior work experience* – responsible for reviewing applications for completeness, communicate with communities and proposed developer to assure completeness as well as develop monthly agendas, maps, and other materials for committee use. Additionally, responsible for the development and relay of correspondence with the applicants based on the committee's determination.

Cayuga County - County Wide Planning Board Training Programs - *Prior work experience* - responsible for SEQR training for County Planning Board, ZBA, and Council Board Members, including presentation materials and sample SEQR process materials. Presentations also included Land Use Tools and Techniques: Special Use Permits and Variances.

Emerson Park, Auburn, NY - Coordinated the grant application materials including a boat launch improvement master plan and cost estimate. Alumni Quadrangle New Construction Project, DASNY, Albany State University- Provided site planning and design services to support razing and replacing Waterbury Hall with new alumni commons that will integrate dining, retail, fitness, meeting rooms, social spaces, and a new contemporary residence hall in

a phased approach. Site work shall include relocating and reconfiguring the existing service entrance, loading dock, and utilities to support the new alumni commons and residence hall. LEED™ Silver Base Rating.

Alumni Quadrangle New Construction Project, DASNY, Albany State University - Provided site planning and design services to support razing and replacing Waterbury Hall with new alumni commons that will integrate dining, retail, fitness, meeting rooms, social spaces, and a new contemporary residence hall in a phased approach. Site work shall include relocating and reconfiguring the existing service entrance, loading dock, and utilities to support the new alumni commons and residence hall. *LEED™ Silver Base Rating.*

Nappi Longevity Institute, Upstate Medical University, Syracuse, NY - Provided site planning and design services to support development of a new 200,000 SF, 5-story building on an existing surface parking lot. Outdoor spaces include café, meditation garden, labyrinth pavement, drop-off circulation, and back-of-house access. The proposed building will house outpatient treatment facilities. LEED™ Silver Base Rating

Equal Rights Heritage Center, City of Auburn, NY - Managed site planning, design, and engineering services to support development of a new regional welcome center in the South State Street Historic District in Downtown Auburn. The project is located directly across from Memorial City Hall and adjacent to the William H. Seward House Museum (a national historic landmark). It provides a rare opportunity to highlight regional tourism and the agricultural industries.

Southside Park, Veteran's Memorial, City of Binghamton Parks and Recreation, Binghamton, NY - Developed design options to relocate, improve, and expand existing memorial gathering space and memorial bench.

Washington Street Mall, City of Binghamton Parks and Recreation, Binghamton, NY - Designed a renovation for the existing Metrocenter Plaza. The pocket park style space creates a downtown amenity including outdoor dining, lighting, landscape, performance space, and a safe pedestrian environment.

Veterans Service Facility, Broome County DPW, Conklin, NY - Serves as project manager for the project and the main point of contact for EDR. Manages the project timeline, tasking, client communication, monitoring and reporting. EDR services include landscape architecture, civil engineering, site wastewater engineering, cultural resource assessment, and environmental/ecological consulting services.

LA Term Services, City of Binghamton Parks and Recreation, Binghamton, NY - Responsible for managing the EDR team assigned to a term contract for Landscape Architectural Services. EDR is currently providing site planning and design services on an as-needed basis. EDR has been assigned work on: Washington Street – Metrocenter Plaza, Recreation Park Tennis, The Discovery Center, MacArthur Park, Fireman's Memorial, Charles Street Open Space, West End Park, Southside Park – Veteran's Memorial.

One Steamboat Place, Steamboat Springs, CO - *Prior to EDR*, Designed one-acre public outdoor space, outdoor pool and plaza, and overall site for the private "cowboy chic" luxury condominiums at the base of Steamboat Mountain. Developed project from concept design through construction administration. Designed signature site elements including custom lighting and outdoor fireplaces to compliment the distinctive architectural style and unique client flair. Lead Quality Control for the multi-disciplinary site design team.

Visual Impact Assessment

Visual Rating Panel Guidance

1.0 INTRODUCTION

Thank you for participating in the Visual Impact Assessment (VIA) of the Atlantic Shores Offshore Wind Project (Project) as a visual expert and rating panel member.

As proposed, the Project will be located in federal waters on the Outer Continental Shelf (OCS), in Bureau of Ocean Energy Management (BOEM) Renewable Energy Lease Areas OCS-A 0499 (Lease Area). The proposed wind energy generation facility will be located in the southern portion of the Lease Area, measuring approximately 159.4 sq mi (413 sq km). This area will contain the major visible component of the Project and is henceforth referred to as the Wind Turbine Area (WTA). At its closest point, the WTA is approximately 8.7 mi (14 km) from the New Jersey shoreline as measured from the northernmost edge of Brigantine City in Atlantic County. The WTA is also 9.4 mi (15.1 km) east of Atlantic City, 16.3 mi (26.2 km) east of Ocean City, 25.3 mi (40.7 km) south of Barnegat Light Borough, and 35.7 mi (57.5 km) northeast of Wildwood. The purpose of the Visual Impact Assessment (VIA) is to analyze the potential visibility of the proposed Project and determine the difference in landscape and seascape visual quality between existing and proposed conditions.

The visible components of the offshore Project will include 200 wind turbine generators (WTGs) and five offshore substations (OSS). The VIA considers the largest wind turbine technology currently under consideration for the Project, which includes WTGs with a rotor diameter of 919 feet, hub height of 574 feet and a total height of 1,047 feet with the rotor blade in the full upright position. The OSSs will include four substations measuring 31,484 square feet and 189 feet tall as well as one substation measuring 48,438 square feet and 205 feet tall.

The potential visual impact associated with the Project will be evaluated using a modified version of the *U.S. Army Corps of Engineers' (USACE) Visual Resource Assessment Procedure (VRAP)*¹. This will include the evaluation of key observation points (KOPs) within the visual study area (VSA) with and without the project in place. The modifications to the VRAP process are described Section 2.2 of this document. To make this pre- and post-installation comparison the rating panel members will provide a scenic quality score for the existing conditions photograph and then score again separately for the visual simulation illustrating the Project in place. The scenic quality score applied to the existing conditions photograph will result in a Scenic Quality Classification (SQC) which will, in turn, apply a threshold of acceptable visual impact to the KOP (see Table 2-1). If the proposed conditions simulation results in a decrease in visual quality that either exceeds the threshold and/or reduces the SQC category, the Project is expected to result in visual impacts to that KOP.

In addition to the VRAP rating process, EDR also included a means to assess the visual threshold level (VTL), which measures the Projects visual prominence that is described in *Offshore Wind Turbine Visibility and*

Visual Impact Assessment

Visual Rating Panel Guidance

*Visual Impact Threshold Distances*². This analysis is included as a supplement to the VRAP process and will be used to inform the degree of potential visual impact associated with the Project.

2.0 RATING PANEL INSTRUCTIONS

2.1 Project Introduction

Using the provided introductory material (See Section 2.4 and Table 2-3) rating panel members should take a few moments to review the VSA and general location of the KOPs.

- a) Google Earth file of the Project, VSA, and KOPs
- b) Review landscape similarity zones (LSZ) map and descriptions to become familiar with the LSZ's present within the VSA.
- c) Review visually sensitive resources (VSRs) considering the resource, its viewers, and their sensitivity to visual change.

2.2 KOP Rating

Step 1 – KOP Familiarization (Rating Form Page 1 and 2 of 6)

KOP Familiarization includes a series of questions designed to familiarize you with the existing conditions present at each KOP. These include the identification and description of focal points, order, visual clutter, movement, duration of view, atmospheric conditions, lighting direction, and scenic, historic or recreational value. The following steps are required in order to complete this portion of the visual impact rating forms:

- a) The simulations provided to each panel member have a contextual cover sheet (Sheet 1). This sheet contains a large panorama view from the KOP position along with an inset or on occasion multiple insets defining the simulation field of view. Additionally, the context sheet includes a regional context map and a local context map, information about the location of the simulation, distance from the Project, landscape similarity zone (LSZ), user group, and any visually sensitive resources represented by the KOP. Each simulation set will also include a prescribed Google Earth tour, but users may also desire to complete their own walking tour/fly-through.
- b) Rating panel members shall thoroughly examine the contextual information described above and complete the Google Earth tour of the KOP and the surrounding landscape, making note of visibility to the seascape and/or surrounding landscape or built features as the viewer approaches the KOP.
- c) Based on review of the contextual information, the rating panel member shall record initial reactions to the KOP by recording reactions to the questions relating to the "Principles of Composition" and "Factors Affecting Visual Impact". (Pages 1 and 2 of the VIA Rating forms).

² Sullivan Robert G., Kirchler Leslie B., Cothren Jackson, Winters Snow L. *Offshore Wind Turbine Visibility and Visual Impact Threshold Distances*. Argonne National Laboratory, Argonne, IL, 2012.

Visual Impact Assessment

Visual Rating Panel Guidance

Step 2: Scenic Quality Classification (Rating Form Page 3 of 6)

The VRAP process typically involves a two-step approach beginning with the Management Classification System (MCS) followed by the VIA rating. However, given the nature of offshore wind projects, which occur outside of the managed landscape, the VRAP methodology has been adapted by EDR to remove the MCS portion of the rating system and apply the scoring system to the existing conditions view. As such, EDR has renamed the MCS portion to the Scenic Quality Classification (SQC). The SQC uses the same MCS terminology and scoring and is used to establish a baseline scenic quality level and a threshold for acceptable visual impacts (see Table 2-1). This also eliminates the process that averages potential impacts across an entire LSZ. Rather, the thresholds are applied directly to the existing conditions at each individual KOP.

The Scenic Quality Classification consists of the following approach:

The visual impact rating form for the existing conditions is include on Page 3 of 6. The following steps are required to establish a SQC for each KOP:

- a) Rating panel member shall review the existing condition photographs from the selected KOPs along with regional information, including LSZs, Visually Sensitive Resources (VSRs), and distance from the Project (completed in Step 1 - KOP Familiarization).
- b) Next, use professional aesthetic judgment to assess the visual quality of the KOP's existing condition and assign a numerical assessment value to each of the contributing factors (water resources, landform, vegetation, land use, and user activity).
 - i. Rating panel members are requested to use whole numbers to score each of the contributing factors unless a resource is not present, in which case a score of 4.5 should be applied. For example, when evaluating the contributing factor of Vegetation, however, no vegetation is visible in the simulation specific view, then vegetation should be assigned a score of 4.5 thereby nullifying its impact on the composite score average.

The numerical assessment values provided by individual rating panel members will be averaged and a composite assessment score will be established for each category. Based on the composite score each KOP is assigned to a corresponding SQC, which defines the degree and nature of visual change acceptable for that KOP. Rating panel members should enter numerical results into the digital PDF rating form that will compile necessary totals for each KOP. EDR will enter individual scores to a separate database to verify result accuracy.

Visual Impact Assessment

Visual Rating Panel Guidance

Step 3: VIA Evaluation (Rating Form Page 4 of 6)

The VIA evaluation consists of the following approach:

The visual impact rating form for the proposed conditions is include on Page 4 of 6. The following steps are required to establish a SQC for each KOP:

- a) The rating panel member shall review simulations of the proposed Project from each KOP.
- b) Use professional aesthetic judgement to assess the selected KOP with the proposed Project in place. Assign a numerical value to each of the contributing factors considering the proposed conditions at that KOP.
 - i. Rating panel members shall use whole numbers to score each of the contributing factors/resources unless a resource is not present, in which case a score of 4.5 should be applied.

Step 4: VIA Evaluation – Compatibility and Contrast Rating (Rating Form Page 5 of 6)

- a) The visual impact rating form for the compatibility and contrast rating is include on Page 5 of 6. The following steps are required to establish a compatibility rating for each KOP: The rating panel member shall assign visual Contrast Rating scores to each category comparing the Project in place to the surrounding landscape as a means to evaluate its compatibility, scale contrast, and spatial dominance within the study area (see Table 2-2). Refer to the definitions listed in Section 2.3 to assist with terminology presented in the form.
- b) Rating panel members shall use whole numbers to score each of the contributing factors/resources, however, on this form if elements are missing from the view, the score should be 0, which removes its inclusion in the averaged score.

Step 5: VIA Evaluation – Visibility Threshold Level (Rating Form Page 6 of 6)

The visual impact rating form for the visibility threshold rating is include on Page 6 of 6. The following steps are required to establish a threshold rating for each KOP:

- a) Check the VTL box that best reflects the degree of visibility and visual prominence of the Project at each KOP. The VTLs are described in detail in Table 2-3, below.
- b) Rating panel members shall check a box next to the most appropriate VTL description, which will then correlate to a threshold rating score that will be tallied and averaged across the rating panel responses.

Visual Impact Assessment

Visual Rating Panel Guidance

2.3 Definitions and Tables

Conditions Rating

Distinct – Something that is considered unique and is an asset to the area. It is typically recognized as a visual/aesthetic asset and may have many positive attributes. Diversity and variety are characteristics in such a resource.

Average – Something that is common in the area and not known for its uniqueness, but rather is representative of the typical landscape of the area.

Liability – Something that lacks any positive aesthetic attributes and may actually diminish the visual quality of surrounding areas.

Contrast Rating

Dominant – The modification is the major object or area in the confined setting and occupies a large part of the setting.

Co-Dominant – The modification is one of the major objects or areas in a confined setting, and its features are of equal visual importance.

Subordinate – The modification is insignificant and occupies a minor part of the setting.

Factors to be Considered During the Visual Evaluation

Landscape/Seascape, viewer, and Project-related factors that rating panel members should consider in their evaluation of visual impact should include the following:

- **Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape and/or seascape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- **Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- **Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- **Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale

Visual Impact Assessment

Visual Rating Panel Guidance

is likely to vary depending on the distance from which it is seen and other contextual factors.

- **Focal Point:** Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.
- **Order:** Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape/seascape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.
- **Visual Clutter:** Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.
- **Movement:** Motion of existing and proposed elements in a view can attract viewer attention.
- **Duration of View:** Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time such as riding a ferry or water taxi. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.
- **Atmospheric Conditions:** Clouds, precipitation, haze, and other ambient air-related conditions which affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of landscape/seascape and project components and the design elements of form, line, color, texture, and scale.
- **Lighting Direction:** Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape/seascape and project elements.
- **Scenic or Recreational Value:** Designation as a scenic, historic or recreational resource is an indication that there is broad public consensus on the value of that particular resource.

Visual Impact Assessment

Visual Rating Panel Guidance

KOP – Key Observation Point

Geographic positions within the visual study area that have views toward the Project and were considered for the development of visual simulations.

LSZ - Landscape Similarity Zones

Within the regional landscape, LSZs are established to provide a more specific framework within which to define and evaluate the visual resources of a study area. An LSZ represents a specific landscape type or setting that has common characteristics of landform, water resources, vegetation/ecosystems, land use, and user activity. As opposed to the diversity that can exist within the Regional Landscape, an LSZ has a fairly homogeneous, unified visual character. It should be apparent that the size of the zones and the level of detail with which they are defined can vary over a wide range. Prior to considering a project, judgments are made on the existing visual quality of the LSZs using the inventory and assessment of each zone's visual resources.

VSA – Visual Study Area

The visual study area is within a 40-mile radius of the offshore wind turbines. This represents a reasonable area beyond which the physical ability to see the Project diminishes such that visual impacts are no longer possible under typical viewing conditions.

VSR - Visually Sensitive Resources

For each KOP, nearby VSRs will be identified and summarized. The VSRs may include State Parks, National Register Historic Properties, National Historic Landmarks, or other resources officially designated as unique, scenic, or protected/designated specifically for the use and enjoyment by the public.

VTL - Visibility Threshold Level & Visual Prominence

Offshore Wind Turbine Visibility and Visual Impact Threshold Distances (Sullivan et.al., 2013) lists six VTLs that were used to rate the visual prominence of several operational offshore wind farms in Europe. The six VTLs are described below. Rating panel members will check a box next to the appropriate VTL description, which will then assign a set whole number VTL to each set of visual simulations from each KOP (Rating Form Page 6 of 6). The VTL score will be averaged across all panel members and rounded to the nearest whole-number VTL score. Visual prominence and the resultant VTL score may not necessarily influence visual impact scores. However, there is a strong correlation between high VTL's and elevated visual impacts. The VTL score will be used to describe the degree of potential visual impact based on the SQC assigned to each KOP.

Visual Impact Assessment

Visual Rating Panel Guidance

Table 2-1 Scenic Quality Classification (SQC)

Scenic Quality Classification	Total Assessment Value	Acceptable Impact Threshold	Description
Preservation	17 & above	0	These areas are considered to be unique and to have the most distinct visual quality in the region. They are highly valued and are often protected by Federal and State policies and laws. These areas include wilderness areas, some natural areas, portions of wild and scenic rivers, historic sites and districts, and similar situations where changes to existing resources are restricted. While limited project activity is not precluded, it should not be readily evident. Structures, operations, and use activities should appear to be extensions of the protected resource and should faithfully represent, repeat, or reinforce the visual character of that resource.
Retention	14-16	-2	These areas are regionally recognized as having distinct visual quality but may not be institutionally protected. Project activity may be evident but should not attract attention. Structures, operations, and use activities should remain subordinate to the existing visual resources and should repeat the form, line, color, texture, scale and composition characteristics of the resource.
Partial Retention	11-13	-5	These areas are locally valued for above average visual quality but are rarely protected by institutional policies. Project activity may be evident and begin to attract attention. Structures, operations, and use activities should remain subordinate to the existing visual resources. Form, line, color, texture, scale, and composition may differ from but should be compatible with the visual characteristics of the existing resource.
Modification	8-10	-6	These areas are not noted for their distinct qualities and are often considered to be of average visual quality. Project activity may attract attention and dominate the existing visual resource. Structures, operations, and use activities may display characteristics of form, line, color, texture, scale, and composition that differ from those of the existing visual resources. However, the project should exhibit good design and visual compatibility with its surroundings.
Rehabilitation	7 & Below	-8	These areas are noted for their minimal visual quality and are often considered blighted areas. Project activity should alter the existing undesirable visual resources. Structures, operations, and use activities should exhibit good design and display characteristics of form, line, color, texture, scale, and composition that contribute to making the area compatible with the visual character of adjacent higher quality landscapes.

Visual Impact Assessment

Visual Rating Panel Guidance

Table 2-2 Compatibility and Contrast Ratings

Modifier	Definition	Rating
Spatial dominance	<p>The prevalent occupation of a space in a land scape by an object(s) or landscape element.</p> <p>Spatial dominance can be described in terms of being Dominant, Co-dominant, or Subordinate.</p>	<p>Dominant--the modification is the major object or area in a confined set ting and occupies a large part of the setting.</p> <p>Co-dominant--the modification is one of the major objects or areas in a con fined setting, and its features are of equal visual importance.</p> <p>Subordinate--the modification is insignificant and occupies a minor part of the setting.</p>
Scale contrast	<p>The difference in absolute or relative scale in relation to other distinct objects or areas in the landscape.</p> <p>Scale contrast can be described in terms of being Severe, Moderate, or Minimal.</p>	<p>Severe--the modification is much larger than the surrounding objects.</p> <p>Moderate--the modification is slightly larger than the surrounding objects.</p> <p>Minimal--the modification is much smaller than the surrounding objects.</p>
Compatibility	<p>The degree to which landscape elements and characteristics are still unified within their setting. Compatibility can be described.</p> <p>in terms of being Compatible, Somewhat Compatible, or Not Compatible.</p>	<p>Compatible--The modification is harmonious within the setting.</p> <p>Somewhat Compatible--The modification is more or less harmonious within the setting.</p> <p>Not Compatible--The modification is not harmonious within the setting.</p>

Visual Impact Assessment

Visual Rating Panel Guidance

Table 2-3 Visibility Threshold Level (VTL)

Visibility Rating	Description
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections! and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45 degrees from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.

2.4 Material Provided to the Rating Panel

The Project and KOP familiarization material and rating forms are detailed below in Table 2-3.

Table 2-4 Materials Provided to the Rating Panel

Item	Content
General Project Information – to be provided at the Project introduction	
Rating Panel Guidance	Introduction to the Project
	Definition of Terms used
	Instructions for Visual Rating Panel
LSZ Information	Mapped location and description of LSZ within the VSA
Location File	A Google Earth file that illustrates the VSA, KOPs, and Project Components
Information for each KOP – to be provided as information data sets during the visual rating process	
KOP Simulation Set	Context Page with panorama and KOP-specific information
	Existing Project conditions photograph(s)
	Proposed Project conditions simulation(s)
Tour File	Google Earth file, providing a tour that provides an overview of the KOP location relative to the Project and a walking tour that illustrates the typical approach to the KOP.
Rating Panel Forms	Familiarization Form
	Existing Conditions/Scenic Quality Classification (SQC) Form
	Proposed Conditions Form
	Contrast Rating Form

Landscape Similarity Zone: _____

Key Observation Point Name/Number: _____

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- **Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- **Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- **Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- **Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☐ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☐ No

If yes, how does the natural order affect the view?

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☐ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as:

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☐ Yes ☐ No

How would the site be used for scenic or recreational enjoyment?

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections! and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 2/25/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Atlantic City

Key Observation Point Name/Number: AC02 Jim Whelan Bo

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: A building that protrudes in to the water.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a natural layering of built shoreline, beach, water and open sky.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC02 Jim Whelan Bo

Date: 2/25/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The built elements become the focus of the view.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. **Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.**

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: More moisture in the atmosphere would likely decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. **Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.**

The relevant lighting condition can be described as: ☐ backlight ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is beach front destination for a large population.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC02 Jim Whelan Bo

Date: 2/25/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>8</u>
Landform:	<u>5</u>
Vegetation:	<u>4.5</u>
Land Use:	<u>6</u>
User Activity:	<u>7</u>
Existing Conditions #1 Total:	<u>30.5</u>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<u>2</u>
Special Condition B. Are there other aesthetic elements that add to this resource?	<u>1</u>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	<u>2</u>
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) 5

Existing Conditions Grand Total (Sum #1 Total and #2 Total) 35.5

3. Comments:

This is a highly used, highly populated beach front area that has open water views. The existing infrastructure along the beach captures the viewers attention, as would the activity of the many users of this area. This scene is dominated by a large building that breaks through the beach line and into the water.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC02 Jim Whelan Bo

Date: 2/25/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>1</u>
Landform:	<u>3</u>
Vegetation:	<u>4.5</u>
Land Use:	<u>3</u>
User Activity:	<u>2</u>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: 3

Total: 16.5

3. Comments:

The simulated view shows an enormous field of turbines in the ocean in close enough proximity to shore to be highly visible. This new view is in stark contrast to the existing open water views. The number and proximity of the visible turbines creates a kind of urban/industrial condition in the open water. This will have a significant impact on the character and aesthetic of the area.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC02 Jim Whelan Bog

Date: 2/25/21

Proposed Conditions

8. **Visibility Threshold Level** - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions are dominant to the extent that they completely change the character of the view.

Visual Impact Assessment

Date: 23 February 2021

Personnel: KAC

Landscape Similarity Zone: Atlantic City

Key Observation Point Name/Number: AC02 JW Boardwalk

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Shopping center, 6) big screens, beach activities, piers, ocean and horizon.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

The natural order of beach to ocean to sky is interrupted by the large man-made structures that jut into the ocean and obstructs the clear view to the entire seascape.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC02 JW Boardwalk

Date: 23 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *The Playground Pier shopping mall is both visual clutter and visually incongruent with the anticipated beach experience. The building is a visual obstruction.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Duration of views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: *Clearer atmospheric conditions would increase the detail of the turbines on the horizon.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *Atlantic City Beach, Atlantic City Convention Hall*

Special Condition B. Are there other aesthetic elements that add to this resource?

1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

3

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

28.5

3. Comments:

Cultural | Historic: Atlantic City Beach, Atlantic City Convention Hall.

Aesthetic: Wide open sandy beach.

Litter: Beach and city visitor litter.

Summary of View: Contextually, the interesting architecture of the Jim Whelan Boardwalk Hall is minimized amongst the larger, modern buildings and casinos that flank it, especially the Playground Pier shopping mall that juts into the ocean and obstructs the full beach experience. The (6) big-screen towers on top of the mall match the scale of the casinos across the boardwalk and dominate the view due to the cross-cross steel framing. The beach, ocean and horizon are secondary elements to the man-made structures in this view, which is visually compromised in it's existing condition.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC02 JW Boardwalk

Date: 23 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	4.5
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 27.5

3. Comments:

The addition of the wind farm and elevated substations to the existing view further industrializes and commercializes the Atlantic City beach strip. The view is already compromised by the man-made structures that have been built upon it, adjacent to it, and right into the ocean, especially the Playground Pier shopping mall and associated (6) big-screen towers with extensive structural framing. The mass and scale of the proposed turbines at 11.42-miles to the nearest turbine is visually clear and the lack of order, varying heights, stacking and level of bisection on the horizon serves to intensify the perceived level of visual clutter in the view. However, the turbines are lighter in color and finer in texture in comparison to the midground building architecture that sits heavily in the view and holds the viewer's attention.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC02 JW Boardwalk

Date: 23 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	4.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	5

7. Comments:

Compatibility: The turbines are in full view, however, the existing view is compromised by existing built elements within the view.

Scale: The turbine are easy to see at 11.42-miles to the nearest turbine and are an extension of the existing scale of the buildings along the edge of the view.

Spatial Dominance: The turbines are visual dominance in the view, however, they are in keeping with the dominance that the built forms have within the view.

Visual Impact Assessment

Date: 02-22-2021

Personnel: KV

Landscape Similarity Zone: Atlantic City

Key Observation Point Name/Number: AC02 - Boardwalk Hall

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: the ocean side edge of developed pier

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

the repetition of tire track lines on the shore and the repeating wooden docks draw the viewer from the less congested right edge of the view into the scene landing on the congested focal point of the developed pier

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: AC02 - Boardwalk Hall

Date: 02-22-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? the business of the beach users and orange cones becomes a focus attracting attention away from the more serene elements

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: visibility on a clear day may increase, while an overcast hazy day will decrease

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? this site is used for recreation purposes such as swimming, non-motorized boating, sunbathing, and a variety of other beach activity.

2 of 6

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	4.5
Land Use:	3
User Activity:	5

Existing Conditions #1 Total:

22.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

2

Existing Conditions #2 Total (Sum 2A through 2C)

5

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

27.5

3. Comments:

motion attracting viewer attention: ocean waves, beach goers, birds

This view captures an expanse of ocean shoreline connected to a highly developed area. While large scale hotel, casino, and recreation facilities are primarily behind the framed view, they are represented within the view by an intensely developed recreation pier originally developed as a 4-story shopping mall. The otherwise open ocean is partially blocked by this pier. Landform in this view is a smooth sandy shoreline with gradual decline to the ocean, and distant views of landform are blocked in this direction by the pier. No vegetation is available in the view, but within this region grassy dunes general back the sandy beach and obscure portions of the boardwalk from ocean visibility. Land use within this scene is primarily recreational ranging from low impact to very high impact. User activity within this view is similarly recreational and may be represented by beach goers or shoppers/tourists within the pier. Just beyond the viewframe large early day crowds are beginning to form. A variety of ATV tracks are found in the view from life guards and other safety/maintenance employees traversing the shore. Outside vehicles are not permitted in these locations.

This site is from shoreline directly in front of the Atlantic City Convention Hall NHL. No other aesthetic resources are apparent, minimal litter is present but the many trash cans just out of view assume that it is common.

3 of 6

Visual Impact Assessment

Personnel: KV

KOP: AC02 - Boardwalk Hall

Date: 02-22-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	3
Landform:	4
Vegetation:	4.5
Land Use:	3
User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **23.5**

3. Comments:

This scene with the addition of the WTG array shows a horizon densely populated with turbines. The size and massing are unmistakable and atmospheric conditions are unlikely to diminish visibility by a noticeable amount except during extremely conditions such as very cloudy/foggy days. The large substations sit visibly as heavy blocks between turbines. Across the breadth of the array WTG clustering and stacking seems to expand and contract with disorganized, scattered clusters aligning into a formalized procession before disbanding and realigning, depending on the viewer's exact location. Areas of stacked turbines create a higher value coloration but vacant lanes between allow for the understanding that open horizon exists beyond. Where turbines appear scattered they individually sit lighter on the horizon, but crowd the viewer.

Water resources, previously impacted by the intensely developed pier, find further reduction in natural scenic value. The above score reflects a notion that reduction of natural scenic value will result in an overall reduction of scenic value. However, it may be worth noting that scenic value at a highly developed, high volume tourist attraction may not be rooted in natural quality alone. However, a deeper understanding of the users within this space would be required to assess that. Similarly, the flat sandy shoreline is further diminished by the vertical nature of the WTG, and when compared to the more natural form is likely to see a decrease in quality. Given the intensity of existing development related to both land use and user activity components of either are unlikely to be displaced by this new development.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: AC02 - Boardwalk Hall

Date: 02-22-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="9"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="9"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="10"/>

7. Comments:

The WTG at this location are not compatible with the water resources or landform, similarly the scale contrast is severe and are spatially dominant. However, the WTG are compatible with the current highly developed (but non-point source polluting) land use. Similarly, the WTG are minimal when compared to the current scale contrast, but co-dominant spatially. Yet, existing user activity may focus on either developed or natural activity and therefore WTGs may be viewed as somewhat compatible, moderate in scale, and co-dominant.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: AC02 - Boardwalk Hall

Date: 02-22-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

These turbines are intensely visible and the visual prominence is likely to detract noticeable from the existing view of the seascape. However, assessing what this means for the proposed view in highly developed area is difficult as there is no precedent.

Visual Impact Assessment

Date: March 02, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Resident / Tourist

Key Observation Point Name/Number: AC02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Large billboards, unique architecture with boardwalk style deck over the water.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The order is from the ocean waves cresting on the shoreline, across a wide sandy beach, to urban development with high-rises and glass to take advantage of the oceanfront view.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC02

Date: March 02, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The clutter is within the architecture. Variety of color, materials, and forms. The beach has a smaller, less obtrusive clutter with safety cones, gulls, and lifeguard elements.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Thin clouds in the middle of the sky transitioning to a dense white haze at the horizon.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? The land has been developed to take specific use of this location and view.

Existing Conditions #1 Total:	<input type="text" value="34.5"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This portion of beach is adjacent to large hotel development, the Boardwalk with multiple beach connections, and the historic Boardwalk Hall. The architecture is designed to take advantage of this location with glass facades and deck perched over the water. This appears to be a busy beach given the advertising. Low waves casually approach the shore and wash up on the sand. The sky is hazy white at the horizon, leading to wispy clouds before turning to a pale blue at the top of the view.

Total:

3. Comments:

The proposed turbines fill the horizon, scattered across the entire view. Though not particularly high in the sky (at approximately the same level as the ocean-side deck at the Hall), the turbines become the collective focal point in the distance. Stacking and spacing makes some of the rows appear more dense and dark against the light sky.

Visual Impact Assessment

Date: 2/16/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Casino District/City Center

Key Observation Point Name/Number: AC04 Ocean Casino

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe. *The Pierpiers act to center one's view to that area.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The open water view that meets the horizon and skyline create a natural order to the majority of the scene.

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *There are numerous built elements on land that do not relate strongly to one another, but generally act as a built field relative to the beach line and open water.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. **Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.**

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *More moisture in the atmosphere would likely decrease visibility*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. **Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.**

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ sidelit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This is an oceanfront destination location for large amounts of people.*

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC04 Ocean Casino

Date: 2/16/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	8
Landform:	5
Vegetation:	4
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	31

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	3
Special Condition B. Are there other aesthetic elements that add to this resource?	2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	2
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) **7**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **38**

3. Comments:

This is a pristine open water view that will be seen by many users for extended periods of time. The visual clutter of the land area is perceived as a general mass relative to the clean open lines of the piers and horizon that frame the water. There is likely to be movement in the waves and in the users along the shoreline, including traffic and pedestrians.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC04 Ocean Casino

Date: 2/16/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	3
Vegetation:	3
Land Use:	3
User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **20**

3. Comments:

The open ocean view is dominated by a highly visible and very large field of turbines. Users in this space will focus on the turbine field and it has a significant impact on the view. Viewers will be drawn to the grid formation of the turbines and the varying perspectives of the straight lines of structures. The movement of the blades will be clearly visible and will animate the view.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC04 Ocean Casino

Date: 2/16/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>10</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>2</u>	Total:	<u>13</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

7. Comments:

This view is a significant component of how this particular landscape is valued and the impact of this proposed field of turbines is significant. The proposed field of turbines will become the focus of the landscape, and because of its relative close proximity and large scale, it will dominate the landscape.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC04 Ocean Casino

Date: 2/16/21

Proposed Conditions

8. **Visibility Threshold Level** - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions are highly visible, create strong contrast, and will strongly alter the image of this landscape.

Visual Impact Assessment

Date: 16 February 2021

Personnel: KAC

Landscape Similarity Zone: Casino District | City Center

Key Observation Point Name/Number: AC04 OCR Sky Garden

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon line and slip of pink sky.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Urban landscape, dune, beach, ocean, horizon, and sky; horizontal landscape with very few vertical elements.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC04 OCR Sky Garden

Date: 16 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Dispersed land uses; utility poles and guard rails along roadway at beach edge and man-made jetties

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Thick cloud layer at the horizon in the photo interrupts the pink-red sky from being fully visible.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? The Atlantic City Beach.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	6
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	33

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **36**

3. Comments:

Cultural | Historic: Atlantic City Beach

Aesthetic: Extensive water views to the horizon. Natural rock jetty is interesting in texture against the relatively smooth nature of the water surface. Large surf waves.

Litter: Urban visitor litter.

