This section discloses potential bird impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

<u>Accidental releases and discharges:</u> Future offshore wind and non-wind activities could expose coastal offshore waters to contaminants (e.g., fuel, sewage, solid waste, or chemicals, solvents, oils, or grease from equipment) in the event of a spill or release during routine vessel use. Ingestion of hard and soft plastic debris could lead to blockages and could result in adverse health effects to birds, such as decreased hematological function, dehydration, drowning, hypothermia, starvation, weight loss, and even death (Briggs et al. 1997; Haney et al. 2017; Paruk et al. 2016). Vessel compliance with USCG regulations would minimize trash or other debris; therefore, BOEM expects accidental trash releases from offshore wind vessels to be rare. Spills could result in small exposures that cause oiling of feathers that can lead to adverse effects such as changes in flight efficiencies and result in increased energy expenditure during daily and seasonal activities (Maggini et al. 2017). All future offshore wind projects would be required to comply with regulatory requirements related to the prevention and control of accidental spills administered by the USCG and BSEE. OSRPs are required for each project and would provide for rapid spill response, cleanup, and other measures that would help to minimize potential impacts on affected resources from spills. WTGs and OSSs are generally self-contained and would not generate discharge (see COP Appendix D). Vessels would also have onboard containment measures that would further reduce the impact of a spill in the event of an allision or collision. Based on the low risk of spills from vessels due to implementation of safe handling, storage, and cleanup procedures, impacts from accidental spills and trash would represent a **negligible** adverse impact to birds.

<u>Anchoring and new cable emplacement/maintenance:</u> Infrequent construction impacts associated with onshore power infrastructure would be required over the next 6 to 10 years to tie future offshore wind energy projects to the electric grid. Typically, this would require only small amounts of habitat removal, if any, and would occur primarily in previously disturbed areas. Up to 109,808 acres of localized temporary seafloor disturbance and associated increased suspended sedimentation could occur during construction of proposed wind farm cables and anchoring (see Table E-4 in Appendix E). Where future offshore wind activities overlap the GAA, there would be increased anchoring of vessels during survey activities and during the construction and installation, O&M, and decommissioning of offshore components. In addition, there could be increased anchoring/mooring of meteorological (met) towers or buoys. Disturbed seafloor from construction of future offshore wind projects and anchoring may affect diving birds' foraging success or may affect some prey species (e.g., benthic assemblages); however, impacts would be temporary and localized, and birds would be able to successfully forage in adjacent

areas and would not be affected by increased suspended sediments and no population-level impacts would occur. Suspended sediment concentrations during activities other than dredging would be within the range of natural variability for this location. Therefore, adverse impacts would be **minor**. See Sections 3.6 and 3.13 for detailed information on potential effects to benthic habitat.

Climate change: Impacts associated with climate change (i.e., increased storm severity and frequency, ocean acidification, altered migration patterns, increased disease frequency, habitat conversion, and increased erosion and sediment deposition) could result in long-term **minor** adverse risks to birds and could lead to changes in prey abundance and distribution, changes in nesting and foraging habitat abundance and distribution, and changes to migration patterns and timing. During construction, future offshore wind development activities may result in a small temporary increase in greenhouse gas (GHG) emissions (see Section 3.4.2.2.2). However, operation of these projects may beneficially contribute to a broader combination of actions to reduce future impacts to birds from climate change over the long term due to reduced reliance on fossil fuel–generated energy sources.

Light: Nighttime lighting associated with offshore structures and vessels could also represent a source of bird attraction. Under the No Action Alternative, offshore WTGs and OSSs would have hazard and aviation lighting that would be added beginning in 2021 and continuing through 2027 (see Table E1-3 in Appendix E1). Construction vessels are also a source of artificial lighting. Vessel lighting would be temporary and result in a **minor** adverse impact to birds; structure lighting may pose an increased collision or predation risk (Hüppop et al. 2006), although this risk would be localized in extent and minimized using BOEM lighting guidelines (BOEM 2021c; Kerlinger et al. 2010), and therefore would also be a **minor** adverse impact.

Noise: Table E-3 in Appendix E indicates that multiple offshore wind project construction periods are anticipated between 2022 and 2027. Construction noise sources will include, most notably, pile driving as well as geological and geophysical surveys, offshore and onshore construction, and aircraft and vessel traffic. These would create noise and may temporarily impact some bird species by displacing them and changing their behavior. Noise generated by construction equipment also has the potential to mask signals used by certain bird species for communication and mating, as well as hunting, which can lead to a decrease in bird density in the affected area (Bottalico et al. 2015). Potential impacts could be greater if avoidance and displacement of birds occur during seasonal migration periods. Noise transmitted through water could temporarily displace diving birds in a limited space around each pile and could cause short-term stress and behavioral changes ranging from mild annoyance to escape behavior (BOEM 2014b, 2016). Vessel and aircraft noise could also disturb some individual diving birds, but they would acclimate to the noise or move away, potentially resulting in temporary displacement. Collectively, these noise sources would be temporary and localized, resulting in a **minor** adverse impact to these birds.

Presence of structures: Onshore land development or port expansion activities could result in limited loss of nesting and/or foraging habitat for some bird species. The presence of offshore structures can lead to impacts, both beneficial and adverse, on birds through fish aggregation and the associated increase in foraging opportunities as well as entanglement and gear loss/damage, migration disturbances, and WTG strikes and displacement. These impacts may arise from buoys, met towers, foundations, scour/cable protections, and transmission cable infrastructure.

The primary threat to birds from the presence of structures would be from collision with WTGs. Birds are susceptible to collision with structures, particularly at night and/or during other periods of low visibility (e.g., rain or fog) (Stantec 2018). As discussed above, the Atlantic Flyway is an important migratory pathway for up to 164 species of waterbirds, and a similar number of land birds, with the greatest volume of birds using the Atlantic Flyway during annual migrations between wintering and breeding grounds (Watts 2010). As discussed in BOEM (2012), 55 bird species could encounter operating WTGs on the Atlantic OCS. However, the abundance of birds that overlap with the anticipated development of wind energy facilities on the Atlantic OCS is relatively small (Curtice et al. 2019; Winship et al. 2018). Of 55 bird species, 47 have sufficient survey data to calculate the modeled percentage of a species population that would overlap with the anticipated offshore wind development on the Atlantic OCS (Winship et al. 2018); the relative seasonal exposure is generally very low, ranging from 0.0% to 5.2% (Table 3.7-2). BOEM assumes that the 47 species (85%) with sufficient data to model the relative distribution and abundance are representative of the 55 species that may overlap offshore wind development on the Atlantic OCS.

**Table 3.7-2. Percentage of Atlantic Seabird Populations that Overlap with Anticipated Offshore Wind Energy Development on the Outer Continental Shelf by Season**

| Species | Spring | Summer | Fall | Winter |
|---|---|---|---|---|
| Artic tern (*Sterna paradisaea*) | N/A | 0.2% | N/A | N/A |
| Atlantic puffin (*Fratercula arctica*) | 0.2% | 0.1% | 0.1% | 0.2% |
| Audubon shearwater (*Puffinus lherminieri*) | 0.0% | 0.0% | 0.0% | 0.0% |
| Black-capped petrel (*Pterodroma hasitata*) | 0.0% | 0.0% | 0.0% | 0.0% |
| Black guillemot (*Cepphus grille*) | N/A | 0.3% | N/A | N/A |
| Black-legged kittiwake (*Rissa tridactyla*) | 0.7% | N/A | 0.7% | 0.5% |
| Black scoter (*Melanitta americana*) | 0.2% | N/A | 0.4% | 0.5% |
| Bonaparte’s gull (*Chroicocephalus philadelphia*) | 0.5% | N/A | 0.4% | 0.3% |
| Brown pelican (*Pelecanus occidentalis*) | 0.1% | 0.0% | 0.0% | 0.0% |
| Band-rumped storm-petrel (*Oceanodroma castro*) | N/A | 0.0% | N/A | N/A |
| Bridled tern (*Onychoprion anaethetus*) | N/A | 0.1% | 0.1% | N/A |
| Common eider (*Somateria mollissima*) | 0.3% | 0.1% | 0.5% | 0.6% |
| Common loon (*Gavia immer*) | 3.9% | 1.0% | 1.3% | 2.1% |
| Common murre (*Uria aalge*) | 0.4% | N/A | N/A | 1.9% |
| Common tern (*Sterna hirundo*) | 2.1% | 3.0% | 0.5% | N/A |
| Cory’s shearwater (*Calonectris borealis*) | 0.1% | 0.9% | 0.3% | N/A |
| Double-crested cormorant (*Phalacrocorax auritus*) | 0.7% | 0.6% | 0.5% | 0.4% |
| Dovekie (*Alle alle*) | 0.1% | 0.1% | 0.3% | 0.2% |
| Great black-backed gull (*Larus marinus*) | 1.3% | 0.5% | 0.7% | 0.6% |

| Species | Spring | Summer | Fall | Winter |
|---|---|---|---|---|
| Great shearwater (*Puffinus gravis*) | 0.1% | 0.3% | 0.3% | 0.1% |
| Great skua (*Stercorarius skua*) | N/A | N/A | 0.1% | N/A |
| Herring gull (*Larus argentatus*) | 1.0% | 1.3% | 0.9% | 0.5% |
| Horned grebe (*Podiceps auritus*) | N/A | N/A | N/A | 0.3% |
| Laughing gull (*Leucophaeus atricilla*) | 1.0% | 3.6% | 0.9% | 0.1% |
| Leach's storm-petrel (*Oceanodroma leucorhoa*) | 0.1% | 0.0% | 0.0% | N/A |
| Least tern (*Sternula antillarum*) | N/A | 0.3% | 0.0% | N/A |
| Long-tailed duck (*Clangula hyemalis*) | 0.6% | 0.0% | 0.4% | 0.5% |
| Manx shearwater (*Puffinus puffinus*) | 0.0% | 0.5% | 0.1% | N/A |
| Northern fulmar (*Fulmarus glacialis*) | 0.1% | 0.2% | 0.1% | 0.2% |
| Northern gannet (*Morus bassanus*) | 1.5% | 0.4% | 1.4% | 1.4% |
| Parasitic jaeger (*Stercorarius parasiticus*) | 0.4% | 0.5% | 0.4% | N/A |
| Pomarine jaeger (*Stercorarius pomarinus*) | 0.1% | 0.3% | 0.2% | N/A |
| Razorbill (*Alca torda*) | 5.2% | 0.2% | 0.4% | 2.1% |
| Ring-billed gull (*Larus delawarensis*) | 0.5% | 0.5% | 0.9% | 0.5% |
| Red-breasted merganser (*Mergus serrator*) | 0.5% | N/A | N/A | 0.7% |
| Red phalarope (*Phalaropus fulicarius*) | 0.4% | 0.4% | 0.2% | N/A |
| Red-necked phalarope (*Phalaropus lobatus*) | 0.3% | 0.3% | 0.2% | N/A |
| Roseate tern (*Sterna* dougallii) | 0.6% | 0.0% | 0.5% | N/A |
| Royal tern (*Thalasseus maximus*) | 0.0% | 0.2% | 0.1% | N/A |
| Red-throated loon (*Gavia stellate*) | 1.6% | N/A | 0.5% | 1.0% |
| Sooty shearwater (*Ardenna grisea*) | 0.3% | 0.4% | 0.2% | N/A |
| Sooty tern (*Onychoprion fuscatus*) | 0.0% | 0.0% | N/A | N/A |
| South polar skua (*Stercorarius maccormicki*) | N/A | 0.2% | 0.1% | N/A |
| Surf scoter (*Melanitta perspicillata*) | 1.2% | N/A | 0.4% | 0.5% |
| Thick-billed murre (*Uria lomvia*) | 0.1% | N/A | N/A | 0.1% |
| Wilson's storm-petrel (*Oceanites oceanicus*) | 0.2% | 0.9% | 0.2% | N/A |
| White-winged scoter (*Melanitta deglandi*) | 0.7% | N/A | 0.2% | 1.3% |

Source: Calculated from Winship et al. (2018).

Notes: N/A = not applicable.

The primary operational impact to bird resources would be collision with WTGs. In the contiguous United States, bird collisions with operating WTGs are believed to be a relatively rare event, with an estimated 140,000 to 328,000 (mean = 234,000) birds killed annually by 44,577 onshore turbines (Loss et al. 2013). Robinson Willmott et al. (2013) evaluated the sensitivity of bird resources to collision and/or displacement due to future wind development on the Atlantic OCS and included the 164 species selected by Watts (2010) plus an additional 13 species, for a total of 177 species that may occur on the Atlantic OCS from Maine to Florida during all or some portion of the year. As discussed in Robinson Willmott et al. (2013), species populations with high scores for sensitivity for collision include gulls, jaegers, and the northern gannet (*Morus bassanus*). In many cases, high collision sensitivity was driven by high occurrence on the Atlantic OCS, low avoidance rates with high uncertainty, and time spent in the RSZ. Many of the species addressed in Robinson Willmott et al. (2013) that had low collision sensitivity include migrating passerines that typically fly above the RSZ. As discussed in BOEM (2012), 55 species may be expected to have some level of potential overlap with the WEA and could encounter operating WTGs on the Atlantic OCS. However, generally the abundance of bird species that overlap with the anticipated development of wind energy facilities on the Atlantic OCS is relatively small. As described above, of the 177 species that may occur along the Atlantic coast, 55 are likely to encounter WTGs associated with offshore wind development. Of these, there are a total of 47 marine bird species with sufficient survey data to calculate the modeled percentage of a species population that would overlap with the anticipated offshore wind development on the Atlantic OCS (Winship et al. 2018); the relative seasonal exposure is generally very low, ranging from 0.0% to 5.2% (see Table 3.7-2). BOEM assumes that the 47 species (85%) with sufficient data to model the relative distribution and abundance on the Atlantic OCS are representative of the 55 species that may overlap with offshore wind development on the Atlantic OCS.

It is generally assumed that inclement weather and reduced visibility causes changes to migration altitudes and could potentially lead to large-scale mortality events (BOEM 2021a). However, this has not been shown to be the case in studies of offshore wind facilities in Europe, with oversea migration completely, or nearly so, ceasing during inclement weather (Fox et al. 2006; Hüppop et al. 2006) and with migrating birds avoiding flying through fog and low clouds (Panuccio et al. 2019). Further, many of these passerine species, while detected on the OCS during migration as part of BOEM's Acoustic/Thermographic Offshore Monitoring project (Robinson Willmott and Forcey 2014), were documented in relatively low numbers. In addition, most of the activity (including blackpoll warblers) was during windspeeds less than 10 kilometers per hour—below the turbine cut-in speed (see Figure 109 in Robinson Willmott and Forcey 2014) and therefore pose little risk to migrating passerines.

During migration, many bird species, including songbirds, are likely to fly at heights well above the RSZ (89 to 696 feet [27 to 212 m] above sea level) (BOEM 2021a). As shown in Robinson Willmott et al. (2013), species with low sensitivity scores include many passerines that only cross the Atlantic OCS briefly during migration and typically fly well above the RSZ. Additionally, with the proposed 1-nm (1.9-km) spacing between structures associated with future offshore wind development and the distribution of anticipated projects, only a small percentage of bird species migrating over the Atlantic OCS would encounter WTGs, with most flying above or below spinning turbines. Further, the spacing between turbines would likely permit birds to fly through individual lease areas without changing course or only making minor course corrections to avoid operating WTGs. Course corrections made to avoid a wind energy facility could result in exposure to one or more additional wind energy facilities within the GAA, but again, the 1-nm spacing would allow for migrating individuals to make only small course correction, if any, to avoid operating WTGs. Course corrections made by migratory birds to avoid a project or individual WTG would be relatively minor when compared to the distances traveled during seasonal long-distance migrations. Adverse impacts of additional energy expenditure due to minor course corrections or complete avoidance of lease areas would not be expected to be biologically significant, and no population-level effects would be expected. Therefore, these adverse impacts would be **minor**.

The addition of WTGs to the offshore environment could result in increased functional loss of habitat for those bird species with higher displacement sensitivity. However, substantial foraging habitat for resident birds would remain available. Further, a recent study of long-term data collected in the North Sea found that despite the extensive observed displacement of loons in response to the development of 20 wind farms, there was no decline in the region's loon population (Vilela et al. 2021).

The presence of new structures could result in increased prey items for some marine bird species. WTG foundations could increase the mixing of surface waters and deepen the thermocline, possibly increasing pelagic productivity in local areas (English et al. 2017). The new structures may also create habitat for structure-oriented and/or hard-bottom species. This reef effect has been observed around WTGs, leading to local increases in biomass and diversity (Causon and Gill 2018). Invertebrate and fish assemblages may develop around these reef-like elements within the first year or two after construction (English et al. 2017). Although some studies have noted increased biomass and increased production of particulate organic matter by epifauna growing on submerged foundations, it is not clear to what extent the reef effect results in increased productivity versus simply attracting and aggregating fish from the surrounding areas (Causon and Gill 2018). Recent studies have found increased biomass for benthic fish and invertebrates, and possibly for pelagic fish, marine mammals, and birds as well (Pezy et al. 2018; Raoux et al. 2017; Wang et al. 2019), indicating that offshore wind energy facilities can generate beneficial permanent impacts on local ecosystems, translating to increased foraging opportunities for individuals of some marine bird species. BOEM anticipates that the presence of structures may result in permanent beneficial impacts. Conversely, increased foraging opportunities could attract marine birds, potentially exposing those individuals to increased collision risk associated with operating WTGs. Therefore, these impacts would be **minor** adverse.

#### 3.7.2.2.3 Conclusions

Under the No Action Alternative, birds would continue to follow the current general trends and respond to current and future environmental and societal activities. Although the Project would not be built as proposed under the No Action Alternative, ongoing activities (e.g., commercial fisheries) and future offshore wind development would continue to have temporary to permanent adverse impacts (e.g., disturbance, displacement, injury, mortality, habitat degradation, habitat conversion) on birds primarily through accidental releases, anthropogenic noise, traffic, presence of structures, and climate change. In addition to ongoing activities, the impacts of planned actions other than offshore wind development, including new submarine cables and pipelines, increasing onshore construction, marine minerals extraction, port expansions, and the installation of new structures on the Atlantic OCS, would be **minor** adverse. The combination of ongoing activities and reasonably foreseeable activities other than offshore wind would result in **minor** adverse impacts on birds in the GAA.

Considering all the IPFs together, the overall impacts associated with offshore wind activities in the GAA would result in **minor** adverse impacts to birds. Most of the offshore structures in the GAA would be attributable to offshore wind development. Migratory birds that use the offshore WEAs during all or parts of the year would either be exposed to new collision risk or would have long-term functional habitat loss due to behavioral avoidance and displacement from WEAs on the Atlantic OCS. The offshore wind development would also be responsible for most of the impacts related to new cable emplacement and pile-driving noise, but impacts on birds resulting from these IPFs would be localized and temporary and would not be biologically significant.

The No Action Alternative would forgo postconstruction avian monitoring for migratory birds and ESA-listed species and annual mortality reporting, the results of which could contribute to an improved understanding of the effects of offshore wind development, benefit the future management of these species, and inform planning of other offshore development. However, ongoing and future surveys and monitoring could still supply similar data.

### 3.7.2.3 Alternative B: Impacts of the Proposed Action on Birds

#### 3.7.2.3.1 Construction and Installation

#### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> Some potential for mortality, decreased fitness, and health effects exists due to the accidental release of fuel, hazmat, and trash and debris from vessels associated with construction and installation of the Proposed Action. Vessels associated with the Proposed Action may generate operational waste, including bilge and ballast water, sanitary and domestic wastes, and trash and debris. All vessels associated with the Proposed Action would comply with USCG requirements and BSEE regulations for the prevention and control of oil and fuel spills. Potential adverse impacts to birds from contaminant discharges or releases or from improper disposal of trash or debris during construction would be avoided or minimized with adherence to federal, state, and local regulations regarding disposal of solid and liquid wastes, resulting in short-term **negligible** to **minor** adverse impacts. Accidental spills or releases of oils or other hazardous materials offshore would be managed through the OSRP (see COP Appendix D [Orsted 2023]). Additionally, training and awareness of BMPs proposed for waste management and mitigation of marine debris would be required of Project personnel, reducing the likelihood of occurrence to a very low risk. These accidental releases, if any, would occur infrequently at discrete locations and vary widely in space and time; for this reason, BOEM expects localized and temporary **negligible** adverse impacts on birds.

