BOEM
BUREAU OF OCEAN ENERGY MANAGEMENT

GULF OF MAINE MEETINGS FOR THE FISHING COMMUNITY
JULY 24-27, 31, 2023 - MEETING SUMMARY

DISCLAIMER: This meeting summary was prepared by the Consensus Building Institute (CBI), a non-profit entity contracted by BOEM to facilitate discussions. This summary is not intended to be a meeting transcript. Rather, it focuses on the main points covered during the meetings.

MEETING IN BRIEF
BOEM convened five in-person meetings for the Gulf of Maine fishing community in the following municipalities: Portland, ME; Ellsworth, ME; Rockport, ME; Plymouth, MA; and Portsmouth, NH. BOEM also held a virtual meeting requested by Massachusetts fishermen. The purpose of these meetings was to create an opportunity for fishermen to meet the BOEM and spatial modeling teams, learn about the data BOEM has received, offer feedback and on-the-water knowledge to improve the spatial models used to inform draft Wind Energy Areas (WEAs) for future offshore wind leasing.

BOEM staff and Dr. James Morris from NOAA's National Centers for Coastal Ocean Science (NCCOS) shared information about BOEM's process, the data, and the modeling effort. Most of each meeting was dedicated to discussion with participants in plenary and smaller groups.

ACTION ITEMS

Who	What
BOEM	- Post meeting summary - Incorporate feedback in the next iteration of the model and in the analysis to designate Draft WEAs. - Schedule an additional round of discussions once Draft WEAs are available for review
Public	Review and provide input on Draft WEAs once they are available in the coming months

ATTENDANCE
Approximately 250 people participated in the six meetings. In addition to members of the fishing community and government representatives, participants in some meetings included interested citizens, wind developers, and environmental non-governmental organizations. (See attendee list on page 3.)

SUMMARY OF PRESENTATION

BOEM project coordinators Seth Theuerkauf and Luke Feinberg, along with NCCOS's James Morris, provided an opening presentation that described BOEM's leasing process in the Gulf of Maine, the comments and feedback received so far, the modeling effort being used to help analyze areas of greatest and least conflict with offshore wind, as well as preliminary model results. The presentation showed how BOEM has partnered with NCCOS to develop spatial modeling as a tool to look at multiple layers of data representing different ocean uses and resources all together. The spatial model compiles the best available data to inform decisions about how to minimize conflicts when siting offshore wind. The model is comprised of 5 different submodels: national security; industry; fisheries; wind; and natural and cultural resources. For the purposes of this meeting, BOEM and NCCOS focused on details of the fisheries submodel. BOEM designed model scenarios to explore different questions and stakeholder perspectives to

understand how altering priorities affects the model outputs. BOEM shared examples of different model results, including one where Lobster Management Area (LMA) 1 was entirely removed from the model and another where LMA1 received a low (unsuitable) score. BOEM also described the next step, which will be to incorporate feedback from these meetings into the development of Draft Wind Energy Areas (WEAs). This step will be another opportunity to have similar discussions with fishermen and other stakeholders.

DISCUSSION

At each meeting, members of the fishing community and other participants were able to ask questions and give feedback, providing specific input on data sets and the model, as well as general comments around the leasing process. Conversations occurred in one group and around tables in smaller groups.

Below is a summary of key themes and topics discussed during the meetings. BOEM also provided written feedback forms, and a total of 12 were collected. BOEM is considering those comments as well as those received orally at the meetings.

Feedback on data and the model
- Fishermen, particularly in Maine, raised concerns about the lack of detailed data from the lobster industry to inform the model and the leasing process. They asked BOEM to slow down the leasing process to incorporate new data that will be coming out starting in 2024, as all lobster boats start reporting.
- Relatedly, fishermen and some state regulators said datasets showing revenue and landings did not accurately reflect lobster landings, particularly for areas along the Maine coast.
- Many participants urged BOEM to remove LMA 1 from consideration. Justifications included (but weren't limited to) the density of fishing activity, the inability of Maine fishermen to fish outside of Maine waters (Lobster Management Zones), and to preserve the deeper waters of LMA1 to account for the movement of lobsters further offshore. Individuals also raised concerns about the entire economy of coastal communities (e.g., restaurants, tourism), not just the livelihoods of individual lobstermen.
- Several fishermen raised concerns about the accuracy of fisheries data used from the National Marine Fisheries Service (NMFS), particularly NMFS survey data. However, other fishermen and state regulators urged BOEM to include surveyed biomass data to complement fishing effort, because fishing effort reflects management constraints.
- More broadly, participants expressed concern about how this process might anticipate changes in habitat and fishing grounds as the Gulf of Maine changes over the coming decades, considering the wind leases will be in a fixed location for 30+ years.
- Many participants wanted to understand more deeply how the model was giving more or less weight to different data layers and producing results.
- Several participants provided detailed information on fishing effort, for example regarding effort in LMA3 and more detail around the boundaries of Platts Bank.

Wind turbine and cable impacts on fisheries and ecology

- Many participants inquired about the likely transmission routes and interconnection points of future offshore wind development, as well as the timing of transmission planning.

- Many participants expressed concerns about the potential negative impacts from having turbines and cables in the Gulf of Maine. In particular, participants raised concerns about:
    - Electromagnetic fields and heat from cables affecting the benthic environments and organisms;
    - Survey activities and potential effects on wildlife, such as whales;
    - Lack of baseline environmental data; and
    - Effects to the Gulf of Maine gyre and spawning migrations.
- Many participants expressed concerns about how lease areas would impact their transit to fishing grounds. Participants sought answers about whether they would be able to fish safely inside the array, and many doubted they could.

Other comments

- Several participants questioned the urgency of moving forward now with offshore wind, and wondered if the grid would be able to accept this new energy source. Several participants urged policymakers to focus on other sources of energy.
- Many participants expressed frustration that commercial leasing was happening roughly at the same time as Maine's proposed Research Lease, rather than leaving more time to learn from the Research Array.
- Fishermen and their representatives asked for detailed discussion around draft Wind Energy Areas, for instance with the type of workshops used for stock assessments.

PARTICIPANT LIST

BOEM team

Name	Affiliation
Seth Theuerkauf	BOEM Office of Renewable Energy Programs Project Coordinator
Luke Feinberg	BOEM Office of Renewable Energy Programs Project Coordinator
Zachary Jylkka	BOEM Office of Renewable Energy Programs Project Coordinator
Brandon Jensen	BOEM Office of Renewable Energy Programs Fisheries Biologist
Ursula Howson	BOEM Office of Renewable Energy Programs Fisheries Biologist
Liz Oliver	BOEM Office of Renewable Energy Programs Tribal Liaison

Facilitation team

Name	Affiliation
David Plumb	Consensus Building Institute
Melanie Gárate	Consensus Building Institute
Laura Singer	Consensus Building Institute
Maddie Collins	Consensus Building Institute
Chiara Fargnoli	Consensus Building Institute
Pat Field	Consensus Building Institute

Attendees*

*Note: Some attendees registered via hand-written form. Please excuse any misspellings of names and affiliations.

Day 1, July 24, 2023 – Portland, ME

First Name	Last Name	Affiliation

Craig	Morin	N/A
Geonce	Star	Lobster Advocate
Pamela	Star	lobster advocate
Amber-Jean	Nickel	MLA
Emily	Coffin	MCFA
Patrice	McCarron	MLA