Summary of View: This elevated view from the casino building terraces allows a wide, unobstructed view to the strong line where the ocean and horizon meet. The view is focused outward as there is no adjacent architecture or land use to draw the viewer's attention away from the ocean. Repeated utility poles punctuate the border of the vegetated dune and beach edge and fencing directs the path of travel. These elements interrupt the seamless transition between the built landscape, vegetated beach front and the rolling surf.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC04 OCR Sky Garden

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	6
Vegetation:	6
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **30**

3. Comments:

With the Project in place the view is now completely focused on the massive wind farm and multiple elevated substations that are installed mid-row within the turbine arrangement. The view to the horizon is interrupted by the dense overlay of stacked turbines that are clearly visible at this viewing distance. The turbines do not have an organized pattern and are seemingly scattered throughout the view, thereby introducing visual clutter to what was otherwise a mostly pristine seascape view. It would be impossible to sit in the Sky Garden and not be focused on the whirling and turning of the turbine blades, which would be spinning at different cadences to each other.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC04 OCR Sky Garden

Date: 16 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	1	Total:	12

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	1	Total:	12

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	3
Landform:	1	User Activity:	3
Vegetation:	1	Total:	11

7. Comments:

Compatibility: The magnitude of the turbine installation is overwhelming to the view.

Scale: At 10.54 miles to the closest turbine the wind farm scale overpowers the adjacent land uses and items of visual interest.

Spatial Dominance: The wind farm is the dominant visual feature within the view.

Visual Impact Assessment

Date: 02-16-2021

Personnel: Kiva VanDerGeest

Landscape Similarity Zone: Atlantic City

Key Observation Point Name/Number: AC04 - Ocean Casino

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: *Focus in this view is drawn to the point of the drone jetty sitting out on the ocean.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

The striation of dunes exhibited across the view draws the viewer into the frame, the gaze then scans across the view and the dark sea at the horizon accenting the electric pink horizon sandwiched between dark sea and clouds hold the view.

1 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: AC04 - Ocean Casino

Date: 02-16-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *the amount and variety of boardwalk user amenities adds visual clutter to the image, although it is entirely contained within the very bottom of the first framed view.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *clear conditions could increase visibility, and hazy decrease visibility*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *The boardwalk and concentration of site amenities signifies this place as a recreational resource that is highly utilized.*

3. Comments:

Motion likely to attract viewer attention in this view: Other users moving along the boardwalk and beach (walking, biking, jogging, exercising). Buoys floating on waves/floating in dim lighting. Ocean waves.

The existing view demonstrates a high overlook toward the ocean in the early morning hours. The unique nature of this view is largely attributed to the water resources and the ability to view from such an elevated vantage point. Land form in this view is minimal and provides a glimpse of large boardwalk and concentration of site amenities suggest this location anticipates serving large crowds. The minimal vegetation suggests its purpose as a protective element to hold the sandy shoreline and boardwalk, the height of the dunes blocks the majority of views from the boardwalk to the ocean, suggesting boardwalk user activity is centered away from the ocean view itself. The views anchored on the bottom left corner by heavily muted grays, line, and texture of the boardwalk. Viewer gaze moves across this area following the variety of lines, the boardwalk and handrails draw horizontal to vertical light posts, diagonal lines of the vegetation and the shoreline with the stone pier projecting on a cross access brings viewer attention to the ocean scene. The electric hues of the early morning sky help separate the deep tint of the clouds from the ocean and highlight the expanse of the outward view of unimpacted ocean dotted in the foreground by buoys. However, the scene just beyond the selected view indicates a sharp transition from well maintained shoreline recreation to neglected landscapes with dirt and gravel lots marred by pitting and pooled water run-off.

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: AC04 - Ocean Casino

Date: 02-16-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	3
Landform:	5
Vegetation:	5
Land Use:	4
User Activity:	3

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **25**

3. Comments:

This view within a highly developed urban area benefits from the uniqueness of the elevated vantage point providing viewers with a sense of the expansive nature of the open ocean. However, the introduction of the turbine encloses the view and re-centers the scene back to a strong emphasis on the built environment. The backlit turbines spanning a good stretch of horizon, along with large substation masses greatly alters the nature of this view which once provided a visual respite from the intense development on land.

4 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: AC04 - Ocean Casino

Date: 02-16-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="8"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="13"/>

7. Comments:

The turbines placed and backlit on the horizon greatly affect the water resources and ocean viewing within this scene. However, the existing vegetation is minimal and the land form is primarily flat from heavy development which leads to a decrease in the impact of the WTGs. Similarly, land use and user activity at this location straddle a fine line of intense high rise development, neglected and abandoned land, with space carved out along the shoreline to take in the disparities between a more natural sand beach and the highly developed resort destination. In this way, at this location, the WTG find some sense of compatibility with the existing land use and user activity.

5 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: AC04 - Ocean Casino

Date: 02-16-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The strong back-lighting against the muted pastel colors of the sky make the dark silhouettes pronounced within the view. With the turbines in motion it will become difficult to distract viewer attention from the turbines. However, if the boardwalk and beach become fully utilized during the height of tourist season the entire view will be busy, distracting, and difficult to find focus. On days that are both busy and more overcast or hazy the turbines may be more appropriately classified as a VTL5.

Visual Impact Assessment

Date: February 17, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Casino District/ City Center

Key Observation Point Name/Number: AC04

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Man-made stone jetty extending approximately 375' straight out from the coastline. Pedestrian accessible.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is an order in the expansive open water meeting the sky as the sun rises; coming back to land with cresting waves lapping at a sandy beach. The beach is backed by low grassy vegetation and an elevated wood boardwalk.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC04

Date: February 17, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Cloud bank creates a dark edge on the water at the horizon.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment?

The view is from a Sky Garden at the Ocean Casino-Resort, a lush outdoor deck space.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	7
Vegetation:	6
Land Use:	9
User Activity:	9
Existing Conditions #1 Total:	40

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

3

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

2

Existing Conditions #2 Total (Sum 2A through 2C)

8

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

48

3. Comments:

This is a postcard view from the hotel Sky Garden where the eye is immediately drawn to the dark, clean, and calm horizon, accentuated by the rosy orange sunrise. The view is drawn back to shore by a straight, stone-tiled jetty extending into the water. This focuses attention on the waves cresting at the sandy shore, leading up to a scrubby swath of vegetation. A wide wood boardwalk adds a constructed recreation aspect with railings, pedestrian scale double-hung lighting, benches, adirondack chairs, and trash receptacles. There is a softness to this view both in color with warm blues and earth-tones, and texture with the waves at the beach.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC04

Date: February 17, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	3
Landform:	4
Vegetation:	6
Land Use:	2
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 20

3. Comments:

The proposed turbines have an imposing presence on the horizon, their density and spacing forming a semi-transparent fence-like line that extends across the majority of the view. Lighting plays an important role in proposed turbine visibility. The structures are backlit by the rising sun and there is a break in the clouds at the horizon that lightens this portion of the view. The clouds and water are dark near the turbines, with the exception of the opening in the clouds that adds an orange band as a backdrop.

There is minimal existing development or interference in the natural order of this view, limited to a small boat on the left, buoys in the water, the stone jetty, and the elevated boardwalk. The turbines and associated infrastructure contribute a band of development at the perfectly clean horizon.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC04

Date: February 17, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	1	Total:	12

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	1	Total:	12

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	3	Total:	12

7. Comments:

The proposed turbines terminate the expansive existing view. The horizontal edge where the dark water meets the light sky is interrupted by picket-like structures that will add motion to an otherwise calm view. The only existing movement is the flat water, the wave action at the shore, and the pedestrians. The turbine spacing appears tight as they line up behind each other, creating darker and more dense forms.

Visual Impact Assessment

Date: 2/16/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BC02 North Brigantine

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe. *The horizon line acts as a focal point in this view.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The open water view that meets the horizon and skyline create a natural order.

1 of 6

Visual Impact Assessment

41.5

3. Comments:

This is a pristine open water view that will be seen by users for extended periods of time. There is movement in the waves, and a clean, simple organization of line and form. The open water view dominates the landscape.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BC02 North Brigantine

Date: 2/16/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	3
Vegetation:	4.5
Land Use:	3
User Activity:	3

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **20.5**

3. Comments:

The open ocean view is dominated by a highly visible and very large field of turbines. Users in this space will focus on the turbine field and it has a significant negative impact on the view. This is a stark contrast to the undeveloped nature of the environment in the existing conditions. The proposed conditions add significant visual clutter that becomes the focus of the view. The motion of the turbine blades will add to their presence. The perspective of the arrangement of the structures creates new lines in the view.

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BC02 North Brigantine

Date: 2/16/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>9</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>0</u>	Total:	<u>11</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>0</u>	Total:	<u>10</u>

7. Comments:

Users of this environment will find a strong contrast in before/after conditions. The general appeal of this particular landscape is its undeveloped nature and pristine open water views. This will change dramatically with the view being dominated by the field of turbines. These proposed turbines create a significant "bulk" presence in an otherwise natural landscape.

Date: 2/16/21

Proposed Conditions

2. **Visibility Threshold Level** - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Fairly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions are highly visible, create strong contrast, and will strongly alter the image of this landscape.

Visual Impact Assessment

Date: 16 February 2021

Personnel: KAC

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BC02 N Brigantine NA

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Beach, surf, waves, ocean, and horizon; horizontal landscape with strong striations of waves.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BC02 N Brigantine NA

Date: 16 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? NA

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Hazy or overcast conditions could reduce the depth of visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Undeveloped Beach with associated natural area

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BC02 N Brigantine NA

Date: 16 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	4.5
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	29.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **4**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **33.5**

3. Comments:

Cultural | Historic: Undeveloped Beach | Natural Area

Aesthetic: Wide water view to the horizon. Rolling surf and sense of isolation and privacy.

Litter: Limited visitor litter.

Summary of View: The undeveloped view to the ocean and horizon is a visually pleasing combination of light colored fine sand that is clear of sea debris and visitor trash, gently rolling surf and sea birds dashing through the scene. The deep blue-green color of the water meets the light blue of the horizon strongly, which emphasizes the flatness of the horizon. The long rolling waves create strong striations of textured water through the midground, contrasting the stillness of the sky and sand.

Visual Impact Assessment

Personnel: KAC

KOP: BC02 N Brigantine NA

Date: 16 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	4.5
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: **28.5**

3. Comments:

With the Project in place, the view is totally focused on the massive wind farm and multiple elevated substations that are positioned within the turbine arrangement. The straight on view to the wind farm emphasizes the perceived disorder of the turbine layout. There is a limited section of turbines that are densely stacked over themselves while the others are in a more random pattern, at varying heights. This layout pattern increases the level of perceived visual clutter and detracts from the aesthetic quality of what was once a pristine seascape. The beach is no longer "undeveloped" due to the industrialized intrusion of the massive wind farm.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BC02 N Brigantine NA

Date: 16 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	0	Total:	10

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	0	Total:	10

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	0	Total:	10

7. Comments:

Compatibility: The undeveloped character of the beach is transformed by the intrusion of an industrial utility.

Scale: At 9.03-miles to the nearest turbine, the towers, rotors and blades are massive in scale and highly visible against the background sky. If there were other scaleable object in the view, the turbines would appear even larger than they do in its undeveloped beach area.

Spatial Dominance: The wind farm dominates the viewers experience.

Visual Impact Assessment

Date: 02-16-2021

Personnel: KV

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BC02 - Brigantine Nat

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

natural order in this view provides a strong sense of calm with smooth sand recently washed by waves, birds combing the tide, and the gentle ocean swells

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: BC02 - Brigantine Nat

Date: 02-16-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *instances in which the turbines are backlit against light clouds, or frontlit against dark storm clouds could increase visibility*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *The North Brigantine Natural Area is utilized for enjoyment of the natural landscape including fishing, beach combing, and swimming*

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	2
Special Condition B. Are there other aesthetic elements that add to this resource?	2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	3
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) **7**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **40.5**

3. Comments:

Movement attracting viewer attention: variety of birds, ocean waves.

This existing view demonstrates an ocean beach scene with a sense of undisturbed natural environment. Water Resources at this location are within the range of distinct in part due to limited human interaction. Much of the surrounding region is highly developed serving a large tourism market while this distant portion of the Natural Area blocked from beach vehicle traffic, and passerby are infrequent. An expanse of open ocean draws viewer attention to the distance, but then movement of the near foreground ocean ecosystem becomes apparent. Ocean waves circulating sea life, a variety of bird types scour the tide, fluttering, and settle in response to wave movement. Visible land form is flat, sandy beach with gentle slope toward the water. Horizontal lines stack beach shoreline ocean horizon/sky, and encourage viewers to square themselves to the frame. Vegetation is not found within this view although the location map suggests the viewer finds dunes to their back. Preservation and protection make-up the primary Land use and User activity within the framed view, but to the right hand side, just beyond the view, former dock posts remind the viewer the scene is not untouched. However, the noticeable decay of the posts relates them to the natural ocean processes established in the view. While this view is focused on the recreational nature of the site and its sweeping expanse of ocean, it may be worth noting that a view directly down the shoreline to the south will find the distant high-rise buildings of Atlantic City shrouded in a soft haze.

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	3
Vegetation:	4.5
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	6
---------------------	----------

Total: **28.5**

3. Comments:

With the proposed project in place the view transitions from a space for viewing natural processes to a space of viewing turbines. As the WITGs sweep across the view they appear to transition between scattered disorganization and regimented alignment based on the exact location of the viewer. The once expansive ocean view is enclosed by a wall of turbines centered on the horizon. This walled effect may increase with the unsynchronized movement of turbine blades further capturing viewer attention. The horizontal nature of the land form stacked with beach ocean horizon/sky now finds intensely vertical structures protruding upwards. Land Use and User Activity is distracted from natural processes and entangled with development. It is unlikely that the interplay of birds and waves will so easily attract the viewers gaze once competing with the constant methodical motion of the WITGs.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: BC02 - Brigantine Na

Date: 02-16-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="12"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="12"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="10"/>

7. Comments:

The WTG compared to the existing environment do not find compatibility and their scale is quite severe. Despite the expanse of visible horizon at this location the size of the WTG at such close distance dominate the view. While vegetation is not in the view it is directly behind the viewer and limits the depth of the sandy beach. The relative shallowness of the beach width (and land form) is likely to be exacerbated by an enclosed feeling created from the expanse of turbines at this near distance. Hazy conditions or variable lighting conditions may lessen this impact, but the size and expanse of the WTGs in this array and at this distance will be visible under a majority of conditions.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: BC02 - Brigantine Na

Date: 02-16-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

With the Turbines roughly centered on the available horizon, the size of individual turbines, and breadth of the array the Project at this location becomes the major focus of visual attention.

Visual Impact Assessment

Date: February 18, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BC02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BC02

Date: February 18, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Sky and air are both clear, as evidenced by a distant sailboat on the horizon.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☒ No

How would the site be used for scenic or recreational enjoyment? This is an open, unobstructed view across the ocean. Also have to go to this spot intentionally.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BC02

Date: February 18, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	8
Landform:	7
Vegetation:	4.5
Land Use:	8
User Activity:	7
Existing Conditions #1 Total:	34.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

0

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

3

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

37.5

3. Comments:

This is a nondescript stretch of oceanfront beach. There is nothing distinctive that gives the view any sort of identity, which in turn gives it a unique sense of isolation. Warm grey sand, white low waves in the surf, dark blue to the horizon, and a faded blue to light blue cloudless sky. If not for the sailboat, there would be nothing to focus on in the distance, just endless water.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BC02

Date: February 18, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	2
Vegetation:	4.5
Land Use:	3
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 16.5

3. Comments:

This location has an ironic feeling of seclusion, where someone could come to a place wide open and free and still have a sense of privacy and detachment. Someone would need to come here with purpose; this is not a casual view from a road or a scenic overlook. The proposed turbines bring industry, constructed repetition and motion, and scale to the view. A previously undisturbed view of the ocean focuses on rows of turbines that extend deep into the perspective. The sky is a faded white-blue color at the horizon, clearly defining every component of the turbines that appear darkened in this light.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BC02

Date: February 18, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	0	Total:	12

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	0	Total:	11

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	0	Total:	12

7. Comments:

People would come to this spot for the view. While there is no defined existing focal element, the openness becomes the focal point; if people walk here it would be to specifically detach and not have a focus. The proposed turbines alter this feeling by dominating the entire horizon. There is nothing denoting scale other than one turbine to the next, making this field seem enormous. As there is nothing to focus on in the existing view, the field of turbines becomes the sole, unavoidable focus.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BC02

Date: February 18, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

There is nothing to see in this existing view. Your sight is either focused on the beach, the waves and water, or the sky. The turbines provide a dominant and consistent focal point in the distance.

Visual Impact Assessment

Date: 2/16/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01 Beach Haven

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe. *The tall beach lookout chair anchors this view.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The layering of shoreline, open water and horizon create a natural order.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB01 Beach Haven

Date: 2/16/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *The fence line and chair in the foreground attract one's attention.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. **Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.**

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: *Drier conditions might increase visibility*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. **Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.**

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This area will be used by nearby homeowners and visitors for recreation and views.*

KOP: BHB01 Beach Haven

Date: 2/16/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 or 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	5
Vegetation:	5
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	33

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	3
Special Condition B. Are there other aesthetic elements that add to this resource?	2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	3
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) **8**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **41**

3. Comments:

This is a pristine open water view that will be seen by users for extended periods of time. The open water view dominates the landscape with the movement of the waves animating the scene. There is some visual clutter in the foreground, consisting of fences and roads, that will likely host human movement and activity. This area tends to act as a somewhat cohesive element because most of the horizontal lines within it are parallel to the shoreline. The sidewalk beach lookout chair anchors the view in the foreground.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB01 Beach Haven

Date: 2/16/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 or 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	3
Landform:	4
Vegetation:	4
Land Use:	3
User Activity:	3

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **22**

3. Comments:

The open ocean view is dominated by a very large field of turbines that will be in motion. Users in this space will focus on the turbine field and it has a significant negative impact on the view. The perspective of the arrangement of the structures creates new lines in the view. The conditions appear to be hazy in this simulation and one could expect that clearer conditions or alternative lighting could increase the visibility and level of contrast of the turbines.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB01 Beach Haven

Date: 2/16/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>9</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>9</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

7. Comments:

The general appeal of this particular landscape is its open water views. This will change dramatically with the view being occupied by the proposed field of turbines. These proposed turbines create a significant "built" presence in an otherwise natural landscape. The level of contrast in this view, despite the visible nature of the turbines, is lower due to atmospheric and lighting conditions.

Visual Impact Assessment

Date: 16 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01 BHaven HD

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Fore-ground beach fencing, pink-tinged horizon line and cotton-candy clouds.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Man-made sand dune control, beach fence, beach and surf, ocean and horizon; the horizontal landscape is punctuated by the repeating vertical fence elements and railings, which are a visual barrier, and the broken clouds in the sky that compress the view to the center of the image.

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Handrails, beach fence, signage and life guard chair.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: The early morning view has a dark sky, a clear or bright sky would increase turbine definition.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Beach Haven Historic District.

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01 BHaven HD

Date: 16 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	6
Land Use:	7
User Activity:	6
Existing Conditions #1 Total:	32

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **35**

3. Comments:

Cultural | Historic: Beach Haven Historic District

Aesthetic: Wide water view to the horizon over a thin beach in front of the dune vegetation and beach fence, however, it is obstructed by man-made objects in the foreground.

Litter: Beach visitor litter.

Summary of view: The early morning view across the pedestrian entry to the beach and greater ocean landscape is pleasant and visually appealing although the foreground railings and beach fencing are both a visual barrier and visual clutter to the initial beach experience. The early morning sky is tinged pink and is heavy with atmospheric haze and spotted cloud cover rendering the colors in the view to be deep hues and the ocean a mostly monochromatic deep green color.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01 BHaven HD

Date: 16 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **32**

3. Comments:

The early morning sky is dark and dense as the sun has not burned through the clouds. The side-lit condition as the sun is rising minimizes the extent of the wind farm's visual impact in this view, at this moment, since a portion of the turbines blend into the deep blue shades of the morning sky and others glow in a ghostly light blue color to the far right of the view. The elevated substations appear as dark elements dotted along the horizon line. The light colored turbines are visually compelling and draw the viewer into the experience to engage the in between of the moment between light and dark, when the wind farm transitions from being camouflaged to fully visible against the sky. The impacts of the installation may be significantly greater later in the day, when the turbines are even more clearly articulated against the sky.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01 BHaven HD

Date: 16 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	2	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9

7. Comments:

Compatibility: The morning light conditions minimize the visual effect of the wind farm as the turbines sit ghostly against the sky.

Scale: The foreground elements are greater in perceived visual scale than the nearest turbine a 13.5-miles away.

Spatial Dominance: The lightness of the turbines against the sky reduces the viewer's ability to clearly see the patterning, or lack of patterning in the turbine massing, therefore, the turbines are not spatially dominant due to the camouflage of the morning light and color.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01 BHaven HD

Date: 16 February 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and fleeting, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-17-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01 Beach Haven #1

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: while ocean meeting horizon serves as a primary focal point, the fencing, life guard stand, etc, are also a focal

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

natural order serves to help circulate the viewers gaze throughout the image despite the high value contrast of the shadowed railings and fencing

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: BHB01 Beach Haven #1

Date: 02-17-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? varied and bisecting lines from built elements add both interest and distraction to this view, the lines encourage the eye to move throughout the view, but add visual weight

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: clear even skies could increase visibility, current color variability make some turbine clusters contrast more or less

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlight ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? this area is an NRHP Historic District and provides location to view the ocean and to access the shoreline beach.

3

Existing Conditions #2 Total (Sum 2A through 2C)

6

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

37

3. Comments:

Movement attracting viewer attention: Ocean waves

The existing view at this location takes advantage of a colorful horizon just after sunrise, a golden glow is cast across the scene. While aesthetically pleasing, Oceanfront Residential areas are a primary land use within this study area, many of which have similarities with this location. Much of the elements in this view, natural and man-made, serve as protective measures and are common to this type of view. The rolling dune landform not only assists in holding the shoreline but protecting the residences behind them. Young dune grasses, sand fencing, and highly constructed beach access points protect these dunes. Lifeguard stands and safety signage protect users in the scene. These elements enliven and compliment the scene, yet are extremely utilitarian and could be described as integral parts of an average Oceanfront Residential scene.

This area is within a NRHP district, the high sloping dunes are well maintained, and the view is generally in a well maintained area free from visible pollution/litter.

3 of 6

Visual Impact Assessment

Personnel: KV

KOP: BHB01 Beach Haven #1

Date: 02-17-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **6**

Total: **30**

3. Comments:

While the existing scene has a primary focus on elements which serve in support of ocean viewing, this scene with the Project in place becomes in support of viewing the WTs. The backlit/side-lit turbines sit as dark silhouettes on the horizon with greyish blue hues break up the pink horizon. Where the sky begins to darken the turbines blend with the sky, but are highlighted with a white glow from side-lit components. Turbines echo the horizontal lines of the sand fencing in a manner that could be complimentary for some, but distracting for others.

Turbines break-up the open horizon and heavy substations sit as blocks in the distance. While the vegetation and land form are not changed by the introduction of turbines the viewer is likely to be distracted from them and focus on the arrangement of the turbines, both cluttered and forming a stacked arrangement. Slow methodical movement of the turbine blades will likely hold the viewer attention.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: BHB01 Beach Haven

Date: 02-17-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="13"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="11"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="11"/>

7. Comments:

Turbines in the proposed view are primarily not compatible with the scene, however the echo of horizontal lines from the sand fencing and vegetation with a strong vertical growth pattern lend to somewhat compatibility.

The distance of the turbines minimizes their scale contrast leading a primarily moderate contrast.

The WTGs and amount of space they hold on the visible horizon become co-dominant with other elements in the scene. However, given that the ocean previously was a primary focus of viewer attention, and the turbines are now likely to be a primary focus the turbines are considered to become dominant over the water resources.

Visual Impact Assessment

Date: February 18, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BHB01

Date: February 18, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? There is "clutter" in this view (boardwalk railing, dilapidated shoreline fence, signage, and lifeguard chair) but it is not significant enough to disrupt any kind of natural order.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: There is a haze hovering over the water and the lighting creates a warm glow over the whole scene.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? There are residences along the beach presumably to take advantage of the view and the amenities here.

KOP: BHB01

Date: February 18, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	5
Vegetation:	5
Land Use:	9
User Activity:	9
Existing Conditions #1 Total:	37

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

2

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

39

3. Comments:

There are two and three-story multi-family residential buildings in this area taking advantage of the oceanfront view and location. The sunrise (left in view) provides a warmth to everything and a transparency to the creating waves. The view out over the water is free from significant development (only a boardwalk, fence line, and signage), although turning 180 degrees completely alters the calm nature of this scene with the presentation of a dense urban residential land use. The partly cloudy sky has a dense grayish pink haze at the horizon, creating a matte backdrop before ascending to light blue dappled with gray and white clouds.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BHB01

Date: February 18, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	1
Landform:	5
Vegetation:	5
Land Use:	1
User Activity:	1

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **1**

Total: 14

3. Comments:

The proposed turbine field breadth is significant, capturing the majority of the horizon. A combination of lighting, sky color, and turbine spacing accentuate the turbines, increasing their visibility and presence. The turbines on the left side of the view are stacked in way that makes their appearance more dense, to the point where head on view of row looks tree-like. The low side-light makes the turbines on the right side of the view glow, as though they are illuminated. The horizon haze masks the turbines on the right side, blending the individual structures into a larger mass.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BHB01

Date: February 18, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	1	User Activity:	3
Vegetation:	1	Total:	11

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	1	User Activity:	3
Vegetation:	1	Total:	11

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	3	Total:	13

7. Comments:

The height and width of the overall turbine field makes this a dominant feature in the view. Residences along the shoreline have a consistent view of the ocean that is industrialized by the addition of turbine rows. The turbines on the far left have little to no presence as they fade into the haze and are standalone structures. The stacked formation turning to the right makes the turbines unavailable in this view.

5 of 6

KOP: BHB01

Date: February 18, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

9. Comments:

The atmospheric conditions make this a Level 5 instead of a Level 6. The haze obscures a portion of the turbine field, reducing the dominant presence.

Visual Impact Assessment

Date: 08/22/22

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB02 Center Street

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a basic layering of sky, horizon, ocean, beach and dune area. The layers are skewed slightly in a perspective moving to the right side of the view.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB02 Center Street

Date: 08/22/22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? ☐ There are some elements (vegetation/fencing) on the dunes in the foreground that grab ones attention.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: ☐ Clear ☐ conditions would increase view

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? ☐ This view will be used by nearby residents and visitors for recreational enjoyment and viewing.

Date: 08/22/22

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	5
Vegetation:	4.5
Land Use:	8
User Activity:	9

Existing Conditions #1 Total:

35.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

8

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

43.5

3. Comments:

This is an uninterrupted open water view that will be seen by users repeatedly and for long periods of enjoyment. The open water view dominates the landscape and the movement of the waves provides the focal activity. The darker objects occupying the foreground dune areas create a base frame for this view and create a contrast to the open, clear water view.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB02 Center Street

Date: 08/22/22

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	3
Vegetation:	4.5
Land Use:	3
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **19.5**

3. Comments:

This open water view is now dominated by a large field of highly visible turbines that form their own patterns. They become the focus of the view and lend an industrial component to the landscape. Viewers will be affected by the presence of the turbines, likely in a negative manner. They create significant contrast to the existing open nature view. The turbines are highly visible in all lighting conditions and the magnitude of the field extends across the horizon line.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB02 Center Street

Date: 08/22/22

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	2
Landform:	1	User Activity:	2
Vegetation:	0	Total:	8

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	2
Landform:	1	User Activity:	2
Vegetation:	0	Total:	8

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	0	Total:	9

7. Comments:

The open natural water view is interrupted by a large imposing industrial field of turbines extending across the horizon line and forming patterns of rows that range from ordered to chaotic as one moves ones head back and forth. The contrast is high and the turbines dominate the view.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB02 Center Street

Date: 08/22/22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The average visibility level is 5 due to size, scope and pattern of the field of infrastructure. The proposed turbines populate the entire horizon from this view and become the focus of the viewer. The patterns created by the receding rows in perspective create a level of intrigue, as the order and alignment is clear from some directions and then appears to fall out of order as the view crosses rows. Visibility reduces during sunset hours as the lighting creates a less contrasting condition.

6 of 6

Visual Impact Assessment

Date: 22 August 2022

Personnel: KAC

Landscape Similarity Zone: Oceanfront Res, Seascape

Key Observation Point Name/Number: BHB02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Open beach view with sand fence in foreground and pink-tinged sunset with fluffy clouds in background.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Man-made dune control, sand fence, beach and surf, ocean and horizon. Foreground view is punctuated by the repeating vertical fence posts, the midground waves accentuate the horizontal alignments in the ocean, sand, and sky.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB02

Date: 22 August 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Sand fence rails and posts

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Lack of cloud cover; clear sky conditions

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☒ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Beach Haven Historic District

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	6
Land Use:	7
User Activity:	6
Existing Conditions #1 Total:	32

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **35**

3. Comments:

Cultural | Historic: Beach Haven Historic District

Aesthetic: Wide-open water views to the horizon over a compressed beach view due to an elevation change in front of the dune vegetation and sand fence.

Litter: Beach visitor litter.

Summary of view: The early morning view across the pedestrian entry to the beach and the greater view to the ocean landscape is pleasant and visually appealing. The Noon and sunset views are not as visually compelling in color, atmosphere and texture since the noontime sun bleaches out the colors in the view, and the sunset views are dulled in contrast to the sunrise view; however, the Noon view has the most dynamic water conditions. The noontime water seems to sparkle as the waves roll in.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB02

Date: 22 August 2022

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **2**

Total: **30**

3. Comments:

The sunrise sky is dominated by the line of backlit turbines along the horizon line. The midground ocean wave action has more visual interest in this view and draws the viewer's attention, in addition to the spotting pallet of sunrise colors that leads the viewer's attention over the teal/blue of the ocean to the warm texture of the sand fence.

The Noon view is highly contrasting between the sky, water, sand and fencing, thereby making the elements look separate and distinct. The sunset view is dull in color and texture and the waves less dramatic. The addition of the side lit turbines and front lit turbines along the horizon line in both the Noon and sunset views are just another textural element within the view.

4 of 6

Vegetation:	1	Total:	12

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	1	Total:	11

7. Comments:

Compatibility: The density of turbines and the industrial footprint on the horizon reduces the aesthetic quality of the view.

Scale: The scale of the turbines is based upon the cumulative visual weight of the entire system, versus a singular turbine.

Spatial Dominance: The vastness of the ocean is in contrast to the visual weight of the turbines. Both have visual weight and spatial dominance in the view.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB02

Date: 22 August 2022

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and infrequent, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

Visual Impact Assessment

Date: 2022-08-22

Personnel: Kiva VanDerGeest

Landscape Similarity Zone: SCA - Ocean Front Res ider

Key Observation Point Name/Number: BHB02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: *there is no central focal point of this view, but rather the open expansiveness of the horizon is the focus.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Natural order of this view provides the viewer entry into the scene and alludes to the surrounding land uses providing beach access to those in the residential areas just beyond the scene.

1 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BHB02

Date: 2022-08-22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *Dune fencing, silt fencing, and access point adds minimal clutter to the view. However, these elements and the shadows they cast also added interest to the view.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *Haze, overcast conditions*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *Public beachfront*

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	7
Vegetation:	6
Land Use:	5
User Activity:	5

Existing Conditions #1 Total:

29

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

5

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

34

3. Comments:

Movement attracting viewer attention: Ocean waves; clouds and vegetation moving in the wind.

The existing view is situated on a slightly elevated viewing platform located at the midpoint of a wooden beach access structure. The access structure and associated fencing create strong vertical lines in an otherwise horizontal view and the darker colors of the wood provide an location from which the viewers eye can enter the scene. The access structure, dunes, and dune vegetation are all protective measures to support both the shoreline and the residential use just behind the view. The washed browns of the wooden access structure are offset by the light colors of the sandy shoreline flecked with dark colors of vegetation along the dunes and shadows from foot prints and vehicle tracks closer to the shoreline. A strong horizon-line marks a definitive line between the deeper colors of the ocean water and the lighter colors of the sky. The sky is represented in three various conditions with a multi-color sunrise, mid-day with elevated sun reflecting on the water, and sunset with subdued bluish hues.

This area is a publicly accessible beach, the beach access structure adds variety and interest to line and form in this view, no litter is currently present.

3 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BHB02

Date: 2022-08-22

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	6
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **31**

3. Comments:

The existing view does not have a strong central focus beyond the open expanse of horizon and the central focus of the proposed view becomes the turbines on the horizon. The expanse of turbines and dark silhouettes when back-lit somewhat encloses the outward view of the ocean. The vertical lines of the turbine's mimic the access point and fencing, and further enclose the viewer especially during conditions in which the turbines are back-lit and are more similar in color to vertical elements along the shore.

The expanse of turbines on the horizon breaks up the open view and will draw viewer attention from the existing landform and vegetation. Viewers may also be drawn to position their view in a direction to specifically include or exclude visibility of the turbines.

At this distance the turbines have a potential to be quite variable depending on time of day, lighting, and atmospheric haze. When back-lit the turbines may sit heavy on the horizon, but when front or side-lit especially during times of atmospheric hazing the color contrast will be low and may only draw minimal viewer attention.

4 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BHB02

Date: 2022-05-22

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>2</u>	Total:	<u>13</u>

5. Rate scale/contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

7. Comments:

Turbines on the horizon introduce contrast into the view based on the open expanse of the view and uninterrupted horizon. However, the vertical elements mimic the built infrastructure.

The scale of the turbines does not tower over the viewer at this distance and individual components are not discernible, the height of the turbines at this distance does not appear out of scale with development and structures in the surrounding area of this view. Similarly, the turbines do not dominate the view, but do become co-dominant with other features such as the access point fencing and vegetation.

KOP: BHB02

Date: 2022-05-22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, or focus in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of viewers in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectors and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for viewers in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines are plainly visible on the horizon and draw viewer attention, however they do not occupy the majority of the field of view.

Visual Impact Assessment

Date: August 23, 2022

Personnel: Steve Breitka

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: There is a triangular portion in the lower right consisting of a railing with pickets and plant material.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The order consists of development, signified by a railing that presumes access to the beach; followed by a smooth beige sandy beach lapped by low cresting waves. The water appears infinite, drawing the viewer in and extending to the horizon where it meets a solid cloud bank.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: BHB02

Date: August 23, 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: ☐ Haze or fog would decrease visibility. The horizon is a clear line at all three times of day in this view.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view portrays an idyllic beach scene

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

The Simulated Photograph Excerpt frames a postcard view of this public beach. Controlled access through the dune landscape protects the limits of disturbance, the sand appears smooth and free of large rocks, and the calm water gently rolls toward the viewer. The sharp horizon, defined by the dark water and hazy clouded sky divides the view in two. This leaves all of the texture and dominant colors to the lower half of the view and a soft blue sky with faded white clouds in the upper half.