<u>Anchoring and new cable emplacement/maintenance:</u> Construction of the WTG foundations and the installation of the submarine cables could result in short-term habitat disturbance for foraging birds. Seafloor disturbed by cable installation and dredging prior to cable installation would result in turbidity effects that could reduce marine bird foraging success or have temporary and localized impacts on marine bird prey species. These impacts would be temporary, lasting up to 12 hours, and localized to the emplacement corridor. Vessel anchoring during construction would also result in increased turbidity. Individual birds would successfully forage in nearby areas not affected by increased turbidity/sedimentation during anchoring and cable emplacement, and only nonmeasurable **negligible** adverse impacts, if any, on individuals or populations would be expected given the localized and temporary nature of construction activities.

<u>Climate change:</u> Construction of the offshore facilities would result in a small temporary increase in GHG emissions within the GAA during the construction phase. However, these emissions could be reduced by staggering construction time frames and implementing applicant-proposed EPMs (see Table G-1 in

Appendix G). As a result, adverse impacts to birds from construction of the Proposed Action associated with climate change would be short term **negligible** adverse.

Light: Lighting used during construction would be limited to the minimum required for safety during construction activities to minimize potential impacts. Therefore, adverse impacts to birds from lighting during construction would be localized and temporary **negligible** to **minor** adverse.

Noise: **Negligible** to **minor** adverse impacts to birds would occur from construction noise related to pile driving as well as geological and geophysical surveys and aircraft and vessel traffic. These activities could flush birds in the path of vessels, causing temporary displacement from the area. However, these impacts would be temporary and similar to baseline conditions as vessel traffic already occurs, resulting in similar temporary displacement of birds in the GAA (Stantec 2018). These impacts could be greater if avoidance and displacement of birds occur during seasonal migration periods. As described in Section 4.1.2.2 of the BA (BOEM 2022), underwater noise from monopile installation would be unlikely to measurably affect prey availability for birds.

Presence of structures: The various types of impacts on birds that could result from the presence of structures during construction include fish aggregation and an associated increase in foraging opportunities as well as entanglement and fishing gear loss/damage, migration disturbances, and displacement. These impacts would be temporary, and BOEM expects them to be **negligible** adverse. **Negligible** to **minor** temporary adverse impacts from bird collisions with visible structures could occur during construction, depending on the species and number of individuals involved.

### Onshore Activities and Facilities

Accidental releases and discharges: Onshore, construction and HDD activities could result in the accidental releases of fuel, fluids, or hazmat; sediment; and/or trash and debris. These releases, if any, would occur infrequently at discrete locations and vary widely in space and time. Revolution Wind would prepare a construction SPCC plan in accordance with applicable requirements and would outline spill prevention training, plans, and steps to take to contain and clean up spills that could occur. Based on the low risk of spills due to implementation of safe handling, storage, and cleanup procedures, impacts from accidental spills and trash would represent a localized and temporary **negligible** adverse impact to birds.

Climate change: Onshore impacts to birds associated with climate change from construction of the Proposed Action would be similar to those discussed above for offshore facilities and activities: short term **negligible** adverse.

Light: Most of the onshore construction would occur during the daylight hours, although some overnight lighting may occasionally be necessary during construction of the onshore facilities. However, this is not expected to have a measurable effect on bird behavior, therefore BOEM anticipates temporary **negligible** adverse impacts to birds.

New cable emplacement/maintenance: Land disturbance and habitat alteration resulting from construction within the landfall work area may result in the direct injury or mortality of bird species. Mobile individuals would be able to temporarily vacate an area of disturbance and therefore would be less susceptible to mortality or injury compared to less mobile (pre-volant) individuals. Mitigations like observing time-of-year restrictions on vegetation removal would avoid the breeding season of birds, thus reducing the likelihood of injury and/or mortality from construction activities. Therefore, the impacts (e.g., injury and/or mortality) resulting from land disturbance and habitat alteration would be temporary **negligible** adverse. Further, HDD would be employed to make the connection between the onshore transmission cable and the landfall work area, which would limit or completely avoid impacts to the human-made shoreline and the ruderal grassland/shrubland because the onshore transmission cable would be installed under these resources. Because construction work within the landfall work area would occur largely outside of the breeding period of listed species that might nest in the area, and because use of the shoreline by shorebirds within the landfall work area has not been documented (VHB 2023), onshore impacts for listed species from land disturbance would be **negligible** adverse. A detailed impacts analysis to federally listed birds from construction activities is in the USFWS BA (BOEM 2022, 2023a).

The temporary onshore construction work area for HDD operations would likely be situated within a previously developed area (e.g., an existing parking lot) and would not impact the human-made shoreline and/or the ruderal grassland/shrubland. Because the landfall work area is limited to anthropogenically made or disturbed features of the human-made shoreline and the ruderal grassland/shrubland, the potential for land disturbance and habitat alteration to significantly affect birds is **negligible** adverse. Additional land disturbance and habitat alteration would result from the installation of the onshore transmission cable from the transition joint bays to the OnSS. The onshore transmission cable installation would result in temporary ground disturbance. Most of the temporary ground disturbance would occur in previously disturbed areas along paved roads or parking lots and would not result in impacts to bird habitat.

Onshore transmission cable installation would also result in temporary ground disturbance. Most of the temporary ground disturbance would occur in previously disturbed areas along paved roads or parking lots and would not result in impacts to bird habitat.

<u>Noise:</u> Noise from traffic associated with construction and vegetation removal within the landfall work area and other onshore facilities could affect shorebirds, some seabirds, and land birds that use the terrestrial habitats in the immediate vicinity of construction activities through displacement or avoidance behavior of individuals and/or disruptions in communication, mating, and hunting. Displacement and avoidance behavior are expected to only occur during construction, which would occur primarily in already developed areas where birds are habituated to these types of activities. The impacts associated with construction would be similar to existing sources of noise and traffic in the local area and therefore are considered a temporary **negligible** adverse impact.

<u>Presence of structures:</u> Impacts from habitat alteration and land disturbance on coastal and terrestrial bird habitats generated from the construction of the onshore facilities would create habitat loss and conversion, affect bird habitat use, and possibly create habitat degradation. The OnSS and ICF parcels include ruderal forested swamp, shrub marsh, ruderal mixed oak/white pine forest, ruderal pitch pine barren, and a landfill. Vegetation clearing and ongoing vegetation management would convert some of these cover types to permanently developed land or shrubland within the areas that would undergo vegetation maintenance. This habitat conversion may be detrimental to species reliant on forest habitat but beneficial to other species that are more suited to the newly converted habitat (e.g., passerines adapted to grassland and shrubland). The OnSS would result in a permanent loss of 3.8 acres of mixed oak/white pine forest and 0.6 acre of ruderal pitch pine barren. However, the portion of forested habitat removal would be small relative to the available forested habitat in the surrounding area. During the breeding season, clearing of trees or vegetation could result in destruction of nests, adversely impacting some individuals. However, lasting impacts to local breeding populations are not anticipated. Tree and shrub removal work would

occur before May 1 and after August 15, as feasible (see COP Table ES-1), to avoid the potential disturbance of birds during the breeding season. If tree and shrub removal cannot be avoided during this season, Revolution Wind would coordinate with the appropriate agencies to determine the appropriate course of action. Visible structures (i.e., construction equipment) would be present during construction of the onshore facilities. Collisions between birds and vehicles or construction equipment have some limited potential to cause injury and mortality. However, these impacts, if any, would be temporary **negligible** adverse, as most individuals would avoid noisy construction areas (Bayne et al. 2008; Goodwin and Shriver 2010; McLaughlin and Kunc 2013). Therefore, impacts to birds from construction of onshore facilities would be short term **negligible** to **minor** adverse.

#### 3.7.2.3.2 Operations and Maintenance and Decommissioning

#### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> Impacts to birds from this IPF during operation and decommissioning of the offshore facilities are expected would be similar to offshore construction impacts and result in short-term **negligible** to **minor** adverse impacts with compliance with the USCG requirements and BSEE regulations for the prevention and control of oil and fuel spills and adherence to federal, state, and local regulations regarding disposal of solid and liquid wastes.

<u>Anchoring and new cable emplacement/maintenance:</u> Other than temporary increases in turbidity from seafloor disturbance due to occasional vessel anchoring, no impacts to bird species are anticipated during the O&M phase for the offshore RWF or RWEC. Impacts from decommissioning would be similar to construction impacts unless the RWEC is abandoned in place: **negligible** adverse.

<u>Climate change:</u> The expected impacts on climate change from operation of the offshore facilities alone would not result in a measurable increase in the adverse impacts to birds beyond those described under the No Action Alternative. In addition, operation of the Proposed Action could also contribute to a long-term net decrease in GHG emissions and may beneficially contribute to a broader combination of actions to reduce future impacts to birds from climate change over the long term due to reduced reliance on fossil fuel–generated energy sources, but this change would likely not be measurable. Therefore, BOEM expects the impacts from the Proposed Action on climate change would be long term **negligible**.

<u>Light:</u> Under the Proposed Action, up to 100 WTGs and up to two OSSs would be lit with USCG navigational and FAA hazard lighting. These lights have some potential to attract birds and result in increased collision risk (Hüppop et al. 2006). However, the mandatory use of red flashing aviation obstruction lights, the avoidance of any steady-burning aviation obstruction lights, and the use of ADLS (see Table F-2 in Appendix F for details) are expected to minimize bird attraction and therefore collision risk (Kerlinger et al. 2010; Orr et al. 2016). For this reason, BOEM expects adverse impacts, if any, to be long term **negligible** adverse from offshore lighting.

<u>Noise:</u> Impacts to birds from operational noise and decommissioning of the offshore facilities would be similar to offshore construction impacts and result in **negligible** adverse impacts.

<u>Presence of structures:</u> Within the Atlantic Flyway along the North American Atlantic coast, much of the bird activity is concentrated along the coastline (Watts 2010). Waterbirds use a corridor between the coast and several kilometers out onto the Atlantic OCS, whereas land birds tend to use a wider corridor extending from the coastline to tens of kilometers inland (Watts 2010). However, operation of the

Proposed Action would result in impacts on some individuals of offshore bird species and possibly some individuals of coastal and inland bird species during spring and fall migration. These impacts could arise through direct mortality from collisions with WTGs and/or through behavioral avoidance and habitat loss (Drewitt and Langston 2006; Fox et al. 2006; Goodale and Millman 2016). To reduce the collision risk with WTGs, Revolution Wind is committed to an indicative layout scenario with WTGs sited in a grid with a spacing of approximately 1.15 miles (1 nm) × 1.15 miles (1 nm) that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This wide spacing of WTGs is expected to allow birds to avoid individual WTGs and minimize risk of potential collision (see COP Table ES-1).

In COP Appendix AA (BRI 2023), vulnerability was assessed to determine how sensitive a bird population is to mortality or habitat loss related to the presence of a wind farm and in terms of collision vulnerability and displacement vulnerability. Factors considered in vulnerability assessments include vital rates, existing population trends, relative abundance, nocturnal flight activity, diurnal flight activity, avoidance, proportion of time within the RSZ, maneuverability in flight, percentage of time flying, and habitat flexibility. Avian flight heights were important in the assessment of behavioral vulnerability. Flight heights used in the assessment were gathered from OSAMP boat-based surveys (local) and datasets in the Northwest Atlantic Seabird Catalog (regional). Final exposure and vulnerability assessments for each taxonomic group and species are provided in Sections 3.4 through 3.10 of COP Appendix AA (BRI 2023) and in Table 3-38 of COP Appendix AA (BRI 2023).

The presence and operation of the offshore facilities may result in displacement of waterbirds, waterfowl, seabirds, and phalaropes that use the area for foraging, resting, or nighttime roosting. Some species can be displaced several kilometers outside the Lease Area (Welcker and Nehls 2016). Generally, the relative abundance of bird species that are most sensitive to displacement is low within the offshore portion of the Project during all seasons (BRI 2023). These long-term adverse impacts would be **negligible** to **minor**, depending on whether birds are at high risk for displacement or are able to access preferred habitat, and these impacts may change over time if birds become habituated to the presence of the WTGs and OSSs. Impacts to birds from decommissioning of the RWF and offshore RWEC would be similar to those described for the construction phase.

The Lease Area is generally beyond the range of most breeding terrestrial or coastal bird species. Coastal birds that may forage in the Lease Area occasionally, visit the area sporadically, or pass through on their spring and/or fall migrations include shorebirds (e.g., sandpipers, plovers), waterbirds (e.g., cormorants, grebes), waterfowl (e.g., scoters, mergansers), wading birds (e.g., herons, egrets), raptors (e.g., falcons, eagles), and songbirds (e.g., warblers, sparrows). Overall, with the exception of migratory falcons and songbirds, coastal birds are considered to have minimal exposure to the Lease Area. Falcons, primarily peregrine falcons, may be exposed to the Lease Area. Some migratory songbirds, particularly the blackpoll warbler, may also be exposed to the Lease Area during fall migration, but population-level impacts are unlikely because exposure of the population to the Lease Area is expected to be minimal to low and limited to migration. Of the marine birds, loons, sea ducks, gulls, terns, and auks received up to a medium overall exposure assessment. Loons, sea ducks, gannets, and auks are documented to avoid wind farms, but displacement from the Lease Area is unlikely to affect populations because there is likely available foraging habitat outside the Lease Area (BRI 2023).

Special-status bird species were also assessed, including golden eagle, bald eagle, red knot, piping plover, and roseate tern. The Project is not expected to affect special-status species populations. Golden and bald eagle exposure to the Lease Area is considered minimal because these species are rarely detected in the offshore environment. Red knots and piping plovers have the potential to be exposed only during migration, and vulnerability to collision is considered low because shorebirds fly substantially above the RSZ during migrations. Although tracked roseate terns were estimated to have passed through the northern portion of the Lease Area (BRI 2023), individual impacts are unlikely because the birds were not detected in the Lease Area during surveys, and they would be primarily flying below the RSZ. A detailed analysis of the impacts from O&M and decommissioning of the offshore facilities on federally listed birds can be found in the BA (BOEM 2022, 2023a).

### Onshore Activities and Facilities

Accidental releases and discharges: The OnSS would require various oils, fuels, and lubricants to support its operation. As described above in Section 3.7.2.2.1, accidental discharges, releases, and disposal could indirectly cause bird habitat degradation; however, risks would be avoided through spill prevention and control measures and associated BMPs. Therefore, potential adverse impacts associated with discharges and releases are considered short term and localized **negligible** adverse.

Climate change: No measurable climate change impacts to birds from O&M of the onshore facilities are expected. Climate change impacts from decommissioning would be similar to those described for construction. Therefore, the adverse impacts from this IPF are expected to be long term **negligible** adverse.

Light: During the O&M of the OnSS and ICF, yard lighting would be used for assessment of equipment. In general, operational lighting would be limited to the minimum necessary to ensure safety and compliance with applicable regulations (see COP Table ES-1). Most decommissioning activities would occur during the day, and overnight lighting would only be necessary if there is work in progress on-site or lights are left on for safety and security purposes. Therefore, the adverse impacts resulting from this IPF would be long term **negligible**.

New cable emplacement/maintenance: Operation of the onshore transmission cable would pose no risk to birds because it would be buried. Land disturbance in the form of vegetation management would occur on a periodic basis to maintain vegetation at shrub height within the perimeters of the onshore facilities. Hazard tree removal would be performed on a cyclical basis to inspect and remove trees that may fail that are outside the edge of the maintained ROW. Land disturbance as it relates to vegetation clearing may result in the direct injury or mortality of birds. However, mortality and injury impacts would be mitigated by observing time-of-year restrictions on vegetation removal that would avoid the breeding season of bird species. Therefore, the adverse impacts resulting from this IPF would be **negligible**. Impacts from land disturbance during decommissioning would be similar to those described in Section 3.7.2.2.1, though the impacts would likely be less because new vegetation clearing, and grading would not be necessary.

Noise: According to the VHB (2023) onshore acoustic assessment, during O&M, the proposed OnSS and ICF would introduce new sources of sound, which is modeled to be 45.5 dBA (Leq) or less when measured at the nearest anthropogenic sensitive receptors and falls within the ambient sound range measured at baseline conditions. Temporary noise and construction-related traffic may occasionally be generated due to nonroutine maintenance. Pickup trucks or other automobiles would be used to make routine visits to the OnSS and ICF during O&M. Occasional maintenance and operational emergency visits may necessitate bucket trucks, cranes, and similar vehicles to facilitate these activities. Infrequent vehicle usage within the OnSS and ICF may create temporary noise-related disturbance to birds adjacent to the OnSS. However, such disturbance would be short term, and normal avian activity would likely resume after the traffic ceases. BOEM expects these adverse impacts to be **negligible**.

Presence of structures: The OnSS and ICF would be visible structures that would result in permanent bird habitat conversion and loss. The OnSS access road and fenced-in property would become nonhabitat and result in habitat fragmentation. The conversion of forested cover type outside the OnSS and ICF fences would alter the structural diversity within a forested area by adding more edge habitat. Considering the adjacent landscape consists primarily of residential and commercial developments with some undisturbed areas of ruderal forested swamp, the adverse impacts to birds from the OnSS and the ICF on forested habitat fragmentation would be long term **negligible** to **minor**.

This change in the visible landscape would present a very minor risk of mortality or injury to birds due to collision with the OnSS or ICF, and, generally, the changes to the habitat conditions would result in avoidance behavior and may influence bird habitat selection near these structures (e.g., breeding habitat for some forest-dependent species may be less suitable). These impact risks would exist throughout the O&M phase of the Project. The potential for avian mortality or injury due to the low risk of collision with the OnSS and related structures would be a long-term **minor** adverse impact. The potential for avian avoidance behavior related to habitat conversion and loss from the OnSS would also be a long-term **minor** adverse impact. If the footprint of the OnSS and ICF yards are left in place after they have been decommissioned and equipment has been removed, the remaining development would still be considered a visible structure because it would remain a hard structure within a forested area. Adverse impacts to birds from habitat fragmentation related to a visible change in the landscape during decommissioning would be **negligible** because local populations would have adapted to the landscape changes.

#### 3.7.2.3.3 Cumulative Impacts

### Offshore Activities and Facilities

Accidental releases and discharges: Future offshore wind activities would contribute to an increased risk of spills and associated impacts due to fuel, fluid, or hazmat exposure. The contribution from future offshore wind and the Proposed Action would be a low and non-measurable percentage of the overall spill risk from all ongoing offshore activities. In the context of reasonably foreseeable environmental trends, the combined impacts from this IPF from ongoing and planned actions, including the Proposed Action, would be likely limited in extent and duration and would result in localized and temporary **negligible** adverse cumulative impacts on birds.

Anchoring and new cable emplacement/maintenance: The Proposed Action would add 7,213 acres of seafloor disturbance from RWEC and IAC installation and anchoring to the No Action Alternative, which equates to 7% of the total seafloor disturbance estimated under the No Action Alternative. This would result in localized turbidity effects that could reduce marine bird foraging success or impact marine bird prey species. However, individual birds would be expected to successfully forage in nearby areas not affected by increased turbidity, and only non-measurable **negligible** adverse impacts, if any, on individuals or populations would be expected given the localized and temporary nature of the potential impacts. In the context of reasonably foreseeable environmental trends, the combined cable emplacement impacts from ongoing and planned actions, including the Proposed Action, could occur if impacts are in close temporal and spatial proximity. However, these adverse impacts from anchoring and cable emplacement would be **negligible** and would not be biologically significant. For these reasons, the Proposed Action when combined with other past, present, and reasonably foreseeable projects would result in short-term **negligible** to **minor** cumulative adverse impacts to birds.

<u>Climate change:</u> The types of impacts from global climate change described for the No Action Alternative would occur under the Proposed Action. However, the Proposed Action could also contribute to a long-term net decrease in GHG emissions. This difference may not be measurable but would help reduce climate change impacts. Therefore, long-term **minor** adverse and long-term **negligible** beneficial cumulative impacts to birds are expected.