3 of 6

Special Conditions:

Total:

3. Comments:

The proposed turbines become a definitive focal point extending from one side of the view to the other. There are points where the turbines are staggered from this viewpoint, making them appear cluttered, and points where the turbines are in line with one another, making them appear dark and heavy. The existing view presents angles in the landscape including the railing, the line of the beach against the waves, and the horizon. The turbines punctuate the horizon like fence posts and provide an edge to the otherwise infinite water body. The clouds are pale blue at the horizon, further defining the turbines as dark vertical forms.

4 of 6

Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="11"/>

7. Comments:

This pristine beach view is given an industrial edge with the consistent line of turbines running the length of the horizon. As the centerpiece of the view, the turbines steal attention from every other visual feature. There is minimal landform change and vegetation, further minimized by the dominance of the vertical turbines in the distance. The rolling waves, similarly extending across the entire view, will contribute movement in the foreground and offer a different focal point that will compete with the rotating blades.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition is strong contrast in form, line, color, and texture, bright light sources such as lighting and reflectional and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrast in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

There is no missing the continuous line of turbines across the horizon. Regardless of the time of day, sunrise, noon or sunset, the turbines dominate the view.

Visual Impact Assessment

Date: 08/22/22

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB03 Holyoke Avenue

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a clear layering of beach, sand fence, water, horizon line, and sky. These are all uninterrupted horizontal layers across the view.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB03 Holyoke Avenue

Date: 08/22/22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Clear conditions would increase view

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view will be used by nearby residents and visitors for recreational enjoyment and viewing.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB03 Holyoke Avenue

Date: 08/22/22

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	5
Vegetation:	4.5
Land Use:	8
User Activity:	9
Existing Conditions #1 Total:	35.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	3
Special Condition B. Are there other aesthetic elements that add to this resource?	2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	3
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) **8**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **43.5**

3. Comments:

This is an uninterrupted open water view that will be seen by users repeatedly and for long periods of enjoyment. The open water view dominates the landscape and the movement of the waves provides the focal activity. There only man made element in this view is the sand fence and it fits into the horizontal order of the scene with clear regularity.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB03 Holyoke Avenue

Date: 08/22/22

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	3
Vegetation:	4.5
Land Use:	3
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	5
---------------------	----------

Total: **19.5**

3. Comments:

This open water view is now dominated by a large field of highly visible turbines that form their own patterns. They become the focus of the view and lend an industrial component to the landscape. Viewers will be affected by the presence of the turbines, likely in a negative manner. They create significant contrast to the existing open nature view. The turbines are highly visible in all lighting conditions and the magnitude of the field extends across the horizon line.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB03 Holyoke Ave.

Date: 08/22/22

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>8</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>8</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>9</u>

7. Comments:

The original appeal of this landscape is the uninterrupted open water view. The proposed turbines completely change the mood of the landscape, lending a strong industrial developed feel to the view. There is strong contrast from existing to proposed conditions. These are most visible when backlit, and highlight the magnitude of the infrastructure.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB03 Holyoke Ave.

Date: 08/22/22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The average visibility level is 5 due to size, scope and pattern of the field of infrastructure. The proposed turbines populate the entire horizon from this view and become the focus of the viewer. The patterns created by the receding rows in perspective create a level of intrigue, as the order and alignment is clear from some directions and then appears to fall out of order as the view crosses rows.

Visual Impact Assessment

Date: 22 August 2022

Personnel: KAC

Landscape Similarity Zone: Oceanfront Res, Seascape

Key Observation Point Name/Number: BHB03

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: sand fence edge in foreground and horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

thin line of dune sand, buried sand fence with vertical posts, and rolling surf leading to the horizon.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB03

Date: 22 August 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? sand fence, vertical post, and footprints along dune edge.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Lack of cloud cover; clear conditions

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☒ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Beach Haven Borough Public Beach

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	5
Vegetation:	5
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	28

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **2**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **30**

3. Comments:

Cultural | Historic: Beach Haven Borough Public Beach

Aesthetic: Wide-open water view to the horizon over a thin beach strip in front of the dune vegetation and sand fence.

Litter: Beach is litter free.

Summary of view: The early morning view across the beach and greater ocean landscape is pleasant; however, the sand fence is a visual obstacle to reaching the water, oddly buried, and is not welcoming to the viewer to make any further approach. The dark colors and shadows are also foreboding, but rich in hue. The Noon view is not as visually compelling in color, atmosphere, and texture since the sun bleaches out the mid-day colors. The sunset view is the most visually compelling due to the dynamic water conditions, warm colors, and textures. Since the light is subdued in the sunset view, and the sand fence is gently lit, the fence does not appear to be such an obstacle to reaching the water. The deep rich color of the ocean at sunset is the visually dominant element in the ocean view.

3 of 6

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **1**

Total: **26**

3. Comments:

The sunrise sky is dominated by the line of backlit turbines along the horizon line. The midground ocean wave action has equal visual interest to the turbines in the view alternating the viewer's attention between the turbines and the surf action. The condensed space between the sand fence and rolling surf at high tide is visually off putting and not inviting, especially due to the dark shadows and dark ocean. The stacked turbines in the left of the view and slightly to the center are highly visible at sunrise.

The Noon view is highly contrasting between the sky, water, sand and fencing, thereby making the elements look separate and distinct from each other. The repetition of the turbines along the horizon are in keeping with the repetition of the sand fence panels in the foreground, sandwiching the ocean in between. The addition of the side lit turbines along the horizon line in the Noontime view is another distinct textural element within the view. The stacked turbines in the left of the view, somewhat center and far right are highly visible at Noon, inspiring a dinky extension of turbines over the horizon line.

The sunset view is more restrained in color and texture; however, the hues of the colors are rich and inviting to look at, as well as the rolling surf in its deep teal color and dynamic wave action. The water's edge is not up against the sand fence edge and therefore it feels welcoming to enter the beach area. At sunset, the front lit turbines along the horizon line are just another textural element within the view, but they are visually muted due to the light turbine coloring against the light colored sky. The view is slightly shifted, therefore, the stacked turbines to the left of the view are no longer visible in this view; however, the far right stacked turbines are moderately visible against the light colored sky.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB03

Date: 22 August 2022

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	10

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	10

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	1	Total:	11

7. Comments:

Compatibility: The density of turbines and industrial footprint on the horizon reduces the aesthetic quality of the view; however, the sunset view is less affected due to the front lighting of the turbines and light sky conditions.

Scale: The scale of the turbines is based upon the cumulative visual weight of the entire system, versus a singular turbine.

Spatial Dominance: The vastness of the ocean is in contrast to the visual weight of the turbines. Both have visual weight and spatial dominance in the view.

Visual Impact Assessment

Date: 2022-08-22

Personnel: Kiva VanDerGeest

Landscape Similarity Zone: SCA- Oceanfront Residentia

Key Observation Point Name/Number: BHB03

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The dune fence is far enough from the viewer to be a central focus in the view

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The viewer's eye is drawn through the image in a formal order moving from one horizontal line to the next, from the dune, to the fencing, to the shoreline, and across the waves to the horizon and skyline.

1 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BHB03

Date: 2022-08-22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Haze/overcast

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is a public beach with ocean access.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="6"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="5"/>

Existing Conditions #1 Total:

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

Movement attracting viewer attention: Ocean waves; clouds and vegetation moving in the wind.

This view is from a sand dune at the top of a path leading to the beach shoreline. The path to the shoreline is just out of view with the scene looking across the enclosed and protected dune duff with small clumps of grass, and toward the far side of the dune fencing. The dune itself creates the primary landform which creates a gentle slope toward the fencing and the dune from view. The flat even shoreline extends from the dune fence to the tide line where small ponds form depending on time of day. The dune fencing creates a hard vertical and horizontal lines in a view that is otherwise limited in human intervention. The distance of the fencing and location at a slightly lower elevation, and partially obscured by the dune, make the fence a focal point in the view with strong lines and color contrast with the water line beyond. The waves and slight movement of the water are also somewhat parallel to the dune fencing. The horizon sits more distant in the view, but again is parallel to the dune, dune fencing, and shoreline. The sky has a gentle distribution of clouds which continue the horizontal lines. Vegetation is limited to small clumps of dune grass. The land use and user activities directly in the view are centered on beach viewing and access. Land use and user activity in the surrounding landscape are strongly residential.

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="5"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="5"/>
User Activity:	<input type="text" value="5"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The introduction of turbines into this view adds an expanse of structures across the horizon which, especially during back-lit conditions, somewhat enclose the viewer. The vertical form of the turbines across the horizon mimics the form and span of the dune fencing and duffs. The open view of the water is now limited by the massing of turbines with limited glimpses to the horizon in locations where the turbines align, or stack. The turbines appear cluttered in locations where the rows do not align, and the massing diminishes toward the right of the view where the turbine array ends. During conditions in which the turbines are side and front-lit, and the sky appears light in color the turbines are visible on the horizon, but do not hold the viewer attention. Viewers are likely to look at the turbines, but also orient their view to other areas where the open ocean is visible.

The slightly elevated view causes the turbines to appear at eye level and the viewer to look across the landscape leaving the landform largely unaffected by the turbines. The viewer's attention is drawn to the turbines and the minimal vegetation is likely to be overlooked. The land use and user activity will also see minimal change, but the view of open ocean in this largely residential area is changed to a view of the turbines.

4 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BHB03

Date: 2022-05-22

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

5. Rate scale/contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>9</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 codominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

7. Comments:

The project is not compatible with the current view of the open ocean, but is somewhat compatible with the low variation and elevation of the landform, vegetation, land use, and user activities. The scale of the turbine on the horizon somewhat endorses the viewer, but the expanse of shoreline and rolling dunes are not overwhelmed by the turbines. Similarly, the ocean becomes dominated by the turbines, but the landform, vegetation, land use and user activity are to over shadowed by the turbines and are considered co-dominant.

5 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BHB03

Date: 2022-05-22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, or focus in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of viewers in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectors and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for viewers in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

During the clearest conditions back-turbines may draw and hold viewer attention. However, during front and side-it conditions the turbines are subdued and do not overwhelm the viewer. Viewers during front and side-it conditions are likely to see the turbines, but focus their view in front of them and out to the open horizon.

Visual Impact Assessment

Date: August 24, 2022

Personnel: Steve Breitza

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB03

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The order is simply comprised of beach, water, and sky. The beach is interrupted by a low sand fence and small sporadic grass clumps; the water is calm and dark, only breaking at the beach; and the sky is a hazy white nearly filled by a solid cloud bank.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitza

KOP: BHB03

Date: August 24, 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: ☐ Haze or fog would decrease visibility. The horizon is a clear line at all three times of day in this view. The light and clouds at sunset obscure the turbines more than other times of day.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view portrays an idyllic beach scene.

Special Conditions:

Total:

3. Comments:

The proposed turbines become a horizontal focal point extending across the entire view. There is a line of turbines on the left that are in line with one another, giving the appearance of one massive turbine. Turbines to the right are staggered, making them appear abundant and cluttered. The turbines serve as another fence in the view, repeating the line established by the foreground sand fence. This encloses the water and condenses the view.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: BHB03

Date: August 24, 2022

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="11"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="11"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="11"/>

7. Comments:

One of the greatest impacts is how the turbines truncate the extensive view into this scene toward the horizon. There are now two fence lines in this view: the existing sand fence in character with the beach and the dominant and continuous line of turbines against the sky. This line will be more apparent as it will likely be in constant movement.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: BHB03

Date: August 24, 2022

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition is strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectional and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The turbines have a strong presence from one side of the view to the other. There is some relief on the far left and right where the turbines appear aligned, although this alignment makes the turbines heavier on the horizon. The lighting and cloud color in the sunset simulation obscure the turbines more than the other times of day, as though there is a sheer veil at the horizon. The turbines are still noticeable though more as a mass than individuals.

Visual Impact Assessment

Date: 08/24/22

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Residents/Tourists

Key Observation Point Name/Number: BLB02 Barnegat Light

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a basic layering of foreground with a pattern of development on land and the ocean in the mid-ground and sky above.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BLB02 Barnegat Light

Date: 08/24/22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The buildings covering much of the landscape draw one's attention

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Clear conditions would increase view

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is a coveted view from a lighthouse.

KOP: BLB02 Barnegat Light

Date: 08/24/22

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="8"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="8"/>
User Activity:	<input type="text" value="9"/>

Existing Conditions #1 Total:

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This view from a lighthouse is anchored by a vast expanse of developed land in the foreground and open ocean views in the background. People will come to this location for the viewpoint at this height, which maximizes the viewing distance.

3 of 6

Visual Impact Assessment

Date: 08/24/22

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="5"/>
Landform:	<input type="text" value="4"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="8"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

Viewers will come to this location to have an extended view. This view includes the proposed turbines in the distant waters. Viewers will see these turbines as features of the landscape. The turbines are distant enough that they do not overwhelm the view.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BLB02 Barnegat Light

Date: 08/24/22

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>8</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>2</u>	Land Use:	<u>1</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>7</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>1</u>	Land Use:	<u>1</u>
Landform:	<u>1</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>6</u>

7. Comments:

This simulation shows that the turbines are visible but not dominant on the horizon. Viewers will see them, but they do not overwhelm the view.

5 of 6

Visual Impact Assessment

KOP: BLB02 Barnegat Light

Date: 08/24/22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

This simulation suggests visibility level 3, but clear conditions with a bright backlit condition could render the turbines much more impactful.

Visual Impact Assessment

Date: 24 August 2022

Personnel: KAC

Landscape Similarity Zone: Resident/Tourists

Key Observation Point Name/Number: BLB02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon and neighborhood housing.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Fan of residential structures out to ocean, water tower on the far right, surf edge, ocean and horizon with fluffy clouds above.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BLB02

Date: 24 August 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Mass of residential homes with interspersed tree canopy.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Clear skies and time of day.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Barnegat Lighthouse State Park and Fishing Access

2 of 6

Visual Impact Assessment

Date: 2022-08-24

Personnel: Kiva VanDerGeest

Landscape Similarity Zone: LCA - Recreation

Key Observation Point Name/Number: BLB02 - Barnegat Light

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Central point where shadowcast on land by clouds dissipates. & Roadway and water tower draw attention.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The viewer's eye moves between the dark green vegetative canopy & the muted light colors of the ocean/horizon/sky

1 of 6

Date: 2022-08-24

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: visibility will increase on clear & partly cloudy days

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? The lighthouse is an NRHP within a State Park

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="3"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="3"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	<input type="text" value="3"/>
--	--------------------------------

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

Movement attracting viewer attention: tree canopy, wave, and cloud movement

This elevated KOP provides a view from the Barnegat lighthouse across the barrier island and out to the open ocean. Visible water resources are similar to other open views of the ocean, and the landform is primarily even with minimal topographic change. Vegetation is predominantly canopy from trees in the residential areas, however, shoreline dune grass and scrub/shrub forest are also discernible near the coastline. Land use at this KOP is State Park land open which preserve the site for access and use to anyone. User activity at this KOP is recreation with a focus on the State Park amenities including the historic nature and character of the lighthouse and its coastal setting.

This KOP is an NRHP and State Park, the elevated view provides a unique aesthetic element. No pollution is visible.

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BLB02 - Barnegat Light

Date: 2022-08-24

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="5"/>
Landform:	<input type="text" value="4"/>
Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="5"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

With the Facility in place the dark and hazy silhouette of turbines are visible on the horizon. While these turbines appear back-lit and represent a high color contrast the haze and overcast conditions subdue the turbines and obscure their visibility considerably. During clear conditions the turbines are likely to be much more prominent in the view and further distract viewers from the existing scene.

Under the conditions presented in the photo simulation the turbines minimally distract from the landform with their apparent height somewhat diminishing the already low, even landscape. The vegetation is largely unaffected. Land Use is somewhat reduced as the focus on maritime history may now include a focus on modern technology, energy, and shifts in the maritime relationship. User Activity will continue to be ocean and seascape viewing, but again, is likely to introduce a strong emphasis on viewing the turbine array.

4 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BLB02 - Barnegat Light

Date: 2022-05-24

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>3</u>	User Activity:	<u>3</u>
Vegetation:	<u>2</u>	Total:	<u>13</u>

5. Rate scale/contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>2</u>	Total:	<u>13</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 codominant, 3 dominant)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>10</u>

7. Comments:

The turbines are not compatible with the water resources or landform, but are somewhat compatible with the canopy vegetation in this view. Land use and user activity are also somewhat compatible as the focus will continue to be on viewing the ocean.

There is a high scale contrast between the Facility and the even open ocean, but a more moderate contrast with the landform and vegetation. There is also a severe scale contrast with land use and user activity as the light house was once the dominant sight point and numerous towers are now available on the horizon.

The turbines subdued by haze become co-dominant with the landscape features. However, under clear conditions it is likely that they may become dominant at this distance.

5 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: BLB02 - Barnegat Light

Date: 2022-05-24

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing, otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject, otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, or focus in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of viewers in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectors and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for viewers in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Due to the hazy overcast conditions the turbines are visible, but faint and do not compete with major landscape elements. They may be considered co-dominant with other features in this view. However, under other lighting and sky conditions it is anticipated that the VFL may be higher.

Visual Impact Assessment

Date: August 24, 2022

Personnel: Steve Breitka

Landscape Similarity Zone: Recreation

Key Observation Point Name/Number: BLB02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Water tower to right and interesting architecture scattered among mature vegetation in the foreground.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Seaside town development with two to three-story single-residential homes. The homes all appear to be similar sizes although they vary in style and color. The homes and adjacent trees do not illustrate a particular street pattern.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: BLB02

Date: August 24, 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The architecture creates a clutter though it is not negative or disruptive. The angles and colors create a unique built texture for the foreground, softened by mature trees.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: There is a haze at the horizon, more prominent toward the middle of the view than the sides.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Climbing the Barnegat Lighthouse and gazing out over the town from 172' in the air.

Existing Conditions #1 Total:	<input type="text" value="36"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This is a unique view from a unique piece of architecture, offering a commanding view over the town and out to sea. The foreground is rich in texture and color with angled roof lines on the homes interspersed with dark green mature vegetation. Although a mostly cloudy day, the water in the distance has a mirror-like appearance shining in the mid-day light. The water and sky are separate but the horizon is blurred with the gray sky and grayish white clouds.

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The proposed turbines are almost imperceptible on the distant horizon where the gray sky and gray water join. There is a small grouping in the center of the view where the structures are aligned, increasing their prominence. Viewing the turbines left and right of center requires zooming into the view 150%+. There is little impact on the overall scene, however, visitors to the lighthouse expecting an open and expansive view from the top will catch glimpses of turbines dotting the horizon. Their constant motion will likely make them more visible and the only consistent movement in the view.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: BLB02

Date: August 24, 2022

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="6"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="5"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="5"/>

7. Comments:

The turbines have a limited impact on the overall scene. They add an obscure focal point from the elevated lighthouse view although their visibility will depend on lighting and cloud cover.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: BLB02

Date: August 24, 2022

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition is strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectional and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines may become more visible and apparent when in motion.

Visual Impact Assessment

Date: 2/16/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: BRT01 Bass River SF

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe. *The horizon line generally acts as the focus of this view.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

The layering of the fields in the foreground, distant vegetation in the mid-ground and the sky meeting the land at the horizon create a natural order to this view.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BRT01 Bass River SF

Date: 2/16/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. **Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.**

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *Increased moisture in the atmosphere could reduce visibility.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. **Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.**

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *Residents or tourists may pass through this area.*

Personnel: Jocelyn Gavitt

KOP: BRT01 Bass River SF

Date: 2/16/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

7. Comments:

Small portions of the proposed turbines can be seen in this simulation, and may be most noticed due to their motion, but are not visible enough to create much impact. They are likely to be lost in the presence of the vegetation in the mid-ground of the view.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BRT01 Bass River SF

Date: 2/16/21

Proposed Conditions

2. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The proposed conditions are not very noticeable. Portions of the turbines can be seen, but they will likely go unnoticed much of the time.

Visual Impact Assessment

Date: 16 February 2021

Personnel: KAC

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: BRT01 Bass R SF

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Topological undulation and horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Textured grass, scrub, marshland, low hills, man-made structures and horizon, flat landscape almost perfectly divided into equal bands of blue sky and green grass.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BRT01 Bass R SF

Date: 16 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Any atmospheric haze would reduce the visibility of the turbine blade tips in the view.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? National Wildlife Refuge and Bass River Forest Historic District.

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BRT01 Bass R SF

Date: 16 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	28.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **5**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **33.5**

3. Comments:

Cultural | Historic: National Wildlife Refuge and Bass River Forest Historic District.

Aesthetic: Grassy vegetation with low scrub vegetation.

Litter: Limited visitor litter.

Summary of View: Highly textured grass and scrub vegetation in the foreground that emphasizes the flatness of the salt marsh topology with a background view to the low, undulating terrain and man-made structures. The grassy vegetation is interspersed with low scrub vegetation is visually dynamic and the movement of the grass by the wind would be pleasing to walk through. The view is relatively undeveloped with man-made structures restricted to the background view thereby increasing the sense of remoteness and the immersion into the natural environment.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BRT01 Bass R SF

Date: 16 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **33.5**

3. Comments:

In this view, the installed project is almost invisible behind the undulating background terrain and man-made development on the hillsides. The movement of the rotor blades have the opportunity to draw the viewer's attention as they look across the salt marsh, however, any foreground distractions such as the engagement of small mammals, birds and flower species have the potential to keep the viewer's attention focused in the foreground and midground views. In addition, as the foreground and midground scrub vegetation grows taller in this view it may further obstruct the clear view to the horizon line and proposed turbine blade tips.

4 of 6

Visual Impact Assessment

Proposed Conditions

8. Visibility Threshold Level- Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-17-2021

Personnel: KV

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: BRT01 - Bass River F

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: *A variety of vegetation both distant and near draw viewer attention, but neither serve as a primary focal point*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

natural order in this view helps the gaze read across the view by scanning layered colors of vegetation from near foreground to distant background through the sky and back again.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: BRT01 - Bass River F

Date: 02-17-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *hazy/overcast days may limit visibility at this location*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlight ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This area is part of the Bass River State Forest, and holds an informal trail*

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	5

Existing Conditions #1 Total:

27.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

2

Special Condition B. Are there other aesthetic elements that add to this resource?

1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

6

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

33.5

3. Comments:

Movement attracting viewer attention: wetland grasses on a breezy day.

Bass River State Forest preserves NJ Pine Barren forest landscape and the wetlands woven throughout it. This view, focusing on the wetlands just at the edge of dense forest where marsh grasses and shrubs flourish, but water resources are not visible. The landform is that of a lowlying marsh with gentle undulation. Background hills are visible on the horizon but lend little vertically. The horizon line is generally level across the view. Landform and Vegetation, although serene and calm, represent a common view within this area of the Salt Marsh. Land Use and User Activity are minimal as this is primarily an unmaintained natural area. However, the distant housing development suggests that residents will look out towards this area to provide a sense of openness and rural character. This suggests that views at this location may be both short-term, occasional or long-term, repeated depending on user group.

3 of 6

Visual Impact Assessment

Personnel: KV

KOP: BRT01 - Bass River F

Date: 02-17-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **6**

Total: **32.5**

3. Comments:

The turbines within this view are situated at a distance in which blade tips will be the primary visible component of the Project. The nacelle of a few turbines may also be visible primarily those that sit within a valley of two distant hills.

Turbines at such a distance, and primarily screened by distant hills and vegetation, are likely to have a minimal impact on the overall view. Land Uses, and User activity. However, due to a lack of existing focal point, or other strong visual components in the foreground, the movement of the turbine blades rising and sinking over the distant hills is likely to attract viewer attention and distract from the serene and still natural environment.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: BRT01 - Bass River F

Date: 02-17-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="8"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="6"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

7. Comments:

The WTGs in this view, and at such a distance, are somewhat compatible with other developed elements in the distance. The scale of the WTGs above the distant hills and vegetation, but this unlikely to have great impact on users of this resource. Although some distraction from the movement of the turbines may take place this is likely to be minimal. Similarly the WTGs while present in the view do not dominate the scene.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: BRT01 - Bass River F

Date: 02-17-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Fairly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Turbines in this view having visible nacelle are compatible with VTL 3 describing "can be easily detected after a brief look and would be visible to most casual observers."

While some turbines in this view with more ample screening (from distant topography) may more closely align with the VTL 2 description the more apparent turbines situated between the two hills pushes the entire view into the VTL 3 range. During times of poor visibility, such as overcast or mostly cloudy days, visibility may generally be more comparable to VTL 2.

Visual Impact Assessment

Date: February 18, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: BRT01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BRT01

Date: February 18, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: *The sky is undefined: no consistent color or cloud formations, just a hazy white blue.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☐ Yes ☒ No

How would the site be used for scenic or recreational enjoyment? *While this is a unique setting in the middle of a salt marsh, it is not easily accessible and there are no amenities.*

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BRT01

Date: February 18, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	5
Vegetation:	7
Land Use:	5
User Activity:	5
Existing Conditions #1 Total:	26.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

4

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

30.5

3. Comments:

Open view from the middle of the marshland with stands of scraggly shrubs amid low thin grasses. Distant trees and residences line the horizon. The view is split into two dominant color types: earth tone greens in the bottom half and pale white blue in the top half. The residences in the distance are not discernible but rather blend together as a mass. There is nothing that focuses the eye in this view as each component is a wash of color.

The horizon has some variation in height but appears to be plant material (trees) and residential roof lines, not changes in topography.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BRT01

Date: February 18, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	5
Vegetation:	7
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: 30.5

3. Comments:

The proposed turbines are almost indiscernible along the horizon following the viewing parameters. Zooming in to 150% allows the viewer to clarify where the turbines are located, only visible by blades and mostly one blade. The turbine blades take on a similar appearance to the mishpash shrubs in the foreground with angled branches.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BRT01

Date: February 18, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	0	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	4

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	0	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	4

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	0	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	4

7. Comments:

The turbines, distinguished by blades only, have very little presence in this view.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BRT01

Date: February 18, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input checked="" type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

9. Comments:

The foreground landscape, while not a singular focal point, has a level of variety in color and texture that detracts from any variation presented by the turbine blades at the horizon.

Visual Impact Assessment

Date: 2/25/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BT01 Island Beach Stg

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes.)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe. The vanishing point of the beach lines and the horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a natural layering of shoreline, beach, water and open sky.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BT01 Island Beach Stg

Date: 2/25/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments.)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: More moisture in the atmosphere would likely decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is more remote beach front destination for a large population of nearby residents and visitors.

2 of 6

Visual Impact Assessment

KOP: BT01 Island Beach Stg

Date: 2/25/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="9"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="7"/>
User Activity:	<input type="text" value="8"/>
Existing Conditions #1 Total:	<input type="text" value="36"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="2"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="2"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	<input type="text" value="2"/>
Existing Conditions #2 Total (Sum 2A through 2C)	<input type="text" value="6"/>
Existing Conditions Grand Total (Sum #1 Total and #2 Total)	<input type="text" value="42"/>

3. Comments:

This is a more remotely accessed beach front free from visual clutter. This is a pristine setting of uninterrupted beach line, and open water.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BT01 Island Beach Stg

Date: 2/25/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="4"/>
Landform:	<input type="text" value="5"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="4"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	<input type="text" value="5"/>
Total:	<input type="text" value="29"/>

3. Comments:

The viewer can see the distant windmill field along the horizon, with attention focused in the areas where the subject turbines fall in close proximity to one another due to perspective issues. This increases the visibility in places. While these are at a great distance, they are visible, and have a moderate level of impact due to the large quantity of structures. Viewers will take notice of these structures.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BT01 Island Beach St

Date: 2/25/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>10</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>2</u>	Land Use:	<u>1</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>9</u>

7. Comments:

This proposed field of turbines are the only structures in the view and become more of a focus once they have been fully noticed. They stretch across a large portion of the horizon, though they are quite distant in nature.

Visual Impact Assessment

Date: 23 February 2021

Personnel: KAC

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BT01 Island Beach SP

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Vegetated dune and horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, interest and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Beach, vegetated dune, ocean, and horizon; this is a sweeping landscape with a strong perspective center. The eye moves over the light colored, open sand beach to the rolling surf to the focal point and then to the lush green of the vegetated, undulating dunes before landing on the horizon.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BT01 Island Beach SP

Date: 23 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: A clearer sky will allow greater visual definition to the turbines.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Island Beach State Park

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	7
Vegetation:	7
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	35

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

4

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

39

3. Comments:

Cultural | Historic: Island Beach State Park

Aesthetic: Wide open, light colored sand beach with rolling topography and vegetated dunes.

Litter: Beach visitor litter.

Summary of View: The existing beach is well balanced in offering views to the ocean as well as to the undulating vegetated dunes in the background. The limited visibility of man-made elements, except for the few on the far horizon, and the topological interest of the dunes inspires a sense of remoteness and privacy. The light colored, fine sand beach is the backdrop to the blue-green ocean that deepens in color as it reaches the visual perspective focal spot, in the same way as the green vegetation is accentuated in the right side of the view. This seascape view stands out in its caliber of visual quality and attractiveness.

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: 38

3. Comments:

The addition of the wind turbines on the horizon does not immediately attract the viewer's attention when taking in this highly attractive seascape. Upon observing the greater view to the sand, surf, dune vegetation and then horizon, the eye moves to the center of the view and fixes on the light gray, fine textured turbine silhouettes on the horizon. Upon focusing on the darker mass of ordered, stacked turbines in the center view, the additional individualized turbines to the left and right of the center mass also become more visible. The light color and fine texture of the turbines at 30.25-miles to the nearest turbine mitigates the potential impacts to visual quality at this viewing distance.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BT01 Isld Beach SP

Date: 23 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5.5

7. Comments:

Compatibility: The rotor blades are not readily apparent on the horizon at this viewing distance.

Scale: The turbines are not easily recognizable on the horizon at 30.25-miles to the nearest turbine.

Spatial Dominance: The turbines are not visually dominant on the horizon at this viewing distance.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BT01 Isld Beach SP

Date: 23 February 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-22-2021

Personnel: KV

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BT01-Island Beach SP

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: at the vanishing point where the green vegetation meets the blue sea and people congregate in the view

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

sea, beach, vegetation and sky and wispy clouds create lines in the view that draw the viewers eye to the distance.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: BT01-Island Beach SP

Date: 02-22-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: a fully clear day may increase visibility, while a overcast/hazy will decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlight ☐ frontlit ☐ sidelit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This state park is used for a variety of beach activity including swimming, fishing, sunbathing, etc.

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="3"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="3"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

Movement attracting viewer attention: ocean waves, beach goers

This view captures a natural beach setting with (panning left to right) open ocean, sandy shoreline, and a significant dunescape. While this scene demonstrates a natural landscape a heavy human use is apparent due to the multiple groups of beach users, numerous sets of vehicle tire tracks in the sand, and a Jeep parked in the distance near the waterline. Water resources captured in this view appear particularly clear. Intensity and value of the water's blue hue is mimicked in the green hue of the dune vegetation. While the ocean at this location reads as expansive a stretch ships and/or navigation structures dot the horizon. Landform is representative of the long linear beaches in this region, but a glimpse over the inlet to a portion of Bamegat Island jutting beyond the middle ground shoreline adds visual interest. Vegetation takes the form of a significant vegetated dunescape which has been maintained to a level uncommon in this typically developed region. As such land use in the scene is primarily preservation in nature. User activity tends toward low impact beach recreation activities (save for the beach vehicle access), educational activity is also a component of this State Park which maintains a variety of structures used to inform visitors, such as school groups, about shoreline ecosystems, vegetation, and historical lifestyles in the region.

User Activity:	<input type="text" value="6"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

With the proposed project in place the WTG array sits tightly on the horizon due to distance from the project at this location. Despite the light profile of the turbines the extent of the array raises the potential for visibility. The appearance of a scattered WTG arrangement at the edge of the array, where turbines sit low on the horizon, makes visibility of individual turbines more difficult to distinguish. More central positioning in the array find turbines sitting higher on the horizon, and visibility is increased with the appearance of more dense value coloration from the stacked massing. Water resources retain a high scenic quality, but may become more comparatively average in the area rather than maintaining a distinct quality. Landform, however, with the unique nature in which the distant headland is visible and the hilly dune system has been maintained, may not be highly effected by the turbines. WTGs are likely to draw viewer attention from the landform, but these characteristics are unique enough to the area, and the turbines distant enough, that viewers attention will not be so strongly held by the WTGs. Similarly, the established vegetation throughout the dune landscape is unique within this region and will likely capture viewer attention despite the presence and movement of the WTGs. Land use at this location, and at this distance from the WTGs is unlikely to find substantial effects. User Activity at this location is likely to remain very high in peak season, but with the WTG in place some users may opt for a more undisturbed seascape location.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: BT01-Island Beach SP

Date: 02-22-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="13"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="6"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="7"/>

7. Comments:

The WTG at this location are not compatible with the water resources, landform, or vegetation. Yet, due to the distance of the turbines from this location, and other elements on the horizon, the land use and user activity may be somewhat compatible with the current high use recreation and sand vehicle permitting.

Scale contrast of the WTG at such a distance from this location is consistent with a moderate scale contrast for water resources. However, the bright color of the green vegetation, tall dunes landform, and high intensity recreation land use and user activity scale tends more toward a minimal contrast.

WTG become spatially co-dominant with water resources and landform, but are subordinate to the bright vegetation and the highly recreational land use and user activity.

5 of 6

Visual Impact Assessment

KOP: BT01-Island Beach SP

Date: 02-22-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Turbines are easily recognized on the horizon under these atmospheric conditions, however they are distant enough on the horizon that they will compete with major landscape elements. In hazy or overcast conditions visibility may be decreased.