<u>Light:</u> The Proposed Action would add up to 100 new WTGs with red flashing aviation hazard lighting to the No Action Alternative; these lights could attract birds and result in increased collision risk (Hüppop et al. 2006). Additionally, marine navigation lighting would include one or more flashing white lights on each WTG and the OSSs and would be directed out and down to the water surface. Vessel lights during construction and installation, O&M, and decommissioning would be minimal and limited to vessels transiting to and from wind farm areas. Ongoing and future non–offshore wind activities are expected to cause short-term impacts, primarily from vessel lights. For these reasons, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in long-term **negligible** to **minor** adverse cumulative impacts to birds, and no individual or population-level impacts would be expected.

<u>Noise:</u> Pile-driving and other construction noise and activity associated with the Proposed Action could add to baseline noise and activity associated with other offshore wind projects with overlapping construction periods. Potential impacts could be greater if avoidance and displacement of birds occur during seasonal migration periods. However, the Proposed Action’s contribution to adverse noise impacts would be limited in duration, negligible, and cease when construction ends. No individual fitness (i.e., a bird’s ability to survive and reproduce) or population-level effects would be expected. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in **negligible** to **minor** adverse cumulative impacts to birds.

<u>Presence of structures:</u> The Proposed Action would add up to 100 additional WTGs and up to two OSSs compared to the No Action Alternative. The total cumulative foundations on the Atlantic OCS would be 3,190, and the Project would account for less than 4% of that total number. Adverse impacts to migration patterns or collision risk from these additional turbines would be negligible and would persist until decommissioning is complete. Additionally, beneficial impacts to foraging near offshore structures would similarly be negligible and persist for the life of the Project. Therefore, cumulative impacts on birds from the presence of structures associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be long term **minor** adverse and long term **minor** beneficial.

### Onshore Activities and Facilities

<u>Accidental releases and discharges:</u> Onshore construction activities and operation of the OnSS under the Proposed Action could result in the accidental releases of fuel, fluids, or hazmat; sediment; and/or trash and debris. These releases, if any, would occur infrequently at discrete locations and vary widely in space and time. Ongoing and future onshore activities could contribute to impacts to birds from accidental releases if they occur at the same time within the GAA. However, incidences such as these would be mitigated by implementation of project-specific SPCC plans. In the context of reasonably foreseeable

environmental trends, the combined impacts from this IPF from ongoing and planned actions, including the Proposed Action, would be localized and temporary due to the likely limited extent and duration of a release and result in **negligible** adverse cumulative impacts to birds.

Climate change: The types of impacts from global climate change described for the No Action Alternative would occur under the Proposed Action, but no measurable change from the operational impacts of onshore activities and facilities to birds under the No Action Alternative is anticipated. Therefore, the combined impacts from this IPF from ongoing and planned actions, including the Proposed Action and cumulative impacts, are expected to be long term **minor** adverse.

Light: Lighting used during construction of the Proposed Action would be limited to the minimum required for safety. Operational lighting would be limited to the minimum necessary to ensure safety and compliance with applicable regulations (see COP Table ES-1). Decommissioning activities would primarily occur during the day, and overnight lighting is not expected. Therefore, impacts to birds from the Proposed Action would be localized and temporary **negligible** to **minor** adverse. Ongoing and future onshore activities could contribute to impacts to birds from light if they occur at the same time within the GAA. However, these effects are also expected to be localized and temporary and would not contribute to adverse cumulative impacts to birds in the GAA.

New cable emplacement/maintenance: The Proposed Action would result in temporary ground disturbance from installation of the onshore transmission cable and construction at the landfall work area. Most of this temporary ground disturbance would occur in previously disturbed areas along paved roads or parking lots and would not result in impacts to bird habitat. Operation of the onshore transmission cable would pose no risk to birds because it would be buried, and no other impacts to bird species are anticipated during routine onshore operations. Therefore, the contribution of the Proposed Action on adverse cumulative impacts to birds from new cable emplacement or maintenance in the context of reasonably foreseeable onshore environmental trends within the GAA is expected to be **negligible** adverse.

Noise: Onshore construction activities would add to onshore noise, resulting in localized and temporary impacts to birds (i.e., avoidance and displacement), particularly if ongoing and planned onshore activities overlap with the Proposed Action in space and time. Normal operation of the OnSS would generate continuous noise. However, BOEM expects long-term **negligible** adverse impacts when considered in the context of the other commercial and industrial noises nearby. Therefore, in the context of reasonably foreseeable environmental trends, the combined impacts from this IPF from ongoing and planned actions, including the Proposed Action, would be localized and temporary due to the likely limited extent and duration of noise and would result in **negligible** adverse cumulative impacts to birds.

Presence of structures: The Proposed Action would result in the permanent conversion, loss, and fragmentation of onshore bird habitat through the removal of forested cover types for construction of the OnSS and the ICF. These actions could result in localized and temporary impacts to birds, including avoidance and displacement, although no individual fitness or population-level effects would be expected. These changes would have a **negligible** adverse effect on birds because forested habitat is common within the surrounding area. In addition, the permanent onshore facilities (ICF and OnSS) would be located on the edge of previously developed areas. The presence of these structures when considered in the context of ongoing and planned actions within the GAA would be a very minor risk of mortality or injury to birds due to collision, and generally, the changes to the habitat conditions would result in avoidance behavior and may influence bird habitat selection. Therefore, BOEM anticipates long-term **negligible** to **minor** adverse cumulative impacts to birds.

#### 3.7.2.3.4 Conclusions

Project construction and installation and decommissioning would introduce noise, lighting, human activity, debris and contaminants, and new structures and vessels (increasing potential collision risk) to the GAA as well as alter existing bird habitat. Noise, lighting, and human activity impacts from Project O&M would occur, although at lower levels than those produced during construction and decommissioning. Offshore structures would also represent a long-term collision risk. BOEM anticipates the impacts resulting from the Proposed Action alone would range from **negligible** to **minor** adverse for the duration of the Project. Therefore, BOEM expects the overall impact on birds from the Proposed Action alone to be long term **minor** adverse; however, the resource would recover completely after decommissioning without remedial or mitigating action.

In the context with other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from temporary to long term **negligible** to **minor** adverse as well as long term **negligible** beneficial. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in **minor** cumulative adverse impacts to birds. This determination is because the impacts would not be expected to result in noticeable change to the condition of birds in the GAA, and the populations would recover completely without remedial or mitigating action.

### 3.7.2.4 Alternatives C, D, E, and F

Table 3.7-1 provides an analysis of all evaluated IPFs for birds across these alternatives.

#### 3.7.2.4.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and their associated IACs, which would have an associated reduction in potential collision risk, BOEM expects that the impacts to birds resulting from the alternative alone would be similar to the Proposed Action and range from **negligible** to **minor** adverse. Therefore, BOEM expects the overall impact on birds from the Proposed Action alone to be long term **minor** adverse; however, the resource would recover completely after decommissioning without remedial or mitigating action.

In the context of other reasonably foreseeable environmental trends and planned actions, BOEM also expects that Alternatives C through F's impacts would be similar to the Proposed Action (with individual IPFs leading to impacts ranging from **negligible** to **minor** adverse and **minor** beneficial). The overall impacts of Alternatives C through F when combined with past, present, and reasonably foreseeable activities would therefore be the same level as under the Proposed Action: **minor** adverse.

### 3.7.2.5 Alternative G: Impacts of the Preferred Alternative on Birds

Table 3.7-1 provides a summary of IPF findings for this alternative.

#### 3.7.2.5.1 Conclusions

Although Alternative G would reduce the number of WTGs and their associated IACs, which would have an associated reduction in potential collision risk, BOEM expects that the impacts to birds resulting from the alternative alone would be similar to the Proposed Action and range from **negligible** to **minor** adverse. Therefore, BOEM expects the overall impact on birds from the Proposed Action alone to be long term **minor** adverse; however, the resource would recover completely after decommissioning without remedial or mitigating action.

In the context of other reasonably foreseeable environmental trends and planned actions, BOEM also expects that Alternative G's impacts would be similar to the Proposed Action (with individual IPFs leading to impacts ranging from **negligible** to **minor** adverse and **minor** beneficial). The overall impacts of Alternative G when combined with past, present, and reasonably foreseeable activities would therefore be the same level as under the Proposed Action: **minor** adverse.

### 3.7.2.6 Mitigation

Mitigation measures resulting from agency consultations for birds are identified in Appendix F, Table F-2, and addressed in Table 3.7-3. Conservation recommendations proposed to BOEM by the USFWS on May 30, 2023, are identified in Appendix F, Table F-3, and addressed in Table 3.7-4.

**Table 3.7-3. Mitigation and Monitoring Measures Resulting from Consultations for Birds (Appendix F, Table F-2)**

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| Bird-perching deterrent devices | To minimize attracting birds to operating turbines, the Lessee must install anti-perching devices on WTGs and the OSS. The location of anti-perching devices must be proposed by the Lessee based on BMPs applicable to the appropriate operation and safe installation of the devices. The Lessee must confirm the locations of anti-perching devices with a monitoring plan to track the efficacy of the anti-perching devices as part of the as-built documentation it must submit with the facility design report. | Anti-perching devices would discourage birds from perching on WTGs and the OSS, which would reduce the risk of collision with WTGs as well as minimize the perching of avian predators. |
| Annual bird and bat mortality reporting | The Lessee must submit an annual report covering each calendar year, due by January 31 of the following year, documenting any dead (or injured) birds or bats found on vessels and structures during construction, operations, and decommissioning. The report must be submitted to BOEM (at renewable_reporting@boem.gov) and BSEE (at OSWSubmittals@bsee.gov) and the USFWS. The report must contain the following information: species name, date found, location, a picture to confirm species identity (if possible), and any other relevant information. Carcasses with federal or research bands must be reported to the USGS Bird Band Laboratory (https://www.usgs.gov/labs/bird-banding-laboratory). Any occurrence of dead ESA-listed birds or bats must be reported to BOEM, BSEE, and the USFWS as soon as practicable (taking into account crew and vessel safety), but no later than 24 hours after the sighting, and if practicable, the dead specimen must be carefully collected to preserve the material in the best possible state. | This measure would not reduce impacts; however, the data gathered from the mortality reporting would be used to evaluate impacts and potentially lead to additional mitigation measures, if required (30 CFR 585.633(b)). |
| Annual bird and bat mortality reporting | Any occurrence of dead ESA birds or bats must be reported to BOEM, BSEE, and USFWS as soon as practicable (taking into account crew and vessel safety), but no later than 24 hours after the sighting, and if practicable, carefully collect the dead specimen and preserve the material in the best possible state. | This measure would not reduce impacts; however, the data gathered from the mortality reporting would be used to evaluate impacts and potentially lead to additional mitigation measures, if required (30 CFR 585.633(b)). |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| Avian and bat monitoring program | At least 45 calendar days before beginning surveys, the Lessee must complete, obtain concurrence from the DOI, and adopt an avian and bat monitoring plan (ABMP), as described in Revolution Wind's *Avian and Bat Post-Construction Monitoring Framework* (see Appendix G and COP Appendix AA), including coordination with interested stakeholders. The DOI will review the ABMP and provide any comments on the plan within 30 calendar days of its submittal. The Lessee must resolve all comments on the ABMP to the DOI's satisfaction before implementing the plan. The Lessee may conclude that the DOI has concurred in the ABMP if the DOI provides no comments on the plan within 30 calendar days of its submittal date. a. Monitoring. The Lessee must 1) install acoustic monitoring devices for bats for 2 years, 2) install Motus receivers within the wind farm, 3) refurbish up to two onshore Motus receiver stations, 4) provide funding for up to 150 Motus tags per year for up to 3 consecutive years, and 5) conduct a 1- to 2-year cross-Project radar study to measure migrant flux rates and flight heights and marine bird avoidance.<br>b. Annual monitoring reports. The Lessee must submit to BOEM (at renewable_reporting@boem.gov), the USFWS, and BSEE (at OSWSubmittals@bsee.gov) a comprehensive report after each full year of monitoring (preconstruction and postconstruction) within 6 months of completion of the last avian survey. The report must include all data, analyses, and summaries regarding ESA-listed and non-ESA-listed birds and bats. The DOI will use the annual monitoring reports to assess the need for reasonable revisions (based on SME analysis) to the ABMP. The DOI reserves the right to require reasonable revisions to the ABMP and may require new technologies as they become available for use in offshore environments.<br>c. Postconstruction quarterly progress reports. The Lessee must submit quarterly progress reports during the implementation of the ABMP to BOEM (at | This measure would not reduce impacts; however, the data gathered from the monitoring would be used to evaluate impacts and potentially lead to additional mitigation measures, if required (30 CFR 585.633(b)). |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | renewable_reporting@boem.gov) and the USFWS by the fifteenth day of the month following the end of each quarter during the first full year that the Project is operational. The progress reports must include a summary of all work performed, an explanation of overall progress, and any technical problems encountered.<br>d. Monitoring plan revisions. Within 15 calendar days of submitting the annual monitoring report, the Lessee must meet with BOEM and the USFWS to discuss the following: the monitoring results; the potential need for revisions to the ABMP, including technical refinements or additional monitoring; and the potential need for any additional efforts to reduce impacts. If the DOI determines after this discussion that revisions to the ABMP are necessary, the DOI may require the Lessee to modify the ABMP. If the reported monitoring results deviate substantially from the impact analysis included in the Final EIS, the Lessee must transmit to DOI recommendations for new mitigation measures and/or monitoring methods.<br>e. Operational reporting (operations). The Lessee must submit to BOEM (at renewable_reporting@boem.gov) and BSEE (at OSWSubmittals@bsee.gov) an annual report summarizing the following monthly operational data calculated from 10-minute SCADA for all turbines together in tabular format: the proportion of time the turbines were operational (spinning at > x rpm) each month, the average rotor speed (monthly rpms) of spinning turbines plus 1 standard deviation, and the average pitch angle of blades (degrees relative to rotor plane) plus 1 standard deviation. The DOI will use this information as inputs for avian collision risk models to assess whether the results deviate substantially from the impact analysis included in the Final EIS.<br>f. Raw data. The Lessee must store the raw data from all avian and bat surveys and monitoring activities according to | |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | accepted archiving practices. Such data must remain accessible to the DOI and USFWS, upon request for the duration of the lease. The Lessee must work with BOEM to ensure the data are publicly available. The USFWS may specify third-party data repositories that must be used, such as the Motus Wildlife Tracking System or MoveBank, and such parties and associated data standards may change over the duration of the monitoring plan. | |
| Adaptive mitigation for birds and bats | If the reported postconstruction bird and bat monitoring results (generated as part of Revolution Wind's *Avian and Bat Post-Construction Monitoring Framework* [BRI 2023]) indicate bird and bat impacts deviate substantially from the impact analysis included in this EIS, then Revolution Wind must make recommendations for new mitigation measures or monitoring methods. | This mitigation measure, if adopted, ensures that Project activities would not impact birds beyond the negligible to minor range of impacts discussed in this EIS. |
| Marine debris elimination | Materials, equipment, tools, containers, and other items used in Atlantic OCS activities that could be lost or discarded overboard must be marked to clearly identify the owner and must be durable enough to resist the effects of the environmental conditions to which they may be exposed. | This mitigation measure, if adopted, ensures that Project activities would not impact birds beyond the negligible to minor range of impacts discussed in this EIS. |
| USFWS Biological Opinion RPM 1 to minimize take of piping plovers and rufa red knots* | Periodically review current technologies and methods for minimizing collision risk of migratory birds with WTGs, including but not limited to: WTG coloration/marking, lighting, avian deterrents, remote sensing such as radar and thermal cameras, and limited WTG operational changes.*† | This measure would provide incremental reductions in impacts for two listed birds species, would improve accountability, and reduce uncertainty associated with estimated rates of collision mortality, but would not alter the overall impact determination of the Proposed Action. |
| USFWS Biological Opinion RPM 2 to minimize take of piping plovers and rufa red knots* | Implement those technologies and methods deemed reasonable and prudent to minimize collision risk.*‡ | This measure would provide incremental reductions in impacts for two listed birds species, would improve accountability, and reduce uncertainty associated with estimated rates of collision mortality, but would not alter the overall impact determination of the Proposed Action. |
| USFWS Biological Opinion Terms and Conditions 1: Collision | Periodically review current technologies and methods for minimizing collision risk of listed birds. | This measure would provide incremental reductions in impacts for two listed birds species, would improve accountability, and reduce uncertainty associated with estimated rates of collision |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| risk minimization and monitoring* | • Prior to the start of WTG operations at Revolution Wind, BOEM must compile, from existing project documentation (e.g., the BA, other consultation documents, the final EIS, the COP), a stand-alone summary of technologies and methods that BOEM evaluated to reduce or minimize bird collisions at the Revolution Wind WTGs.<br>• Within 5 years of the start of WTG operation, and then every 5 years for the life of the project, BOEM must prepare a Collision Minimization Report (CMR), reviewing best available scientific and commercial data on technologies and methods that have been implemented, or are being studied, to reduce or minimize bird collisions at offshore and onshore WTGs. The review must be global in scope.<br>• BOEM must distribute a draft CMR to the USFWS, Revolution Wind, and appropriate state agencies for a 60-day review period. BOEM must address all comments received during the review period and issue the final report within 60 days of the close of the review period.<br>• Within 60 days of issuing the final CMR, BOEM must convene a meeting with the USFWS, Revolution Wind, and appropriate state agencies to discuss the report and seek consensus on whether implementation of any technologies/methods are reasonable and prudent. If consensus cannot be reached, the USFWS will consider input from the meeting participants and make the final determination of whether any measures are reasonable and prudent and should be implemented under RPM 2.* | mortality, but would not alter the overall impact determination of the Proposed Action. |
| USFWS Biological Opinion Terms and | Implement those technologies and methods deemed reasonable and prudent. | This measure would provide incremental reductions in impacts for two listed birds species, would improve accountability, and |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| Conditions 2: Implementation of measures to minimize take of piping plovers and rufa red knots* | • BOEM will require Revolution Wind to adopt and deploy reasonable and prudent technologies and methods to avoid or minimize take of the piping plover and rufa red knot. BOEM will specify the USFWS-approved timeframe in which any required minimization measure(s) must be implemented, as well as any requirements to monitor, maintain, or adapt the measure(s) over time.<br>• BOEM will require Revolution Wind to provide periodic reporting on the implementation of any minimization measure(s) according to a schedule developed by BOEM and approved by the USFWS.* | reduce uncertainty associated with estimated rates of collision mortality, but would not alter the overall impact determination of the Proposed Action. |

* Information in these rows was taken directly from the final biological opinion (USFWS 2023) has not been edited.

† Operational changes may include, but are not limited to, feathering, which involves adjusting the angle of the blades to slow or stop them from turning under certain conditions.

‡ Reasonable and prudent minimization measures will include only actions that occur within the action area, involve only minor changes to the project, and reduce the projected level of take. Measures are reasonable and prudent when they (and their implementing terms and conditions) are consistent with the project's basic design, location, scope, duration, and timing (50 CFR 402.14(i)(i)(2)). The reasonableness determination will consider both technical and economic factors; the test for reasonableness is whether the proposed measure would cause more than a minor change to the project. The prudency determination will consider the likelihood, based on best available information, of successfully and appreciably reducing bird collisions relative to the cost and technical difficulty of the measure. The BOEM and the Service will ensure that any reasonable and prudent measures and terms and conditions are within the legal authority and jurisdiction of the BOEM and Revolution Wind to carry out.

### Table 3.7-4. Additional Mitigation and Monitoring Measures under Consideration for Birds (Appendix F, Table F-3)

| Mitigation Measure* | Description* | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| USFWS Biological Opinion Conservation Recommendation 1: Adopt compensatory mitigation ratios greater than 1:1 | Estimated levels of collision mortality are associated with high uncertainty. Future advancements in SCRAM are expected to substantially reduce, but not eliminate, uncertainty. In addition, compensatory mitigation actions will likely be associated with their own levels of uncertainty (e.g., probability of success, actual number of bird mortalities offset), and may occur later in time that the project-induced mortality. Thus, the USFWS recommends a compensatory | Pursuant to 50 CFR 402.14(j), conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information |

| Mitigation Measure* | Description* | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | mitigation ratio greater than 1:1, particularly given the extent of full buildout of WTGs anticipated on the OCS. | |
| USFWS Biological Opinion Conservation Recommendation 2: Establish an Offshore Wind Adaptive Monitoring and Impact Minimization Framework to guide and coordinate monitoring, research and avian impacts assessment coastwide. | To address Service concerns related to potential effects of WTG operation on listed and other species of concern, at both the project and coastwide scales, the USFWS recommends that the BOEM develop and adopt an Offshore Wind Adaptive Monitoring and Impact Minimization Framework (Framework) for flying wildlife. Many details will need to be worked out, but here the USFWS provides some basic principles for establishment, adoption, and operation of the Framework.<br>• Establish a Framework Principals Group to consist of representatives from the BOEM, the BSEE, the USFWS, State natural resource agencies responsible for management of birds, bats, and insect, and offshore wind energy developers/operators.<br>• Develop and adopt a written Framework foundational document specifying:<br>○ the governance structure of the Principals Group;<br>○ the geographic coverage of the Framework;<br>○ the species covered by the Framework; and<br>○ the duration of the Framework.<br>• Establish an annual operating budget for the Framework to be funded by offshore wind energy developers/operators.<br>• Arrange for the Principals Group to meet at least annually, and for the Framework foundational document to be updated at least every 5 years.<br>• Provide for experts (both internal and external to the Principals Group) to regularly assess new and improved technologies and methods for estimating collision risk of covered species and measuring or | Pursuant to 50 CFR 402.14(j), conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information |

| Mitigation Measure* | Description* | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | detecting collisions. Adopt and deploy such methods deemed most promising by the Principals Group.<br>• Coordinate monitoring and research across wind energy projects. Share and pool data and research results coastwide.<br>• Provide for experts (both internal and external to the Principals Group) to regularly assess new and improved technologies and methods for minimizing collision risk of covered species. Adopt and deploy such technologies/methods deemed most promising by the Principals Group.<br>• Provide for experts (both internal and external to the Principals Group) to periodically assess new and improved technologies and methods for evaluating indirect effects to covered species from WTG avoidance behaviors (e.g., impacts to time and energy budgets).<br>• Periodically assess the level and type of compensatory mitigation necessary to offset any unavoidable direct and indirect effects of WTG operation on covered species. Adopt and require the levels and types of mitigation deemed appropriate by the Principals Group.<br>• Consider partnering with other stakeholders or cross-sector organizations to provide administrative, institutional, and technical support to the Principals Group. | |
| USFWS Biological Opinion Conservation Recommendation 3: Conduct a coastwide buildout analysis that considers all existing, proposed, and future | The definition of "cumulative effects" at 50 CFR 402.02 excludes future Federal actions because such actions will be subject to their own consultations under section 7 of the ESA. Further, the analysis of environmental baseline conditions for each subsequent consultation would be limited to the action area of that particular project. While we can use the Status of the Species section of a biological opinion to capture the | Pursuant to 50 CFR 402.14(j), conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information |

| Mitigation Measure* | Description* | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| offshore wind energy development on the Atlantic OCS | anticipated effects of completed consultations, we cannot consider additive effects of concurrent, ongoing consultations. Even this creates a situation where the effects analysis for each individual offshore wind energy project cannot fully account for synergistic effects that may occur with nearby projects and especially not full build-out of offshore wind infrastructure along the coast.<br>Besides the two existing offshore wind energy facilities (Block Island Wind offshore Rhode Island and Coastal Virginia Offshore Wind), we understand there are 26 additional projects in various stages of development offshore the U.S. coast from Maine to Virginia. As the Department of the Interior continues moving toward the national goal of deploying 30 gigawatts of offshore wind by 2030, we anticipate still more projects beyond those 26 (e.g., within the New York Bight, Central Atlantic, and Gulf of Maine). While the Service will complete a thorough assessment of potential direct and indirect effects for each individual offshore wind project, a coastwide analysis may indicate or suggest additive and/or synergistic effects among projects. Therefore, the Service recommends that BOEM analyze potential aggregate effects from WTG operation at a coastwide scale. A coastwide analysis will work in concert with the Offshore Wind Adaptive Monitoring and Impact Minimization Framework to comprehensively assess, monitor, and manage avian impacts from wind energy development along the U.S. Atlantic coast. A Programmatic consultation for wind energy development in the New York Bight is already underway and could set the stage for a full coastwide analysis. Ultimately, a coastwide programmatic Opinion may emerge as the most effective and efficient mechanism for assessing, monitoring, minimizing, and offsetting effects to listed birds from WTG operation on the OCS. | |

Note: The USFWS acknowledges that the manner and extent to which these recommendations are implemented are at the discretion of BOEM/BSEE.

* Information in these rows was taken directly from the final biological opinion (USFWS 2023) and has not been edited.

#### 3.7.2.6.1 Measures Incorporated into the Preferred Alternative

Mitigation measures resulting from consultations, authorizations, and permits listed in Table 3.7-3 and in Appendix F, Table F-2 are incorporated into Alternative G (Preferred Alternative). The anti-perching devices would reduce the risk of collision with WTGs as well as minimize the perching of avian predators. The additional measures would further define how the effectiveness and enforcement of EPMs would be ensured and improve accountability for compliance with EPMs by implementing an avian and bat monitoring program. Because these measures ensure the effectiveness of and compliance with EPMs that are already analyzed as part of the Proposed Action, implementation of these measures would not further reduce the impact level of the Proposed Action but would ensure that Project activities would not impact birds beyond the negligible to minor range of impacts discussed in this EIS, and the data gathered from avian mortality reporting would be used to evaluate impacts and potentially lead to additional mitigation measures, if required (30 CFR 585.633(b)).

# 3.8 Coastal Habitats and Fauna

## 3.8.1 Description of the Affected Environment and Environmental Consequences of the No Action Alternative for Coastal Habitats and Fauna

Geographic analysis area: The GAA for coastal habitats and fauna (Figure 3.8-1) comprises the construction footprints for the following onshore Project components: the onshore transmission cable, landfall work area, OnSS, and ICF. The coastal habitats within the GAA include the area from state waters inland to the mainland, including the foreshore, backshore, dunes, and interdunal areas. Aquatic habitats are discussed in Section 3.21 and Section 3.6. Offshore components of the Project would not impact coastal habitat and fauna other than certain avian and bat species, which are discussed in Section 3.7 and Section 3.5, respectively.

Affected environment: Appendix K of the COP includes the results of field investigations conducted for the Project's onshore facilities as well as descriptions of habitats, delineations of freshwater and coastal wetlands, identification of plant and wildlife species, records of rare species observations, and observations of invasive species (VHB 2023). Plant communities were documented by VHB and compared to the key habitat profiles provided in the RIWAP (Rhode Island DEM et al. 2015) to assign the appropriate plant communities within the GAA. These plant communities are provided in Table 3.8-1 and described below. "Native coastal fauna" is defined herein as terrestrial mammals, reptiles, amphibians, and terrestrial and intertidal invertebrates. Most of the GAA for coastal habitats and fauna is disturbed from previous anthropogenic uses. Therefore, habitat quality and the potential suitability for use by fauna have been degraded. However, several key habitats, as identified in the RIWAP (Rhode Island DEM et al. 2015), suitable to a range of wildlife and plant species are present in the GAA. Invasive plant species are prevalent throughout the GAA because of prior anthropogenic disturbance (VHB 2023). VHB identified habitat for a variety of terrestrial mammals, reptiles, and amphibians during habitat assessment surveys conducted on July 30, August 14, September 3, and December 10, 2019, and March 27 and July 13, 2020.

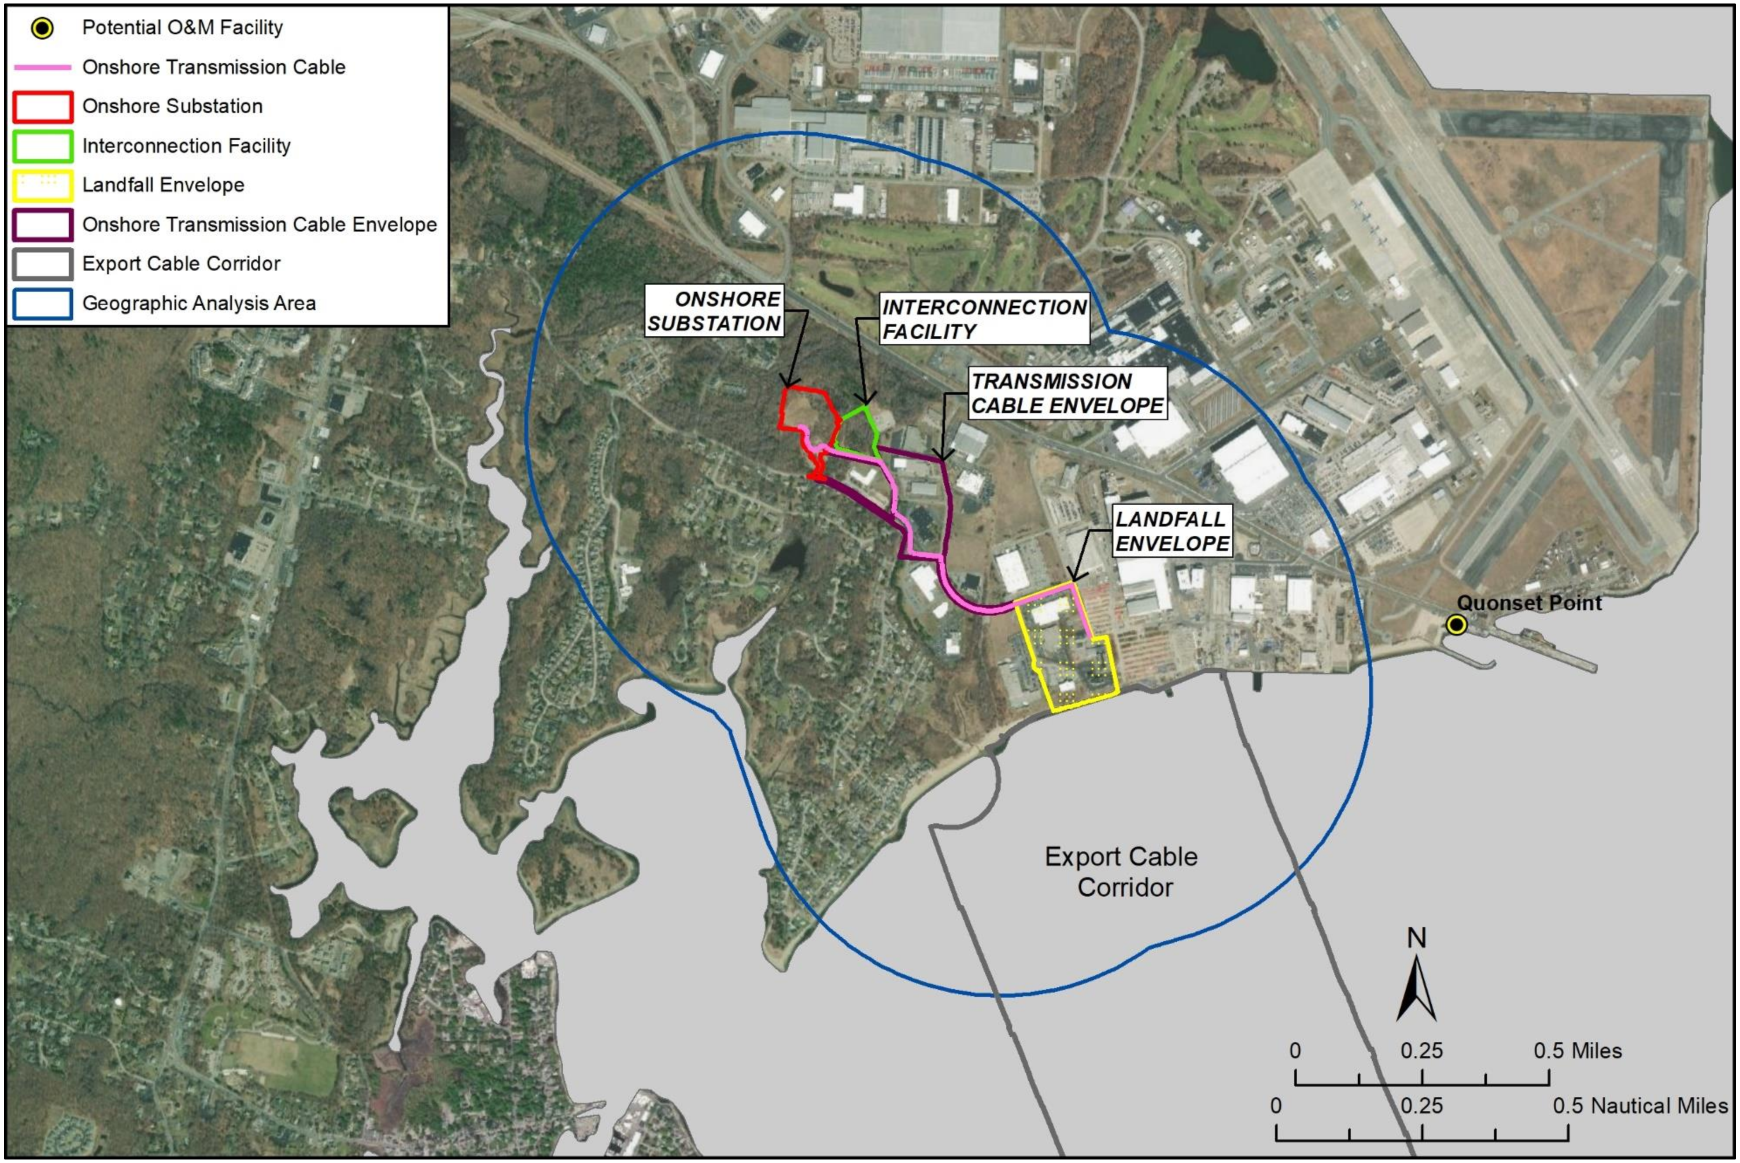

**Figure 3.8-1. Geographic analysis area for coastal habitats and fauna.**

| Mowed lawn | 0.020 |
| Ruderal grassland/shrubland | 0.020 |
| Oak forest | 0.008 |
| Pitch pine barren | 0.006 |

Source: VHB (2023); Rhode Island DEM et al. (2015).

### Landfall Work Area

The modified coastal beach plant community comprises areas within the landfall work area that have been altered by placement of seawalls and riprap revetments, which expose the sandy beach during low tides. Vegetation at the base of the seawall and along the top of the seawall includes spotted knapweed (*Centaurea maculosa*), an invasive species; common milkweed (*Asclepias syriaca*); prickly lettuce (*Lactuca serriola*); and American pokeweed (*Phytolacca americana*). Adjacent to areas of modified coastal beach, the landfall work area contains ruderal grassland/shrubland. Ruderal grasslands/shrublands constitute early successional habitats defined by Anderson et al. (1976) as uplands where the potential natural vegetation is predominantly grasses, grass-like plants, forbs, or shrubs. Such habitats are typically anthropogenically created or maintained due to management strategies. The vegetation within ruderal grassland/shrubland areas is similar to the species composition along the seawall described above and also includes northern bayberry (*Myrica pensylvanica*) and eastern red cedar (*Juniperus virginiana*) (VHB 2023).

**Transmission Cable Envelope**

The transmission cable envelope is comprised primarily of industrial and residential land uses and consists of lots with managed lawns. Although managed lawn is not considered a key habitat by the RIWAP, it provides limited utility to some species of wildlife (e.g., passerines and rodents) in an otherwise heavily developed industrial and commercial area. It should be noted that some of these lots containing only managed lawn may be designated for future development (VHB 2023). The preferred transmission cable route is an approximate 1 mile (1.6 km) route that would predominantly follow along paved roads or previously disturbed areas such as parking lots.

Some of the alternative routes under consideration within the transmission cable envelope contain segments that would pass through undeveloped, vegetated areas and would be approximately the same length. Alternative transmission cable routes would pass a vacant lot that supports a dry ruderal grassland/shrubland field that gently slopes downward toward an access path. This plant community supports a mix of shrubs and herbaceous forbs and grasses, including eastern red cedar, pitch pine (*Pinus rigida*), *Yucca* sp., Virginia creeper (*Parthenocissus quinquefolia*), and common milkweed. The ruderal grassland/shrubland supports some invasive species, including autumn olive (*Elaeagnus umbellate*), Morrow's honeysuckle (*Lonicera morrowii*), Asiatic bittersweet (*Celastrus orbiculatus*), and mugwort (*Artemisia* sp.). Alternative onshore cable transmission routes would also pass through upland forest and shrubland. Vegetation within this area shows signs of anthropogenic disturbance and is composed of a ruderal mixed oak/white pine forest with a shrubby understory. Dominant vegetation within the canopy layer includes eastern white pine (*Pinus strobus*), red oak (*Quercus rubra*), white oak (*Quercus alba*), and eastern red cedar. Dominant species within the shrub and herb stratum include autumn olive, Morrow's honeysuckle, Asiatic bittersweet, multiflora rose (Rosa multiflora), green briar (*Smilax rotundifolia*), garlic mustard (*Alliaria petiolata*), and poison ivy (*Toxicodendron radicans*) (VHB 2023).

**Onshore Substation and Interconnection Facility**

The primary plant community within the footprint of both the OnSS and the ICF is mixed oak/white pine forest. Dominant species within the canopy include red oak, black oak (*Quercus velutina*), scarlet oak (*Quercus coccinea*), and eastern white pine, and other canopy species include red maple, black cherry *(Prunus serotina*), and black birch (*Betula lenta*). Understory vegetation includes Morrow's honeysuckle, green briar, Virginia creeper, and spotted wintergreen (*Chimaphila maculata*). As with the adjoining ruderal forested swamp that occurs within the OnSS footprint (described below), the oak and white pine forest shows signs of human disturbance from its previous use as a landfill.

Ruderal forested swamp is also present within the OnSS footprint. The dominant canopy species within the forested swamp is red maple (*Acer rubrum*) with scattered patches of black gum (*Nyssa sylvatica*), swamp white oak (*Quercus bicolor*), red oak, and eastern white pine. The understory contains scattered sapling recruitment from the canopy layer and shrub thickets of sweet pepperbush (*Clethra alnifolia*), highbush blueberry (*Vaccinium corymbosum*), winterberry (*Ilex verticillata*), and alder (*Alnus* sp.). Poison ivy, green briar, sensitive fern (*Onoclea sensibilis*), and skunk cabbage (*Symplocarpus foetidus*) are common in the herbaceous stratum. A ruderal shrub marsh is present in the northern part of the OnSS footprint. The southern boundary of the marsh is highly altered, with demolition debris stacked along slopes above the marsh. The northern limit of the marsh extends beyond the OnSS footprint based on available topographic mapping and aerial photographs. The ruderal shrub marsh has a forested perimeter, and open water seasonally inundates the shrubland cover type (VHB 2023).

A large area (2.6 acres) within the OnSS footprint is considered capped landfill because of the alterations associated with the former Camp Avenue Dump, which is listed on the Superfund Enterprise Management System database as a State Hazardous Waste Site. From approximately 1949 to 1953, and as late as 1970, the Camp Avenue Dump was used as a general landfill by the U.S. Navy before the Quonset Point Naval Air Station was deactivated in 1974. Previous studies conducted at the dump, as well as field observations during Project surveys, reported wastes such as construction debris, roofing tar, ship parts, and unspecified industrial waste (VHB 2020). Evidence of the site's past use as a landfill is present throughout with fill artifacts, disturbed topography that indicates previous cutting and filling, and pervasive invasive vegetation that includes glossy buckthorn (*Frangula alnus*), Asiatic bittersweet, Morrow's honeysuckle, black locust (*Robinia pseudoacacia*), multiflora rose, privet (*Ligustrum* sp.), tree of heaven (*Ailanthus altissima*), black swallow-wort (*Cynanchum louiseae*), mugwort, and garlic mustard (VHB 2023).