Visual Impact Assessment

Date: March 05, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: BT01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The natural order is within the beach landscape: open seemingly endless water, waves crashing at the shore, wide sandy beach, and grass covered rolling sand dunes.

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BT01

Date: March 05, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: The cloud cover is like a thin white veil across the sky.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is a wide open sandy beach free of any visible development. It feels remote.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BT01

Date: March 05, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="9"/>
Landform:	<input type="text" value="8"/>
Vegetation:	<input type="text" value="8"/>
Land Use:	<input type="text" value="9"/>
User Activity:	<input type="text" value="9"/>
Existing Conditions #1 Total:	<input type="text" value="43"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This view portrays a classic beach scene: low waves cresting at the shore, open sandy beach, and grass covered dunes providing an edge. The colors in the view are muted but all in a warm earth tone range. The sky is a hazy white at the horizon, fading through pale blue to blue toward the top of the view. Thin, wind-swept clouds extend across the entire sky.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BT01

Date: March 05, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="4"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="5"/>
User Activity:	<input type="text" value="5"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The proposed turbines, though distant and camouflaged in the haze, become the only visible sign of development in this view. They interrupt the horizon flowing across the water and into the dune landscape. The low grass covered dunes are the primary focus in the view until the turbines are added across the majority of the scene. The stacking and spacing of the turbines makes some rows appear dense while others are more sparse on the edges.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BT01

Date: March 05, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

7. Comments:

This beach scene is void of any development until the turbines populate the horizon. They are subdued given distance and a cloudy white haze but they still add a clutter that is not present in the existing condition. The wave action will detract any motion created in the distance.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BT01

Date: March 05, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines do not dominate the view but they do steal attention away from the natural beach features.

Visual Impact Assessment

Date: 08/24/22

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Residents/Tourists

Key Observation Point Name/Number: EMC01 Tuckahoe Wind

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a basic layering of tall vegetation in the foreground, open low vegetation in the mid-ground punctuated by tall trees/forest along the horizon line.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: EMC01 Tuckahoe Wind

Date: 08/24/22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *Shown are already the clearest conditions.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This is part of a wildlife management area.*

KOP: EMC01 Tuckahoe WMA

Date: 08/24/22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input checked="" type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

This simulation suggests visibility level 1, as portions of the turbines are only visible upon close inspection.

Visual Impact Assessment

Date: 24 August 2022

Personnel: KAC

Landscape Similarity Zone: Residents/Tourists

Key Observation Point Name/Number: EMC01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon, but obstructed by tall grass and perennial plants in foreground.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Smooth natural paving, highly textured foreground plant edge, short meadow grass and thin strip of background vegetation on the horizon with a large view to the sky.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: EMC01

Date: 24 August 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Foreground vegetation mass.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: cloud cover or haze would reduce visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Tuckahoe WMA

2 of 6

Visual Impact Assessment

KOP: EMC01

Date: 24 August 2022

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	5
Vegetation:	5
Land Use:	5
User Activity:	5
Existing Conditions #1 Total:	24.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **27.5**

3. Comments:

Cultural | Historic | Wildlife Refuge

Aesthetic: Close up views to bird and insect visitors to the tall grasses and perennials.

Litter: Visitor litter.

Summary of view: The views focused on the foreground to the tall grass and perennials that physically and visually interrupts the long view to the midground and background vegetation. The midground is a uniform expanse of grasses that is edged by a very low, dark green hedgerow in the background. Along the horizon line there are multiple tall, thin, man-made objects that break the horizon in multiple locations from the left to the right of the view. The expanse of the clear blue sky is equally visually weighted in the view to the green and tan tones in the lower half of the view.

Date: 24 August 2022

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	5
Vegetation:	5
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **27.5**

3. Comments:

There is no noticeable change in the view, especially when competing with the existing tall, thin objects dotted along the horizon.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: EMC01

Date: 24 August 2022

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

7. Comments:

There is no noticeable impact to the view, especially when competing with the existing tall, thin objects dotted along the horizon.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: EMC01

Date: 24 August 2022

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input checked="" type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 2022-08-24

Personnel: Kiva VanDerGeest

Landscape Similarity Zone: LCA - Salt Marsh

Key Observation Point Name/Number: EMC01 - Tuckahoe WMA

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: There is more than one focal point. Primary focus - tall foreground plants & the open grass to the right.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Natural order moves the viewer's eye through the frame. Form, line, and color shifts from the orange hue gravel path to the form of the tall vegetation, the open grassy field and dark forest hills on the horizon with open blue sky.

1 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: EMC01 - Tuckahoe WMA

Date: 2022-08-24

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? various utility towers and background development add discord and draw viewer attention from the natural setting of the foreground view.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: visibility at this distance would no longer be available if hazy/overcast conditions.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? State Wildlife Management Area - Viewing and interacting with nature and wildlife

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	5
Vegetation:	6
Land Use:	7
User Activity:	6

Existing Conditions #1 Total:

28.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

2

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

7

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

35.5

3. Comments:

Movement attracting viewer attention: Vegetation movement in the wind

This inland view from the Tuckahoe WMA looks outward from a gravel pathway across wetland vegetation and marshland grasses to distant forest land on the left of the view, and, to the right of the view, the bays and bridges separating the mainland from the barrier islands that make up the ocean shoreline. A variety of orange-browns and range of green vegetation color the landscape which is offset by the soft blue sky. No water resources are visible in the single frame view, although a brightly colored pond exists to the left of the view. The landform is open, even, and primarily flat, which provides interesting long-range views despite a lack of variation in topography. Land use is primarily focused on preservation of natural environment for all, and user activity is open and available space for the enjoyment of natural resource and wildlife.

This is a State WMA. Color variation in vegetation and elements just beyond the view add aesthetic elements to this view. No litter is present in the view.

3 of 6

User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **7**

Total: **35.5**

3. Comments:

Distant turbines have been added to this view. However, it is unlikely that viewers at this distance would be able to discern the Facility without prolonged viewing. Visible portions of the turbines are primarily limited to the blade-tips with an occasional nacelle. Viewer distance and color of the turbines limits visibility of the Facility and does not perceptibly change this view. The front-lit turbines appearing light white on the horizon and blend considerably with the light blue shade of the sky. A variety of tall utility structures are already present in the scene and, appearing dark against the sky, distract from the addition of turbine blade tips.

Turbines may be more visible during conditions in which the turbines appear dark on the horizon, however they are still likely to be obscured by intervening vegetation, utility towers, and other elements on the horizon.

Landform, vegetation, land use, and user activity will not be altered due to the addition of the 28 distant turbines.

4 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: EMC01 - Tuckahoe W

Date: 2022-09-24

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

5. Rate scale/contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 codominant, 3 dominant)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="4"/>

7. Comments:

Turbines are unlikely to visible to the casual observer. Visibility may be available during conditions in which the turbines are backlit, but even under these conditions they will be difficult to discern and will be compatible in scale and subordinate in dominance with the utility structures already present in the view.

5 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: EMC01 - Tuckahoe W

Date: 2022-09-24

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input checked="" type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, or focus in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of viewers in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectors and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for viewers in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Potential visibility of these turbines is very limited and may not be discernible to most viewers. A VTL of 1 may be an overstatement.

Visual Impact Assessment

Date: August 24, 2022

Personnel: Steve Breitza

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: EMC01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: There are intriguing plant materials but nothing worthy of "focal point"

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, incoherence and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The natural order in this view is just that, natural. There is a dirt road curving off the left side of the scene and wild salt marsh vegetation filling the remainder of the lower half of the scene.

Visual Impact Assessment

Personnel: Steve Breitza

KOP: EMC01

Date: August 24, 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as:

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Viewing wildlife, hiking, observing salt marsh vegetation

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	6
Vegetation:	7
Land Use:	8
User Activity:	7
Existing Conditions #1 Total:	32.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

3

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

9

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

41.5

3. Comments:

The salt marsh is a unique landscape with unusual waterways and expansive fields of low vegetation. The grasses (possibly phragmites?) in the foreground will sway in the wind, likely a constant feature across this flat area. There is indiscernible development at the horizon including towers (water, communication, electrical) and a bridge at far right. These elements are not clear until zoomed into the view.
A dark blade of distant vegetation separates the foreground marsh from the clear blue cloudless sky.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: EMC01

Date: August 24, 2022

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: 9

Total: 41.5

3. Comments:

The proposed turbines are difficult to locate in this view at almost 26 miles away. They were not apparent until zooming in to 300% and then still had to scan the horizon to find them. Once found, they are not visible at 100% viewing. The turbines are low at this distance and they are below existing utility structures. The sky transitions to a gray blue at the horizon, further obscuring the gray/white turbine structures.

It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition, is strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Perhaps the turbines will be more visible when in motion but they are simply not visible until zooming into the view and specifically looking for them.

Visual Impact Assessment

Date: 2/25/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: GT01 Edwin B. Forsyth

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The road anchors the view.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a layering of salt marsh with a built horizon area.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: GT01 Edwin B. Forsyth

Date: 2/25/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Only slightly. The distant built environment generally reads as a mass.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. **Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.**

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: More moisture in the atmosphere would likely decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. **Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.**

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ sidelit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? The salt marsh landscape is interesting.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: GT01 Edwin B. Forsyth

Date: 2/25/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>7</u>
Landform:	<u>5</u>
Vegetation:	<u>7</u>
Land Use:	<u>7</u>
User Activity:	<u>6</u>
Existing Conditions #1 Total:	<u>32</u>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<u>2</u>
Special Condition B. Are there other aesthetic elements that add to this resource?	<u>1</u>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	<u>2</u>
Existing Conditions #2 Total (Sum 2A through 2C)	<u>5</u>
Existing Conditions Grand Total (Sum #1 Total and #2 Total)	<u>37</u>

3. Comments:

This view of salt marsh in the foreground and a built condition along the horizon line has complexities of texture that keep the view generally in the center, along the road. The complexity of the salt marsh landscape calls attention, and the unevenness of the built condition along the horizon calls attention to the presence of buildings.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: GT01 Edwin B. Forsyth

Date: 2/25/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>6</u>
Landform:	<u>4</u>
Vegetation:	<u>6</u>
Land Use:	<u>6</u>
User Activity:	<u>6</u>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	<u>5</u>
Total:	<u>33</u>

3. Comments:

The offshore turbines are obscured by the presence of the built up shoreline from this vantage point. The turbines are clearly visible, and front lit in this simulation, perhaps allowing them to blend better with the background sky coloring. While they are clearly visible, and in great abundance, the complexity of the view and shapes within the salt marsh and the built shoreline have a distracting factor.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: GT01 Edwin B. Forsyth

Date: 2/25/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>10</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>10</u>

7. Comments:

These turbines are highly visible due to their quantity, but are somewhat mitigated by the presence of complex forms in this view.

Date: 2/25/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Numerous turbines are clearly visible in this view.

Visual Impact Assessment

Date: 23 February 2021

Personnel: KAC

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: GT01 EBFNWR

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Gravel road, marsh, man-made structures, and horizon.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intensity and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Gravel road, marsh, built horizon; the view is heavily bisected by the gravel roadway that divides the salt marsh in half and leads the eye to the built horizon and landing on the water towers.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: GT01 EBFNWR

Date: 23 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Vehicle gate, car, and built structures on the far horizon.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Atmospheric haze may change the level of visibility to the turbines.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Edwin B. Forsythe NWR

KOP: GT01 EBFNWR

Date: 23 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	7
Vegetation:	7
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	35

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **38**

3. Comments:

Cultural | Historic: Edwin B. Forsythe MWR

Aesthetic: Salt marsh environment that clearly shows the old mosquito ditching marks in the water vegetation.

Litter: Visitor roadway litter.

Summary of View: The elevated view from the roadside observation platform provides a long distance view through the salt marsh to the residential community on the horizon. The elevated position provides visual access to the manipulated landforms impacted by the old practice of mosquito ditching (the long striations of alternating water and grass in the marsh). In addition, the unique view highlights in the interwoven tapestry of the light colored road, highly textured and deep green roadside grass, deep blue water rippling in the breeze, and the chartreuse marsh grass; there is a high level of visual interest and texture in all seasons.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: GT01 EBFNWR

Date: 23 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **33**

3. Comments:

The visual impacts of the Project in place is offset by the white color and slender profile of the turbines on the horizon. The visual impact of the wind farm could be more severe if the turbines were black, thereby appearing visually heavier on the background sky, or if the sky itself was darker in color or overcast. The light color of the turbines allows the rich tapestry of the wildlife refuge vegetation and waterways to remain the dominant feature in the view, however, the aesthetic quality of the views is modified by the introduction of such a massive wind farm that spans the entire view from the observation platform.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: GT01 EBFNWR

Date: 23 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1
Vegetation:	1	Total:	6

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1
Vegetation:	1	Total:	6

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1
Vegetation:	1	Total:	6

7. Comments:

Compatibility: The light color of the turbines at this viewing distance mitigates the Project's visual impacts.

Scale: There is no foreground or midground vertical objects to compete with the proposed turbines, and the background structures are so far away on the distance that the turbine scale at 14.34-mile to the nearest turbine does not over-power the overall sense of scale in the view.

Spatial Dominance: The light color of the turbines reduces the potential visual dominance.

5 of 6

Visual Impact Assessment

Date: 02-23-2021

Personnel: KV

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: GT01 Forsythe NWR

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: as the central roadway curves to the right, just beyond the left branching roadway.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

The foreground roadway provides an entrance into the frame and the neutral colors of the roadway, both echoed in the marsh land and offset by the variety of greens and blues, combined with a variety of texture circulates the eye throughout the view; the developed horizon adds contrast.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: GT01 Forsythe NWR

Date: 02-23-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? the development on the horizon adds a mottled cluttered span inserted into an otherwise ordered natural environment.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: overcast/hazy could decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This NWR is often used for bird watching, walking/hiking, and general enjoyment of nature.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="8"/>
Landform:	<input type="text" value="8"/>
Vegetation:	<input type="text" value="8"/>
Land Use:	<input type="text" value="7"/>
User Activity:	<input type="text" value="6"/>
Existing Conditions #1 Total:	<input type="text" value="37"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="3"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="1"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

movement attracting viewer attention: tall grass types in the breeze, rippling water, birds.
This view from within the Forsythe NWR allows for access to an expanse of primarily natural wetlands only disrupted by the packed gravel roadway providing access. The deep wetland pools within the view are filled by the bay, partially visible in the distance. The water resources in this view represent a unique and natural environment that supports a large and ecosystem. The deep pools repeating across the view appear clean and pristine in quality making them distinctive. Landform is primarily flat with gentle sloping as it transitions to water and back again. Flat landform is common in this region but a view of landform holding wetlands, sporadically appearing and disappearing below water is available for close viewing at limited locations. Vegetation provides a soft texture throughout the view with a variety in chroma and value of the green and neutral hues accenting the blue water and sky. Shrub/scrub vegetation appears dotted through the view adding small vertical elements. Land use is primarily centered on preservation and light recreation, however the distant community development sits heavy on the horizon and provides a background disparate to the purpose of this location. Similarly, user activity while often focused on the enjoyment of this natural area, is primarily confined within vehicles. The linear gravel drive passing through the NWR is for use by bike, walking, or driving. However, these uses often conflict with one another and there are few dedicated parking areas or walking trails. While visiting this location it is apparent that many local users take frequent drives through this location to enjoy the natural setting and bird life, but never leave their cars.

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="7"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="7"/>
Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="5"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The front-4 view of WTGs at this location are softened by their white appearance which provides a low contrast with the pale blue horizon. However, the apparent height and quantity of the turbines is large. The deep blue water resources hold the primary focus of a viewer. Moreover, the turbines sitting behind the water resource keep the view primarily intact. Vegetation in the view is similarly maintained at a distinct visual quality as the texture and variety in value and intensity holds the viewers gaze. While the turbines also sit behind the landform the vertical nature of the turbines serves to further flatten and highlight the horizontal nature of the landform. Land use, once primarily focused on viewing the natural environment despite the distant community development now has a strong emphasis on viewing the turbines. In addition viewing from the tower height places the turbines looking back toward viewers at eye/hacelle level. The previous bent toward development becomes louder and more obvious. Land use, while still focused on preservation begins to take on a feeling of impact from the loss of distant open views. Similarly, user activity centered on enjoyment of the serene nature view will be distracted by the motion of the distant turbines.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: GT01 Forsythe NWR

Date: 02-23-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="14"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="15"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

7. Comments:

WTG in this view are not compatible with Water Resources, Landform, vegetation, or land use. However they may be somewhat compatible with user activity primarily because so many users do not get out of their vehicle and locations to do so are very limited. Similarly, the scale contrast is severe as the WTG loom large on the horizon.

However, the spatial dominance is co-dominant due to the fact that views of the WTG are completely contained within the view frame and WTG would not be visible when viewers direct their gaze to the left or right.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: GT01 Forsythe NWR

Date: 02-23-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

WTG are clearly visible on the horizon and are likely to strongly attract viewer attention even though the white coloring lowers contrast. In addition the expanse captured in one frame allows viewers an ability to turn their gaze away from the array.

Visual Impact Assessment

Date: March 06, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Salt Marsh

Key Observation Point Name/Number: GT01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: There are two distant water towers but they are not focal points.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intensity and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: GT01

Date: March 06, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Perfectly clear day free of clouds and haze.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Expansive view over the salt marsh from a meandering narrow gravel road.

2 of 6

Visual Impact Assessment

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	7
Vegetation:	7
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	34

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **3**

Existing Conditions #2 Total (Sum 2A through 2C) **5**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **39**

3. Comments:

This view presents a unique environment where people are allowed access through the marsh. The beige gravel road snakes through the vegetation disappearing on a straightway into the distance along the edge of the marsh.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: G701

Date: March 06, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	7
Vegetation:	6
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **31**

3. Comments:

The horizon is lined, edge to edge in this scene, with proposed turbines. They appear as bright white spindles projecting out of the dark water, vegetation, and distant housing development. The turbines give an edge to the view, reaching into the sky further than any existing elements. The central row has a dense appearance since the turbines are nearly aligned, giving the impression on a wider structure.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: G701

Date: March 06, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	2
Landform:	3	User Activity:	2
Vegetation:	3	Total:	13

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	3	Total:	15

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	2	Total:	10

7. Comments:

The turbines add a rigid, industrial edge to an organic landscape. The vegetation is low and spread across the marsh, creating pockets of water in the foreground. The turbines are bright white against the pale blue sky, accentuating their presence.

5 of 6

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines are low along the horizon but they spread across the entire field of view. This reach is what makes them more visible and dominant.

Visual Impact Assessment

Date: 2/16/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Dredged Lagoon/Salt Marsh

Key Observation Point Name/Number: LAT01 Edwin B Forsyth

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Large bird's nest on vertical post in center of view.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a layering of salt marsh in the foreground, horizontal lines in the midground consisting of open water and some distant land form, and the open sky above the horizon. There is textural complexity in the foreground with the salt marsh plants and water.

1 of 6

Visual Impact Assessment

KOP: LAT01 Edwin B Forsyth

Date: 2/16/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Conditions are generally clear, but long term visibility seems hazy. Moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Local residents will enjoy this view on a regular basis.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LAT01 Edwin B Forsyth

Date: 2/16/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>8</u>
Landform:	<u>8</u>
Vegetation:	<u>8</u>
Land Use:	<u>6</u>
User Activity:	<u>6</u>
Existing Conditions #1 Total:	<u>36</u>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<u>2</u>
Special Condition B. Are there other aesthetic elements that add to this resource?	<u>2</u>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	<u>2</u>
Existing Conditions #2 Total (Sum 2A through 2C)	<u>6</u>
Existing Conditions Grand Total (Sum #1 Total and #2 Total)	<u>42</u>

3. Comments:

This view has some complexity. The foreground has a high amount of vegetative texture balanced with pockets of open water. There is a focal point that anchors one's attention in the center (a bird nest) and the midground view consists of open water framed by distant landform.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LAT01 Edwin B Forsyth

Date: 2/16/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>6</u>
Landform:	<u>6</u>
Vegetation:	<u>6</u>
Land Use:	<u>4</u>
User Activity:	<u>5</u>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	<u>4</u>
Total:	<u>31</u>

3. Comments:

The proposed turbines are visible in the distant open water. Due to the large quantity and alignment, they can be seen across a good portion of the horizon. The existing landform elements mask their impact in a portion of the view. These turbines occupy the horizon, but in this simulation the focal point still remains the bird nest in the foreground.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LAT01 Edwin B Forsyth

Date: 2/16/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>10</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>2</u>	Land Use:	<u>1</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>9</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>2</u>	Land Use:	<u>1</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>9</u>

7. Comments:

The turbines are visible in the distance and due to the long nature of the view in this location, viewers are likely to focus on the field of turbines to a level that competes with focus in the foreground.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LAT01 Edwin B Forsyth

Date: 2/16/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The proposed conditions are noticeable but not overwhelming. There could be a much higher level of visibility if atmospheric conditions were clearer or lighting different.

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Dredged Lagoons/Salt Marsh

Key Observation Point Name/Number: LAT01 EBFNWR

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Nesting bird platform and pink-tinted horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Marsh grass, still water channels, ocean, nesting platform, and horizon line; flat landscape equally divided between the grass marsh and sky punctuated by the nesting platform.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01 EBFNWR

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Nesting platform is a strong vertical element in the view.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Elements on the horizon would have greater definition on a clear day.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Birding and Wildlife Management

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01 EBFNWR

Date: 17 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	7
Vegetation:	8
Land Use:	7
User Activity:	6
Existing Conditions #1 Total:	35

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **2**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **5**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **40**

3. Comments:

Cultural | Historic: Edwin B. Forsythe Wildlife Refuge.

Aesthetic: Vibrant, highly textured grassy marshland.

Litter: Limited visitor litter.

Summary of View: The low marsh grass is highly textured in various shades of green and russet orange that are compositionally appealing in contrast to the reflection of the blue sky in the still water channel interwoven into the marshland. The blended colors of the sky also contrast the highly articulated strokes of the grass blades. The nesting platform directs the viewer's attention and punctuates the flat landscape with authority and purpose. It is easy to imagine visitors to the NWR traveling to this view to observe the waterfowl. The flat landscape in the background view is occasionally interrupted by man-made built forms such as water towers, cell towers, and other elements that float on the hazy horizon.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01 EBFNWR

Date: 17 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	7
Land Use:	7
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **37**

3. Comments:

With the Project in place, the viewer's attention is initially stopped and brought to the foreground bird nesting platform, however, very quickly the eye is drawn to the stacked rows of turbines in the background view, which seem to grow out of the landmass to the left and diminish to the right. Looking further left, the viewer would observe the bisected rotors partially obscured by the low lying land mass, which would appear contextually odd in the view. At 32.18-miles to the nearest turbine, the wind farm appears to be an extension of the background land mass and man-made elements on the horizon, however, even at this distance the presence of the turbines cannot be ignored and they visually compete with the visual quality of the intimate, secluded character of the WNR experience.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01 EBFNWR

Date: 17 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	2	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1	Total:	8

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1	Total:	8

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1	Total:	8

7. Comments:

Compatibility: The background viewing distance to the wind farm softens the compatibility score of the Project since the turbines are initially perceived to be "small", however, when observed with more detail, the stacked mass of turbines on the horizon in combination with the rotating rotors that are bisected by the land mass creating an odd optic could be considered out of place in this naturalized view.

Scale: The wind farm on the background horizon has enough scale and mass to draw the viewer's attention from the element of immediate interest to the movement and magnitude of the industrial installation 32.18-miles away at the nearest point. The development in place will influence the viewer's experience of the site.

Spatial Dominance: Before the Project's installation, the viewer's attention is focused on the water and landform elements in this, which is modified to be co-dominant with the Project given the scale and magnitude that it has on the horizon.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01 EBFNWR

Visual Impact Assessment

Date: 02-17-2021

Personnel: KV

Landscape Similarity Zone: Dredged Lagoon, Salt Marsh

Key Observation Point Name/Number: LAT01 Forsythe NWR

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: he Osprey nesting box

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

The natural order within this view provides repetition in the texture, line, and color that draws the eye from dark grassy banks and through glassy water textures then repeated by land on the distant horizon and the stratification of colors in the sunrise.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: LAT01 Forsythe NWR

Date: 02-17-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: clear skies could increase visibility, or hazy/overcast decrease

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Primarily boating, viewing, and birdwatching, but the housing development just out of view likely brings other variety of recreation.

3. Comments:

Movement attracting viewer attention: while none exists in this view the osprey box suggests the frequent appearance of birds. This view looks out across the salt marsh and open bay towards the barrier islands. The location map indicates the view to be at the edge of a densely developed neighborhood. Both Salt Marsh and Residential Development are common in this area, but locations which overlook the Salt Marsh at close proximity as it transitions to Open Bay are not overly abundant. The interplay between Water Resources and Landform are integral components within this view. Landform, represented by herbaceous grassland is interrupted with intermittent channels of water in the near-foreground. The bay provides separation from the near-foreground and the background barrier island reaching out over the horizon. Headlands on the barrier island landform terminate about halfway across the view and visible portions of the barrier island are set further back on the horizon becoming less prominent and allowing the bay water to become more dominant within the view. Land Use and User Activity at this location have a strong residential emphasis, however, homes typical of the Dredged Lagoon communities are provided with individual docking. This adds a focus on recreational boating in addition to bird watching as evidenced by inclusion in the Forsythe NWR footprint and foreground nesting box. As with many areas along the bayfront, especially those within the Forsythe NWR, this area is inundated by bird activity at various times of day.

3 of 6

Visual Impact Assessment

Personnel: KV

KOP: LAT01 Forsythe NWR

Date: 02-17-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	7
Land Use:	5
User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **6**

Total: **34**

3. Comments:

The turbines set within this scene are at a distance in which they primarily sit low on the horizon. At this location the turbines are viewed as part of the distant background elements. This however interrupts the interplay between the Water Resources and Landform. Where the barrier island once appeared to taper off and recede into the water, water resource is now occupied by man made structures. Stacking of turbines at this location make individual WTWG blend into each other and thus appear as larger and more visible masses, however the view of the array appears well organized. Movement of the turbine blades may draw viewer attention, but at this distance the effect will be diminished and will distract minimally from bird viewing or water recreation.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: LAT01 Forsythe NWR

Date: 02-17-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="12"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="7"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="7"/>

7. Comments:

the WT G although distant and small on the horizon are set at the edge of a land mass in a manner that seems to move development from land into the water resources. This detracts from both the Water Resources and the landform. The stacking of turbines creates strong vertical lines that pull the viewer from foreground elements. Despite this the overall scale is moderate and is unlikely to change the way vegetation is viewed or effect the land use or user activity. Similarly, these noticeable turbines sit low on the horizon and are co-dominant with the land and water resources surrounding.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: LAT01 Forsythe NWR

Date: 02-17-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The barrier island in the left of the view screens a section of turbines that appear scattered in layout, blade tips above the barrier island may be viewed as part of island development. However just to the right of the visible portion of the barrier island rows of turbines within the array begin to stack. Each row appears as a large mass on the horizon, individual WT G are not easily defined. This competes with water resources and landform elements as the stacked rows of WTGs fill a space on the horizon otherwise appearing as primarily vacant. However, the turbines at this distance are small enough, and sit low enough on the horizon that they do not strongly attract visual attention.

Visual Impact Assessment

Date: February 18, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Dredged Lagoon/Salt Marsh

Key Observation Point Name/Number: LAT01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: *There is a man-made nesting post jabb'd into the salt marsh grass landscape.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The salt marsh in the foreground has patches of open water interspersed among large swaths of low lush grasses. This transitions to open water deeper in the view, extending to the horizon.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01

Date: February 18, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: *The may pink sunrise haze at the horizon blurs the line between water and sky in the distance.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment?

The unobstructed view of the adjacent homes is a tremendous scenic resource.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01

Date: February 18, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	8
Land Use:	8
User Activity:	7
Existing Conditions #1 Total:	36

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **2**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **3**

Existing Conditions #2 Total (Sum 2A through 2C) **7**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **43**

3. Comments:

The salt marsh foreground has unique coloring and texture. This is a soft landscape with gentle undulation and open pockets of smooth reflective water. The open water in the distance blends with the sky at the blurred horizon, sharing color and texture. The sky is a rose pink at the horizon turning to a pale whitish blue with few thin wispy clouds. The primary focal element is a leaning singular wood post with an enormous bird nest perched on top. This adds unique composition to the view since there are a couple of awkward branches sticking out of the nest, protruding into the sky.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01

Date: February 18, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	8
Land Use:	7
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **6**

Total: **39**

3. Comments:

Following the viewing parameters, the apex of the turbine field appears to be the same elevation as distant adjacent vegetation. This continues a line across the view above the horizon. Similar to how the sky melts with the water on the right side of the view, the turbines blend as well, disappearing into the haze. Rows of turbines, central to the view, are more prominent given their spacing and the light direction and level. These turbines appear like long bands extending deeper into the view.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01

Date: February 18, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	2	Land Use:	2
Landform:	1	User Activity:	2
Vegetation:	1	Total:	8

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

7. Comments:

The turbines are visible in the distance but they do not have a dominant presence given the other features in the view. The salt marsh and the bird nest perch remain the focus of this view.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: LBT03 Beach at Longsight

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: the focus is at the horizon line where the beach meets the ocean

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

This view has a clear definition of shoreline, water and sky. Each of the se elements converge at the focal point.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT03 Beach at Longsight

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Local residents will enjoy this view on a regular basis.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT03 Beach at Longsight

Date: 2/17/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="9"/>
Landform:	<input type="text" value="7"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="7"/>
Existing Conditions #1 Total:	<input type="text" value="34"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="2"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="1"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	<input type="text" value="2"/>
Existing Conditions #2 Total (Sum 2A through 2C)	<input type="text" value="5"/>
Existing Conditions Grand Total (Sum #1 Total and #2 Total)	<input type="text" value="39"/>

3. Comments:

The view from this vantage point is relatively straightforward and predominantly natural. There is a balance of open ocean, with wave motion to garner one's attention, a wide sandy beach, some vegetated dune area and open sky. All elements converge at the focal point on the horizon. Footprints provide an interesting texture to the beach, and area that likely sees pedestrian movement on a regular basis.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT03 Beach at Longsight

Date: 2/17/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="4"/>
Landform:	<input type="text" value="4"/>
Vegetation:	<input type="text" value="4"/>
Land Use:	<input type="text" value="3"/>
User Activity:	<input type="text" value="3"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	<input type="text" value="4"/>
Total:	<input type="text" value="22"/>

3. Comments:

The proposed turbines are highly visible in the open water. Due to the large quantity and alignment, they can be seen across a good portion of the horizon. These turbines span a large area of open water and penetrate the horizon line. The turbines become the focus of this view. They have a significant impact.

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>3</u>	Total:	<u>13</u>

7. Comments:

The turbines become the focal point in this view. They completely cover the open water view and occupy the horizon line. They create a "built" condition in the water that spans the entire area.

KOP: LBT03 Beach at Long

Date: 2/17/21

Proposed Conditions

2. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Fairly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions are highly noticeable and will capture the viewer's attention as a focus.

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: LBT03 Long B Isld

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Rolling surf and horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Sandy beach, rolling surf, waves, ocean and horizon; horizontal landscape with strong perspective pull to the right of the view causing the sand, waves and sky to fan out from the perspective center point.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT03 Long B Isld

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Atmospheric haze could affect the quality of visibility to the Project.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Open beach.

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT03 Long B Iskl

Date: 17 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	4.5
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	29.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

0

Special Condition B. Are there other aesthetic elements that add to this resource?

1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

2

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

31.5

3. Comments:

Cultural | Historic: None apparent.

Aesthetic: Open, light colored sandy beach contrasted against the blue-green rolling ocean surf and clear, sky-blue horizon.

Litter: Visitor beach litter.

Summary of View: The wide open, sandy beach with very little rock outcroppings or harsh pebble sand would make this a popular place to enjoy sunbathing and beach activities at the ocean that is common along the New England seaboard, therefore, while pleasing, the beach is not visually unique. The extensive amount of foot traffic in the view further supports the high use by the local and visiting community.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT03 Long B Iskl

Date: 17 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	4.5
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **2**

Total: 30.5

3. Comments:

Despite the magnitude of the Project in this view, the organized and symmetrical nature of the turbines that are evenly spaced and at uniform heights along the horizon are visually appealing in their composition. There is no visual competition between the turbines and other elements in the view, such as land mass, vegetation, buildings, etc., therefore, the view is all about the wind farm itself, which offers something unique to the classic New England beach typology. It is important to note that the visual quality of the view is not reduced by the introduction of the wind farm from this vantage point due to the balanced, symmetrical and uniform heights of the turbines that recede into the perspective.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT03 Long B Iskl

Date: 17 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1.5
Landform:	1	User Activity:	1.5
Vegetation:	0	Total:	5.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1.5
Landform:	1	User Activity:	1.5
Vegetation:	0	Total:	5.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1.5
Landform:	1	User Activity:	1.5
Vegetation:	0	Total:	5.5

7. Comments:

Compatibility: The back lit gray of the turbines on the horizon blends with the tan, French gray, sea green and blue hues of the view. Therefore, the compatibility score is triggered by the introduction of an industrialized installation into a seascape.

Scale: The installed turbines at 24.87 miles to the nearest turbine are relatively small in perceived height and do not exceed an allowable proportion of the view that would cause them to be considered severe in contrast.

Spatial Dominance: The combination of the beach, ocean and sky still dominate the viewer's attention, however, the light gray turbines sit lightly on the horizon and contribute to the overall viewing experience.

5 of 6

Visual Impact Assessment

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: LBT03 - Long Beach

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: the horizon line against the ocean provides a focus, but no strong single focal point is present

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The viewer's gaze is drawn along this image following the vanishing lines of the shoreline and horizon which are highlighted by darkened tracks in the sand and waves, respectively.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: LBT03 - Long Beach

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Overcast/Hazy conditions could limit visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ sidelit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☐ Yes ☒ No

How would the site be used for scenic or recreational enjoyment? While the shoreline beach is a recreational location, there are no designated resources captured by this view.