General wildlife records for the GAA are based on observations made during VHB's field investigations in July, August, September, and December 2019 and March and July 2020; the review of the RIWAP for species tied to specific key habitats within the GAA; and other pertinent literature, including *New England Wildlife: Habitat, Natural History, and Distribution* (DeGraaf and Yamasaki 2001). Appendix C in COP Appendix K (VHB 2023) provides a list of wildlife species observed during field investigations and species with the potential to occur within the GAA based on habitat preferences and habitat availability.

VHB evaluated information from the USFWS IPaC tool and the Rhode Island DEM ERM to assess if any federal or state-listed species; rare, threatened, or endangered species; or species of greatest conservation need were present within the analysis area. During field investigations for the onshore transmission cable, butterfly milkweed (*Asclepias tuberosa*), a Rhode Island state species of concern was recorded. Butterfly milkweed has showy orange flowers in umbels and occurs within disturbed habitats, grassland, meadows, and fields. As with other milkweed species, this plant provides important food sources for the larval form of butterfly species. This includes the monarch butterfly (*Danaus plexippus*), which is a candidate species under the federal ESA (Monarch Joint Venture 2019; USFWS 2019). In accordance with Rhode Island Natural Heritage Program (RINHP) policy, the occurrence of butterfly milkweed within these habitats will be reported to the RINHP during the state permitting process. No other federal or state-listed species; rare, threatened, or endangered species; species of greatest conservation need; or associated critical habitats, other than those discussed in Sections 3.5 and 3.7, were identified as having the potential to occur within the GAA for coastal habitats and fauna (BOEM 2022, 2023; VHB 2023).

## 3.8.2 Environmental Consequences

### 3.8.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

This assessment analyzes the maximum-case scenario; however, there is the potential for variances in the Project build-out, as defined in the PDE (see Appendix D). The Project design parameters that would influence the magnitude of the impacts on coastal habitats and fauna include the location of the OnSS and ICF, the location of construction within the landfall work area and within the transmission cable envelope, and the time of year during which construction occurs. For example, the summer and fall months (May through October) constitute the most active season for coastal fauna in this area, especially reptiles and amphibians. Therefore, construction during months in which coastal fauna are not present, not breeding, or less active would have fewer impacts than construction during more active times.

The following EPMs would be implemented to minimize potential impacts to coastal habitats and fauna:

- Onshore facilities would be sited within previously disturbed and developed areas to the extent practicable, as follows:
    - Revolution Wind evaluated siting alternatives for the OnSS using the criteria that included avoidance or minimization of disturbance to ecologically sensitive areas.
    - The OnSS and ICF would be located on parcels that are already highly altered and include buried demolition waste.
    - The transmission cable would be located primarily in unvegetated and previously disturbed or developed ROWs.
- Accidental spills or releases of oils or other hazardous materials offshore would be managed through the OSRP.
- At the landfall location, drilling fluids would be managed within a contained system to be collected for reuse, as necessary. An HDD contingency plan would be prepared and implemented to minimize the potential risks associated with release of drilling fluids.
- Revolution Wind would comply with the RIPDES General Permit for Stormwater Discharges associated with construction activity, which requires the implementation of a soil erosion and sedimentation control (SESC) plan and spill prevention and control measures.
- An SESC plan, including erosion and sedimentation control measures, would be implemented to minimize potential water quality impacts during construction and operation of the onshore facilities. Revolution Wind would implement the site-specific SESC plan and maintain it during the entire construction process until the entire worksite is permanently stabilized by vegetation or other means. The measures employed in the SESC plan use BMPs to minimize the opportunity for turbid discharges leaving a construction work area.
- The spill prevention and control measures mandate that the operator identifies all areas where spills can occur and their accompanying drainage points. The operator must also establish spill prevention and control measures to reduce the chance of spills, stop the source of spills, contain and clean up spills, and dispose of materials contaminated by spills. Spill prevention and control training would be provided for relevant personnel.
- The perimeter surrounding onshore facilities would be managed to encourage the growth of native grasses, ferns, and low-growing shrubs. This management strategy would include the removal of invasive plants in compliance with state and federal regulations (e.g., herbicide use would not be permitted within regulated wetlands).
- In accordance with Section 2.9(B)(1)(d) of the Freshwater Wetland Rules, the onshore facilities would be designed to avoid and minimize impacts to freshwater wetlands to the maximum extent practicable. Any wetlands that would be impacted as a result of the Project would be mitigated via

the federal and state permitting process in accordance with Section 404 of the CWA and the Freshwater Wetland Rules.

- The documented sickle-leaved golden aster (*Pityopsis falcata*) population on the OnSS parcel would be protected during construction.

These EPMs would be implemented across all alternatives; therefore, BOEM would not expect measurable potential variances in impacts across the alternatives.

See Appendix E1 for a summary of IPFs analyzed for coastal habitats and fauna across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Table E2-1 in Appendix E1. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4, to facilitate reader comparison across alternatives.

Table 3.8-2 provides a summary of IPF findings carried forward for analysis in this section. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion.

A detailed analysis of the Proposed Action is provided following the table. Detailed analysis of other considered action alternatives is also provided below the table if analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action.

The Conclusion section within each alternative analysis discussion includes rationale for the overall effect call determination for that alternative. The overall impact of any alternative would be **minor** adverse because the effects on coastal habitats and fauna would be small, and the resource would be expected to recover completely, with no mitigation required.

**Table 3.8-2. Alternative Comparison Summary for Coastal Habitats and Fauna**

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTGs | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| Climate change | **Onshore**: Impacts of climate change could contribute to impacts on coastal habitats and fauna primarily according to existing global and regional climate trends. Although the impacts resulting from climate change on coastal habitats and fauna are uncertain, BOEM anticipates that future offshore wind activities, without the Proposed Action, could have **negligible** adverse impacts on onshore coastal habitats and fauna. | **Onshore**: Climate change would contribute to impacts on coastal habitats and fauna primarily according to existing global and regional climate trends. The Proposed Action could contribute to a long-term net decrease in GHG emissions. This difference may not be measurable but would help reduce climate change impacts. Although the impacts resulting from climate change on coastal habitats and fauna are uncertain, BOEM anticipates that the Proposed Action would have no measurable influence on climate change and therefore the resulting impacts to coastal habitats and fauna would be **negligible** adverse.<br>No additional impacts from climate change beyond those discussed under the impacts analysis for construction and installation are expected during O&M and Project decommissioning.<br>The types of cumulative impacts from global climate change to coastal habitats and fauna described under the No Action Alternative would occur under the Proposed Action. However, the Project could also contribute to a long-term net decrease in GHG emissions. This difference may not be measurable but would help reduce climate change impacts (although effects would still be **negligible** to **minor** adverse). | **Onshore**: Alternatives C through F would not alter impacts to onshore activities. Therefore, construction, O&M and Project decommissioning impacts would be the same as the Proposed Action: **negligible** adverse. Cumulative impacts would also be the same as the Proposed Action: **negligible** to **minor** adverse. | | | | **Onshore**: Alternative G would not alter impacts to onshore activities. Therefore, construction, O&M, and Project decommissioning impacts would be the same as the Proposed Action: **negligible** adverse. Cumulative impacts would also be the same as the Proposed Action: **negligible** to **minor** adverse. |
| Presence of structures | **Onshore**: In addition to electrical infrastructure, some habitat conversion may result from port expansion activities required to meet the demands for fabrication, construction, transportation, and installation of wind energy structures as well as onshore substations and associated facilities. Land disturbance for construction of | **Onshore**: The operational footprints of the OnSS and ICF would create habitat loss when forested upland is cleared and replaced with hard structures and crushed gravel yards that are not capable of supporting plants or wildlife. The ICF would result in a loss of approximately 1.6 acres of mixed oak/white pine forest, which is reflective of the operational footprint of the ICF. The OnSS would result in a loss of 3.8 acres of mixed oak/white pine forest. Together, these losses represent a relatively small fraction of the 52 acres of contiguous habitat identified in the RIWAP (Rhode Island DEM et al. 2015) and represent a **negligible** to **minor** adverse impact to coastal habitats. Overall, the habitat loss that would result from the construction of the OnSS and ICF would be considered negligible because | **Onshore**: Alternatives C through F would not alter impacts to onshore activities. Therefore, construction, O&M and Project decommissioning impacts would be the same as the Proposed Action: **negligible** to **minor** adverse. Cumulative impacts would also be the same as the Proposed Action: **negligible** to **minor** adverse. | | | | **Onshore**: Alternative G would not alter impacts to onshore activities. Therefore, construction, O&M, and Project decommissioning impacts would be the same as the Proposed Action: **negligible** to **minor** adverse. Cumulative impacts would also be the same as the Proposed Action: **negligible** to **minor** adverse. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTGs | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | onshore substations, associated facilities, and port expansion activities in the GAA is expected to result in **negligible** to **minor** adverse impacts to coastal habitat and fauna. | this loss would be small relative to the unimpacted similar habitat in the general region.<br>At the OnSS and ICF, land disturbance in the form of vegetation management would occur on a periodic basis to maintain vegetation at shrub height. Presence of structures as it relates to vegetation clearing may result in the direct injury or mortality of wildlife as well as habitat alteration or removal. Impacts from vegetation management may include reduction in habitat quality via the spread of invasive species and temporary displacement of individuals. However, the spread of invasive species would be controlled with periodic vegetation management, and wildlife displacement could occur only during vegetation removal activities. The impact of habitat degradation and wildlife displacement resulting from vegetation management of the OnSS and ICF is expected to be short term **negligible** adverse. The impact of habitat degradation and/or loss, wildlife displacement, and wildlife injury and/or mortality resulting from land disturbance during decommissioning of the OnSS and ICF would be short term **negligible** adverse.<br>Because of the small amount of affected onshore habitat, land disturbance from the Proposed Action when added to other past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts to coastal habitats and fauna. | | | | | |

Note: Each cell includes analysis for the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion.

### 3.8.2.2 Alternative A: Impacts of the No Action Alternative on Coastal Habitats and Fauna

#### 3.8.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for coastal habitats and fauna (see Section 3.8.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.8.2.2.2 Cumulative Impacts

**Onshore Activities and Facilities**

This section discloses potential impacts to coastal habitats and fauna associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

Climate change: Impacts of climate change could contribute to impacts on coastal habitats and fauna primarily according to existing global and regional climate trends. Activities that contribute to climate change are provided in the Air emissions and climate change section in Section 3.4.1.1. Although sources of GHG emissions contributing to regional and global climate change mostly occur outside the GAA for coastal habitats and fauna, these resources may be affected by climate change, sea level rise, more frequent and intense storms, and altered habitat. Although the impacts resulting from climate change on coastal habitats and fauna are uncertain, BOEM anticipates that future offshore wind activities, without the Proposed Action, could have **negligible** adverse impacts on onshore coastal habitats and fauna.

Presence of structures: In addition to electrical infrastructure, some habitat conversion may result from port expansion activities required to meet the demands for fabrication, construction, transportation, and installation of wind energy structures as well as onshore substations and associated facilities. The general trend along the coastal region from Virginia to Maine is that port activity will increase modestly and require some conversion of undeveloped land to meet port demand and will result in permanent loss of forested habitat for local bat populations. However, the increase from future offshore wind development would be a minimal contribution in the port expansion required to meet increased commercial, industrial, and recreational demand (BOEM 2019). The current bearing capacity of existing ports is considered suitable for wind turbines, requiring no port modifications for supporting offshore wind energy development (DOE 2014). Land disturbance for construction of onshore substations, associated facilities, and port expansion activities in the GAA is expected to result in **negligible** to **minor** adverse impacts to coastal habitat and fauna.

#### 3.8.2.2.3 Conclusions

Under the No Action Alternative, coastal habitats and fauna would continue to follow current regional trends and respond to current and future environmental and societal activities. The current state of local coastal habitat and fauna resources is generally stable, although some fauna may be subject to disturbance from ongoing activities in the GAA. For example, land disturbance from onshore construction of cables and structures periodically causes temporary and permanent habitat loss, temporary displacement, injury, and mortality, resulting in small short-term impacts on certain coastal fauna species. Climate change, influenced in part by GHG emissions, is altering the seasonal timing and patterns of certain species' distribution and ecological relationships, likely causing permanent impacts of unknown intensity. Considering current conditions and the modest pace of development in the GAA, coastal fauna resources are expected to remain generally stable under the No Action Alternative.

BOEM anticipates that the impacts of ongoing activities, especially onshore construction and climate change, would be negligible. In addition to ongoing activities, planned actions other than offshore wind may also contribute to impacts on coastal habitats and fauna. Planned actions other than offshore wind primarily consist of increasing onshore construction, although no future construction projects were identified within the GAA. BOEM anticipates that the impacts of planned actions other than offshore wind would be **negligible** adverse.

If any onshore components of future offshore wind activities overlap the GAA, impacts such as displacement, mortality, and/or habitat loss would be similar to those resulting from the Project alone. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with future offshore wind activities combined with ongoing activities, reasonably foreseeable environmental trends, and planned actions other than offshore wind in the GAA would result in **negligible** to **minor** adverse impacts, primarily through onshore construction (most are attributable to ongoing activities) and climate change.

### 3.8.2.3 Alternative B: Impacts of the Proposed Action on Coastal Habitats and Fauna

#### 3.8.2.3.1 Construction and Installation

##### Onshore Activities and Facilities

<u>Climate change:</u> Climate change would contribute to impacts on coastal habitats and fauna primarily according to existing global and regional climate trends. Although sources of GHG emissions contributing to regional and global climate change mostly occur outside the GAA for coastal habitats and fauna, these resources may be affected by climate change, sea level rise, more frequent and intense storms, and altered habitat. The Proposed Action could contribute to a long-term net decrease in GHG emissions. This difference may not be measurable but would help reduce climate change impacts. Although the impacts resulting from climate change on coastal habitats and fauna are uncertain, BOEM anticipates that the Proposed Action would have no measurable influence on climate change and therefore the resulting impacts to coastal habitats and fauna would be **negligible** adverse.

<u>Presence of structures:</u> The OnSS would occupy an operational footprint measuring up to 3.8 acres and would connect to the ICF with two 115-kV underground transmission cables up to 527 feet long. Additionally, the OnSS would include a compacted gravel driveway, stormwater management features, and associated landscaped or managed vegetated areas totaling up to 7.1 acres inclusive of the up-to-4-acre operational footprint of the facility. The adjacent ICF would have an operational footprint of 1.6 acres and would also include a paved access road, stormwater management features, and associated landscaped or managed vegetated areas within the approximate 4.0-acre construction footprint. Construction of these facilities would result in habitat loss and habitat conversion in the areas surrounding the RWEC, the OnSS, and the ICF. The operational footprints of the OnSS and ICF would create habitat loss when forested upland is cleared and replaced with hard structures and crushed gravel yards that are

not capable of supporting plants or wildlife. The ICF would result in a loss of approximately 1.6 acres of mixed oak/white pine forest, which is reflective of the operational footprint of the ICF. The OnSS would result in a loss of 3.8 acres of mixed oak/white pine forest. Together, these losses represent a relatively small fraction of the 52 acres of contiguous habitat identified in the RIWAP (Rhode Island DEM et al. 2015) and represent a **negligible** to **minor** adverse impact to coastal habitats.

In addition to impacts on the mixed oak and white pine forest, the OnSS would develop 0.6 acre of pitch pine barren. The OnSS has been designed to avoid occurrences of sickle-leaved golden aster, a plant species of state concern within Rhode Island that were observed within the pitch pine barren outside of the footprint of the OnSS (VHB 2023). In accordance with the state environmental permitting needed for the Project, the occurrence of this state-listed species must be reported to the Rhode Island DEM, which will advise if a mitigation plan will be needed. Overall, the habitat loss that would result from the construction of the OnSS and ICF would be considered negligible because this loss would be small relative to the unimpacted similar habitat in the general region. As previously described in the impacts discussion for the landfall work area, land disturbance and habitat alteration from the construction of the OnSS and ICF could cause habitat degradation through the spread of invasive species. As noted previously, invasive plant growth within the OnSS parcels is pervasive. Invasive plant species were also observed throughout the forested portion of the ICF parcel (VHB 2023). This observation indicates that invasive species are likely to become further established in these areas if proper management techniques are not followed.

#### 3.8.2.3.2 Operations and Maintenance and Decommissioning

#### Onshore Activities and Facilities

<u>Climate change:</u> No additional impacts from climate change beyond those discussed under the impacts analysis for construction and installation described in Section 3.8.2.2.1 are expected during O&M and Project decommissioning. BOEM anticipates that the Proposed Action would have no measurable influence on climate change and therefore the resulting impacts to coastal habitats and fauna would be **negligible** adverse.

<u>Presence of structures:</u> At the OnSS and ICF, land disturbance in the form of vegetation management would occur on a periodic basis to maintain vegetation at shrub height. Vegetation control methods would employ integrated vegetation management practices, including manual cutting, mowing, the prescriptive use of herbicides, and the use of environmental and cultural controls (Eversource 2018). The method of control would be determined following inspections of the site scheduled for maintenance. The current maintenance cycle for vegetation control using integrated vegetation management practices is 3 or 4 years depending on the vegetation composition, facilities, and site conditions (Eversource 2018). Hazard tree removal would also be performed on a cyclical basis to inspect and remove trees that may fall that are outside the edge of maintained ROWs. Presence of structures as it relates to vegetation clearing may result in the direct injury or mortality of wildlife as well as habitat alteration or removal. Impacts from vegetation management may include reduction in habitat quality via the spread of invasive species and temporary displacement of individuals. However, the spread of invasive species would be controlled with periodic vegetation management, and wildlife displacement could occur only during vegetation removal activities. The impact of habitat degradation and wildlife displacement resulting from vegetation management of the OnSS and ICF is expected to be short term **negligible** adverse.

At the end of the Project's operational life, the OnSS and ICF would be decommissioned in accordance with a detailed Project decommissioning plan that would be developed at that time. OnSS and ICF equipment may be removed while keeping the substation yard and fencing intact. Under such a scenario, land disturbance and habitat alteration activities may be similar to those described under the construction impact analysis, although the impacts would likely be less because new vegetation clearing and grading would not be necessary. The impact of habitat degradation and/or loss, wildlife displacement, and wildlife injury and/or mortality resulting from land disturbance during decommissioning of the OnSS and ICF would be short term **negligible** adverse.

#### 3.8.2.3.3 Cumulative Impacts

#### Onshore Activities and Facilities

Climate change: The types of cumulative impacts from global climate change to coastal habitats and fauna described under the No Action Alternative would occur under the Proposed Action. However, the Project could also contribute to a long-term net decrease in GHG emissions. This difference may not be measurable but would help reduce climate change impacts (although effects would still be **negligible** to **minor** adverse).

Presence of structures: Construction and installation, O&M, and decommissioning of the OnSS under the Proposed Action would contribute to the habitat conversion and habitat loss described under the No Action Alternative, potentially changing the composition and abundance of faunal assemblages through the removal of forested habitat at the OnSS and ICF. Because of the small amount of affected onshore habitat, land disturbance from the Proposed Action when added to other past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts to coastal habitats and fauna.

#### 3.8.2.3.4 Conclusions

In summary, the activities associated with the Proposed Action may affect coastal habitats and fauna through temporary land disturbance, injury or mortality of individuals, and permanent conversion of a small proportion of the overall habitat available regionally. Considering the avoidance, minimization, and mitigation measures proposed, construction of the Proposed Action alone would likely have **negligible** to **minor** impacts on coastal habitats and fauna. The Proposed Action would contribute to the cumulative impact rating primarily through the temporary displacement, mortality, temporary to permanent habitat loss, and noise generated from construction of the OnSS and ICF. Considering all the IPFs together, BOEM anticipates that the impacts to coastal habitats and fauna from ongoing and planned actions, including the Proposed Action, would likely be **minor** adverse in the GAA because the measurable impacts expected would be small and/or the resource would likely recover completely when the impacting agent is gone and remedial or mitigating action is taken. The main drivers for this impact rating are ongoing and future land disturbance and ongoing climate change.

### 3.8.2.4 Alternatives C, D, E, and F

Table 3.8-2 provides a summary of IPF findings for these alternatives.

#### 3.8.2.4.1 Conclusions

Considering the avoidance, minimization, and mitigation measures proposed, construction of the Proposed Action alone would likely have **negligible** to **minor** impacts on coastal habitats and fauna. The overall impacts of Alternatives C through F to coastal habitats and fauna when combined with past, present, and reasonably foreseeable activities would be the same as under the Proposed Action: **minor** adverse.

### 3.8.2.5 Alternative G: Impacts of the Preferred Alternative on Coastal Habitats and Fauna

Table 3.8-2 provides a summary of IPF findings for this alternative.

#### 3.8.2.5.1 Conclusions

Considering the avoidance, minimization, and mitigation measures proposed, construction of t Alternative G alone would likely have **negligible** to **minor** impacts on coastal habitats and fauna. The overall impacts of Alternative G to coastal habitats and fauna when combined with past, present, and reasonably foreseeable activities would be the same as the Proposed Action: **minor** adverse.

### 3.8.2.6 Mitigation

No mitigation measures resulting from agency consultations for coastal habitats and fauna are identified in Table F-2 in Appendix F.

*This page intentionally left blank.*

## 3.9 Commercial Fisheries and For-Hire Recreational Fishing (see section in main EIS)

# 3.10 Cultural Resources (see section in main EIS)

# 3.11 Demographics, Employment, and Economics (see section in main EIS)

# 3.12 Environmental Justice (see section in main EIS)

## 3.13 Finfish and Essential Fish Habitat (see section in main EIS)

# 3.14 Land Use and Coastal Infrastructure

## 3.14.1 Description of the Affected Environment and Environmental Consequences of the No Action Alternative for Land Use and Coastal Infrastructure

Geographic analysis area: The GAA for land use and coastal infrastructure includes the town of North Kingstown, Rhode Island, and the ports potentially used for Project construction and installation, O&M, and decommissioning. The ports included as part of the GAA include port facilities and surrounding areas at Sparrow's Point, Paulsboro Marine Terminal, Port of Brooklyn, Port Jefferson, Port of Montauk, Port of New London, Port of Davisville at Quonset Point, Port of Galilee, Port of Providence, and the New Bedford Marine Commerce Terminal. The Proposed Action and other reasonably foreseeable wind energy projects may use the port facilities shown in Figure 3.14.1. Although the extent of port facilities and upgrades are unknown at this time, land use impacts could occur at these 10 port facilities and surrounding areas, which is why they are included in the land use and coastal infrastructure GAA.

The GAA also includes the 18 BOEM OCS lease areas that range from the offshore Norfolk, Virginia, area in the south to the offshore Rhode Island area in the north (see Figure 3.14-1). Appendix E contains detailed descriptions of these port facilities and lease areas. These areas encompass locations where BOEM anticipates direct and indirect impacts associated with proposed onshore facilities and ports.

Affected environment: The town of North Kingstown, one of 10 towns in Washington County, is located south of Providence, Rhode Island, and is bordered on the south by the towns of South Kingstown and Narragansett, on the north by East Greenwich, on the west by Exeter, and on the east by Narragansett Bay. North Kingstown is the second-largest Washington County town, with a population of 26,323 in 2019 (U.S. Census Bureau 2019). It is part of the Providence metropolitan area, with a land area of approximately 58 square miles.

North Kingstown is a primarily residential community characterized by a mixture of farms, natural areas, cultural centers, villages, historic districts and towns, and countryside (Interface Studio 2019). There are several unique points of interest in the town, including the Davis Memorial Wildlife Refuge, Smith's Castle, and Quonset Point, among others. Land use within the town of North Kingstown largely comprises small areas of low-density residential enclaves surrounded by forests, brushland, and pastures. North Kingstown also contains areas with mines, quarries, and gravel pits, as well as industrial and commercial hubs. The waterfront areas of North Kingstown include transportation facilities such as the Port of Davisville at Quonset Point, open space, high-density residential, wetlands, and other uses.

The proposed RWEC landing site would be within the landfall envelope described in the COP (see COP Figure 2.2.1-3), which totals approximately 20 acres, located at the Port of Davisville at Quonset Point in North Kingstown (see COP Figure 1.1-1). The landfall envelope is generally bounded by Whitecap Drive on the west, the Electric Boat property on the east, and Circuit Drive on the north. Within the landfall envelope is a landfall work area measuring up to 3.1 acres. The landfall work area is part of the Port of Davisville at Quonset Point, which is the location of the former Naval Air Station Quonset Point. The landfall work area consists of several onshore elements:

- Up to two underground transmission circuits (called the onshore transmission cable), co-located within a single corridor
- An OnSS and ICF located adjacent to the existing Davisville Substation

- An underground ROW connecting the OnSS to the ICF (Interconnection ROW)
- An overhead ROW connecting the ICF to the Davisville Substation (TNEC ROW)

Land uses in the landfall envelope are primarily commercial and industrial. This area of the Port of Davisville at Quonset Point is part of the Quonset Business Park and contains several large businesses, including boat and pool manufacturers, medical laboratories, distribution centers, lumber distributors, and office space, among others (*SO Rhode Island* 2014). The landfall envelope area contains a few manufacturing and industrial buildings, associated parking lots, and access roads. Blue Beach, a public beach, is approximately 500 feet west of the southwest corner of the landfall envelope. Blue Beach is accessed via a trail located to the west of the Hayward Industries, Inc., building, which is just outside the landfall envelope. Compass Rose Beach, another public beach, is approximately 2,600 feet east of the southeast corner of the landfall envelope. The Martha's Vineyard Fast Ferry dock is located directly east of Compass Rose Beach. The eastern edge of the Quonset State Airport is also approximately 2,600 feet east of the landfall envelope. The North Kingstown Golf Course is approximately 2,000 feet north of the northern edge of the landfall envelope and is separated from the landfall envelope by Roger Williams Way.

Regardless of the landfall site selected, the preferred onshore transmission cable route is an approximate 1-mile (1.6-km) route that would predominantly follow along paved roads or previously disturbed areas such as parking lots. There are alternative onshore transmission cable routes under consideration within the onshore transmission cable envelope, as depicted on Figure 4.3.1-2 in the COP. Some of the routes under consideration have segments that would be installed in undeveloped, vegetated areas within parcels 179-003 and 179-005 (the Davisville Substation parcel), although most would be installed within paved roads and parking lots, as with the preferred onshore transmission cable route, and would be approximately the same length. Regardless of the exact route chosen, impact determinations would not be affected for any IPF (COP Figure 4.3.1-2). Land uses around the onshore Project footprint consist of low-density residential, commercial, and public lands on the south side of Camp Avenue, and other commercial and industrial uses. There are two public beaches in the Project vicinity, Blue Beach and Compass Rose Beach, as well as three small schools. Based on the Town of North Kingstown's Assessors' Data (Interface Studio 2019), the segment of the RWEC from the mean high water level to the transition joint bays (TJBs), landfall work area, and onshore transmission cable are located within an area that is predominantly industrial but also consists of some large business commercial, low-medium residential (including single-family residences and duplexes), and undeveloped land uses. The property hosting the OnSS and ICF is surrounded by low-medium residential, medium-high-density residential, utility (i.e., the existing Davisville Substation), and undeveloped land uses. The OnSS would be located on two adjacent parcels (179-030 and 179-001) totaling 15.7 acres, both owned by the Rhode Island Commerce Corporation. The ICF would be located on an adjacent 6.1-acre parcel (179-005) owned by TNEC. COP Figure 4.6.7-1 (VHB 2023a) depicts land uses near the onshore components of the Project.

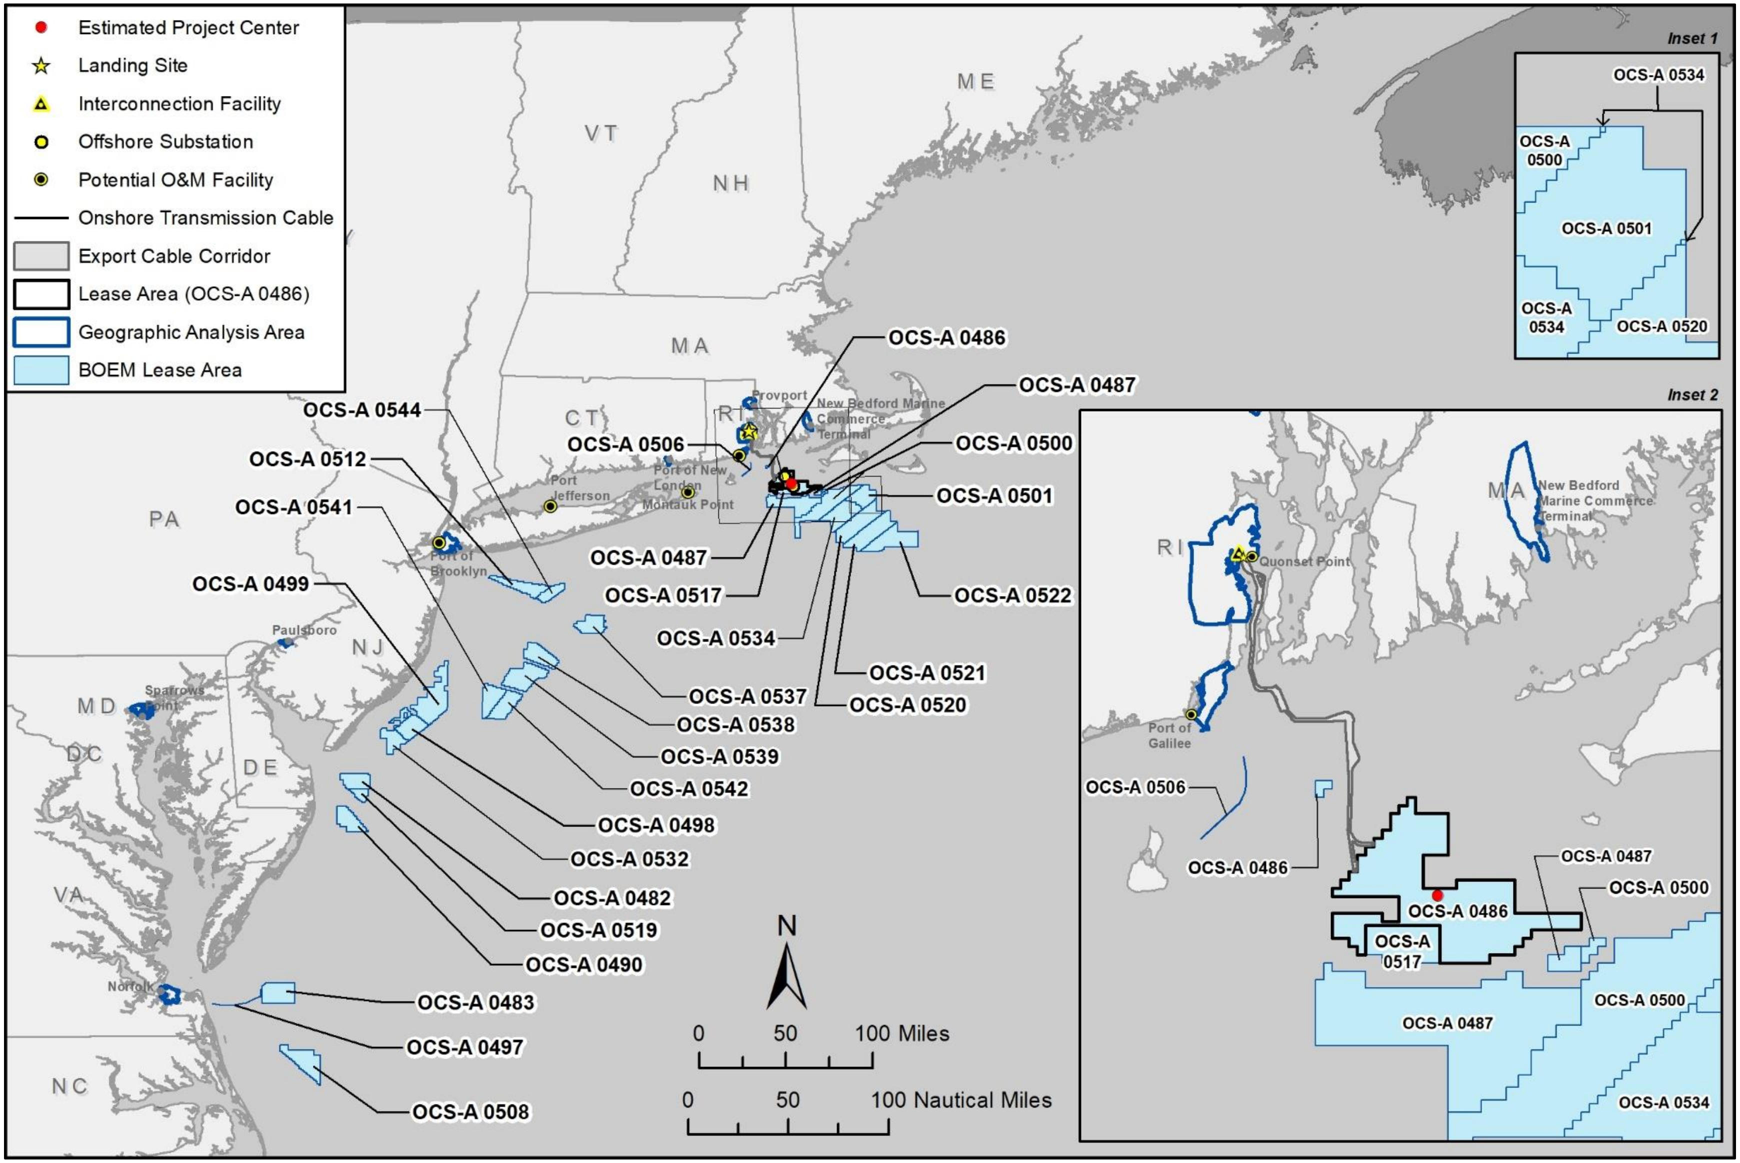

**Figure 3.14-1. Geographic analysis area for land use and coastal infrastructure.**

An OnSS and ICF would be constructed to support interconnection to the existing Davisville Substation, which is located within the Quonset Business Park in North Kingstown. The Davisville Substation operates at 115 kV and connects to the regional transmission grid via two 115-kV transmission tap lines. The existing substation is within North Kingstown Assessor's Plat 179 Lot 005. The OnSS location is on the north side of Camp Avenue in an undeveloped area. The Town of North Kingstown has designated the undeveloped area as a planned village development that is surrounded by the Quonset Business Park District (Town of North Kingstown, Rhode Island 2021a). The RWEC would enter the landfall work area underground, pass through the TJBs, and continue underground as the onshore transmission cable to the OnSS. The connection cables running from the OnSS to the ICF would be underground. The cables connecting from the ICF to the existing Davisville Substation would be the only aboveground and overhead cables (VHB 2023a).

The Port of Davisville at Quonset Point, a port located in North Kingstown, is a former naval air station that was subsequently redeveloped into a modern industrial park (Interface Studio 2019). The industrial park, known as Quonset Point/Davisville Business Park, is on a peninsula in Narragansett Bay. The port is a multimodal transportation area with deepwater piers used for both shipping and ship repairs, an airport with the longest runway in the state, freight and passenger rail facilities, and interstate highway connections. The availability of a variety of industrially zoned land with full-service networks provides opportunities for new industries (Maguire Group, Inc. 2008). The Port of Davisville at Quonset Point is served by Rhode Island Route 403 and a railroad spur from Amtrak's Northeast Corridor, along with freight service provided by the Providence and Worcester Railroad. It is also the home of the Port of Davisville at Quonset Point, a golf course, four public beaches, ferry service to Martha's Vineyard, and two museums.

Other port facilities in New York, Rhode Island, Connecticut, Virginia, Massachusetts, Maryland, and New Jersey could also support construction of the RWF and offshore components of the RWEC (see COP Table 3.3.10-1). These ports are generally industrial in character and are typically adjacent to other industrial or commercial land uses and major transportation corridors. Before construction begins, Revolution Wind would finalize mobilization plans and arrangements at port facilities to support Proposed Action activities, including logistic support for fabrication, as needed (VHB 2023a). See Section 3.9, Section 3.11, and Section 3.18 for discussions of recreational vessel and commercial fishing activity in these ports.

### 3.14.2 Environmental Consequences

#### 3.14.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

The analysis presented in this section considers the impacts resulting from the maximum design scenario under the PDE approach developed by BOEM to support offshore wind project development (Rowe et al. 2017). The maximum design size specifications defined in Appendix D, Table D-1, are PDE parameters used to conduct this analysis. Several project parameters could change during the development of the final project configuration, potentially reducing the extent and/or intensity of impacts resulting from the associated IPFs.

The following design parameters would result in reduced impacts relative to those generated by the design elements considered under the PDE:

- The use of a casing pipe method to construct the RWEC sea-to-shore transition would eliminate the need for a temporary cofferdam, resulting in less extensive acoustic and vibration impacts than vibratory pile driving to construct a cofferdam thus reducing onshore noise and vibration impacts to coastal land uses (Zeddies 2021).
- The selection of an 8-MW WTG design would reduce the total WTG height from 873 to 648 feet, reducing the visual impact of the facility on coastal land uses.
- The selection of an alternate route for the onshore component of the RWEC could alter the location and increase or decrease the extent of construction-related ground disturbance, but the nature and overall significance of these impacts on land use would remain unchanged.

See Appendix E2 for a summary of IPFs analyzed for land use and coastal resources across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Appendix E1, Table E2-13. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4, to facilitate reader comparison across alternatives.

Table 3.14-1 provides a summary of IPF findings carried forward for analysis. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion. This comparison considers the implementation of all EPMs proposed by Revolution Wind to avoid and minimize adverse impacts on land use. These EPMs are summarized in Appendix F, Table F-1.

A detailed analysis of the Proposed Action is provided following the table. A detailed analysis of other considered action alternatives is also provided below the table if the analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component.

The Conclusion section within each alternative analysis discussion includes rationale for the effects determinations. Overall, impacts to land use and coastal infrastructure from any action alternative would be **minor** adverse because they would be small, and the resource would be expected to recover completely with no mitigating action required.