3

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

29.5

3. Comments:

Motion attracting viewer attention: Birds, waves, user groups on the beach.

This view depicts a serene beach where human activity is present but effort to accommodate users is primarily focused on local residents. This is evidenced by the lack of highly developed beach access points and the somewhat neglected stone pier. Sand dunes with young dune grass and sand fencing just beyond the view hold the dunes at a height to form protection to residences beyond. Water resources and landform at this location are expansive and open, but also common to the region. No vegetation is found within this view, although young dune grasses are used to hold the dunes and provide nesting location for sea birds. Land use and user activity are as discussed are targeted to those in the immediate area as well as visitors requiring minimal amenities or seeking a less frequented beach.

While this beach is in proximity to a local community resource, the Long Beach Island Foundation of the Arts & Sciences, but no state or national resources are located in close proximity.

User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: 4

Total: 24.5

3. Comments:

WTGs at this location expand across the selected viewframe. WTGs at the center of the array create a stacked line with a dense appearance, rows moving out from the center slowly lose the stacked appearance and begin to have a densely scattered and disorganized pattern before the spread tapers out to appear as individual turbines dotting out from the edge of the array. The wide open expanse of ocean becomes cluttered with easily visible turbines, and the movement of the blades is likely to attract and retain viewer attention. Landform within this view is a thin coastline beach and the intensely vertical turbines limiting the expansiveness of the horizon may increase the closed-in experience of the thin beach closely backed by tall dunes, just beyond the view. Vegetation is not found within this view. Land use and user activity at this view have been acting primarily as location for passive and active beach recreation, but with the turbines in place the emphasis of the view becomes the turbines.

4 of 6

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

WTG within this view occupy a constrained expanse of ocean and do not affect the full available horizon. However, turbines are at such a size that beach users will readily distinguish them on the horizon. The scatter distribution appearance of the turbines at the edge of the array softens the visibility, but stacking of the central rows create dense silhouettes on the horizon and draws the viewers gaze. Due to the distance of the WTG at this location weather conditions and atmosphere are likely to have a great deal of effect on the VTL. However, in these clear conditions, even at such a distance it is likely to be a major focus of visual attention.

Visual Impact Assessment

Date: February 18, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: LBT03

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LBT03

Date: February 18, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: The sky appears as clear as could be.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? There are residences lining the oceanfront with direct beach access.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LBT03

Date: February 18, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	8
Vegetation:	4.5
Land Use:	9
User Activity:	9
Existing Conditions #1 Total:	39.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

0

Special Condition B. Are there other aesthetic elements that add to this resource?

3

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

2

Existing Conditions #2 Total (Sum 2A through 2C)

5

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

44.5

3. Comments:

Open and expansive warm grey sandy beach leading to the water. Frothy white waves cresting along the length of the shoreline. Footprints in the sand provide a unique texture and shadowlines. There is small outcropping of dark rocks where the water meets the sand. Seagulls are scattered around the beach. The sky is completely clear fading from whitish blue at the horizon to a rich golden blue at the top of the view.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LBT03

Date: February 18, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	4
Vegetation:	4.5
Land Use:	2
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 17.5

3. Comments:

While not tall features in the overall sky portion, the proposed turbines command attention, extending across the majority of the view. The thinner spaced turbines on the left and right fade into the horizon, the stacked formation turbines in the center are cluttered. The three central rows appear like dark jagged masses protruding from the water. The pale white sky at the horizon makes the turbines appear dark with such a light colored background. The turbines add an industrial feel to an otherwise undeveloped existing view. The scene behind the viewer is sprawling dense low level residential, but the view in this direction is open and unobstructed.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LBT03

Date: February 18, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	0	Total:	11

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2	Land Use:	3
Landform:	2	User Activity:	3
Vegetation:	0	Total:	10

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	3
Landform:	1	User Activity:	3
Vegetation:	0	Total:	9

7. Comments:

The view shifts from the three co-dominant components to four: beach, water, and sky are present in the existing view; turbines are added as a significant fourth component in the proposed view. The horizon is a focus in the existing view, serving as a clean line in the distance. The turbines break up this line and add a man-made industrial texture.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LBT03

Date: February 18, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The breadth of the turbine field, extending from one side of the view to the other, becomes the dominant focal point in the distance. The height is not as strong of a factor as the beach, ocean, and sky still comprise the majority of the view.

6 of 6

Visual Impact Assessment

Date: 08/22/22

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: LBT04 Wildlife Refuge

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a clear layering of beach, water, horizon line, and sky

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT04 Wildlife Refuge

Date: 08/22/22

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *Clear, drier conditions would increase view*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This view will be used by nearby residents and visitors for recreational enjoyment and viewing.*

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT04 Wildlife Refuge

Date: 08/22/22

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	5
Vegetation:	4.5
Land Use:	7
User Activity:	8

Existing Conditions #1 Total:

33.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

8

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

41.5

3. Comments:

This is an uninterrupted open water view that will be seen by users repeatedly and for long periods of enjoyment. The open water view dominates the landscape and the movement of the waves provides the focal activity. There is no visual clutter in this wide open view.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT04 Wildlife Refuge

Date: 08/22/22

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	3
Landform:	3
Vegetation:	4.5
Land Use:	3
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **20.5**

3. Comments:

This open water view is now dominated by a large field of highly visible turbines that form their own patterns. They become the focus of the view and lend an industrial component to the landscape. Viewers will be affected by the presence of the turbines, likely in a negative manner. They create significant contrast to the existing open nature view.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT04 Wildlife Refuge

Date: 08/22/22

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	2
Landform:	1	User Activity:	2
Vegetation:	0	Total:	8

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	2
Landform:	1	User Activity:	2
Vegetation:	0	Total:	8

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	0	Total:	9

7. Comments:

The original appeal of this landscape is the uninterrupted open water view. The proposed turbines completely change the mood of the landscape, lending a strong industrial developed feel to the view. There is strong contrast from existing to proposed conditions. These are most visible when backlit, during sunrise and mid-day conditions, and overall have great impact in all lighting conditions.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LBT04 Wildlife Refuge

Date: 08/22/22

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The visibility level in this case is impacted somewhat by the lighting levels. The proposed conditions range from dominant during the daytime (when backlit) to more subtle in the sunset simulation. The overall average is level 5, largely due to the massive extent of the project and its wide range of view. Viewers will focus on the turbines and possibly be drawn to the patterns resulting from the perspective views of the receding rows.

Visual Impact Assessment

Date: 22 August 2022

Personnel: KAC

Landscape Similarity Zone: Undeveloped Beach, Seascape

Key Observation Point Name/Number: LBT04

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon line and bright sun spot.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Compressed horizontal planes of sky, water and sand.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT04

Date: 22 August 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Footprints on the beach, and vegetation clumps.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☒ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Lack of cloud cover, clear conditions.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☒ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Wildlife Refuge, undeveloped beach.

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT04

Date: 22 August 2022

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	4.5
Land Use:	5
User Activity:	5
Existing Conditions #1 Total:	24.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

2

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

26.5

3. Comments:

Cultural | Historic: Wildlife Refuge

Aesthetic: Wide water view to the horizon, but not overly unique.

Litter: Beach water/litter/wash-in litter.

Summary of view: The early morning view across the beach and greater ocean landscape is visually pleasant and the coloring of the sky attractive; however, the view is not overly dramatic or unique to the east coast. The Noon view is more visually compelling in color and texture since the cloud cover keeps the elements in the view from becoming overly bleached out by direct sunlight and the light on the ocean glimmers from mid to background view. The significant glimmering texture on the ocean contrasts the long, thin bands of clouds in the sky. The sunset view has rich, deep colors of dark blue ocean, white surf, and taupe sand intermixed with the active movement in the rolling surf.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT04

Date: 22 August 2022

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4
Landform:	5
Vegetation:	4.5
Land Use:	5
User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **1**

Total: 23.5

3. Comments:

The turbines sit gently on the sunrise sky due to the front lit conditions at the horizon line. The swells of the midground ocean and patterned surf are visually interesting and attract the viewer's attention away from the turbines. The stacked turbines in this left and right of the view are highly visible at sunrise and the ends splay outward as an individual installation.

The Noon view is highly contrasting between the sky, water, and sand due to the bright light conditions. The sparkling, diamond colored water in the midground view and the stark white line that supports the deeply colored turbines are the most visually powerful components of the view. The stacked turbines in the left and right of the view are highly visible at Noon; however, the highly textured water and highly textured turbine arrangement are mutually competing for the viewer's attention.

The sunset view colors are rich and inviting to look at, however, the front lit turbines on the horizon are more difficult to see as they blend into the background sky. The addition of the turbines along the horizon line is a textural element, but they are softened visually due to the light color of the turbines and the light colored sky. The stacked turbines to the left and right of the view are less pronounced in this view and the visual impact lessened.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT04

Date: 22 August 2022

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	2.5	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	1	Total:	10.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2.5	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2.5	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9.5

7. Comments:

Compatibility: The density of turbines and industrial footprint on the horizon reduces the aesthetic quality of the view; however, the intensity of the turbines is lessened at sunrise and sunset, and being a Wildlife Refuge and undeveloped beach, this area likely receives less visitors; however, they may have increased sensitivity to the changed view.

Scale: The scale of the turbines is based upon the cumulative visual weight of the entire system, versus a singular turbine.

Spatial Dominance: The vastness of the ocean is in contrast to the visual weight of the turbines. Both have visual weight and spatial dominance in the view.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LBT04

Date: 22 August 2022

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 2022-08-23

Personnel: Kiva VanDerGeest

Landscape Similarity Zone: SCA - Undeveloped Beach

Key Observation Point Name/Number: LBT04

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: the expanse of open ocean is the central focus of this view, but there is no defined viewpoint within

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The natural order of the view draws a viewer's eye into the frame, and across this level expanse of shoreline, ocean, and toward the distant open horizon.

1 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: LBT04

Date: 2022-08-23

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view?

Missings of sea grass and prints in the sand that form no clear path or pattern allude to activity in the scene that is currently not present.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: hazy/overcast

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? this is a public beach front within the Edwin B. Forsythe NMR

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

8

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

36.5

3. Comments:

Movement apparent in this scene: ocean waves and clouds

This is a beach level view of the open ocean. The low, flat beach places the viewer fully within the scene and looking out toward the distance horizon rather than looking over a scene that they may not be fully integrated into. Vegetation is lacking in this view, although coastal scrub/shrub mixes are located behind the viewer. Land use at this location is associated with preservation of wildlife and user activities are focused on enjoyment of natural resources and wildlife.

This location is within a National Wildlife Reserve; views to the ocean uninterrupted by built structures are available in portions of this beach area. No pollution is present in the view.

3 of 6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **8**

Total: **30.5**

3. Comments:

The introduction of turbines into this view primarily affects the expanse of open ocean previously available. This eye-level view of the beach now includes an expanse of turbines across the view. Due to the low elevation the base of the turbines are substantially screened from view and the offshore substations appear similar to ships on the horizon. The existing landform is further flattened the position of the viewer begins to feel even lower with the height of the towers on the horizon. The minimal vegetation and sea grass available in this view are not affected by the inclusion of the turbines. Land use and User activity previously focused on the natural environment now include views of built structures that will draw viewer attention from the surrounding natural features.

The preservation of undeveloped land within the Forsythe NMR will continue despite the addition of constructed elements in the view.

4 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: LBT04

Date: 2022-05-23

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>3</u>	User Activity:	<u>3</u>
Vegetation:	<u>0</u>	Total:	<u>12</u>

5. Rate scale/contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>3</u>	User Activity:	<u>3</u>
Vegetation:	<u>0</u>	Total:	<u>12</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>3</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>10</u>

7. Comments:

The turbines lack compatibility with this low, flat beach view. When turbines are front-it and difficult to discern on the horizon the impact may decrease but visibility will continue to draw attention away from the natural environment. The scale contrast of the turbines is severe against the relatively small extent to land lacking in other developed features. The extent of turbines becomes a dominant feature in the view compared to the water and landform, but are co-dominant with the undeveloped land use and user activity focused on the natural environment.

5 of 6

Visual Impact Assessment

Personnel: Kiva VanDerGeest

KOP: LBT04

Date: 2022-05-23

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, or focus in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of viewers in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflectors and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for viewers in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The exposure of turbines during site and back-it conditions will draw and hold viewer attention. During front-it and some side-it conditions the visibility may be more consistent with a level 4 VTL as the turbines will continue to draw viewer attention by are unlikely to hold the gaze or distract from other views along the horizon.

Visual Impact Assessment

Date: August 24, 2022

Personnel: Steve Breitka

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: LBT04

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Simple three part order to this view consisting of sandy beach, open water, and cloudy sky. There are no built structures present in the Simulated Photograph Extent although there is a jetty / breakwall outside the Extent to the left.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: LBT04

Date: August 24, 2022

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☒ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: ☐ Would expect haze to obscure the horizon, it is clear at all three times of day in this view.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Wide open sandy beach is inviting and the Wildlife Refuge has a variety of flora and fauna in multiple types of habitat.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	9
Landform:	4.5
Vegetation:	4.5
Land Use:	9
User Activity:	9
Existing Conditions #1 Total:	36

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

3

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

9

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

45

3. Comments:

This view has a simple structure consisting of beach, water, and sky. There are no distinct focal points other than rolling low waves and cloud cover. People visiting this portion of the beach will have the short term and occasional viewpoint while the homes to the north will have the long term repeated viewpoint. The beach is fine sand, appearing soft, with scattered shells and seaweed. The water changes color depending on the time of day; sunrise water is dark against the orange-blue overcast sky; noon water sparkles in the sunlight, and sunset water is deep blue at the horizon.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: LBT04

Date: August 24, 2022

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	1
Landform:	4.5
Vegetation:	4.5
Land Use:	1
User Activity:	1

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: 3

Total: 15

3. Comments:

The proposed turbines create a significant shift in the serene open water view. Even at nearly 12 miles away, the turbines are clearly visible across the entire view. The massing is accentuated by the lines of structures extending further into the scene. When aligned, the turbines appear darker and heavier, when staggered, the viewer is able to see the full breadth of the field. The turbines are equally visible at sunrise and at noon, though they disappear into the clouds at sunset. The lighting at this time of day causes the structures to blend with the sky, filled by a thin and hazy cloud cover. The horizon remains a clean and crisp line through the view despite the hazy appearance of the sky. Water movement is consistent at all three times of day depicted: calm further out from shore with low waves cresting at the beach.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: LBT04

Date: August 24, 2022

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	0	User Activity:	3
Vegetation:	0	Total:	9

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	0	User Activity:	3
Vegetation:	0	Total:	9

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	3
Landform:	0	User Activity:	3
Vegetation:	0	Total:	9

7. Comments:

The view shifts from no focal point to many focal points, or a primary focal point considering the entire line of turbines as one mass. The existing sky and water converge free of any built structure until the turbines are added as a barrier at the horizon. While the actual space consumed by the turbines may be less in this view than the beach, water, or sky, they still dominate the view even though the nearest is 12 miles away.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitka

KOP: LBT04

Date: August 24, 2022

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility. It could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed turbines are fully visible and extend across the entire length of the view. The time of day obscures them, blending with the sky, though their motion will still be present. Constant wave action in the foreground will contribute motion but not in a consistent and linear fashion like the turbines.

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Undeveloped Bay

Key Observation Point Name/Number: LEHT02 Great Bay Bog

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe. The view is pretty balanced with the general focus happening across the horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

This view has a natural layering of shoreline in the foreground, water in the mid-ground, punctuated by the horizon line and open sky above.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LEHT02 Great Bay Bog

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Local residents, tourists and fishermen may enjoy this viewpoint on occasion ...

Land Use:	<input type="text" value="3"/>
User Activity:	<input type="text" value="3"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	<input type="text" value="4"/>
Total:	<input type="text" value="20"/>

3. Comments:

The proposed turbine field is highly visible in the open water and becomes the focus of the view. Due to the large quantity and alignment, the turbines can be seen across a good portion of the horizon. These turbines span a large area of open water and penetrate the horizon line. The impact is significant.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LEHT02 Great Bay B3

Date: 2/17/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>2</u>	Total:	<u>12</u>

7. Comments:

The turbines become the focal point in this view. They completely cover the open water view and occupy the horizon line. They create a "built" condition in the water that spans the entire area.

6 of 6

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Undeveloped Bay

Key Observation Point Name/Number: LEHT02 GBB WMA

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Dark landmass, horizon line and puffy clouds in the sky.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Pebbled beach sand, sea grass, bay and background land mass to horizon; the horizontal qualities of the landscape are interrupted by the foreground tufted grasses and spit of grass extending into the bay waters.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LEHT02 GBB WMA

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Clear sky conditions would accentuate the turbines.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Great Bay WMA, Little Egg Harbor Life Saving Station #63

3. Comments:

Cultural | Historic: Great Bay WMA, Little Egg Harbor Life Saving Station #23

Aesthetic: Interesting marsh edge fringe that extends into the bay.

Litter: Limited visitor litter.

Summary of View: The vegetated, pebbled beach edge is an extension of the grassland behind the viewer. The marsh fringe is visually interesting and interweaves the water and earth elements together, however, this setting is most advantageous for walking and birding activities not recreational beach use. It can be assumed that most visitors to this remote location are taking the potential wildlife in the WMA versus beach lounging, therefore, it is likely that they will be moving through the site more rapidly than resting on the beach.

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 31

3. Comments:

The addition of the proposed Project in the view radically changes viewer's experience of the WMA. The undeveloped bay is rugged in appearance and less refined than the sandy beach areas found in other areas of the study area, however, the ruggedness of the landscape is what makes the view interesting and it is in keeping with what is typically associated with a wilderness management area. The addition of the turbines introduces an industrial overlay to the resource area experience, especially as the turbines emanate from the area to the far right side of the view that includes Atlantic City, bringing the man-made and built forms into this location. The size of the wind farm at 11.91-miles to the closest turbine is a near, unsettling visual addition to the isolated environment and dominates the viewer's attention from this vantage point.

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	2.5	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1	Total:	8.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1.5	Total:	9.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2.5	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1.5	Total:	9

7. Comments:

Compatibility: The 11.91-mile viewing distance brings the turbines into being a much more intimate element within the view. The visual clarity of the turbines on the horizon further emphasizes their proximity and contrast on the water and landform elements in the view.

Scale: The installed turbines are clearly visible and their height and disorganized pattern and overlap is what actively dominates the center portion of the view between the bay and the sky.

Spatial Dominance: The marsh grass fringe and open bay do not have the visual strength in color, texture and visual interest to hold the viewer's attention in comparison with the moving rotor blades, therefore, the view is mostly dominated by the non-sequenced rotating of rotor blades that are stacked upon themselves along the horizon line.

Visual Impact Assessment

Personnel: KAC

KOP: LEHT02 GBB WMA

Date: 17 February 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be averted except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Undeveloped Bay

Key Observation Point Name/Number: LEHT02 - Great Bay Wetlands

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Salt Marsh grasses on the left side of the view stretch out and point to a span of landform on the horizon.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

Within this view natural order of shoreline, water, and vegetation in the lower half with pastel sky along the horizon helps draw the viewer's gaze through the view with repetition of textures and colors.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: LEHT02 - Great Bay Wetlands

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: overcast or hazy conditions would decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This site is a WMA and has a NRHP resource on site, although not visible in this particular view.

39

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

3

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

9

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

48

3. Comments:

Movement attracting viewer attention: ripples on otherwise smooth water surface, grasses and clouds blowing in a breeze.

This view located on a peninsula looks into the serene open bay and toward the distant barrier islands and ocean beyond. Water resources are serene and with small dark ripples indicating gentle movement. Distant landform frames the edge of view along the horizon where water meets sky. A gap in the distant landform in the center of the view adds an expansive feel to the water resources. Near-foreground landform varies between a pebble shoreline and soft grassy ridge at the waters edge. Marsh land vegetation adds another element of texture to this view and defines this as a natural meeting of water and land. Land use is primarily preservation. However, the Rutgers Field station, not in view but located on the same peninsula as this viewpoint, indicates that research activities also occur in proximity. User activity includes preservation, research, fishing, and trapping shellfish.

The Rutgers field station is a NRHP site, and former life saving station. This is also a WMA.

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **8**

Total: **36**

3. Comments:

The WTG set in this image densely populate the horizon and connect two distant landforms creating a sense of walling in this bay location. The WTG are readily visible whether individually or stacked and appearing as a larger cluster, and the substations peek over the horizon as large squared masses. The view of water resources and landform are greatly altered, and the WTG distract from the soft herbaceous vegetation. The untouched quality of this landscape and view are lessened and become more average in nature. While still beautiful, this view becomes comparable to other developed marsh and grassland areas. Although differing in development pattern the sense in this setting, although not residential like the dredged lagoon, becomes much more about human development than the existing scene. Land use and user activity will likely still have emphasis on preservation and research, but looking out over the open water and undeveloped bay will have a very different impact on viewers.

4 of 6

Visual Impact Assessment

Date: February 19, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Undeveloped Bay

Key Observation Point Name/Number: LEHT02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: The sky still has a rosy glow at the horizon following sunrise.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Getting to this location involves driving down Great Bay Boulevard and then hiking to the beach, taking people through the salt marsh.

3. Comments:

Open view of the bay from a short stretch of beach. Calm, but textured, water with spiky grass vegetation along the shore. The lighting angle darkens this view: the grasses appearing black and the water full of dark ripples. The sky is white rosy pink on the left side of the view where the sun is reflecting off the water, transitioning to a rich blue on the right side of the view. Thin cloud cover high the sky, appearing like a thin hazy veil. White and blue puffy clouds closer to the horizon, scattered across the entire view. Land is visible in the distance on both sides of the view, apparently covered with vegetation given the dark color. There is minor topographic change across the dunes..

3 of 6

User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: 24

3. Comments:

The existing view does not have a singular focal point, just openness. The proposed turbines create a transparent wall of structures extending across the view. The adjacent Rutgers University Marine Field Station does give this location a research oriented land use, however, this is also a kayak launch area at the end of Great Bay Boulevard. Even though the nearest turbine is almost 12 miles away, they still create a sense of enclosure. The turbine spacing on the far right and far left feather out and have less presence in the sky. The turbines in the center of the view have a stacked repetitive appearance that increases their mass. The backlit nature of this view also makes the turbines appear dark against the white backdrop at the horizon.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LEHT02

Date: February 19, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	3
Vegetation:	1	Total:	11

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	1	Total:	10

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	3	User Activity:	3
Vegetation:	2	Total:	13

7. Comments:

The proposed turbines alter this view from one of open water to one of industry. Although the landforms in the distance are not significant, the turbines tower over the dunes and connect one side of the view to the other. The proposed view has multiple focal points, or one large focal point as the eye immediately goes to the horizon and the string of rotating blades.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

There is nothing in this view to compete for attention with the proposed turbines; they become the dominant feature given their expansive stretch. The turbines are not high in the sky, though they are the tallest element along the horizon.

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Ocean Residential

Key Observation Point Name/Number: LT02 Cape May Point

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly local, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe. *The view is generally to the horizon line but is anchored by a building in the center of the view.*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a layering of natural salt marsh in the foreground, built-up land in the midground and open sky above the horizon line.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LT02 Cape May Point

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *There are some built elements that permeate the green spaces.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. **Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.**

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *Increased moisture in the air could impact visibility.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. **Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.**

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This view is used mostly by locals and tourists for the purpose of visits.*

KOP: LT02 Cape May Point

Date: 2/17/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>7</u>
Landform:	<u>6</u>
Vegetation:	<u>6</u>
Land Use:	<u>6</u>
User Activity:	<u>6</u>

Existing Conditions #1 Total:

31

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

2

Existing Conditions #2 Total (Sum 2A through 2C)

7

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

38

3. Comments:

This prized view from the lighthouse looking in the direction of the turbine field is over salt marshes and distant built environment. The composition of the view generally terminates at the horizon line, which is occupied by a somewhat built-up environment. The natural salt marsh in the foreground is the more scenic component of the view with a large open water component.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LT02 Cape May Point

Date: 2/17/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<u>7</u>
Landform:	<u>6</u>
Vegetation:	<u>6</u>
Land Use:	<u>5</u>
User Activity:	<u>6</u>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: 7

Total: 37

3. Comments:

The proposed turbine field is barely noticeable above the built conditions at the horizon line. Viewers will likely not notice the turbines, though portions of them can be seen upon close examination.

4 of 6

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The proposed conditions are not very noticeable, and what can be seen would likely be attributed to the existing built environment in the view.

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Ocean Residential

Key Observation Point Name/Number: LT02 Cape May Pt SP

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Grassy marsh opening, water body, water tank, and horizon.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Scrub edge, marsh grass meadow, pond, scrub, man-made structures, utilities, background landform, and horizon; initially this is a sunken landscape with the ring of taller scrub forest vegetation emphasizing elevation difference. Background vegetation is strongly horizontal.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LT02 Cape May Pt SP

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view?

In the background view various utility elements such as cell towers, water supply and the city skyline break the horizon.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Less haze would increase the visibility to the Project.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment?

Cape May State Park, Fishing Access and Beach, Cape May Lighthouse, Bayshore Heritage Scenic Byway.

40

3. Comments:

Cultural | Historic: Cape May State Park, Fishing Access and Beach, Cape May Lighthouse, Bayshore Heritage Scenic Byway.

Aesthetic: Elevated view from the historic lighthouse to the dynamic landscape that is a mix of scrub vegetation, marsh, pond, beach and ocean front.

Litter: Limited visitor litter.

Summary of View: The panoramic photo from this viewpoint has greater visual interest and diversity than the simulated view due to the layers of environmental diversity, color and texture observed as the tidal marsh and ocean front beach meet each other. The simulated view focuses on the carpet of marsh grass that is bordered by the deep green evergreen and deciduous scrub forest, and a water body that reflects the blue of the sky above. The built environment is apparent in the mid-ground and background view, however, very few elements break the horizon and the ones that do are light in color against the sky.

3 of 6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **7**

Total: 40

3. Comments:

With the Project in place it is very difficult to differentiate the rotors on the horizon due to the blade tips blending in with the other utility and man-made features that punctuate the horizon lightly and with very little visual definition. It is possible that the movement of the rotor blades would catch the viewer's attention, however, they would need to be focused and looking past the other interesting colors, texture and natural systems in the foreground setting.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LT02 Cape May Pt SP

Date: 17 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5

7. Comments:

Compatibility: Turbines are not clearly visible at this distance, only the blade tips upon close observation.

Scale: The turbines do not break the horizon line with enough height to be visible and be in contrast to their surroundings.

Spatial Dominance: The turbines are almost imperceptible, therefore, they do not have any spatial dominance in the view.

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: LT02 - Cape May SP

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Watertowers on the horizon are distant focal points, but the contrast of flat grass among trees is a focal point

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

the flat grassy area and the pond that mirrors the sky hold a viewer's gaze within the center of the view.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: LT02 - Cape May SP

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: overcast/hazy conditions may reduce visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This lighthouse is used for viewing and experiencing history. The State Park and beaches provide recreational resources.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	7
Land Use:	7
User Activity:	7

Existing Conditions #1 Total:

34

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

3

Special Condition B. Are there other aesthetic elements that add to this resource?

3

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

9

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

43

3. Comments:

Movement attracting viewer attention: none.

This view is from the top of the Cape May lighthouse looking back up the Cape May peninsula. The inland tidal pond among the herbaceous wetland vegetation and the dispersed forest canopy throughout make for a unique scene. The elevated vantage point and long distance view that it provides is unique. The landform at this location is flat in the foreground with low hills in the distant background. The variation in ponding and texture of the wetland vegetation mixed with forest is again unique. Land use and user activity at this state park emphasizes tourism and history. While not in the view frame the large parking area detracts from the visual quality of the elevated view. However, the shoreline beach similarly just beyond the view frame adds to the unique quality of the view by adding even greater variety in resources at this location.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: LT02 - Cape May SP

Date: 02-18-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines added to this relatively still view will likely be apparent primarily because of the motion of blade tips rising and sinking in the distant background. On hazy or overcast days it is unlikely that viewers will be able to discern the WTW from other elements on the distant horizon.

Visual Impact Assessment

Date: February 19, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Ocean Residential

Key Observation Point Name/Number: LT02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The natural landscape has an order of ocean to beach to inland salt marsh to dense wooded area. The man-made order depicts development at the beach including parking, beach access, beach front residential.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LT02

Date: February 19, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: There is a light haze in the distance. It covers a portion of the landscape and blurs the horizon.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is an elevated view from the lighthouse that provides a unique perspective of a lush landscape.

Existing Conditions #1 Total:	<input type="text" value="40"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

The colors and textures in this view resemble a painting. The elevated perspective lends a softness to the landscape below. The inland marsh has a variety of different materials including grasses, dense shrub thickets, and mature deciduous and coniferous trees. There is open water to brighten the marsh and make the connection to the ocean (outside this view to the right). Development is visible in the distance although exact land use is not clear. Roof lines extend above the vegetation and there are a few narrow and obscure towers in the distance; they appear to include a municipal water tower and thin communication towers on the right side of the view. The sky is predominantly a pale blue, lighter at the horizon with a few patchy white clouds.

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: MCo2 Lucy the Marg

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The built environment is cluttered but contained as one body of shoreline balanced by open water and open sky.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: MCo2 Lucy the Marg

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? ☒ There is considerable clutter in the foreground that competes with the open water view.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Increased moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view is seen from a historic landmark.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: MCo2 Lucy the Marg

Date: 2/17/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="7"/>
Landform:	<input type="text" value="4"/>
Vegetation:	<input type="text" value="3"/>
Land Use:	<input type="text" value="5"/>
User Activity:	<input type="text" value="5"/>
Existing Conditions #1 Total:	<input type="text" value="24"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="2"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="1"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This view out to open water from a historic landmark has significant clutter in the foreground, attracting one's attention to the buildings, people and other built elements that frame the bottom and left of the view. The open water is a pristine balance to the clutter in the foreground. The composition of the view is such to lack any solid focal point. The viewer's gaze eventually rests on the open water at the horizon line.

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: MCo2 Lucy the Marg

Date: 2/17/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="2"/>
Land Use:	<input type="text" value="4"/>
User Activity:	<input type="text" value="4"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The proposed turbine field occupies the one clean open area of the existing view, filling it with the visual clutter of the turbine field at a distance that deems it quite visible. The turbines penetrate the horizontal skyline and become the new focus of the view. They add to the clutter that exists in the foreground.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: MC02 Lucy the Margate

Date: 2/17/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>10</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>10</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>2</u>	Total:	<u>11</u>

7. Comments:

The turbines occupy the horizon and become a focus in this view.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: MC02 Lucy the Margate

Date: 2/17/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Fairly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines are highly visible and the only mitigating factor in their visibility is the presence of visual clutter in the foreground that competes for the viewers' attention.

6 of 6

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: MC02 Lucy NE NHL

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No.

If yes, briefly identify/describe: Tall building, odd architectural angles, utilities, ocean and horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Ship architecture, restored beach grass, beach, jetty, ocean, and horizon; interrupted landscape due to the boxing in of the view with incongruous architectural styles and heights.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: MC02 Lucy NE NHL

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The incongruous architectural styles/materials and high-rise as well as utility poles interrupt the view to the ocean.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: A less hazy horizon line would show more Project detail.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Atlantic Coast Public Beach, Lucy the Margate Elephant, Margate City Public Beach.

Date: 17 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	6
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	30

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **33**

3. Comments:

Cultural | Historic: Atlantic Coast Public Beach, Lucy the Margate Elephant, Margate City Public Beach.

Aesthetic: The folly and amusement of Lucy the Margate Elephant is minimized by the dated architectural structures that surround it, which also prohibit the visual connection and promenade to the beach and ocean.

Litter: Tourist and beach litter.

Summary of View: The street views to Lucy the Elephant itself is likely a more sensitive visual resource than the view from the observation platform on top. The view, outside of being from a historic monument, does not have a superior aesthetic due to the beach and ocean being interrupted by random architectural forms, materials and styles, interrupting utility lines and poles, and elevated views into the service areas of adjacent structures.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: MC02 Lucy ME NHL

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **29**

3. Comments:

The existing view from the lookout top of Lucy the Elephant is not as aesthetically important as the cultural importance and ritual of visiting Lucy by locals and visitors. The existing view is already compromised and separated from the beach and ocean due to the surrounding architecture, utility, and service elements. However, the addition of the massive wind farm on the horizon further industrializes the existing view. The bright white vertical and horizontal pattern of the wind farm is visually prominent but in keeping with the bright white color of the vertical building cladding that occupies much of the view, pool railings and the thin horizontal banding on the high rise building. The proposed turbines at 14.43-miles to the nearest turbine are massive in scale and number in the view, and they lack order and structure from this vantage point that further contributes to the existing visual clutter and chaos, although their slender silhouettes at lighter against the horizon in comparison to other man-made elements. It is preferred that a historic resource like Lucy the Elephant would be preserved within a landscape that supports and accentuates the monument, however, this resource is surrounded by parking lots and strip development.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: MC02 Lucy ME NHL

Date: 17 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1.5
Vegetation:	1	Total:	6.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1.5
Vegetation:	1	Total:	6.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1.5
Vegetation:	1	Total:	6.5

7. Comments:

Compatibility: The introduction of the Project into the view further industrializes and reduces the already compromised visual integrity of the view from Lucy the Elephant.

Scale: The large apartment building/hotel to the left of the view, which is taller than the surrounding buildings from this viewpoint is the most visually dominant scale element in the view. Its proximity to the wind farm minimizes the heights of the turbines on the horizon.

Spatial Dominance: The existing visual clutter in the view with differentiating patterns, colors, textures, and styles within a small viewing area create so many different places for the eye to look and focus that the Project does not have the visual dominance that it has in more pristine and undeveloped areas.

5 of 6

Visual Impact Assessment

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: MC02 - Lucy Margate

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: *the open horizon framed by development draws viewer attention, but does not hold it as a focal point*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: MC02 - Lucy Margate

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *This view is confusing to the eye, and does not inform the viewer what they should be taking from the view as we are looking at the ocean, the buildings, the utilities?*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *Overcast/Hazy would decrease visibility.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *Tourism to Lucy the Elephant, beach goers*

Existing Conditions #2 Total (Sum 2A through 2C) **7**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **33**

3. Comments:

Movement attracting viewer attention: beach goers, residents of the building using the pool or balconies, ocean waves.

This view represents an urban beachfront environment setback from the direct shoreline. A beachfront typical for this region with stone pier is visible, but the setback of this viewpoint also allows the shoreline to be framed by a high-rise dwelling to the left and a variety of smaller structures along the bottom of the frame. The elevated nature of this view allows existing utility poles to be in the line-of-sight. Although this view is from a National Historic Landmark the visual clutter detracts from the visible water resources and shoreline landform. Vegetation in this area is that of low growing dune grasses that are contained within sand fencing and patchy in spots. The land use and user activity in this area is residential and tourist in nature. As evidenced by the number of beach-goers this is a popular location with space for users to simultaneously be within the crowd, but have ample room to establish their location.

Total: **28**

3. Comments:

While the existing water resource previously assisted in balancing cluttered development against an expansive open ocean, the wind turbines within this view extend to the visual clutter of the existing foreground structures and utilities. The amount of turbines at this distance allows them to be highly visible even when softened by their light color against the light sky. Stacking of turbines, rather than lending uniformity in this view, adds to the appearance of a scattered and disorganized layout because locations where turbines align is inconsistent and not in regular intervals. The flat linear nature of the shoreline was already accentuated by the tall structures surrounding. Similarly, the minimal vegetation already experienced a diminishment from the height of surrounding development. However, the WTG located in this area may have impact on land use and user activity. While some users will continue to this beach others may determine that locations at a further distance from the WTG array is more desirable. Yet, Lucy the Margate Elephant was designed as an oddity meant to attract curious travelers, and the turbines could potentially serve to do the same.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: MC02 - Lucy Margate

Date: 02-18-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="13"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="13"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="11"/>

7. Comments:

The WTG in size and amount are not compatible with the expansive horizontal nature of the water resources, or long linear landform primarily due to the intense scale contrast of the large WTG on the horizon. However, the minimal vegetation and already highly developed land use may be somewhat compatible. User activity within this developed location is centered around the ability for ocean views which may be disrupted by the WTGs in place.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: MC02 - Lucy Margate

Date: 02-18-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

While size and quantity of the WTG at this location is strongly contrasting with the water resources the array does not take up a majority of the available horizon.

Visual Impact Assessment

Date: February 19, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: MC02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Beachfront development including low-rise and high-rise residential structures, beach access, commercialized high-traffic areas.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: MC02

Date: February 19, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The clutter spreads across the entire foreground consisting of overhead utilities, paved surface parking lots, a mix of architectural styles, and balconies on a high-rise.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: The sky is almost completely clear with only a few wispy clouds on the right side.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Recreational given the history of Lucy the Margate Bephar.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: MC02

Date: February 19, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	5
Land Use:	8
User Activity:	7
Existing Conditions #1 Total:	33

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **0**

Existing Conditions #2 Total (Sum 2A through 2C) **2**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **35**

3. Comments:

This is a busy beach front area, both in terms of people and in terms of visual distraction. The foreground consists of multiple roof lines to follow, overhead utility lines and poles, rooftop HVAC equipment, and balconies on a residential high-rise building. The middle of the view is further disrupted by inconsistent beach reclamation grass plantings and a scattering of people and colorful umbrellas across the sandy beach. The distant view includes deep blue ocean water with bright white waves cresting at the sand, a hazy horizon line, and white to mid-blue gently faded nearly cloudless sky.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: MC02

Date: February 19, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	4
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **2**

Total: **28**

3. Comments:

The view is further cluttered by the proposed turbines that span the entire width of the view. They are stark white on the horizon with dark blue water below and light blue sky as a backdrop. The overlapping blades create a fence-like barrier along the horizon. The turbines do not extend far into the sky, it is the breadth of the field that gives them such a strong presence. There is a similarity between the layout of the grasses and the distant turbines, linking these two components.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: MC02

Date: February 19, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	1
Landform:	2	User Activity:	2
Vegetation:	1	Total:	9

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	2
Landform:	2	User Activity:	2
Vegetation:	3	Total:	12

7. Comments:

The distant proposed turbines contribute to the existing foreground clutter. This ties the view together while also detracting from the wide open expanse of water.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: MC02

Date: February 19, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines are clearly visible on the horizon although the surrounding context in the foreground serves as a distraction, full of color, angles, and activity.

Visual Impact Assessment

Date: 2/25/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Undeveloped beach

Key Observation Point Name/Number: OC01 Carson's Inlet

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a layering of beach, ocean and open sky.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: OC01 Carson's Inlet

Date: 2/25/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: ☐ More moisture in the atmosphere would likely decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is a pristine beach front location.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

Personnel: Jocelyn Gavitt

KOP: OC01 Carson's Inlet

Date: 2/25/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	5
Vegetation:	4.5
Land Use:	6
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	5
Total:	31.5

3. Comments:

The proposed turbines are visible along the horizon line and become a distant focus for this view. The frontlit nature of the simulation has the turbines appearing bright white, as the whitecaps and creeding waves are as well. This white nature is likely making them blend better with the background sky and could be minimizing their impact relative to other lighting conditions. These turbines do become a focus, but they are not overwhelming in this simulation.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Numerous turbines are visible in this view but at a great enough distance so as not to be overwhelming.

Visual Impact Assessment

Date: 24 February 2021

Personnel: KAC

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: OC01 Corson's SP

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Sand, rolling waves, water, horizon, and sky; the strongly horizontal view is equally divided into sand and sky with a slip of deep blue ocean through the middle.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC01 Corson's SP

Date: 24 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Darker atmospheric conditions could make the turbine's more visible on the horizon.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☐ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Corson's Inlet State Park

KOP: OC01 Carson's SP

Date: 24 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	6
Vegetation:	4.5
Land Use:	6
User Activity:	7
Existing Conditions #1 Total:	30.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

3

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

33.5

3. Comments:

Cultural | Historic: Carson's Inlet State Park.

Aesthetic: Familiar East Coast beach typology and seascape; wide open beach.

Litter: Beach visitor litter.

Summary of View: The existing beach view is along a long stretch of open sand, rolling waves and an unobstructed ocean view. There are low sand dunes to the left of the view that provide an edge and sense of enclosure and privacy. This is a typical East Coast beach condition that provides ample space for beach goers to set up gathering spaces and beach recreation areas in order to fully enjoy the ocean environment.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC01 Carson's SP

Date: 24 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	4.5
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 31.5

3. Comments:

The addition of the frontlit wind turbines on the horizon does not immediately attract the viewer's attention when looking out to the ocean and horizon due to the light color of the turbines against the equally light sky and moderate atmospheric haze. Upon looking closer at the background view the eye focuses on the bright white, fine textured turbine that are stacked on the sky. The eye then focuses on the splay of silhouetted turbines to the left and right of the centered view that are not so heavily stacked on top of each other and more individualized. The light color and fine texture of the turbines at 21.72 miles to the nearest turbine mitigates the level of visual impacts that the installation could have at this viewing distance, especially under dark sky conditions or if the turbines were backlit.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC01 Carson's SP

Date: 24 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	4.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	4.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	4.5

7. Comments:

Compatibility: The bright white turbines are not readily apparent on the horizon at this viewing distance.

Scale: The bright white turbines are not readily apparent on the horizon at 21.72 miles to the nearest turbine.

Spatial Dominance: The bright white turbines are not visually dominant on the horizon at this viewing distance.

KOP: OC01 Carson's SP

Date: 24 February 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-23-2021

Personnel: KV

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: OC01 Corson's Inlet Sl

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: *lump of dark sea grass is a focal point, but the contrast between sand, ocean and sky also draws attention*

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

the natural order of the sand, sea, sky and variety in neutral tones and blue hues, re-centers the viewer after being distracted by the lump of dark sea grass.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: OC01 Corson's Inlet Sl

Date: 02-23-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? *the centrally located lump of dark sea grass is a point of distraction from the view.*

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *clouds are visible, but do not contribute to much decrease in visibility; overcast/hazy conditions would likely cause decrease*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☒ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *This State Park provides location for variety of beach enjoyment, bird watching, and fishing.*

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **37**

3. Comments:

movement attracting viewer attention: birds and waves.

This scene represents an undisturbed section of beach front within a state park. The open ocean sets a serene tone and the deep blue hue cuts a sharp horizon against the pale blue and partially cloudy sky. White capped waves gently roll a shore and white sea birds speckle the upper left portion of the shoreline. Vegetation within the framed view is represented by clumps of sea grasses washed along the beach. However, the context view indicates that a healthy natural dune system exists just beyond the view. Land use within the view is primarily low impact recreation. The undeveloped expanse also indicates a preservation land use. However, just beyond the framed view the context image indicates heavy development on the distant horizon indicating this preserved landscape is distinct. Similarly, user activity at this location takes enjoyment from the quiet, undeveloped nature of the location.

Special Conditions: **6**

Total: **35**

3. Comments:

Front-It turbines within this location sit lightly on the deep blue horizon. The white color of the turbines provides a low contrast with the pale blue sky and assists in softening the visual effects. Despite this softened effect, the open and expansive ocean view is still diminished by the presence of the expanse of turbines. While the WTG at the periphery of the array, and reading as a cluster of individual turbines, are difficult to distinguish with this lighting and atmospheric conditions, turbines more centrally located align to form a stacked massing of turbines that read as one large unit. This stacked massing of WTGs at the center of the view draws viewer attention and is likely to hold the gaze while a viewer works to discern individual elements of the turbines. The flat linear landform at this location is largely unaffected by the pale turbines on the horizon. However, under back-lit conditions, when WTGs are dark and more visible on the horizon, the vertical nature of the turbines may serve to foreshorten the relatively narrow expanse of shoreline. The stream vegetation washed along the shore is not affected by the WTG. Existing land use at this location is that of a small, undeveloped state park. This use and its preserved nature are likely to remain unchanged due to the proposed development. However, User Activity at this location which currently provides an area for recreation and natural enjoyment of an undeveloped setting now, in part, serves as a location from which to view the WTGs.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: OC01 Corsor's Inlet Sl

Date: 02-23-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>2</u>	Land Use:	<u>3</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>1</u>	Total:	<u>11</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>1</u>	Total:	<u>9</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>2</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>1</u>	Total:	<u>10</u>

7. Comments:

The white turbines on the horizon are somewhat compatible with water resources as they echo the white capped waves to diminish the affect of their high visibility. This may not hold true under back-lit lighting conditions. Similarly, while softened by the limited color contrast the WTGs are somewhat compatible with the landform and compatible with the drawn grasses along the beach. However, the undeveloped Land Use and low impact recreation user activity is not compatible with the WTGs.

Scale contrast of the WTG at this location is moderate, but has potential to but stronger with more back-lit lighting conditions, or lessened with increased atmospheric hazing.

Spatial dominance of the WTGs is co-dominant for water resources, landform, and land use because the WTGs are front and center to a viewer who squares themselves to the ocean. However, the low contrast coloring and diminished size at this distance may not draw considerable attention. Yet, User Activity is dominated by the WTGs due to the previous undeveloped experience. In addition, the low contrast color of the turbines does help to diminish visibility, but some viewers may find increased viewing times as their gaze works to distinguish what is seen on the horizon.

KOP: OC01 Corsor's Inlet Sl

Date: 02-23-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Under these lighting conditions the WTGs are plainly visible, but do not strongly attract viewer attention. Other lighting or atmospheric conditions may serve to increase the VTL at this location.

Visual Impact Assessment

Date: March 06, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Undeveloped Beach

Key Observation Point Name/Number: OC01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: OC01

Date: March 06, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: *The sky is mostly clear with only a few wispy white clouds visible.*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *People visiting the State Park will be here for the open beach and views out to sea.*

KOP: OC01

Date: March 06, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="9"/>
Landform:	<input type="text" value="7"/>
Vegetation:	<input type="text" value="4.5"/>
Land Use:	<input type="text" value="8"/>
User Activity:	<input type="text" value="8"/>
Existing Conditions #1 Total:	<input type="text" value="36.5"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

Open dark beige colored sandy beach, rich blue textured water with low waves cresting white at the shore, and a perfectly straight uninterrupted horizon where the sea meets the white hazy sky. The sky then turns to a warm medium blue.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: OC01

Date: March 06, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="4.5"/>
Land Use:	<input type="text" value="2"/>
User Activity:	<input type="text" value="2"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

This view becomes less a of open water and more focused on expansive wind turbines that span the entire view. The lighting makes the turbines stand out against the dark blue water, they appear as white spindles along the horizon. The spacing makes the turbines on the far left and far right more difficult to distinguish. The turbines are more noticeable toward the center as the spacing stacks them, overlapping them and increasing their density.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: OC01

Date: March 06, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="8"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="8"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="8"/>

7. Comments:

The view from the State Park is transformed from one of zero development to one of a more industrial nature. However distant, the turbines become the focal point in the absence of anything else along the horizon. The turbines are bright white, making them highly visible against the beige beach and deep blue water.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: OC01

Date: March 06, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines attract the visual attention because there is nothing else to do so in this view. The horizon is a perfect flat line, accentuated by the color change between the dark blue water and the pale white blue sky.

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Commercial

Key Observation Point Name/Number: OC04 Gillian's Woods

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.**
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The built environment is cluttered but contained as one body of shoreline balanced by open water and open sky.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: OC04 Gillian's Woods

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The general lines converge as a one point perspective on the horizon.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Increased moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view is from a highly used recreational beachfront area.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: OC04 Gillian's Woods

Date: 2/17/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	8
Landform:	6
Vegetation:	4.5
Land Use:	7
User Activity:	8
Existing Conditions #1 Total:	33.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	2
Special Condition B. Are there other aesthetic elements that add to this resource?	2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	2
Existing Conditions #2 Total (Sum 2A through 2C)	6
Existing Conditions Grand Total (Sum #1 Total and #2 Total)	39.5

3. Comments:

This view up the large sandy beach and out into the open wavy water is filled with people and activity. The view is relatively simple, the sandy beach balancing the open water. The waves combined with the presence of beach users creates motion in the landscape. The view generally converges at the vanishing point on the horizon.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: OC04 Gillian's Woods

Date: 2/17/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	3
Vegetation:	4.5
Land Use:	3
User Activity:	3

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	3
Total:	18.5

3. Comments:

The proposed turbine field creates strong lines of turbines receding out into the ocean from this vantage point. The turbine field is large and highly populated, dominating the horizon line and creating a completely altered condition in the open water. This existing view is now populated with man made structures that will be animated by the wind. There is a very strong impact in this view.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: OC04 Gillian's Wond

Date: 2/17/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>2</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>9</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>3</u>
Landform:	<u>2</u>	User Activity:	<u>3</u>
Vegetation:	<u>0</u>	Total:	<u>11</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>3</u>	User Activity:	<u>2</u>
Vegetation:	<u>0</u>	Total:	<u>10</u>

7. Comments:

The turbines occupy the horizon and become a focus in this view. The arrangement of the rows of turbines creates strong lines and circumstance. They have a very strong impact on this view.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: OC04 Gillian's Wond

Date: 2/17/21

Proposed Conditions

2. **Visibility Threshold Level** - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The turbines are highly visible and become a focus of this view.

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Commercial

Key Observation Point Name/Number: OC04 Gillian's WPier

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon line, however, the real focal point is the Pier to the left that is out of view.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Sand, surf, large waves and horizon; horizontal landscape with a strong perspective point to the left that the rolling surf fans out from.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC04 Gillian's WPier

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Clear sky conditions would increase the visibility to the blade tips.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Open beach with large waves.

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC04 Gillian's WPier

Date: 17 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	8
Landform:	7
Vegetation:	4.5
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	33.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

3

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

36.5

3. Comments:

Cultural | Historic: Ocean City Beach Front

Aesthetic: Open beach with large waves.

Litter: Beach visitor litter.

Summary of View: The significance of the existing view is the viewers proximity to the Pier amusements and access to the large surfing waves. The waves are dynamic and visually captivating in their size, action, sound, and perceived power. The existing condition color is monochromatic with the sand, surf, waves and sky all encompassing varying shades of French gray, and the surfers and visitors showing as black silhouettes against the roaring waves. It is difficult to differentiate between the horizon line and the rolling surf from this vantage point, therefore, the view is compressed and focused in the midground.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC04 Gillian's WPier

Date: 17 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	7
Vegetation:	4.5
Land Use:	7
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 34.5

3. Comments:

The Project is minimally visible above the horizon/surf line with just the tips of blades, or bisected rotors sneaking above the wave action. The turbine blades are neatly ordered along the extent of the surf/horizon line in the view. It is probable that the rolling, aggressive wave action obscures the background blade tips on an intermittent basis and the waves retain their visual dominance in the midground view. The juxtaposition and movement of the turbine tips, waves and surfers could make a very interesting visual tapestry during surfing activities.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC04 Gillian's WPier

Date: 17 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1.5	User Activity:	1.5
Vegetation:	0	Total:	5.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	4.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	0	Total:	4.5

7. Comments:

Compatibility: The rolling surf and waves almost fully conceal the blade tips, which indicates that on high tide and during stormy weather, it is likely that the Project would not be less visible, or possibly not seen at all. The organized rows of rotors offer a unique optic form this vantage point.

Scale: The rotors and blades only partially break the horizon/surf line, and the ongoing wave crash movement will offset the rotor movement.

Spatial Dominance: The wide breadth of open sand to the crashing waves maintains spatial dominance in this view despite the number of turbine blades that punctuate the horizon/surf line.

5 of 6

Visual Impact Assessment

Personnel: KAC

KOP: OC04 Gillian's WPier

Date: 17 February 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and air/fair, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be averted except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: OC04 - Gillian's Woods

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: the silhouetted person serves as a focal point in this photo, but the view itself has no stationary focal point

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The first and tone of the sky repeats across the gentle sandy slope marked by tides and scattered with pieces of shell before meeting the ocean and rising waves, the affect is a soft and subtle view that engages the eye as a whole.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: OC04 - Gillian's Woods

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: *visibility may decrease with overcast skies*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This site has a boardwalk and beach access as well as an amusement park and Ocean City Music Pier

4

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

30.5

3. Comments:

Motion attracting viewer attention: large crashing waves, beach users.
This open shoreline beach view demonstrates a large and wide beachfront with large crashing waves. The water resource at this location is the open and expansive ocean. No vegetation exists within the viewframe, but vegetative dunes are located at the far distance of the sandy beach just in front of a boardwalk and amusement park. While fairly common for this region the width of the beach is somewhat notable and provides ample room for summer crowds to gather and have easy access to the amenities of the boardwalk. Land use is directed to summer tourism as is a majority of user activity. However, this late summer scene after the peak of tourism find surfers and other beach goers finding continued enjoyment out of peak season.

Ocean city beach front is the only identified resource at this location. No litter is currently within the view.

3 of 6

Visual Impact Assessment

KOP: OC04 - Gillian's Woods

Date: 02-18-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4
Landform:	6
Vegetation:	4.5
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: 28.5

3. Comments:

The wind turbines in this location are back-lit and silhouetted on the bright white horizon. Although currently obscured by large waves the WTG are likely to have a range of visibility, indicated on the context page, with some obscured up to 200 feet and others having visibility of the nacelle and above. Stacking of the turbines with large breaks between rows is evident for rows to the left side of the view. moving right in the frame turbine rows begin to loose definition and appear less organized. While the turbine array at this location does not appear as a scattered mass and row spacing is apparent this gives an indication of the breadth of sea area utilized for the array. However, this breadth and spread somewhat mimics the intensely horizontal nature of the shoreline and may assist in minimizing the impact to landform. Land use and user activity at this location is likely to continue to be targeted toward summer tourism, but the ocean views will no longer provide the serene balance to a more chaotic boardwalk and midway.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: OC04 - Gillian's Woods

Date: 02-18-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="10"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="10"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="9"/>

7. Comments:

while WTG of this size and massing do not lend compatibility to water resources and landform the existing land use and user activities including a Farris wheel and other large mechanical structures just beyond the viewframe finds some compatibility.

Similarly scale contrast and spatial dominance of the WTG compared to water resources is severe and dominant. However, the spread and breadth of the WTG array highlights the spread and breadth of the landform becoming a co-dominant feature rather than dominant.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: OC04 - Gillian's Woods

Date: 02-18-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

the quantity of turbines, and the spread of the array is likely to strongly attract viewer attention especially when they are all in motion.

Landscape Similarity Zone: Oceanfront Commercial

Key Observation Point Name/Number: OC04

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: The Simulated Photograph Exent does not although the Wonderland Pier to the left does.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

KOP: OC04

Date: February 19, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Thin and hazy dust cover throughout most of the sky.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Large beach with multiple access points adjacent to the boardwalk and the Wonderland Pier, including a tall Ferris Wheel.

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="4"/>
Landform:	<input type="text" value="5"/>
Vegetation:	<input type="text" value="4.5"/>
Land Use:	<input type="text" value="5"/>
User Activity:	<input type="text" value="5"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

There is no apparent limit to the water until the proposed turbines provide an edge protruding from the waves. This edge runs along the majority of the horizon although only the turbine blades and a limited portion of the towers are visible. Although the turbines are against a white background, they have a muted color like the rest of the view.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: OC04

Date: February 19, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="8"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="6"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="6"/>

7. Comments:

The turbines do not command attention in this view but they are visible and their spacing makes them dark forms on the horizon. They are low on the horizon as well, this masks their height and depth.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: OC04

Date: February 19, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input checked="" type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines cannot be missed as a component in this view though the constant wave motion will also detract from the rotating blades in the background.

Visual Impact Assessment

Date: 2/25/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront residential

Key Observation Point Name/Number: SBB01 Ship Bottom #3

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a layering of dune, beach, ocean and open sky.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SBB01 Ship Bottom #3

Date: 2/25/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? There are a few elements in the foreground that capture some attention.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: More moisture in the atmosphere would likely decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is a pristine beach front location.

Date: 2/25/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="8"/>
Landform:	<input type="text" value="7"/>
Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="7"/>
User Activity:	<input type="text" value="7"/>
Existing Conditions #1 Total:	<input type="text" value="35"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This view from a populated beach is focused on the open water. There are a few distractions in the form of some fencing in the foreground and some trash cans. The viewer will focus on the open water and this would be considered a highly prized view. The many users create motion and activity along with the surf action.

3 of 6

KOP: SBB01 Ship Bottom

Date: 2/25/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The large quantity of turbines renders this a very noticeable change in the landscape.

Visual Impact Assessment

Date: 24 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: SBB01 Ship Bottom

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intensity and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Split-rail, dune grass, dune fence, sand, surf, ocean, sky; the channelized view is focused down the access way into the greater beach environment with the split-rail fencing and dune grass heavily guiding the viewer's focus until the open expanse of beach is reached.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: SBB01 Ship Bottom

Date: 24 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Litter receptacles, fencing, and signage.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Atmospheric haze may obstruct the slender appearance of the turbines on the horizon.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Ship Bottom Borough Municipal Beach

KOP: SBB01 Ship Bottom

Date: 24 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	7
Vegetation:	7
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	35

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **38**

3. Comments:

Cultural | Historic: Ship Bottom Borough Municipal Beach

Aesthetic: Wide open beach.

Litter: Beach visitor litter.

Summary of View: The existing view is taken at the narrow elevated pedestrian entry that opens onto the greater beach expanse. Each side of the view is bordered by a split-rail wood fence and vegetated dunes that accentuate the elevation change between the viewpoint and the beach itself. Various man-made objects dot the view near the walkway and fencing, however, the midground beach is an open, light colored sand expanse meets the deep blue-green ocean and crashing waves with strong horizontal strokes left and right. The light blue color of the sky holds the viewer's attention to the horizon.

3 of 6

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	7
Vegetation:	7
Land Use:	7
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **36**

3. Comments:

With the Project in place, the view to the horizon is altered by the mass of wind turbines that extends to either side of the sight line along the access way. The turbine's viewing distance, light color, and slender profile mitigates some of the potential visual impacts, however, the eye is drawn to where the turbines are stacked on each other and the dark color against the sky intensifies. The wind farm is an intense commercial/industrial use within an otherwise residential zone, therefore, the impacts to visual quality are likely to be experienced more intensely by residents and visitors to the beach.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: SBB01 Ship Bottom

Date: 24 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1.5
Vegetation:	1	Total:	6

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1.5
Vegetation:	1	Total:	6

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	2
Vegetation:	1	Total:	6.5

7. Comments:

Compatibility: The wind farm introduces a highly commercialize/industrialized use to this residential community and municipal beach area.

Scale: The turbines sit lightly on the sky at 19.35 miles to nearest visible turbine, therefore, they do not dominate the view.

Spatial Dominance: Despite the mass of the wind farm, it is not visually dominant in the view due to the slender profile and light color against the sky.

5 of 6

It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-23-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Res

Key Observation Point Name/Number: SBB01 Ship Bottom Bc

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: dark silhouette seated on the beach at a direct line from the access point draw viewer attention.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

colors, lines, and texture from the dune entrance, shoreline, water and sky serve to bring the viewer into the frame and circulate the eye within the view.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: SBB01 Ship Bottom Bc

Date: 02-23-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? the more industrial rigid lines and bright color of the trash can clutter the view and draws attention away from the more natural elements in the view.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: hazy or overcast conditions could likely decrease visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? the dense dune scape and open shoreline allow for beach goers enjoying a variety of activities including sunbathing, swimming and fishing

2 of 6

Visual Impact Assessment

Personnel: KV

KOP: SBB01 Ship Bottom Bc

Date: 02-23-2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	6
Vegetation:	7
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	31

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	1
Special Condition B. Are there other aesthetic elements that add to this resource?	1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	2
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) **4**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **35**

3. Comments:

movement attracting viewer attention: waves, beach goers, and dune grasses on a breezy day.

In this view the viewer is positioned at a shoreline beach access point. The viewer is situated at a slight high point looking down a sandy pathway toward the beach. The near foreground is situated on a pathway between split rail fences cordoning off vegetative dunes on either side of the view. Following the pathway to the sandy beach a rough texture in the sand indicates frequent foot traffic. Trash cans are seen to the left. A low spot on the beach indicated by slight water ponding is centrally located. Multiple groups of beach goers are seen to the right along the edge of another small tide pond created by a low spot on the beach. The sandy shoreline is met by active ocean waves with white rolling tops. The distant view is expansive open ocean. This view, and the resources within it, are aesthetically pleasing and of high visual quality, yet they are common to this region and therefore are reviewed in the high average range. One exception is vegetation. While other similar shoreline locations may find a very minimal protective dunescape, this location demonstrates a wide expanse with a variety of vegetation. This location has no landmarks beyond that of the municipal beach location. The slight elevation of this view adds scenic quality. Litter is not found within the view but the presence of trash cans indicates it is common.

3 of 6

Visual Impact Assessment

Personnel: KV

KOP: SBB01 Ship Bottom Bc

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4
Landform:	5
Vegetation:	7
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	4
---------------------	----------

Total: **30**

3. Comments:

Turbines within this scene sit distantly on the horizon. Despite this distance, the front-lit turbines sit tall. The appearance of a more sporadic turbine spacing at the edge of the array causes individual turbines to be more difficult to distinguish. However, the strong stacking of turbines more central in the array causes the appearance of a wider and more visible silhouette or connected chain of silhouettes. The extent of turbines in this view captures viewer attention and limits the once expansive ocean view by creating a series of focal points. This effectively limits the far reaching distant views. The flat shoreline landform becomes slightly foreshortened when sitting low between the vertical turbine structures and the tall sandy dunes topped with residential development just beyond the framed view. Vegetation is minimally affected by the turbines as its purpose is primarily for dune protection and bird habitat. Land Use and User Activity were previously residential and recreational in nature. While these uses are likely to continue as a primary focus, a desire for open ocean views may diminish scenic quality for some users who prefer an ocean view without human impact.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: SBB01 Ship Bottom Bc

Date: 02-23-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="13"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="12"/>

7. Comments:

The proposed turbine array is not compatible with the natural elements within this view. However, it is somewhat compatible with Land Use and User Activity because this residential, tourism, and recreational environment relies on its developed nature.

The size of turbines at this distance is consistent with a moderate scale contrast.

Spatial dominance of the WTG is dominant on the horizon with the strong visual draw of the central stacking. This element may draw user attention away from other elements in the view. However, WTGs are more consistently co-dominant with landform, vegetation, and land use.

5 of 6

Visual Impact Assessment

KOP: SBB01 Ship Bottom Bc

Date: 02-23-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The breadth, height, and stacking of the turbine array at this location contrasts with the surrounding landscape strongly and becomes a major visual focus.

Visual Impact Assessment

Date: March 06, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: SBB01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Wide open ocean, sandy beach, to grass covered sand dunes.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SBB01

Date: March 06, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

There are multiple elements in this view: dune fencing, spiral-rail fence, signage, and beach elements but they do not qualify as clutter.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: The sky is clear of clouds, fading from white/pale blue at the horizon to a darker blue higher in the sky.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Municipal beach open to the general public with great water access.

Special Conditions:

Total:

3. Comments:

The beach scene takes on an industrial tone with turbines lining the majority of the horizon in the view. Their lighting and color blends with the pale white sky, although they are more visible when the spacing makes them stacked upon one another. As the rows grow tighter, the turbines appear darker. There is nothing at the horizon for scale, however, the turbines appear to tower above the ocean given the view from the dunes over the activity on the beach.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SBB01

Date: March 06, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="15"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="14"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="3"/>

Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="12"/>

7. Comments:

The waves crashing at the shore will draw attention, as will the natural dunescape planting in the foreground. Given that there are no vertical features in the existing view, the turbines capture focus as they extend edge to edge within the view.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SBB01

Date: March 06, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines have a strong presence and will be noticed immediately upon approaching the beach. However, there are other features like the waves and the grasses to draw attention.

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Open Water/Undeveloped

Key Observation Point Name/Number: SIC02 Townsends Inlet

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, **especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than** panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

The foreground has elements of open beach with some vegetation, while the mid-ground is occupied by open water.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SIC02 Townsends Inlet

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Increased moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view is from a bridge and will likely get much use.

2 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SIC02 Townsends Inlet

Date: 2/17/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="8"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="7"/>
User Activity:	<input type="text" value="7"/>
Existing Conditions #1 Total:	<input type="text" value="33"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This is a relatively simple view with open sandy land in the foreground and open water in the mid-ground. The horizon line anchors this view. The motion of the waves, and likely use by people add an element of interest to the view.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SIC02 Townsends Inlet

Date: 2/17/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="4"/>
Land Use:	<input type="text" value="3"/>
User Activity:	<input type="text" value="3"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The proposed turbine field creates strong lines of turbines receding out into the ocean from this vantage point. The turbine field is large and highly populated, dominating the horizon line and creating a completely altered condition in the open water. The turbines are at a significant distance, though are highly visible in these backlit conditions. There is a very strong impact in this view.

4 of 6

Visual Impact Assessment

KOP: SIC02 Townsends Inlet

Date: 2/17/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="10"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="11"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="12"/>

7. Comments:

The backlit turbines occupy the horizon and become a focus in this view. The arrangement of the rows of turbines creates strong lines. They have a very strong impact on this view.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SIC02 Townsends Inlet

Date: 2/17/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The turbines are highly visible and become a focus of this view. The backlit condition may be amplifying their visibility.

Personnel: KAC

Landscape Similarity Zone: Open Water | Undeveloped Bay

Key Observation Point Name/Number: SIC02 Townsends Br

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Edge of surf and sand, pink-tinged horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Inlet sand, ocean, horizon; sweeping landscape with the landform bending to the water before the view becoming strongly horizontal with the ocean a wedge between the sand and sky.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: SIC02 Townsends Br

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Clear horizon conditions can increase the visibility of the turbines.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? See Isle City Beach Dune, Townsend Inlet Bridge

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **35**

3. Comments:

Cultural | Historic: Sea Isle City Beach Dune, Townsend Inlet Bridge

Aesthetic: Elevated bridge view across the inlet to the ocean between residential zones.

Litter: Road Litter.

Summary of View: This view is the glimpse to the ocean and horizon that a road traveler would have while moving between the residential areas that border each side of the Cape May County Road. The view would be fleeting for the driver and more long standing for the passenger as the vehicle crosses the bridge, unless the drawbridge is open for boat traffic. While a visual relief from the built landscape on either side of it, the view to the ocean is a common New England seascape that is made more memorable through the act of passing over the drawbridge itself.

User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **33**

3. Comments:

The installation of the wind farm at this viewing distance reduces the visual intrusion of the turbines on the viewers experience while crossing the bridge. The open sand of the inlet, slip of ocean and expanse of horizon and sky do not compete with the turbine installation, but rather the seascape elements knit together with the turbines. The turbines are neatly organized, patterned and appear to be at a similar height, which reduces the visual clutter in the view. In addition, the slender profile of the turbines sits lightly against the morning sky. Therefore, these factors mitigate the potential reduction in visual quality despite the addition of a new industrial element within the seascape. It is possible that some viewers could consider the wind farm a unique visual addition to the common ocean view or even a landmark for travel.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: SIC02 Townsend's Br

Date: 17 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5.5

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5.5

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	1.5	Land Use:	1
Landform:	1	User Activity:	1
Vegetation:	1	Total:	5.5

7. Comments:

Compatibility: The low profile of the turbines on the horizon, as well as their organized and patterned layout minimizes their potential disharmony with the existing view.

Scale: At 27.35 miles away, the turbines are small on the horizon and do not visually dominate the view, especially during the fleeting time spent driving over the bridge.

Spatial Dominance: The proposed turbines are small on the horizon and do not compete with the proportion of sand and sky, which are the major elements within the view.