**Table 3.14-1. Alternative Comparison Summary for Land Use and Coastal Infrastructure**

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| Accidental releases and discharges | **Offshore**: Future offshore activities could result in accidental releases of trash or water quality contaminants (see Section 3.21 for quantities and details). These impacts, however, would generally be localized and short term. On this basis, the effects of accidental releases and discharges on land use under the No Action Alternative would be long term and **minor** adverse. | **Offshore**: Accidental releases and discharges of fuels, lubricants, and hydraulic fluids could occur during the construction and installation phase. Accidental releases would be minimized by containment and cleanup measures detailed in the emergency response plan/OSRP. Therefore, there would be a **negligible** adverse impact from accidental releases and discharges on land use and coastal infrastructure.<br>The Proposed Action and other reasonably foreseeable projects would be expected to comply with any applicable permit requirements to implement erosion, stormwater, and spill controls to minimize, reduce, or avoid impacts on water and air quality. As a result, the Proposed Action when combined with past, present, and other reasonably foreseeable projects would result in **negligible** adverse cumulative impacts on land use and coastal infrastructure because there would be no impact on land use and coastal infrastructure. | **Offshore**: Alternative C to F would require fewer vessel trips relative to the Proposed Action, reducing the risk of accidental releases and discharges from vessels. However, given the likelihood of such releases is low, the difference in level of risk would likely be undetectable. Likewise, risk of accidental releases and discharges could be slightly reduced from the reduced risk of vessel collisions/allisions. Because accidental releases and discharges in the offshore environment of the scale anticipated are not expected to measurably impact land use and coastal infrastructure, these impacts would similarly be **negligible** adverse. | | | | **Offshore**: Alternative G would require fewer vessel trips relative to the Proposed Action, reducing the risk of accidental releases and discharges from vessels. However, given the likelihood of such releases is low, the difference in level of risk would likely be undetectable. Likewise, risk of accidental releases and discharges could be slightly reduced from the reduced risk of vessel collisions/allisions. Because accidental releases and discharges in the offshore environment of the scale anticipated are not expected to measurably impact land use and coastal infrastructure, these impacts would similarly be **negligible** adverse. |
| | **Onshore**: Future onshore activities could result in accidental releases of trash or water quality contaminants (see Section 3.21 for quantities and details). These impacts, however, would generally be localized and short term. On this basis, the effects of accidental releases and discharges on land use under the No Action Alternative would be long term and **minor** adverse. | **Onshore**: Although accidental releases and discharges could impact land use and coastal infrastructure by introducing air or water quality contamination into areas undergoing construction and installation, O&M and decommissioning, it is anticipated that containment would prevent or mitigate discharges before they can impact land uses. Therefore, there would be a temporary, **negligible** adverse impact due to accidental releases and discharges on land use and coastal infrastructure. | **Onshore**: Alternatives C through F would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from accidental releases and discharges would be the same as the Proposed Action: **negligible** adverse. | | | | **Onshore**: Alternative G would consist of the same onshore facilities and activities as those described for the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from accidental releases and discharges would be the same as the Proposed Action: **negligible** adverse. |
| Light | **Offshore**: Permanent aviation warning lighting on any offshore wind WTGs proposed as part of future offshore wind activities would be visible from south-facing beaches and coastlines. However, land use would not be expected to be measurably changed, nor would light itself impact land uses or alter land use patterns. On this basis, the effects of light on land use under the No Action Alternative would be long term and **minor** adverse. | **Offshore**: There would be a temporary increase in the amount of lighting during construction and installation due to the presence of work vessels. Given that offshore elements of the Proposed Action would be located approximately 12 to 15 miles from shore, it is anticipated that there would be very little lighting impact on land use and coastal infrastructure from construction and installation of offshore elements of the Proposed Action. Therefore, there would be a temporary, **negligible** adverse light impact on land use and coastal infrastructure. | **Offshore**: Although Alternatives C through F could result in a slight reduction in construction lighting, the effects of this IPF on land use and coastal infrastructure would otherwise be similar to the Proposed Action, ranging from **negligible** adverse to **minor** adverse. | | | | **Offshore:** Although Alternative G could result in a slight reduction in construction lighting, the effects of this IPF on land use and coastal infrastructure would otherwise be similar to the Proposed Action, ranging from **negligible** adverse to **minor** adverse. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | | During operations, offshore structures would require lighting that conforms to FAA and BOEM guidelines, and USCG requirements. The visibility of WTGs and potentially the OSSs would result in a small impact to onshore land uses and coastal infrastructure by increasing light in the offshore environment that could be visible onshore and could slightly increase visible light in coastal communities. Decommissioning impacts would be similar to impacts from the Proposed Action construction and installation. Therefore, there would be a long-term, **minor** adverse light impact on land use and coastal infrastructure from O&M and decommissioning of offshore elements of the Proposed Action.<br>The Proposed Action and other reasonably foreseeable projects would be expected to comply with applicable permit conditions and lighting requirements to minimize, reduce, or avoid light impacts on onshore land uses and coastal infrastructure. Therefore, the cumulative impact would be **negligible** adverse. | | | | | |
| | **Onshore:** Future offshore activities could result in onshore lighting associated with supporting infrastructure for offshore wind development. These lighting sources would be minor adverse and short term in nature. On this basis, the effects of light on land use under the No Action Alternative would be long term and **minor** adverse**.** | **Onshore**: Nighttime lighting could have a temporary adverse impact on land use and coastal infrastructure by increasing artificial lighting that could be visible by residences and businesses nearby.<br>Operational lighting onshore would be limited to the OnSS and ICF. In general, lighting would be minimal and directed downward. Lighting would be removed as part of decommissioning. Therefore, there would be a long-term, **minor** adverse light impact on land use and coastal infrastructure from construction, O&M, and decommissioning of onshore elements of the Proposed Action.<br>Temporary and permanent lighting would require compliance with local development regulations at the port facilities and locations where reasonably foreseeable future projects would experience onshore lighting impacts. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse on land use and coastal infrastructure. | **Onshore:** Alternatives C through F would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from lighting would be the same as the Proposed Action: **minor** adverse. | | | | **Onshore**: Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from lighting would be the same as the Proposed Action: **minor** adverse. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action)<br>Up to 100 WTGs | Alternative C<br>(Habitat Alternative)<br>64 or 65 WTGs | Alternative D<br>(Transit Alternative)<br>78 to 93 WTGs | Alternative E<br>(Viewshed Alternative)<br>64 or 81 WTGs | Alternative F<br>(Higher Capacity Turbine Alternative)<br>56 WTGs | Alternative G<br>(Preferred Alternative)<br>65 WTGs |
|---|---|---|---|---|---|---|---|
| New Cable Emplacement/Maintenance | **Onshore**: Future offshore activities could result in onshore land disturbances to accommodate supporting cable infrastructure for offshore wind development. Onshore, neighboring or adjacent land to cable placement could also temporarily be disturbed by future offshore wind project–related noise, vibration, and dust, as well as travel delays along impacted roads. All construction and operational impacts from land disturbance would be regulated through local land use and zoning regulations and would therefore comply with applicable laws. On this basis, the effects of land disturbance on land use under the No Action Alternative would be short term and **negligible** adverse. | **Onshore**: All Proposed Action–related construction and installation would take place within areas zoned for industrial and commercial development and would be subject to land use and zoning regulations that limit impacts. Therefore, there would be a short-term, **minor** adverse land disturbance impact on land use and coastal infrastructure.<br>Once installed, the onshore components of the RWEC would be located underground and disturbed areas would be restored to preconstruction conditions or improved. Due to the temporary and intermittent nature of O&M activities, O&M of onshore facilities would have a **negligible** adverse impact on land use over the 35-year lifespan of the Project.<br>The Project and other reasonably foreseeable future projects would be required to comply with local land use and zoning regulations, which would reduce impacts to land use and coastal infrastructure. Therefore, cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse on land use and coastal infrastructure. | **Onshore**: Alternatives C through F would consist of the same onshore facilities and activities as those planned under the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from new cable emplacement/maintenance would be the same as the Proposed Action, ranging from **negligible** adverse to **minor** adverse. | | | | **Onshore**: Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from new cable emplacement/maintenance would be the same as the Proposed Action, ranging from **negligible** adverse to **minor** adverse. |
| Noise | **Offshore**: Future offshore wind activities could result in increased noise during the construction and installation phases. These noise impacts would be subject to state and local noise regulations and ordinances. On this basis, the effects of noise on land use under the No Action Alternative would be long term and **negligible** adverse. | **Offshore**: Although offshore noise associated with the Proposed Action construction could be audible onshore, it would be below ambient noise levels and therefore would have a minimal impact on land use and coastal infrastructure. Therefore, there would be a temporary, **negligible** adverse noise impact on land use and coastal infrastructure.<br>There would be no noise impacts on land use and coastal infrastructure from O&M of offshore facilities. Therefore, the impact on land use and coastal infrastructure from O&M and decommissioning of offshore elements of the Proposed Action would be **negligible** adverse.<br>Noise associated with the Project and reasonably foreseeable offshore wind activities are not expected to generate noise levels that would be audible onshore. Therefore, the cumulative impacts associated with the Proposed Action when combined with past, present, and | **Offshore**: Under Alternatives C through F, fewer monopiles would be constructed and installed. Although Alternatives C through F could result in a slight reduction in construction noise, the effects of this IPF on land use and coastal infrastructure would otherwise be similar to the Proposed Action. Therefore, the impact on land use and coastal infrastructure would be **negligible** adverse, which is the same impact determination as the Proposed Action. | | | | **Offshore**: Under Alternative G, fewer monopiles would be constructed and installed. Although this alternative could result in a slight reduction in construction noise, the effects of this IPF on land use and coastal infrastructure would otherwise be similar to the Proposed Action. Therefore, the impact on land use and coastal infrastructure would be **negligible** adverse. |

| | | reasonably foreseeable activities would be **negligible** adverse. | | | | | |
| | **Onshore**: Future offshore activities could result in onshore noise associated with clearing and grading, construction and installation of aboveground and underground utility infrastructure and impervious surfaces, and other disturbances. These noise sources would be **minor** adverse and short term in nature. | **Onshore**: Noise and traffic would result from construction and installation of the onshore facilities. EPMs would minimize, but not eliminate, noise effects on surrounding land uses. However, these effects would be short term and generally consistent with noise impacts associated with general development under zoned land uses (VHB 2023b). Therefore, there would be short term, **minor** adverse noise impact on land use and coastal infrastructure from construction and installation of onshore elements of the Proposed Action.<br>Noise generated by onshore facilities and O&M and decommissioning activities would be managed under existing local ordinances and regulations as permitted for the approved zoning. As such, noise impacts on land use from the O&M and decommissioning of onshore facilities would have a **negligible** adverse effect on land use.<br>It is expected that noise impacts generated by other planned and foreseeable future actions would similarly be consistent with local ordinances applicable to zoned land uses. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would have a **negligible** adverse effect on land use and coastal infrastructure. | **Onshore**: Alternatives C through F would consist of the same onshore facilities and activities as those planned under the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from noise would be the same as the Proposed Action, ranging from **negligible** adverse to **minor** adverse. | | | | **Onshore**: Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to land use and coastal infrastructure from noise would be the same as the Proposed Action, ranging from **negligible** adverse to **minor** adverse. |

### 3.14.2.2 Alternative A: Impacts of the No Action Alternative on Land Use and Coastal Infrastructure

#### 3.14.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for land use and coastal infrastructure (see Section 3.14.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.14.2.2.2 Cumulative Impacts

This section discloses potential land use and coastal infrastructure impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E2.

<u>Accidental releases and discharges:</u> Future offshore and onshore activities could result in accidental releases of trash or water quality contaminants (see Section 3.21 for quantities and details). Trash and contaminant spills would be minimized by vessel compliance with USCG regulations. In the event of a spill, adjacent properties and coastal infrastructure could be temporarily restricted. The exact extent of restrictions and other impacts would depend on the locations of landfall, substations, and cable routes, as well as the ports used to support future offshore wind energy projects. These impacts, however, would generally be localized and short term. On this basis, the effects of accidental releases and discharges on land use under the No Action Alternative would be long term and **minor** adverse.

<u>New cable emplacement/maintenance:</u> Future offshore activities could result in onshore land disturbances to accommodate supporting cable infrastructure for offshore wind development. Land disturbance impacts would largely be limited to the construction and installation phase of any such projects and would be localized in nature.

Onshore, neighboring or adjacent land to cable placement could temporarily be disturbed by future offshore wind project–related noise, vibration, and dust, as well as travel delays along impacted roads. The simultaneous construction and installation of two or more onshore development projects and/or landing sites and onshore cable routes would generate cumulative short-term impacts to land use. State and local agencies would be responsible for managing actions to help minimize and avoid noise, air quality, and other impacts on nearby neighborhoods during construction and installation. All construction and operational impacts from land disturbance would be regulated through local land use and zoning regulations and would therefore comply with applicable laws. On this basis, the effects of land disturbance on land use under the No Action Alternative would be short term and **negligible** adverse**.**

<u>Light:</u> Future offshore activities could result in onshore lighting associated with supporting infrastructure for offshore wind development. These lighting sources would be minor adverse and short term in nature. All construction and operational impacts from land disturbance would be regulated through local land use and zoning regulations and would therefore comply with applicable laws. On this basis, the effects of light on land use under the No Action Alternative would be long term and **minor** adverse**.**

Permanent aviation warning lighting on any offshore wind WTGs proposed as part of future offshore wind activities would be visible from south-facing beaches and coastlines. Visibility would depend on distance from shore, topography, and atmospheric conditions but would be long term. If this lighting alters visitor behavior, land use in the form of tourism, recreation, and property values could subsequently be impacted. Lighting from substations could also affect the adjacent property use and residential development. However, new substations constructed as part of future offshore wind activities would likely be constructed near existing energy infrastructure or where land development regulations, such as zoning and land use plan designations, allow such uses. Therefore, land use would not be expected to be measurably changed, nor would light itself impact land uses or alter land use patterns. On this basis, the effects of light on land use under the No Action Alternative would be long term and **minor** adverse**.**

Noise: Future offshore activities could result in onshore noise associated with clearing and grading, construction and installation of aboveground and underground utility infrastructure and impervious surfaces, and other disturbances. These noise sources would be **minor** adverse and short term in nature.

Future offshore wind activities could result in increased noise during the construction and installation phases. Given the location of these projects within the RI/MA WEA (see Figure 1.1-2), there would be no noise impacts on land use from construction and installation, O&M, and decommissioning of the offshore components of future offshore wind activities. Future offshore wind activities could result in onshore noise impacts during construction and installation, O&M, and decommissioning of onshore elements of future offshore wind activities due to increased construction, traffic, dust, vibration, and other impacts. These noise impacts would be subject to state and local noise regulations and ordinances and therefore would have limited adverse impacts on land use due to the impacts occurring under regulatory thresholds. On this basis, the effects of noise on land use under the No Action Alternative would be long term and **negligible** adverse.

#### 3.14.2.2.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on land use and coastal infrastructure associated with the Project would not occur. However, ongoing and future offshore wind activities would have continuing temporary to long-term impacts on land use and coastal infrastructure, primarily through onshore construction and installation and port activities.

BOEM anticipates that impacts for reasonably foreseeable offshore wind activities would be **minor** adverse. Impacts for ongoing activities and reasonably foreseeable activities other than offshore wind would be **minor** adverse, as discussed in Appendix E, Table E2-13. Accidental releases, electromagnetic fields (EMF), land disturbance, light, noise, and port utilization could have temporary adverse impacts on local land uses, but as a whole, ongoing use and development would support the region’s diverse mix of land uses and provide support for continued maintenance and improvement of coastal infrastructure.

Considering all the IPFs together, BOEM anticipates that the impacts associated with future offshore wind activities in the GAA, combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind, would result in **minor** adverse impacts because the overall effect would be localized and short term.

### 3.14.2.3 Alternative B: Impacts of the Proposed Action on Land Use and Coastal Infrastructure

#### 3.14.2.3.1 Construction and Installation

##### Offshore Activities and Facilities

Accidental releases and discharges: Accidental releases and discharges of fuels, lubricants, and hydraulic fluids could occur during the construction and installation phase. These impacts are covered in Section 3.21. A draft OSRP has been prepared for the Project and consists of processes for rapid spill response, containment, cleanup, and other measures that would help minimize impacts on water quality from spills. A release during construction and installation of the Proposed Action would generally be localized, short term, and **minor** adverse, resulting in little change to water quality.

Offshore accidental releases and discharges during construction and installation would not result in land use and coastal infrastructure impacts, as incorporation of water quality EPMs described in Appendix F would aid in reducing the chances of accidental releases and discharges; accidental releases and discharges would be contained and mitigated according to federal, state, and local law. Applicable EPMs in Appendix F include compliance with regulatory requirements related to the prevention and control of spills and discharges, implementation of an OSRP to manage accidental spills or releases of oils or other hazardous materials, and compliance with USCG and EPA regulations. Therefore, potential offshore accidental releases and discharges would be unlikely to result in onshore land use and coastal infrastructure impacts, as these impacts would be mitigated prior to any impacts affecting onshore resources. Therefore, there would be a **negligible** adverse impact from accidental releases and discharges on land use and coastal infrastructure during construction and installation of offshore elements of the Proposed Action, as there would be no effect from offshore accidental releases and discharges on land use and coastal infrastructure.

Light: There would be a temporary increase in the amount of lighting during construction and installation due to the presence of work vessels. In general, lights would be required on offshore platforms and structures, vessels, and construction equipment during construction and installation of the RWF. In addition, temporary work lighting would illuminate work areas on vessel decks or service platforms of adjacent WTGs or OSS platforms during nighttime construction. Project construction lighting would meet USGS requirements, when required by federal regulations.

The RWEC would also require USCG-approved navigation lighting for all vessels during construction and installation of the RWEC. All vessels operating between dusk and dawn would be required to turn on navigation lights. Cable laying could occur 24 hours a day during certain periods, and these vessels would be illuminated at night for safe operations. Given that offshore elements of the Project would be located approximately 12 to 15 miles from shore, it is anticipated that there would be very little lighting impact on land use and coastal infrastructure from construction and installation of offshore elements of the Project. Therefore, there would be a temporary, **negligible** adverse light impact on land use and coastal infrastructure from construction and installation of offshore elements of the Proposed Action.

Noise: Construction and installation of offshore elements of the Project would result in increased noise. The proposed Project would be approximately 15 miles west of the town of New Shoreham, Rhode Island, (Block Island) and 15 to 20 miles south of several other coastal towns in Rhode Island including South Kingstown, Narragansett, Jamestown, Newport, Middletown, and Little Compton. The Project would be approximately 12 miles east/southeast of Martha's Vineyard, Massachusetts, and 13 to 16 miles south of other coastal towns in Massachusetts such as Westport, Dartmouth, and Gosnold. The maximum pile-driving noise from construction and installation of offshore Project elements audible from coastal towns would be 11.2 dBA, which is below ambient noise levels at towns in the vicinity, which range from 25 to 45 dBA during the night and 35 to 55 dBA during the day (VHB 2020). Although offshore noise associated with the Proposed Action could be audible onshore, it would be below ambient noise levels and therefore would have a minimal impact on land use and coastal infrastructure. Therefore, there would be a temporary, **negligible** adverse noise impact on land use and coastal infrastructure from construction and installation of offshore elements of the Proposed Action.

### Onshore Activities and Facilities

Accidental releases and discharges: Installation of the RWEC at the landfall location would use an HDD approach to install the cables under the beach and intertidal water areas. The use of drilling fluid, which typically consists of a water and bentonite mud mixture or another non-toxic drilling fluid, would be required. Bentonite is a natural clay that is mined from the earth. Although these fluids are considered non-toxic, Revolution Wind would implement applicable EPMs listed in Appendix F during construction to minimize potential releases of the drilling fluid associated with HDD activities.

Solid wastes and construction debris would be generated predominately during construction and installation of onshore facilities. Per requirements outlined in 30 CFR 585.626, maximum quantities of and disposal methods for liquids and solid wastes, including hazardous materials, are summarized in COP Section 3.3.9.4 for construction. COP Table 3.3.1-2 also outlines maximum quantities of disposal methods for liquids and solid wastes, including hazardous materials for the OnSS. A spill prevention control and countermeasures plan would be developed in support of NPDES compliance and the potential for discharges and releases from onshore construction and installation would be governed by Rhode Island regulations and the Project's COP. It is anticipated that construction and installation of the OnSS would generate approximately 3,000 cy of solid waste that would be disposed of in a landfill and/or recycling center (VHB 2023a).

In accordance with applicable federal, state, and local laws, comprehensive measures would be implemented prior to and during construction and installation activities to avoid, minimize, and mitigate impacts related to trash and debris disposal. Construction and installation of onshore elements could result in accidental releases and discharges of solid wastes and construction debris that could impact land use; however, the Project would implement applicable EPMs (see Appendix F) and comply with federal, state, and local regulations to reduce the impacts to land use and coastal infrastructure. Some of the EPMs listed in Appendix F include containing drilling fluids for later reuse, creating an HDD contingency plan and SESC plan, and compliance with the RIPDES General Permit for Stormwater Discharges associated with Construction Activities.

Although accidental releases and discharges could impact land use and coastal infrastructure by introducing air or water quality contamination into areas undergoing construction and installation, containment measures outlined above would prevent or mitigate discharges before they can impact land uses. Therefore, there would be a temporary, **negligible** adverse impact due to accidental releases and discharges on land use and coastal infrastructure from construction and installation of onshore elements of the Proposed Action.

<u>New cable emplacement/maintenance:</u> Airborne noise, vibration and dust, and increased vehicle traffic associated with construction and installation of the RWEC landing site and onshore export cable components would temporarily disturb neighboring land uses along the RWEC route. Portions of the development footprint could also be fenced and inaccessible at various points during construction and installation. Construction and installation activities causing these impacts consist of HDD for the RWEC, preparation and installation of TJBs that connect the RWEC and onshore transmission cable, and installation of the onshore transmission cable.