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Open Water/Undeveloped

Key Observation Point Name/Number: SIC02 - Townsend Br

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: the small central pooling and dark sand to the left of it holds viewer focus

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

the neutral colors of vegetation and sand, and the gentle pastels of water and sky provide a calming image with the warmth of early sunrise.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: SIC02 - Townsend Br

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: *visibility may be decreased with overcast hazy skies*

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? *While the resource photographed from is not recreational, the view portrays an accessible beach front and dunes landscape*

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="6"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="4"/>
User Activity:	<input type="text" value="3"/>

Existing Conditions #1 Total:

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

motion attracting viewer attention: Birds, ocean waves:

This view takes in a sandy shoreline at the edge of a barrier island where the ocean meets an inlet. Water resources surround this sandy shoreline more than 180 degrees. The landform while primarily flat with a slight decline toward the shoreline has slight undulation particularly moving toward the grassy vegetation where it appears seasonal flooding may take place. The grassy vegetation just reaches into the view, but the context map indicates a large swath of vegetation maintained to hold the edge of the island. While the view in this scene appears natural and is highlighted by the soft pastel sunrise, it is important to note the views from a roadway bridge that provides connection between barrier islands and has many characteristics of a highway bridge. However, this is also balanced with residential land uses just beyond the view. Similarly user activity at this location may range from beach goers and local residents enjoying the sandy shore to divers passing on the highway like bridges.

3 of 6

Visual Impact Assessment

Personnel: KV

KOP: SIC02 - Townsend Br

Date: 02-18-2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="5"/>
Landform:	<input type="text" value="5"/>
Vegetation:	<input type="text" value="5"/>
Land Use:	<input type="text" value="4"/>
User Activity:	<input type="text" value="3"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

With the WTG in place the surrounding open water at this location will be impacted by the intensely vertical turbines, the landform which provides some distance from development and an element of natural character becomes further industrialized backed by the roadway bridge and now fronted by the WTG array. However the distance and angle from the array allows the WTG to appear smaller on the horizon and the stacking allows a view down open waterways between the rows. At this location the effect appears orderly in nature. Given this location in connection with the roadway bridge, land use and user activity are likely to be minimally impacted despite the visibility of the turbines.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: SIC02 - Townsend Br

Date: 02-18-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="13"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="2"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="10"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="2"/>	Total:	<input type="text" value="11"/>

7. Comments:

Again the turbines at this location as seen within the view are not compatible and dominate the water resources, however the juxtaposition with the roadway bridge limits the contrast in consideration of land use and user activity. However, this must also be balanced with the user activities connected with residential and tourism accommodations in close proximity.

5 of 6

Visual Impact Assessment

Personnel: KV

KOP: SIC02 - Townsend Br

Date: 02-18-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The WTG at this location will clearly attract attention especially in weather and atmospheric conditions presented in the view. It is quite likely that at different times of day when the WTG benefits from a stronger front lighting that the white color will blend with sky and visibility will be closer to a VTL 4.

Visual Impact Assessment

Date: February 19, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Open Water/Undevel. Bay

Key Observation Point Name/Number: SIC02

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The natural order is only present in how there are three stages to the landscape progressing from the ocean, to the beach, to the vegetated dunes.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SIC02

Date: February 19, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: The perfectly clear sky has a peachy glow this early in the morning.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☐ Yes ☒ No

How would the site be used for scenic or recreational enjoyment?

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	7
Vegetation:	5
Land Use:	5
User Activity:	5
Existing Conditions #1 Total:	29

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **0**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **2**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **31**

3. Comments:

This is a view the majority of people will see traveling at 25 mph over the bridge. There are sidewalks to accommodate pedestrians and fishermen who will have a prolonged view. The wide sandy beach is accessible although this portion is adjacent to the bridge and road. Low waves are present across the entire visible shoreline adding movement and whitecaps in the otherwise calm water. The sky and the sand share warm colors including the varying shades of beige in the sand to the rosy pink hues fading to pale blue in the sunrise sky.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SIC02

Date: February 19, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	5
Landform:	5
Vegetation:	4
Land Use:	5
User Activity:	5

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **2**

Total: **26**

3. Comments:

There is no defined focal point in the existing view. The cresting waves and the small amount of dark green vegetation provide the most variation in material and color. The proposed turbines add a repeated focal point across most of the horizon, stacked one after the other, at one point appearing like one massive turbine with multiple blades. The turbines add an industrial regularity to the view that is completely missing in the existing condition. A pale pink horizon, coupled with the sunrise, makes the turbines stand out as dark forms across the entire length of the view.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SIC02

Date: February 19, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	2	Land Use:	1
Landform:	3	User Activity:	1
Vegetation:	2	Total:	9

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2	Land Use:	1
Landform:	2	User Activity:	1
Vegetation:	1	Total:	7

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	2	Land Use:	1
Landform:	2	User Activity:	1
Vegetation:	2	Total:	8

7. Comments:

The fact that this view will be had by drivers/passengers makes it less dramatic and more of a fleeting glance. However, rows upon rows of turbines create multiple industrial focal points, or one large focal point when viewing the entire field.

5 of 6

Visual Impact Assessment

KOP: SIC02

Date: February 19, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/ seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/ seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/ seascape elements.	<input type="checkbox"/>

9. Comments:

The proposed turbines are over 27 miles away so they feel distant. It is impossible to disregard them and focus on anything else in this open view.

Visual Impact Assessment

Date: 2/17/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Openfront Residential

Key Observation Point Name/Number: SPB01 Seaside Park

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

There is a balance of shoreline elements and open water in this view.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SPB01 Seaside Park

Date: 2/17/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? ☐ There are some structures on the dunes that capture attention

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Increased moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This view is from a well used beach area.

Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="8"/>
User Activity:	<input type="text" value="8"/>
Existing Conditions #1 Total:	<input type="text" value="36"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	<input type="text" value="2"/>
Special Condition B. Are there other aesthetic elements that add to this resource?	<input type="text" value="2"/>

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

This is a view up the coastline showing open water to one side, a large flat sandy open beach along its edge, and dunes with some built infrastructure adjacent to the beach. There general focus is of the converging lines of beach, water, dune and horizon at the vanishing point. The scene is populated with beach users and has clear wave motion.

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SPB01 Seaside Park

Date: 2/17/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="7"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="6"/>
Land Use:	<input type="text" value="8"/>
User Activity:	<input type="text" value="8"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The proposed turbine field is minimally visible at the horizon line. It will most likely go unnoticed by users, having very little impact on this viewpoint.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SPB01 Seaside Park

Date: 2/17/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="5"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="5"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="1"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="1"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="1"/>	Total:	<input type="text" value="5"/>

7. Comments:

The turbines will likely go unnoticed. They are at a great enough distance as to only be detectable in the clearest of conditions.

5 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: SPB01 Seaside Park

Date: 2/17/21

Proposed Conditions

2. **Visibility Threshold Level** - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input checked="" type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The turbines are not very visible. Most users are likely not to notice them.

Visual Impact Assessment

Date: 17 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: SPB01 Seaside Park B

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). (This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Restored beach grass planting and horizon line.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Pathway, split-rail fence, beach grass, sand, surf, ocean and horizon; sunken landscape with the sloping re-vegetation area pushing against the flat beach and ocean landform that is squeezed between the strong line of the sky at the horizon.

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: SPB01 Seaside Park B

Date: 17 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order) which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? Split-rail fencing, litter receptacles, miscellaneous walkway/ramp handrails, life guards stations, beach sheds, and long-arm light poles at the residential street.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Atmospheric haze would reduce visibility to the turbines.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Seaside Park Beach and Boardwalk, US Life Saving Station

Date: 17 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	7
Vegetation:	7
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	32

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **2**

Special Condition B. Are there other aesthetic elements that add to this resource? **1**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **4**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **36**

3. Comments:

Cultural | Historic: Seaside Park Beach and Boardwalk, US Life Saving Station

Aesthetic: The rolling landform with re-vegetated beach grass slope is visually interesting and dynamic.

Litter: Beach visitor litter

Summary of View: The elevated view from the entry path to the beach offers a unique opportunity to observe a restoration beach grass planting first-hand. The spiky beach grass is visually interesting in neatly planted rows that contrasts texturally with the smoothness of the beach sand and ocean surface, outside of the shoreline waves. This view is dominated by the vegetated intervention rather than the beach itself.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input checked="" type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 02-18-2021

Personnel: KV

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: SPB01 - Seaside Park

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The darkened corner of railing connected to the neighboring beach entrance behind the life guard stands

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The eye enters the either along the fence line or the darkened rooftops; the viewer then scans down the sloping dune and lands on the shoreline where waves and beach goers are active.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: SPB01 - Seaside Park

Date: 02-18-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? trash cans, life guard stands and items for beach maintenance circulate the gaze around the beach shoreline bouncing between all the cluttered amenities.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Overcast/hazy days may have decreased visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Seaside park Borough boardwalk is located just beyond this view

Land Use:	<input type="text" value="6"/>
User Activity:	<input type="text" value="6"/>

Existing Conditions #1 Total:

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

motion attracting viewer attention: beach goers, ocean waves, birds

The view presented is captured from the edge of a beach access location and captures the pathway and split rail fence leading to the shoreline beach. The fencing protects a dune landscape and dune grasses used to hold the shoreline and protect development behind it. Multiple beach access locations are visible in the foreground and middle ground of this view. The shoreline, while minimally populated in this view, suggests frequent and intense usership due to the quantity of scattered amenities including trash cans, lifeguard stands and a maintenance sheds the linear shoreline stretches down the frame on a slight diagonal and appears to continue beyond the vanishing point. The ocean is open across the horizon. Behind the dunes a parking area is serviced by a small structure and an abundance of street lights further development is beyond that is visible at the edge of the frame. This picturesque beach scene with structured amenities and access is similar throughout the region at popular beach fronts in proximity to boardwalk locations such as this.

KOP: SPB01 - Seaside Park

Date: 02-18-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input checked="" type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

Even with the clear conditions presented here the minimal visible portions of the WtG are not readily apparent and viewing is likely to require extended duration.

Visual Impact Assessment

Date: February 19, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Open Water/Undeveloped Bay

Key Observation Point Name/Number: SPB01

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The beachside landscape functions like one large focal point.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The ocean leads to a wide sandy beach, grassy vegetated dune reclamation, wooden boardwalk access, and lowrise multi-family housing.

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SPB01

Date: February 19, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? There are various components and elements visible but they do not appear cluttered.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: The evening sky is clear, transitioning from a pale blue in the lower right to a deeper matte blue along the top.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This particular stretch of beach is not unique although it is still a large swath of open sand.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: SPB01

Date: February 19, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	8
Landform:	6
Vegetation:	5
Land Use:	8
User Activity:	8
Existing Conditions #1 Total:	35

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

2

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

2

Existing Conditions #2 Total (Sum 2A through 2C)

4

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

39

3. Comments:

The existing view is filled with a variety of materials and textures: split-rail wooden fences, wooden handrails along the beach access stair, young wispy grasses planted on-center to stabilize the dunes, people scattered along the beach, and a boardwalk with pedestrian scale lighting.

The waves gently crest at the shore, adding white highlights between the dark blue water and the beige sandy beach. The sky is perfectly clear with subtle color variation at this time of early evening.

Visual Impact Assessment

Date: 26 February 2021

Personnel: KAC

Landscape Similarity Zone: Atlantic City

Key Observation Point Name/Number: AC04N OCR Sky Gard

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Street lamps and boardwalk promenade.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

N/A

KOP: AC04N OCR Sky Gard

Date: 26 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: N/A

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlight ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Atlantic City.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	4.5
Vegetation:	4.5
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	27.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	1
Special Condition B. Are there other aesthetic elements that add to this resource?	1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?	1
--	----------

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **30.5**

3. Comments:

Cultural | Historic: Atlantic City.

Aesthetic: Dark sky with edge of well lit boardwalk promenade is visually interesting.

Litter: Unseen.

Summary of View: The night sky is jet black with no stars or planets visible in the view, which may be influenced by the urban light pollution in the developed strip along Atlantic City. The pedestrian scale street lamps and ghostly lit boardwalk with passerby is visually interesting and provides an atmospheric quality to the otherwise dark scene. Alone wave is moderately visible in the night view, however, the sound of the water would alert the viewer to their presence.

3 of 6

Visual Impact Assessment

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	4.5
Vegetation:	4.5
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:	3
---------------------	----------

Total: **28.5**

3. Comments:

The red obstruction lights of the wind turbine nacelles are small red flashes on the horizon at 10.54-mile to the nearest turbine. The sequence of blinking lights in such a large wind farm installation would be noticeable to the casual viewer against such a dark sky despite the small scale of the lights. However, it should be taken into consideration that the viewing platform is in a highly developed casino area where there would be other competing, often flashing lights in closer proximity than the wind farm.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: AC04N OCR Sky Gard

Date: 26 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1.5"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="2.5"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="2"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1.5"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="1"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="2.5"/>

7. Comments:

Compatibility: The red blinking lights are a new commercial industrial addition to the view, however, this view is in a built urban environment with other competing night-time light sources.

Scale: It is impossible to determine the scale of the turbines in the black sky.

Spatial Dominance: The majority of the blinking red lights are small on the horizon and remain subordinate in the view, however, the one red hot spot in the far right of the view where the lights are stacked on each other glows brighter and initially draws the viewer's attention.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The darkness reduces the layers to shades.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC04N Ocean Casino

Date: 2/26/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? There are some lights and road in the foreground.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: More moisture in the atmosphere would likely decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This is an oceanfront destination location for large amounts of people.

Date: 2/26/21

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	5
Vegetation:	4.5
Land Use:	5
User Activity:	6
Existing Conditions #1 Total:	27.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **3**

Special Condition B. Are there other aesthetic elements that add to this resource? **2**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **7**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **34.5**

3. Comments:

This nighttime open water view has some infrastructure lighting in the foreground that captures the viewers attention. Likewise, the foreground lighting makes the breaking waves visible and the sea will likely become the center of attention of the view.

3 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: AC04N Ocean Casino

Date: 2/26/21

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	2
Landform:	3
Vegetation:	4.5
Land Use:	3
User Activity:	3

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **5**

Total: **20.5**

3. Comments:

This nighttime view is dominated by the red lights attached to the turbine field. They become the focus of attention. They are highly visible, due mostly to the large quantity and the grid arrangement. The effect is significant, it seems as if there is land or an industrial use of some kind off shore.

Date: 2/26/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrast in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions are highly visible, create strong contrast, and will strongly alter the image of this landscape.

Visual Impact Assessment

Date: 03-01-2021

Personnel: KV

Landscape Similarity Zone: Atlantic City

Key Observation Point Name/Number: AC04N-Sky Garden

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The boardwalk lighting draws attention in this view.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The hard lines of the boardwalk draw viewer attention and the softer texture of the dune vegetation draws the gaze to the shoreline before looking out into the dark expanse.

1 of 6

Visual Impact Assessment

Personnel: KV

KOP: AC04N-Sky Garden

Date: 03-01-2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short-Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: overcast and hazy conditions may diminish visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlight ☐ frontlit ☐ sidelit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? The Atlantic City boardwalk is a recreation location families have been frequenting for generations, often going multiple times a year.

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

2

Special Condition B. Are there other aesthetic elements that add to this resource?

2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

1

Existing Conditions #2 Total (Sum 2A through 2C)

5

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

31

3. Comments:

Movement attracting viewer attention: User groups walking along the boardwalk, ocean waves will be lightly visible, but other sounds and music on the sky garden deck will limit the ability to hear the ocean waves.

Water resources are open and expansive, typical of this region. The landform with high rolling dunes sloping down toward the shoreline and light/fill by boardwalk lights provides a serene edge to development. Dune vegetation provides texture and natural order as a transition between developed boardwalk and sandy beach. Land use and user activity is average at this location but is balanced between the local residential activity and the intensely developed casino and hotel resorts that encourage tourism to remain within their structure.

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: **24**

3. Comments:

With the Project in place water resources are affected due to the quantity and expanse of the WTG and their lighting. Distance from the turbines at this location slightly benefits from the very close proximity as the effect of stacking does not cluster lighting as closely as it might at a greater distance. This serves to provide the feeling that the lights are often less intense than they may be at a location where stacked turbine rows overlap more tightly, and mass lighting to appear more intense. However, the breadth of the array invades a large expanse of the visual horizon. It would be difficult, especially while lights are slowly blinking, to look at the ocean horizon in any direction and not catch a glimpse of the blinking in peripheral vision. The landform of high dunes sloping to a flat shoreline becomes foreshortened and enclosed by the expanse of ocean development. The low growing vegetation finds little affect. The high intensity tourism land use at this location is unlikely to be affected by this development. The currently existing large hotels and amusement piers already add light to the night sky. However, user activity will be affected. While tourists are anticipated to continue as usual, local residents and the range of workforce required for this large scale tourism market will experience the affect of losing the single view available demonstrating no development.

4 of 6

Visual Impact Assessment

Personnel: KV

KOP: AC04N-Sky Garden

Date: 03-01-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>3</u>	User Activity:	<u>3</u>
Vegetation:	<u>3</u>	Total:	<u>14</u>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<u>3</u>	Land Use:	<u>1</u>
Landform:	<u>3</u>	User Activity:	<u>2</u>
Vegetation:	<u>3</u>	Total:	<u>12</u>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<u>3</u>	Land Use:	<u>2</u>
Landform:	<u>3</u>	User Activity:	<u>2</u>
Vegetation:	<u>3</u>	Total:	<u>13</u>

7. Comments:

Turbines developed at this location are not compatible, have sever scale contrast, and dominate the water resources, landform, and vegetation. However, the impact of land use and user activity is more variable due to the high intensity tourism development at this location, which also must be balanced with local user groups and their activities often finding beach front as an important part of summer social life.

Visual Impact Assessment

Date: February 25, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Casino District / City Center

Key Observation Point Name/Number: AC04N

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: Pedestrian lights along the boardwalk create a bright spot in an otherwise dark scene.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intensity and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC04N

Date: February 25, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Clouds are barely visible in the night sky.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Views from the Sky Garden of the Ocean Casino Resort.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC 04N

Date: February 25, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="9"/>
Landform:	<input type="text" value="6"/>
Vegetation:	<input type="text" value="4.5"/>
Land Use:	<input type="text" value="9"/>
User Activity:	<input type="text" value="9"/>
Existing Conditions #1 Total:	<input type="text" value="37.5"/>

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

Special Condition B. Are there other aesthetic elements that add to this resource?

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

Existing Conditions #2 Total (Sum 2A through 2C)

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

3. Comments:

The existing view is elevated, looking out over an unfocused darkness. The lit boardwalk is the only feature that captures any attention. The horizon is barely visible across the center of the view, defined by the black water on the bottom and the near-black sky above. A few wispy clouds with a faint rose hue are strung through the sky.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC 04N

Date: February 25, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	<input type="text" value="2"/>
Landform:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="4.5"/>
Land Use:	<input type="text" value="2"/>
User Activity:	<input type="text" value="2"/>

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions:

Total:

3. Comments:

The focus is effectively captured by the horizon where a steady band of red lights march across the majority of the view. This band will blink every two minutes, coupled with blade rotation that will create an alternate and inconsistent second kind of blink. The structures and blades are not visible in the darkness, just the red lights. Some appear more intense than others given the spacing.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC 04N

Date: February 25, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="11"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="11"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="2"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="11"/>

7. Comments:

The red lights become the focal point of this view. There is nothing else, other than the sliver of illuminated boardwalk in the lower left, to draw attention.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: AC 04N

Date: February 25, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The turbines do not detract noticeably from the views of other landscape / seascape elements but only because those elements are not clear at night. The red lights are the major focus because there is nothing else to focus on in this view. The large size is not height but width as the red lights extend across the majority of this view.

Visual Impact Assessment

Date: 26 February 2021

Personnel: KAC

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01N Beach HHD

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: N/A

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

N/A

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01N Beach HHD

Date: 26 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: N/A

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Beach Haven Historic District

Personnel: KAC

KOP: BHB01N Beach HHD

Date: 26 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	4.5
Vegetation:	4.5
Land Use:	7
User Activity:	6
Existing Conditions #1 Total:	26.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	2
Special Condition B. Are there other aesthetic elements that add to this resource?	0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **3**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **29.5**

3. Comments:

Cultural | Historic: Beach Haven Historic District

Aesthetic: Dark sky.

Litter: Unseen.

Summary of View: The existing night sky is very dark but there are no stars or planets visible. There is no spatial understanding or elements of scale in the view.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01N Beach HHD

Date: 26 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	4.5
Vegetation:	4.5
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: **28.5**

3. Comments:

The red obstruction lights of the wind turbine nacelles are small red flashes on the horizon at 13.50-mile to the nearest turbine. The sequence of blinking lights in such a large wind farm installation would be noticeable to the casual viewer against such a dark sky despite the small scale of the lights. There is one location in the left of the view where the nacelle lights are stacked on each other and it is a visual hot-spot that would draw the viewer's attention first before scanning right to the larger installation. In addition, the splay of the red lights caused by the construction layout of the turbines is visually odd along the middle of the view and would be further accentuated by the blinking of the lights.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: BHB01N Beach H HD

Date: 26 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1.5"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="3.5"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1.5"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="3.5"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="2"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="2"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="4"/>

7. Comments:

Compatibility: The addition of the red blinking obstruction lights is a commercial/industrial addition to a predominately residential area. It is likely that there is low levels of residential light pollution since the houses generally sit back from the beachfront.

Scale: While it is impossible to determine the scale of the turbines against the night sky, it is the scale of the installation itself and the construction layout triggers the visual scale contrast for the viewer.

Spatial Dominance: The majority of the blinking red lights are small on the horizon, however, the scale of the installation dominates the view. In addition, there is one red hot spot in the far left of the view where the lights are stacked on each other and glow brighter that initially draws the viewer's attention before moving on to the greater field of lights.

Visual Impact Assessment

Date: 2/26/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01N Beach Haven

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The tall beach lookout chair anchors this view.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

The layering of shoreline, open water and horizon create a natural order.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB01N Beach Haven

Date: 2/26/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? The fence line and chair in the foreground attract one's attention.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Increased atmospheric moisture would reduce visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☒ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This area will be used by nearby homeowners and visitors for recreation and views.

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: **15.5**

3. Comments:

The open ocean view is dominated by a very large field of turbine lights that create patterns of lights based on the perspective point of the grid layout. The lights stretch across the horizon and dominate the view.

4 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: BHB01N Beach Haven

Date: 2/26/21

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	2	User Activity:	2
Vegetation:	0	Total:	10

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	0	Total:	12

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	0	Total:	12

7. Comments:

Due to the darkened night time conditions, the turbine lights become the only real focus of the view - all other elements blend together in the dark in comparison to the stark contrast of the massive field of lights offshore.

5 of 6

Visual Impact Assessment

KOP: BHB01N Beach Haven

Date: 2/26/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrast in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions dominate the view. The darkened conditions amplify the presence of the turbine lights.

Visual Impact Assessment

Date: **03-01-2021**

Personnel: **KV**

Landscape Similarity Zone: **Residential/Oceanfront**

Key Observation Point Name/Number: **BHB01N-Beach Haven**

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: the wall/sail is near enough that it acts as a focus in dim lighting, but sound (ocean) may be a true focus.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

Night views often rely on the expectation of natural order. When visual cues are not reliable the viewer moves through a space with expectation of next steps based on prior experience. Even when viewing photos minimal visibility alludes to natural order creating anticipation of what's next.

1 of 6

Visual Impact Assessment

Personnel: **KV**

KOP: **BHB01N-Beach Haven**

Date: **03-01-2021**

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of Viewing

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Overcast/hazy nights will find a decrease in visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? This location is within the Beach Haven Historic District

2 of 6

Visual Impact Assessment

Personnel: **KV**

KOP: **BHB01N-Beach Haven**

Date: **03-01-2021**

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	6
Landform:	7
Vegetation:	5
Land Use:	6
User Activity:	6
Existing Conditions #1 Total:	30

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	2
Special Condition B. Are there other aesthetic elements that add to this resource?	2

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **3**

Existing Conditions #2 Total (Sum 2A through 2C) **7**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **37**

3. Comments:

Movement attracting viewer attention: in the dim lighting movement is not visible, but the sound of crashing waves will attract viewer attention.

This night view finds limited visibility, but the experience of this low visibility will increase the use of other senses and result in a high sensory experience. Close proximity of water resources will be apparent from crashing waves, wind gusts, and salty ocean scents. While this is typical of the region it is an experience with unique qualities and is expressed by the highest scoring in the average range. Landform in the view, while difficult to see is experienced by an ability to experience the scene from the upper landing of an elevated ramp, or to walk down to the waterline and find a more intimate experience with the ocean meeting the sandy shore. Vegetation in this scene is difficult to distinguish and subtle even in daylight. The experience of the vegetation at this lighting level is minimal. Land use and user activity are centered on tourism and residential uses. Access is available to all.

This view is within the Beach Haven Historic District, the aesthetic elements of resources within this dim lighting are increased due to the multi-sensory experience of the night view. Litter is not visible in this scene.

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4
Landform:	5
Vegetation:	5
Land Use:	5
User Activity:	3

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **7**

Total: **29**

3. Comments:

Blinking of lights at a slow consistent speed, and spanning such a stretch of horizon will give a highly developed feel to this once open scene. Water resources are impacted by the quantity, expanse, and stacking of the WTGs and their lighting. The WTG lighting, with the repetition of aligned rows at regular intervals appear as multiple bursts on the horizon reminiscent of a fireworks pattern. At this distance the clustering of individual lights due to stacking cause them to appear bright and more dramatic than at locations closer to the turbines. The wide breadth of the array on the ocean horizon makes it difficult to view the ocean while not directing the gaze toward some part of the array. This becomes a liability for water resources and user activity. The land use in this historic district has an emphasis on Bed & Breakfast businesses presenting a late 19th century resort community. While it is unlikely that this use will be drastically changed in the near term, user groups may determine that a beach further from this view provides the ocean experience they are more accustomed to. The somewhat narrow shoreline backed by tall dunes may be fore-shortened and gain a more closed in feeling with the wall of turbine lights on the horizon.

Visual Impact Assessment

Date: February 25, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Oceanfront Residential

Key Observation Point Name/Number: BHB01N

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: The lifeguard chair becomes a focal point only because it is white in an otherwise dark landscape.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: BHB01N

Date: February 25, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? There is hardly any ambient light to illuminate the context.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short-Term/Fleeting ☒ Long-Term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☒ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: Clouds are barely visible.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? There are residents along the beach presumably to take advantage of the view and the amenities here.

2 of 6

Visual Impact Assessment

Personnel: Steve Breitzka
KOP: BHB01N
Date: February 25, 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	8
Landform:	5
Vegetation:	5
Land Use:	8
User Activity:	8
Existing Conditions #1 Total:	34

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks? **1**

Special Condition B. Are there other aesthetic elements that add to this resource? **0**

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **1**

Existing Conditions #2 Total (Sum 2A through 2C) **2**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **36**

3. Comments:

The existing view is visually impacting only because of the darkness. There are few features that allow the eye to focus: the wood picket fence in the foreground and the low white surf as it hits the beach beyond. The horizon is barely visible in the distance below a subtle veil of thin clouds. This location will have more auditory benefit and less visual at this time of day.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka
KOP: BHB01N
Date: February 25, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	1
Landform:	5
Vegetation:	5
Land Use:	1
User Activity:	1

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **1**

Total: **14**

3. Comments:

The turbines are only visible due to the red lights; the structure and blades disappear in the darkness. The lights intensify in the stacked row where they overlap each other. When they are more spread out, they appear like a traffic jam of brake lights. The lights add a band of red lights scattered across the horizon, varying in height and, although blinking together, will have an inconsistent blink with the rotating blades. The turbine stretch is accentuated by the lights, identifying each structure across the majority of the view.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka
KOP: BHB01N
Date: February 25, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	1	User Activity:	3
Vegetation:	1	Total:	11

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	3	Land Use:	3
Landform:	1	User Activity:	3
Vegetation:	1	Total:	11

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	3	Total:	15

7. Comments:

The turbines are invisible at night until the red light blinks. Then they cannot be missed as the lights are the brightest and most prevalent feature in the view. There is nothing to compare them too and nothing to drown out their intensity. Ambient light behind the viewer may help, however, there is zero existing light out in the water.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

There is a fine line between the visibility levels here as the turbines go from invisible to obvious every two seconds. There is a strong contrast and then nothing, repeated.

Visual Impact Assessment

Date: 26 February 2021

Personnel: KAC

Landscape Similarity Zone: Dredged Lagoon/Salt Marsh

Key Observation Point Name/Number: LAT01N EBF NWR

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe: N/A

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

N/A

1 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01N EBF NWR

Date: 26 February 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view? N/A

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☐ Long-term

The frequency of this view is: ☐ Repeated ☒ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: N/A

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Birding and Wildlife Management

2 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01N EBF NWR

Date: 26 February 2021

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	4.5
Vegetation:	4.5
Land Use:	7
User Activity:	6
Existing Conditions #1 Total:	26.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?	1
Special Condition B. Are there other aesthetic elements that add to this resource?	1

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter? **2**

Existing Conditions #2 Total (Sum 2A through 2C) **4**

Existing Conditions Grand Total (Sum #1 Total and #2 Total) **30.5**

3. Comments:

Cultural | Historic: Birding and Wildlife Management

Aesthetic: Dark sky.

Litter: Unknown.

Summary of View: The existing night sky is very dark but there are no stars or planets visible, however, there is an existing bright red light in the left side of the view that is part of a structure in the background view along the waterway. Given the wildlife refuge land use it is not anticipated that there would be high numbers of pedestrians moving through this very dark landscape, however, the adjacent residential use would potentially encourage individuals to walk the roadway that borders the NWR.

3 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01N EBF NWR

Date: 26 February 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	4.5
Landform:	4.5
Vegetation:	4.5
Land Use:	6
User Activity:	6

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **4**

Total: **29.5**

3. Comments:

The red obstruction lights of the wind turbine nacelles are small red flashes on the horizon at 32.18-mile to the nearest turbine, except where there are several rows of turbine lights stacked on each other that creates a visual hot-spot. Upon focusing on the bright center of strobing lights, the viewer's attention is then drawn to the associated lights to the left and right of the central hot-spot. The splay of the red lights in the center of the view is caused by the head-on construction layout of the turbines, which is visually odd in its appearance as the perspective diminishes and the lights recede, almost as if they were moving through space. The visual perception of the "moving lights" would be further accentuated by the flashing action of the red obstruction lights.

4 of 6

Visual Impact Assessment

Personnel: KAC

KOP: LAT01N EBF NWR

Date: 26 February 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="1.5"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="2.5"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="1.5"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="2.5"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="0"/>	Land Use:	<input type="text" value="1"/>
Landform:	<input type="text" value="0"/>	User Activity:	<input type="text" value="1.5"/>
Vegetation:	<input type="text" value="0"/>	Total:	<input type="text" value="2.5"/>

7. Comments:

Compatibility: The addition of the red blinking obstruction lights is a commercial/industrial addition to the wildlife refuge and adjacent residential area. It is probable that the levels of residential light pollution are low since the houses are spread out between dredged boat access ways and generally at back from the wildlife refuge.

Scale: While it is impossible to determine the scale of the turbines against the night sky, it is the scale of the installation itself and the head-on construction layout triggers the visual scale contrast for the viewer.

Spatial Dominance: The majority of the blinking red lights are small on the horizon, however, the scale of the overall installation and the visual hot spot in the center of the view where the lights are stacked on each other that draws the viewer's attention before moving on to the greater field of lights.

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/ seascape elements.	<input checked="" type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be a wide except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

Visual Impact Assessment

Date: 2/26/21

Personnel: Jocelyn Gavitt

Landscape Similarity Zone: Dredged Lagoon/Salt Marsh

Key Observation Point Name/Number: LAT01N Edwin B. Ford

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☐ Yes ☒ No

If yes, briefly identify/describe:

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No

If yes, how does the natural order affect the view?

There is a layering of salt marsh in the foreground, horizontal lines in the midground consisting of open water and some distant land forms, and the open sky above the horizon. There is textural complexity in the foreground with the salt marsh plants and water.

1 of 6

Visual Impact Assessment

Personnel: Jocelyn Gavitt

KOP: LAT01N Edwin B. Ford

Date: 2/26/21

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? There are some distant lights that gather attention.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☒ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☒ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☒ Hazy

Conditions that may increase/decrease visibility could be described as: Conditions are generally clear, but long term visibility seems hazy. Moisture in the air could impact visibility.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☒ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? Local residents will experience this view on a regular basis.

Date: 2/26/21

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflective and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in the general direction. Strong contrast in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input checked="" type="checkbox"/>

9. Comments:

The proposed conditions are very noticeable in the nighttime sky. They become by far the most visible feature in the landscape.

Visual Impact Assessment

Date: **03-01-2021**

Personnel: **KV**

Landscape Similarity Zone: **Dredged Lagoon/Salt Marsh**

Key Observation Point Name/Number: **LAT01N-ForsytheWc**

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: the existing red warning light on the distant barrier island

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intactness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☒ Yes ☐ No
If yes, how does the natural order affect the view?

the grassy edge of the wetland is dark and difficult to distinguish, but the water way weaving through it lightly reflects ambient light of the night sky. This gives the viewer something to gaze on and ground themselves within the view while their eyes loosely distinguish the forms surrounding them.

1 of 6

Visual Impact Assessment

Personnel: **KV**

KOP: **LAT01N-ForsytheWc**

Date: **03-01-2021**

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☒ Yes ☐ No

If yes, how does the visual clutter affect the view? although difficult to see at this distance lights from the distant barrier island draw the gaze.

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☒ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☒ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: cloudy/overcast/hazy may decrease visibility

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☒ No

How would the site be used for scenic or recreational enjoyment? This is part of the Forsythe NWR, but in a heavily residential area where non-residents are unlikely to frequent.

3. Comments:

Movement attracting viewer attention: while the wetland grasses rippling in the breeze may not be visible the viewer will hear this soft rustling as part of the marshland nighttime hum.

This night view depicts a location where viewers are able to stand at the edge of development and overlook a natural marshland setting. Water resources, landform, and vegetation in this area could be considered distinct even during this lowlight level. Despite being difficult to see a viewer will experience a variety of sensory experience due to the presence and type of these resources. Light splashes, amphibians, insects, and vegetation will all be audible at this time of year. The light smell of salt water and and herbaceous vegetation will be recognizable when focus on the visual senses is limited. Land use as seen within this view is primarily preserved salt marsh with developed barrier island, however, the context page indicates the viewers back is to a developed dredged lagoon community. Over land access to this location is only available through this community which may give users a sense that they must belong in the community to gain access. Due to this user activity is often limited to local residents, but an occasional wildlife enthusiast may access this location. This location is within the footprint of the Forsythe NWR, the night view adds aesthetic elements as the dim lighting will heighten viewers experience of sound and smell. Litter is not visible in this location.

User Activity:	4

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **6**

Total: **27**

3. Comments:

Water resources in this night view are most recognizable in the near foreground. The WTs and their lighting on the distant horizon are difficult to recognize as developed ocean. This is both a drawback from distant water resources, but also buffers the decrease in quality as the near foreground resources remain high. However, landform, previously recognizable on the horizon by the dim lights of the developed barrier island are highly impacted by the WT G lighting. At once the subtle landform and lighting are both wiped out and expanded. The subtleness of the existing light giving dimension to the distant landform is gone, but the lighting from the WTs seems to extend the landform across the water resources. Those intimate with the area will understand the turbines are developed on water, but others may view this as an extended distant landform stretching across the horizon. This significantly alters the existing landform. The WT G lights occupying the horizon will also draw viewer attention away from the near foreground and diminish the impact of both site and sound attributed to vegetation. Land use appears to take on a more industrial use, especially on the distant horizon. User activity now has a focus on viewing the WTs.

General aesthetic contributions of this night scene are impacted by the introduction of the quantity of lights on the horizon. This visual component not only detracts from the view but will likely decrease sensitivity of sound and smell which are typically heightened in times of low visibility.

KOP: LAT01N-Forsythe/Wes

Date: 03-01-2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="15"/>

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="15"/>

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	<input type="text" value="3"/>	Land Use:	<input type="text" value="3"/>
Landform:	<input type="text" value="3"/>	User Activity:	<input type="text" value="3"/>
Vegetation:	<input type="text" value="3"/>	Total:	<input type="text" value="15"/>

7. Comments:

While the massing of WTGs are contained within a relatively limited area of this view the lighting in this scene makes them not compatible with the listed resources. When flashing at a regular interval viewer attention will be drawn to, and capture by, this installation. Similarly the scale contrast is severe because of the span of the WTG area. Even though it is contained within a portion of the view those looking out toward the ocean will find it difficult to focus on other visual elements. Due to these factors the spatial dominance of the WTGs when lit by the navigation aids will dominate the view.

KOP: LAT01N-Forsythe/Wes

Date: 03-01-2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

While viewers may find it difficult to avoid distraction by the lights blinking at a slow regular interval it is possible to turn and look out over the wetland in a different direction.

Visual Impact Assessment

Date: February 25, 2021

Personnel: Steve Breitzka

Landscape Similarity Zone: Dredged Lagoon/Salt Marsh

Key Observation Point Name/Number: LAT01N

Key Observation Point (KOP) Familiarization

Landscape/seascape, viewer, and related factors to be considered during evaluation of the KOP are outlined below.

The effect of the proposed Project on these factors should be incorporated into the scoring and comments on the VIA assessment form (proposed conditions). *(This form is intended to record initial observations and should be completed quickly, taking no more than 5 minutes)*

General elements of formal visual analysis to be considered include:

- Landscape/Seascape Composition:** The arrangement of objects and voids in the landscape that can be categorized by their spatial arrangement. Basic landscape components include vegetation, landform, water, and sky. Some compositions, especially those that are distinctly focal, enclosed, detailed, or feature-oriented, are more vulnerable to modifications than panoramic, canopied, or ephemeral landscapes.
- Form, Line, Color, and Texture:** These are the four major compositional elements that define the perceived visual character of a landscape/seascape, as well as a project. Form refers to the shape of an object that appears unified, often defined by edge, outline, and surrounding space. Line refers to the path the eye follows when perceiving abrupt changes in form, color, or texture, usually evident as the edges of shapes or masses in the landscape/seascape. Texture, in this context, refers to the visual surface characteristics of an object. The extent to which form, line, color, and texture of a project are similar to or contrast with these same elements in the existing landscape/seascape is a primary determinant of visual impact.
- Spatial Dominance:** The degree to which an object or landscape/seascape element occupies space in a landscape/seascape and thus dominates seascape composition from a specific viewpoint.
- Project Scale:** The apparent size of a proposed project in relation to its surroundings can define the compatibility of its scale within the existing seascape. Perception of project scale is likely to vary depending on the distance from which it is seen and other contextual factors.

Principles of composition to be considered include:

1. Focal Point

Certain natural or man-made landscape/seascape features stand out and are particularly noticeable as a result of their physical characteristics. Focal points often contrast with their surroundings in color, form, scale, or texture, and therefore tend to draw a viewer's attention. Examples include prominent trees, mountains, or cultural features, such as a distinctive lighthouse. If possible, a proposed project should not be sited so as to obscure or compete with important existing focal points in the landscape/seascape.

Does this view contain a focal point? ☒ Yes ☐ No

If yes, briefly identify/describe: A single red dot of light left of center in the view.

2. Order

Natural landscapes/seascapes have an underlying order determined by natural processes. Cultural landscapes exhibit order by displaying traditional or logical patterns of land use/development. Elements in the landscape that are inconsistent with this natural order may detract from scenic quality. When a new project is introduced to the landscape, intrusiveness and order are maintained through the repetition of the forms, lines, colors, and textures existing in the surrounding built or natural environment.

Does this view contain a natural order? ☐ Yes ☒ No

If yes, how does the natural order affect the view?

1 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

Date: February 25, 2021

Principles of composition, continued:

3. Visual Clutter

Numerous unrelated built elements occurring within a view can create visual clutter (disrupting the natural order), which generally has an adverse effect on scenic quality.

Does this view contain elements that contribute to visual clutter? ☐ Yes ☒ No

If yes, how does the visual clutter affect the view?

4. Movement

Motion of existing and proposed elements in a view can attract viewer attention.

Does this view contain elements in motion that are likely to attract viewer attention? ☐ Yes ☐ No

(If the answer is yes, Note these elements in rating form comments)

Factors affecting visual impact:

5. Duration of View

Some views are seen as quick glimpses while driving along a roadway or hiking a trail, while others are seen for a more prolonged period of time. Longer duration views of a project, especially from significant aesthetic resources, have the greatest potential for visual impact.

The duration of this view is: ☐ Short Term/Fleeting ☒ Long-term

The frequency of this view is: ☒ Repeated ☐ Occasional

6. Atmospheric Conditions

Clouds, precipitation, haze, and other ambient weather-related conditions can affect the visibility of an object or objects. These conditions can greatly impact the visibility and contrast of project components with landscape/seascape elements and the design elements of form, line, color, texture, and scale.

Conditions in this view can be described as: ☐ Clear ☐ Partly Cloudy ☐ Overcast ☐ Hazy

Conditions that may increase/decrease visibility could be described as: No atmospheric conditions visible.

7. Lighting Direction

Backlighting refers to a viewing situation in which sunlight is coming toward the observer from behind a feature or elements in a scene. Front lighting refers to a situation where the light source is coming from behind the observer and falling directly upon the area being viewed. Side lighting refers to a viewing situation in which sunlight is coming from overhead or the side of the observer to a feature or elements in a scene. Lighting direction can have a significant effect on the visibility and contrast of landscape and project elements.

The relevant lighting condition can be described as: ☐ backlit ☐ frontlit ☐ side-lit

8. Scenic or Recreational Value

Designation as a scenic or recreational resource is an indication that there is broad public consensus on the value of that particular resource. The characteristics of the resource that contribute to its scenic or recreational value provide guidance in evaluating a project's visual impact on that resource.

Would viewers consider this location a valued scenic or recreational resource? ☒ Yes ☐ No

How would the site be used for scenic or recreational enjoyment? The unobstructed view of the adjacent homes is a tremendous scenic resource.

Existing Conditions

1. In the existing view rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	7
Landform:	5
Vegetation:	4.5
Land Use:	7
User Activity:	7
Existing Conditions #1 Total:	30.5

2. Respond to each question below using a score of 0 to 3 (0 not present to 3 being high density)

Special Condition A. Does this zone contain any scenic, cultural, or historic landmarks?

1

Special Condition B. Are there other aesthetic elements that add to this resource?

0

Respond to each question below using a score of 0 to 3 (0 littered/polluted to 3 free of litter/pollution)

Special Condition C. Is this zone free from pollution and/or litter?

3

Existing Conditions #2 Total (Sum 2A through 2C)

4

Existing Conditions Grand Total (Sum #1 Total and #2 Total)

34.5

3. Comments:

There are few discernible features in this view at night. A narrow meandering ribbon of water crosses the bottom of the view, reflecting whatever ambient light is present. The bird nest perch appears like a dark upright shadow but is not clear. The lone red dot of light draws attention to other nearly invisible lights in the distance. Thin clouds are barely visible in the sky, dissolving the horizon line.

3 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01N

Date: February 25, 2021

Proposed Conditions

1. With the proposed project in place, rate the aesthetic quality/sensitivity of each resource on a score of 1 to 9 (1 liability to 9 distinct)

Note: If an element is not present in the view the score should be 4.5 of 9.0 (no impact), otherwise, rating should be a whole number score.

	Score
Water Resources:	3
Landform:	5
Vegetation:	4.5
Land Use:	2
User Activity:	2

2. Collectively rate special conditions on a score of 0 to 9 (0 liability to 9 distinct)

Note: Special Conditions score is taken directly from Existing Conditions #2 Total and can be adjusted up or down based upon the Proposed Conditions view.

Special Conditions: **3**

Total: 19.5

3. Comments:

The turbine structures and blades are not visible at this time of night. The red lights, given their distance from the viewpoint and their spacing, appear like airport runway lights extending deep into the view. There is a regularity to them in width and depth, creating long red streaks drawing attention into the center of the view. The lights are all at a consistent elevation with little undulation across the field of view. This increases their intensity as they appear stacked on one another.

4 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01N

Date: February 25, 2021

Proposed Conditions - Compatibility and Contrast Rating

Note: If an element is not present in the view the score should be a 0 (no impact), otherwise, rating should be a whole number score.

4. Rate the compatibility of the proposed project on a scale of 1 to 3 (1 compatible to 3 not compatible)

Water Resources:	3	Land Use:	3
Landform:	1	User Activity:	2
Vegetation:	0	Total:	9

5. Rate scale contrast of the proposed project on a scale of 1 to 3 (1 minimal to 3 severe)

Water Resources:	2	Land Use:	2
Landform:	1	User Activity:	2
Vegetation:	0	Total:	7

6. Rate spatial dominance of the proposed project on a scale of 1 to 3 (1 subordinate, 2 co-dominant, 3 dominant)

Water Resources:	3	Land Use:	3
Landform:	3	User Activity:	3
Vegetation:	0	Total:	12

7. Comments:

The turbines become a dominant feature because the red light is the only thing drawing focus in the night time view. These marching rows of blinking red lights will constantly and consistently function as the primary visible element in this view. Their regularity detracts from any natural environment within the salt marsh.

5 of 6

Visual Impact Assessment

Personnel: Steve Breitzka

KOP: LAT01N

Date: February 25, 2021

Proposed Conditions

8. Visibility Threshold Level - Check the box next to the description that most closely describes the visual prominence of the Project from the selected KOP.

Visibility Rating	Description	
Visibility level 1. Visible only after extended, close viewing; otherwise invisible.	An object/phenomenon that is near the extreme limit of visibility; it could not be seen by a person who was unaware of it in advance and looking for it. Even under those circumstances, the object can be seen only after looking at it closely for an extended period.	<input type="checkbox"/>
Visibility level 2. Visible when scanning in the general direction of the study subject; otherwise likely to be missed by casual observers.	An object/phenomenon that is very small and/or faint, but when the observer is scanning the horizon or looking more closely at an area, can be detected without extended viewing. It could sometimes be noticed by casual observers; however, most people would not notice it without some active looking.	<input type="checkbox"/>
Visibility level 3. Visible after a brief glance in the general direction of the study subject and unlikely to be missed by casual observers.	An object/phenomenon that can be easily detected after a brief look and would be visible to most casual observers, but without sufficient size or contrast to compete with major landscape/seascape elements.	<input type="checkbox"/>
Visibility level 4. Plainly visible, so could not be missed by casual observers, but does not strongly attract visual attention or dominate the view because of its apparent size, for views in the general direction of the study subject.	An object/phenomenon that is obvious and with sufficient size or contrast to compete with other landscape/seascape elements, but with insufficient visual contrast to strongly attract visual attention and insufficient size to occupy most of an observer's visual field.	<input type="checkbox"/>
Visibility level 5. Strongly attracts the visual attention of views in the general direction of the study subject. Attention may be drawn by the strong contrast in form, line, color, or texture, luminance, or motion.	An object/phenomenon that is not large but contrasts with the surrounding landscape elements so strongly that it is a major focus of visual attention, drawing viewer attention immediately and tending to hold that attention. In addition to strong contrasts in form, line, color, and texture, bright light sources such as lighting and reflections and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject interferes noticeably with views of nearby landscape/seascape elements.	<input checked="" type="checkbox"/>
Visibility level 6. Dominates the view because the study subject fills most of the visual field for views in its general direction. Strong contrasts in form, line, color, texture, luminance, or motion may contribute to view dominance.	An object/phenomenon with strong visual contrasts that is so large that it occupies most of the visual field, and views of it cannot be avoided except by turning one's head more than 45° from a direct view of the object. The object/phenomenon is the major focus of visual attention, and its large apparent size is a major factor in its view dominance. In addition to size, contrasts in form, line, color, and texture, bright light sources and moving objects associated with the study subject may contribute substantially to drawing viewer attention. The visual prominence of the study subject detracts noticeably from views of other landscape/seascape elements.	<input type="checkbox"/>

9. Comments:

The difference between level 5 and level 6 is difficult in this view. The red lights dominate focus because there is nothing else to see. However, they are distant and fade away on the right and left sides of the field. The turbines are not large in the view but the lights are obvious and unmistakable.

New Brunswick, NJ 08901
<https://rucool.marine.rutgers.edu>

Initial Visibility Modeling Study for Offshore Wind for New Jersey's Atlantic Shores Offshore Wind Project

Introduction:

A key stakeholder concern around the development of offshore wind in the United States is how the constructed wind farms may impact viewshed from the shore, with some concerned that visible wind turbines would be a negative impact, while others have no concern or see it as beneficial, although surveys indicate a strong preference to locate turbines further from shore to reduce visual impacts (Musial & Ram, 2010). Due to the shallow continental shelf of the Mid-Atlantic United States, offshore wind farms can be built further offshore, while still utilizing fixed foundations. The wind energy lease owned by Atlantic Shores Offshore Wind (ASOW) is located more than 8 miles away from the closest shore point, and extending out to 24 miles from the shoreline at its farthest (see Figure 1). Having a firm understanding of the visibility regime present within the wind lease area, areas along the shore, and the ocean between is of interest to ASOW.

The Rutgers University Center for Ocean Observing Leadership (RUCOOL) has been running a real-time version of the Weather Research and Forecasting (WRF, Skamarock et al. 2008) model for wind resource assessment purposes since 2011 (RUWRF), through funding support by the New Jersey Board of Public Utilities (NJBPUI). In addition to being used for wind resource assessment, WRF is a fully dynamic mesoscale atmospheric model, which includes a large

Figure 1: Map depicting the Atlantic Shores Offshore Wind lease area, along with shoreside points used for comparison.

number of output variables frequently used in weather and climate prediction. ASOW approached RUCOOL with this project to evaluate the visibility regime within and around the ASOW lease area, utilizing RUWRF model output¹. Since observations of visibility are only located at selected weather stations, the RUWRF model output was validated against available observations prior to being used to estimate visibility in the full region of interest. Some key messages and findings are included below, with a detailed description of the work to follow.

Key Messages:

- Observational visibility data from 2019 were analyzed at Atlantic City International Airport (ACY) and Ocean City Municipal Airport (26N). ACY is located several miles inland, while 26N is along the shoreline.
- The percentage of daylight hours with observed visibilities of 8 or 10 miles and above range from **73% to 89%** at ACY and 26N. **The observed visibility frequencies at 26N were 6% and 12% lower than the frequencies at ACY** for 8 and 10 miles respectively.
- While monthly visibility frequencies at ACY did not show substantial variations, monthly frequencies at 26N revealed **lower visibility in the late spring, and higher visibility in the late summer and fall**.
- Plots of visibility calculated from RUWRF model data indicate a frequency of **1 out of 4 or 5 days (23%) for "very clear days" in the summer**. "Very clear days" are defined by visibilities above 20 miles throughout the majority of the onshore and offshore environment in New Jersey.
- A majority of summer days exhibited high inland visibility and lower visibility (2-12 miles) over the ocean.
- Higher humidity and larger temperature differences between the air and ocean surface cause haziness and marine clouds/fog to occur more frequently offshore. **Between Atlantic City Airport (ACY) and the Atlantic Shores Offshore Wind lease area, a distance of roughly 25 miles, the percentage of daylight hours with a calculated visibility of 10 or more miles decreases from 78% to 41%.**
- Through comparisons between observed and calculated visibility at ACY and 26N a bias was determined for 8 and 10-mile visibility. Visibility calculated from model data was **9% lower** than observed visibility at ≥ 8 miles. For ≥ 10 -miles, calculated visibility was **6% lower** than observed visibility.
- **Visibility looking towards the lease area from the shore** was estimated by averaging 26N observational visibility with bias-corrected calculated visibility in the ASOW lease area. The results are as follows:
 - ≥ 8 miles: **70%** of daylight hours
 - ≥ 10 miles: **60%** of daylight hours
- Average monthly plots of visibility revealed differences between onshore and offshore seasonal visibility trends. While observational data at 26N showed higher visibility in the late summer and fall, **average monthly plots showed higher offshore visibility in the late fall and winter**.

¹ RUWRF daily model output is available at <https://go.rutgers.edu/RU-WRF>.

Observed Visibility:

To begin assessing visibility along the coastline of southern New Jersey, observational visibility data was downloaded at Atlantic City International Airport (ACY) and Ocean City Municipal Airport (26N). These data were used to compute monthly and yearly frequencies of visibility greater than or equal to eight and ten miles during daylight hours in 2019 (Figure 2). In Ocean City, the fractions of daylight hours during which visibility was at least eight and ten miles were 83% and 73%, respectively. At ACY, visibilities above eight and ten miles were observed 89% and 85% of daylight hours. The higher visibility at ACY can be attributed to the drier inland air, compared to the more humid coastal air around 26N, as explained later on in this report.

Monthly visibility frequencies at ACY demonstrated minimal variation in 2019 (Figure 3a). Conversely, monthly visibility frequencies at 26N exhibited lower visibility in the late spring and higher visibility in the late summer and fall (Figure 3b). The lowest 10-mile visibility frequency at 26N occurred in May (59%) and the highest occurred in September (89%). Monthly visibility data from 2015-2017 at 26N showed similar trends to 2019, although overall visibility was slightly higher (Figure 4). Note that the 2018 data at 26N had significant data gaps, and was not used. Decreased visibility during the late spring are likely due to increased fog and clouds near the coast because of larger temperature differences between the warm late spring air and the cold ocean water. In the late summer, warmer ocean temperatures cause less condensation, and therefore fewer clouds to form as inland air moves over the ocean.

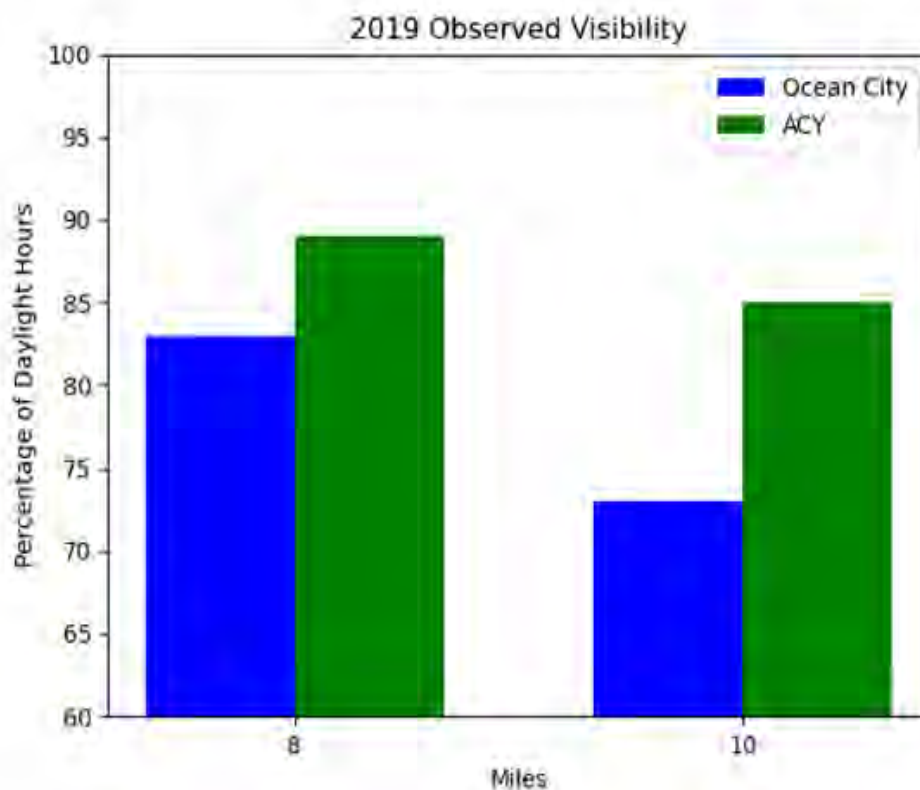

Figure 2: Overall annual visibility observed in 2019 at Atlantic City International Airport (ACY) and Ocean City Airport.

Figure 3: Observed visibility by month at (a) Atlantic City International Airport, and (b) Ocean City Airport.

Modeled Visibility:

Observational visibility data is limited to specific onshore locations such as ACY and 26N, therefore numerical weather prediction model data were necessary to carry out a more comprehensive analysis of coastal visibility in southern New Jersey. The model data used in this study are from the 3-km nested RUWRF model run by RUCOOL. Since RUWRF does not directly compute visibility, it can instead be calculated from humidity and temperature data. Two calculation methods were analyzed to determine which method most accurately computes

Figure 4: Observed visibility by month for 2015-2017 at Ocean City Airport.

visibility in the New Jersey coastal environment, based on methods studied by Bang et al. (2009).

The first method tested was the Forecast Systems Laboratory (FSL) method which uses temperature (T), dew point temperature (T_d), and relative humidity (RH):

$$\text{VIS}_{\text{mi}} = 6000 \cdot \frac{T - T_d}{\text{RH}^{1.75}}$$

The second method tested was the Rapid Update Cycle (RUC) method, which only uses RH:

$$\text{VIS}_{\text{km}} = 60 \cdot \exp\left(-2.5 \cdot \frac{\text{RH} - 15}{80}\right)$$

Monthly and yearly visibility calculated using both methods on RUWRF data were compared to observational data. In addition, visibility in July 2019 was calculated using the FSL and RUC methods on observational temperature and humidity data and compared to observational visibility for a more direct comparison.

Through these comparisons, it was determined that the FSL method more accurately estimates visibility than the RUC method. Although the FSL method overestimates the high end of visibility, it is relatively accurate in the low to middle range. Conversely, the RUC method substantially underestimates visibility during all conditions. An example of FSL-calculated visibility is shown in Figure 5.

Figure 5: Visibility at Atlantic City International Airport (ACY) on 19 July 2019. The gray line depicts the observed visibility, while the orange line shows visibility calculated using observed temperature, dewpoint, and relative humidity, and the blue line depicts calculated visibility using these variables from RUWRF.

Once the FSL method was determined to be the more accurate method of visibility calculation, Python scripts were written to plot FSL visibility at each grid point in the 3-km model during daylight hours. These plots revealed stark differences between land and ocean visibility. In particular, a region of lower visibility appeared directly off of the coast in numerous plots during the summer, with slightly higher visibility farther out in the ocean. An example of this is shown in the plot from 1 August 2019 in Figure 6.

In July and August of 2019, each hour of plotted visibility was analyzed to determine the percentage of days with high visibility (>20 miles) throughout the entire grid, or “very clear days”. Through this analysis, it was determined that roughly 23% of the days during that time period were “very clear days”. A majority of days exhibited high inland visibility and lower visibility (2-12 miles) over the ocean.

Monthly and yearly visibility frequencies were computed at four points to compare observations and modeled data, and to study the impact of marine air on visibility. These points include: Atlantic City Airport (ACY), Ocean City Municipal Airport (26N), the Atlantic City shore, and

Figure 6: Calculated visibility (maximum detectable range) across the region from RUWRF output on 1 August 2019. Note the region of reduced visibility between the shoreline and the wind energy lease areas off southern New Jersey. The color shading indicates the maximum detectable range from a given point, based on the conditions at that point, and only indicate actual visibility if conditions are the same within that range; if nearby points have a reduced visibility, it will also reduce the actual visibility from the maximum detectable range. For instance, if standing in Atlantic City, visibility is reduced if looking to the east, as there is a region of reduced maximum detectable range just offshore, while visible range is high if looking to the west.

Figure 7: RUWRF calculated visibility at the 4 points shown in Figure 1. Note how the visibility rapidly decreases offshore due to the frequent marine fog.

the ASOW lease area (see Figure 1). Each of these points represent data from a single model grid point except 26N, which was an average of two adjacent points. Since 26N is on the coast, we found that the average of an ocean and inland point more accurately capture the coastal environment.

As previously stated, visibility varies rapidly between onshore and offshore locations along the New Jersey coastline. Higher humidity and larger temperature differences between the air and ocean surface cause haziness and marine clouds/fog to occur more frequently offshore. Between ACY and the ASOW lease area, a distance of roughly 25 miles, the percentage of daylight hours with a visibility of 10 or more miles decreases from 78% to 41% (see Figure 7). Although inland visibility is relatively high, the decreasing visibility offshore results in lower average visibility while looking towards the lease area.

While comparing observed and calculated visibility at ACY and 26N in 2019, a trend in lower calculated visibility was observed. At ACY, the percentage of daylight hours with a calculated visibility of ≥ 8 miles was 8% lower than the observed percentage, and 6% lower for 10-mile visibility. In Ocean City, the percentage of daylight hours with a calculated visibility of ≥ 8 miles was 10% lower than the observed percentage, and 6% lower for 10-mile visibility. Therefore, the average bias between these two stations was 9% lower for ≥ 8 -mile visibility and 6% lower for 10-mile visibility (see table and Figure 8 on next page).

	ACY Bias	26N Bias	Average Bias
≥ 8 Miles	8% lower	10% lower	9% lower
10 Miles	6% lower	6% lower	6% lower

Figure 8: Comparison between observed and RUWRF-calculated visibility at (a) Atlantic City International Airport (ACY), and (b) Ocean City Airport (26N). Note that the visibility instruments at these stations only report visibility up to 10 miles; anything greater than 10 miles is reported as 10.

Since visibility varies substantially between onshore and offshore points, a method was developed to estimate the visibility of someone standing on the shore and looking out at the ocean. To do this, we averaged 2019 bias-corrected lease area visibility from RUWRF FSL data with Ocean City (26N) observational visibility. The results of this method are as follows:

- ≥ 8 miles: **70%** of daylight hours
- ≥ 10 miles: **60%** of daylight hours.

Finally, we calculated 2019 average visibility for each month, the summer months combined, and the entire year. Each of these were broken down into morning (13Z), mid-day (17Z), and late afternoon (21Z) average visibility. The yearly, monthly, and summer average visibility each share a trend of increasing visibility from the morning to the late afternoon. Higher visibility over the land appears to extend out into the ocean throughout the day. This is consistent with warmer temperatures during the day lowering the relative humidity and causing higher visibility (recall the FSL calculation method).

In addition to averages at certain times of day, complete averages of all daylight hours were plotted for each month and for the combined summer months (see Figure 9). While these plots demonstrate some similarities to the observed monthly visibility frequencies at 26N, they reveal notable differences in the summer months. Over the ocean, the average visibility in April, May and June ranged from 2.5 to 10 miles, which is consistent with lower frequencies above 10 miles

in the 26N observations. However, in July and August, when visibility frequencies over 10 miles in Ocean City are above 75%, average visibility off the coast ranges from 5 to 12 miles (**Error! Reference source not found.**). The highest offshore visibility occurred in the late fall and winter.

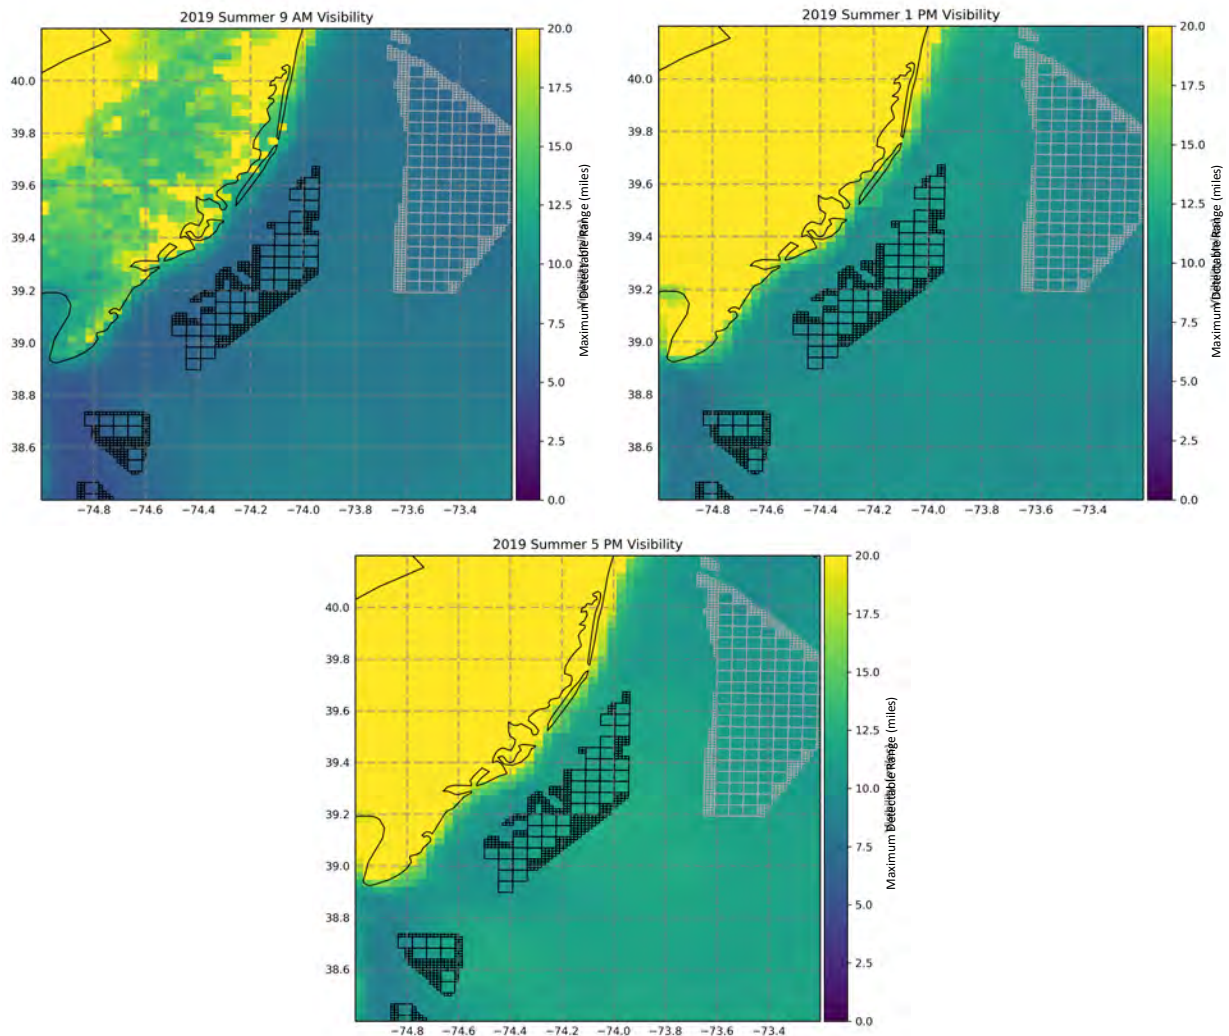

Figure 9: RUWRF-calculated visibility on an average summer day at (a) 9 AM local time; (b) 1 PM local time; and (c) 5 PM local time. The color shading indicates the maximum detectable range from a given point, based on the conditions at that point, and only indicate actual visibility if conditions are the same within that range; if nearby points have a reduced visibility, it will also reduce the actual visibility from the maximum detectable range.

Figure 10: RUWRF-calculated average visibility for July 2019. The color shading indicates the maximum detectable range from a given point, based on the conditions at that point, and only indicate actual visibility if conditions are the same within that range; if nearby points have a reduced visibility, it will also reduce the actual visibility from the maximum detectable range.

Possible visibility instruments for Shore-based and Floating Lidars:

One item of interest to ASOW was the possibility of installing a visibility instrument on either the shore-based lidar system installed at the Rutgers University Marine Field Station (RUMFS), and/or for deployment on one of their floating lidar buoys, to provide additional observations for validation. A selection of possible instruments is indicated below:

- Campbell Scientific
 - CS120A (visibility sensor only)
 - CS125 (visibility sensor plus current weather)
 - If RH is connected, the instrument can determine if obscuration is wet or dry, and it can tell liquid from frozen precip
 - Range: 5m – 75 km
 - Weight: 3 kg
 - Dimensions (inches): 21.26 x 25.2 x 9.7
- R.M. Young Sentry Visibility Sensor
 - Range: 30 m -16 km
 - Weight: 8 kg

- Dimensions (inches): 35 x 11.5 x 12
 - Used/tested by NWS and FAA
- Vaisala – Visibility Sensor PWD50
 - Described as good instrument for marine environments with turbine applications
 - Range: 10m – 50km
 - Weight: 3 kg
 - Dimensions (inches): 5.51 x 15.91 x 27.36