The onshore transmission cable would be installed within an underground duct bank between the TJBs and the OnSS and would be installed within or along previously disturbed areas including the shoulders of existing public roadways, lands owned by Quonset Development Corporation, and private properties. The onshore transmission cable would result in 3.1 acres (1.3 hectares) of land disturbance but would be located outside wetlands and other waterbodies. The landfall work area would require clearing, grading, and hardening to support the installation of the TJBs and would temporarily result in up to 3.1 acres (1.3 ha) of land disturbance. The TJBs would be excavated and installed underground within the landfall work area and access inside the TJBs would be provided by manholes. Therefore, land disturbance associated with the TJB area would be temporary. As discussed above, the onshore transmission cable, landfall work area, and TJBs would result in temporary impacts only. In addition, work would be sited in uplands and all activities would be conducted in compliance with the RIPDES General Permit for the Discharge of Stormwater Associated with Construction Activities and an approved SESC plan. Therefore, with the implementation of the EPMs outlined in Appendix F, land disturbance activities during construction and installation of the onshore transmission cable are expected to result in direct and short-term water quality impacts (VHB 2023a).

Construction and installation of the Project’s onshore components would require construction staging in parking lots adjacent to or near the landing site. Although most of the construction staging would occur on private property, construction could reduce public parking available at the Blue Beach parking lot during construction and installation. These disturbances would be short term, with construction expected to begin in Quarter 1 of 2023 and last approximately 8 months (see COP Section 3.2). Construction along public roadways would be completed in a matter of days or weeks. At the landing site, the Project would make the physical connection between the offshore RWEC and the onshore RWEC in two underground TJBs. The only long-term, visible components of the cable system would be the manhole covers (VHB 2023c).

Onshore construction and installation would include trench excavation and placement of the onshore RWEC within existing paved roads. Revolution Wind would abide by local construction ordinances. Construction and installation would occur primarily during normal daylight hours except for certain activities associated with cable installation at the chosen landing site (VHB 2023c) that could require nighttime activity to meet rapid construction timelines and to reduce the chances of equipment failure. Revolution Wind would work with the Town of North Kingstown to develop a detailed plan that includes traffic and other control measures prior to beginning major construction. The traffic plan with North Kingstown would identify appropriate alternative routes that would accommodate projected traffic loading during construction and installation activities. BOEM assumes that the Project would avoid permanent disruption to existing underground utilities, such as water, sewer, and electrical lines. However, depending on the exact placement of the onshore RWEC cable, the physical size and location of the cable could hamper future installation of public utilities such as water, sewer, and stormwater lines, which are typically placed beneath roadway travel lanes. Vehicular and construction equipment emissions would be similar to those described for offshore development. The potential impacts from construction and diesel-generating equipment would be reduced through EPMs related to fuel-efficient engines and dust control plans, as outlined in Section 3.4.1.

All Project-related construction and installation would take place within areas zoned for industrial and commercial development and would be subject to land use and zoning regulations that limit impacts. Therefore, there would be a short-term, **minor** adverse land disturbance impact on land use and coastal infrastructure from construction and installation of onshore elements of the Proposed Action.

Light: Most onshore construction and installation would be completed during daytime hours. Typical construction work hours for the Project would be 7:00 a.m. to 6:00 p.m. Monday through Friday when daylight permits and 7:00 a.m. to 5:00 p.m. on Saturdays. This is consistent with the Town of North Kingstown noise ordinance (Town Code Article VI). However, some work tasks, such as concrete pours, landfall installation, and cable pulling or splicing, once started, require completion without interruption and could go beyond normal work hours. In addition, the nature of transmission line construction and installation requires line outages for certain procedures such as transmission line connections, equipment cutovers, or stringing under or over other transmission lines. These outages are dictated by ISO New England and can be very limited based on regional system load and weather conditions. Work requiring scheduled outages and crossings of certain transportation and utility corridors may be required on a limited basis outside of normal work hours, including Sundays and holidays.

For nighttime construction and installation work, portable floodlights with a maximum height of approximately 18 feet would be used. All lights on portable lightstands would be downward facing. Any nighttime lighting used during construction and installation would comply with safety and security and local requirements.

Construction equipment, the OnSS, the ICF, and structures within the TNEC ROW would be visible during construction and installation. Although construction is expected to take place primarily during the daylight hours between 7:00 a.m. and 6:00 p.m., some temporary lighting may be required outside those hours. Certain activities associated with cable installation at the chosen landing site (VHB 2023a) could require nighttime activity and lighting to meet rapid construction timelines and to reduce the chances of equipment failure. Nighttime lighting could have a temporary adverse impact on land use and coastal infrastructure by increasing artificial lighting that could be visible by residences and businesses nearby. Therefore, there would be a temporary, **minor** adverse light impact on land use and coastal infrastructure from construction and installation of onshore elements of the Proposed Action.

Noise: Noise and traffic would result from construction and installation of the onshore facilities. As described within the *Onshore Acoustic Assessment* in COP Appendix P2, long-term ambient sound measurements conducted within the proposed layout of the onshore facilities ranged from 44 to 45 dBA (Leq) at night (10:00 p.m. to 7:00 a.m.) and from 49 to 50 dBA during the day (7:00 a.m. to 10:00 p.m.) (VHB 2023b). Operation of construction equipment and construction-related traffic would increase the ambient noise between the typical construction hours of 7:00 a.m. and 6:00 p.m. during the approximately 1-year construction period. The onshore facilities construction noise sources would include equipment used to support the HDD operations at the landfall work area, equipment used to support trenching and cable pulling, and construction vehicles such as excavators, dump trucks, and paving equipment (VHB 2023b).

Temporary construction and facility installation noise would be consistent with noise sources typically associated with a working industrial park. Short-term construction noise impacts would be generated during HDD onshore for the RWEC. A cofferdam could be used to ensure a dry environment during construction and installation and to manage sediment and would align with HDD exit pits. If the cofferdam is required, the cofferdam could be installed as either a sheet piled structure into the seafloor or a gravity cell structure placed on the seafloor using ballast weight. If the cofferdam is installed using sheet pile, a vibratory hammer would be used to drive the sidewalls and endwalls into the seafloor. Installation of the sheet pile cofferdam could take approximately up to 14 days. Noise associated with possible sheet pile installation would produce the maximum amount of noise compared to other construction methods. In general, noise generated by RWEC construction and installation activities would occur during daytime hours (7:00 a.m. to 8:30 p.m.), and would be largely generated by an excavator, crane, and sheet pile driver. If the HDD methodology is selected for construction of the RWEC, HDD operations would occur continuously to minimize the risk of soil settlement and equipment failures and would create noise during nighttime hours (VHB 2023b). Noise generated by construction and installation activities is expected to comply with the Town of North Kingstown noise code. The closest residences to the construction and installation of the onshore transmission cable, ICF, and OnSS are the residences on the south side of Camp Avenue and east side of Mill Creek Drive, which are within a few hundred feet of the construction area. The *Onshore Acoustic Assessment* in COP Appendix P2 (VHB 2023b) analyzes onshore construction noise and found that sound levels around the onshore transmission cable, ICF, and OnSS would be between 40 and 45 dB at residences along the south side of Camp Avenue and east side of Mill Creek Drive, which would be below ambient levels, measured between 44 and 45 dBA (Leq) at night and 49 to 50 dBA during the day at the time of the analysis.

During construction and installation of the onshore elements of the RWEC, construction noise could approach or exceed the Town of North Kingstown’s noise code limit for construction and installation activities at receptors immediately adjacent to the road ROW. EPMs for onshore construction and installation activities include coordination with local governments and compliance with appropriate local ordinances governing noise, light, and traffic impacts consistent with zoned land uses (see Appendix F). These EPMs would minimize, but not eliminate, noise effects on surrounding land uses. However, these effects would be short term and generally consistent with noise impacts associated with general development under zoned land uses. Therefore, there would be short term, **minor** adverse noise impact on land use and coastal infrastructure from construction and installation of onshore elements of the Proposed Action.

#### 3.14.2.3.2 Operations and Maintenance and Decommissioning

### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> The WTGs and OSSs would be designed to contain any potential leakage of fluids, thereby preventing the discharge fluids into the ocean. During WTG operations, small accidental leaks could occur because of broken hoses, pipes, or fasteners. During WTG maintenance, small releases could occur during servicing of hydraulic units or gearboxes. Any accidental leaks within the WTGs would be contained within the hub and main bed frame or tower. During operations, the only

discharges to the sea that are anticipated are those associated with vessels performing maintenance. (see Appendix D of the COP) (VHB 2023a). Decommissioning impacts would be similar to construction and installation impacts discussed above. Any offshore leakage of fluids would not impact land use and coastal infrastructure due to the design feature of WTGs to capture accidental releases and discharges and because implementation of EPMs in Appendix F would minimize the potential for spills. Therefore, there would be a **negligible** adverse impact from accidental releases and discharges on land use and coastal infrastructure from O&M and decommissioning of offshore elements of the Proposed Action.

Light: During operations, offshore structures would require lighting that conforms to FAA and BOEM guidelines, and USCG requirements. BOEM has indicated that offshore lighting should meet standard specifications in FAA Advisory Circulars 70/7460-1L, Change 2 (FAA 2018), and 150/5345-43H (FAA 2016), and USCG standards for marine navigation lighting.

Lighting associated with the Proposed Action would follow lighting and marking design parameters as identified in BOEM's draft proposed *Guidelines for Providing Information on Lighting and Marking of Structures Supporting Renewable Energy Development*, released April 2021 (BOEM 2021). Control, lighting, marking, and safety systems would be installed on each WTG; the specific systems would vary depending on the turbine selected and would be reviewed as part of the federal approval process.

Offshore turbines must be visible not only to pilots in the air, but also mariners navigating on water. In daylight, offshore wind turbines do not require lighting if the tower and components are painted white. The FAA and USCG consider white-colored turbines to be the most effective early warning technique for both pilots and mariners (Patterson 2005). Marine navigation lighting is regulated by the USCG through 33 CFR 67. Structures must be fitted with lights for nighttime periods. The OSSs would be lit and marked in accordance with FAA and USGS requirements for aviation and navigation obstruction lighting, respectively. Lighting on the RWEC during the O&M phase would be short term and limited to the lighting required on vessels while operating along the corridor. As described above for RWF construction and installation, USCG-approved navigation lighting is required for all vessels operating between dusk and dawn.

Although WTGs and the OSSs would be lit, only a relatively small portion of the onshore locations would have open views of the Project. A viewshed analysis of the Project determined that only 44.9 square miles of land within the 6,113 square mile visual study area could have potential views of the Project from ground level (EDR et al. 2023). The visibility of WTGs and potentially the OSSs would result in a small impact to onshore land uses and coastal infrastructure by increasing light in the offshore environment that could be visible onshore and could slightly increase visible light in coastal communities. Decommissioning impacts would be similar to impacts from Project construction and installation. Therefore, there would be a long-term, **minor** adverse light impact on land use and coastal infrastructure from O&M and decommissioning of offshore elements of the Proposed Action.

Noise: There would be no noise impacts on land use and coastal infrastructure from O&M of offshore facilities. Operational noise would not be audible onshore. Decommissioning impacts would be similar to impacts from Project construction and installation. Therefore, because there would be no effect, the impact on land use and coastal infrastructure from O&M and decommissioning of offshore elements of the Proposed Action would be **negligible** adverse.

### Onshore Activities and Facilities

Accidental Releases and Discharges: The OnSS and ICF would require various oils, fuels, and lubricants to support its operations (see COP Table 3.3.1-2 and COP Table 3.3.1-3). Equipment would be mounted on concrete foundations with concrete secondary fluid containment designed for 110% containment and in accordance with industry and local utility standards. With EPMs, accidental release and discharge impacts to land use and coastal infrastructure from onshore O&M would be minimal. Decommissioning would incur similar impacts to those during the construction and installation phase. Therefore, there would be a temporary, **negligible** adverse impact from accidental releases and discharges on land use and coastal infrastructure from O&M and decommissioning of onshore elements of the Proposed Action due to implementation of containment measures and compliance with industry and utility standards.

New cable emplacement/maintenance: Once installed, the onshore components of the RWEC would be located underground, and disturbed areas would be restored to preconstruction conditions or improved. Buried Project features would have no effect on adjacent land uses or coastal infrastructure. Revolution Wind has designed the Project to account for site-specific oceanographic and meteorological conditions within the analysis area, effectively avoiding the potential for beach erosion to expose the RWEC at the sea to shore transition zone.

Due to the temporary and intermittent nature of O&M activities, O&M of onshore facilities would have a **negligible** adverse impact on land use over the 35-year lifespan of the Project.

Impacts during decommissioning would be similar to the impacts during construction and installation. For onshore decommissioning, any removal of the underground, onshore cables (if not decommissioned in place) could result in temporary construction disturbances and delays along the affected roads and near the landing sites. The length and extent of these delays would be shorter in duration compared to those experienced during installation. However, all O&M activities would be consistent with local land use and zoning regulations and would be typical activities associated with industrial and commercial land uses. Therefore, there would be a temporary, **negligible** adverse land disturbance impact on land use and coastal infrastructure from decommissioning of onshore elements of the Proposed Action.

Light: Operational lighting onshore would be limited to the OnSS and ICF. Lighting at these facilities would include 1) yard lighting and 2) task lighting. Both categories would be switched lights and would only be used during yard-based activity. The mounting heights for the lighting would range from 10 to 25 feet off the ground, and the lights would be mounted on lamp posts, substation buildings, fire walls, or steel substation structures. The wattage for the individual lamps would range from 35 to 300 watts depending on the use. Operational lighting for the OnSS and ICF would comply with Quonset Development Corporation lighting regulations and would be mounted with the lamp horizontal to the ground (light facing straight down) or with a lamp tilt no more than 25° from the horizon. The task lighting at both the OnSS and ICF would support emergency maintenance or repairs to the station equipment outside of normal business hours. The task lights would be mounted to direct light toward substation equipment to ensure adequate lighting for workers to perform emergency maintenance or repairs.

Considering the presence of an existing electrical substation and industrial uses of the area, new lighting associated with the OnSS and ICF could adversely affect residences directly adjacent to these facilities. These effects could be reduced through the use of EPMs such as visual screening. Lighting for the OnSS and ICF would be designed to the minimum standard necessary for substation safety and security per utility operational requirements, as well as state and local regulations. General yard lighting would be provided within the OnSS and ICF area for assessment of equipment. In general, yard lighting would be off at night unless lighting is necessary for in-progress site work or for safety and security.

In general, lighting would be minimal and directed downward. Lighting would be removed as part of decommissioning. Therefore, there would be a long-term, **minor** adverse light impact on land use and coastal infrastructure from O&M and decommissioning of onshore elements of the Proposed Action.

Noise: Operational noise of the underground cables is expected have no impacts to current land uses because there would be no permanent noise-generating equipment associated with the onshore transmission cable. The OnSS and ICF, as designed, would generate sound similar to or below existing ambient sound levels; therefore, operational noise levels would have a direct but small impact on land use and coastal infrastructure. The proposed OnSS would introduce new sources of sound including transformers, shun reactors, harmonic filters, and cooling and ventilation associated with the outdoor substation equipment, as well as condensers, pumps, skids, and auxiliary transformers associated with the synchronous condenser building. Sound from the substation would be 43.9 dBA or lower at the closest noise sensitive receptors, which would be below the EPA guideline for noise exposure (48.6 dBA Leq) and below the Town of North Kingston, Rhode Island, nighttime noise ordinance limit for residential properties (50 dBA). Operational sound from the OnSS would also be below 50 dBA at the nearest residential property lines and below 70 dBA at the nearest commercial/industrial property lines, which is below the noise ordinance noise limits (VHB 2023b). O&M vehicles and certain maintenance activities performed during O&M could also periodically generate noise audible to surrounding land uses throughout the life of the Project; generated noise would be similar to typical traffic noise and noise from general construction and installation activities. These continuous and intermittent impacts would be permanent. Noise generated by onshore facilities and O&M activities would be managed under existing local ordinances and regulations as permitted for the approved zoning. Given this, noise impacts on land use from the O&M of onshore facilities would have a **negligible** adverse effect on land use. Decommissioning would generate noise similar to that during the construction and installation phase. Therefore, there would be a long-term **negligible** adverse noise impact on land use and coastal infrastructure from O&M and decommissioning of onshore elements of the Proposed Action.

#### 3.14.2.3.3 Cumulative Impacts

#### Offshore Activities and Facilities

Accidental releases and discharges: The Proposed Action and other reasonably foreseeable future projects could result in accidental release of contaminants, trash, and debris that could add to releases from other reasonably foreseeable projects. The combined offshore accidental release impacts on land use and coastal infrastructure could increase the risk of and potential impacts from accidental releases in the GAA. The Proposed Action and other reasonably foreseeable projects would be expected to comply with any applicable permit requirements to implement erosion, stormwater, and spill controls to minimize, reduce, or avoid impacts on water and air quality. Land use and coastal infrastructure would be unlikely to be impacted by offshore accidental releases, as accidental releases would be mitigated offshore. As a result, the Proposed Action when combined with past, present, and other reasonably foreseeable projects would result in **negligible** adverse cumulative impacts on land use and coastal infrastructure because there would be no impact on land use and coastal infrastructure.

Light: The Proposed Action would add permanent lighting for up to 102 WTGs and two OSSs. Although this lighting would be visible, in part, from south-facing beaches and coastlines, this represents a small but noticeable (3%) increase over total estimated WTG and OSS foundations providing long-term lighting under the No Action Alternative if all projected offshore wind projects are constructed. BOEM estimates a maximum cumulative total of 3,190 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects. The land use impacts from the Proposed Action in the context of reasonably foreseeable future actions would be more extensive than impacts for the Proposed Action alone. However, the Proposed Action and other reasonably foreseeable projects would be expected to comply with applicable permit conditions and lighting requirements to minimize, reduce, or avoid light impacts on onshore land uses and coastal infrastructure. Therefore, the cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be similar to those impacts described under the No Action Alternative and would be **negligible** adverse impacts.

Noise: There would be no noise impacts on land use and coastal infrastructure from offshore facilities. Noise associated with construction and installation, O&M, and decommissioning would not be audible onshore. Similarly, reasonably foreseeable activities are not expected to generate noise levels that would be audible onshore. Therefore, the cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be similar to those impacts described under the No Action Alternative, which are described as having no onshore impacts from offshore facilities and would be **negligible** adverse impacts.

### Onshore Activities and Facilities

Accidental releases and discharges: Installation of the RWEC at the landfall location would use an HDD approach to install the cables under the beach and intertidal water areas. Discharge of drilling fluids, solid wastes, and construction debris is possible during construction and installation. Additionally, discharge of oils, fuels, and lubricants is possible at the OnSS and ICF during Project operations and during maintenance activities. The Project would implement EPMs (see Appendix F) and comply with federal, state, and local regulations to reduce the impact to land use and coastal infrastructure. Reasonably foreseeable future projects would also require the construction of onshore facilities at identified ports along the Atlantic coast. Installation of onshore elements of reasonably foreseeable future projects could also result in the discharge of drilling fluids, solid wastes, construction debris, lubricants, oils, fuels, and other hazardous materials during construction, installation, and decommissioning. In context of reasonably foreseeable future actions, the combined offshore accidental release impacts on land use and coastal infrastructure could increase the risk of and potential impacts from accidental releases in the GAA. Other reasonably foreseeable actions would also be required to implement EPMs and adhere to federal, state, and local regulations to ensure that accidental releases and discharges are minimized and mitigated appropriately. Therefore, cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable future activities would be **negligible** adverse on land use and coastal infrastructure.

<u>New cable emplacement/maintenance:</u> The Proposed Action would result in increased onshore land disturbance during the construction and installation phase of the Project. It would result in temporary increases in construction noise, vibration and dust, and intermittent delays in travel along impacted roads. O&M activities would include periodic inspections and repairs at cable access manholes, which would require minimal use of worker vehicles and construction equipment. Reasonably foreseeable projects are expected to also result in land disturbances consistent with the Proposed Action in terms of scale, intensity, and duration at the ports and other facilities across the Atlantic Coast where these projects are expected to occur. Assuming that new substations for future offshore wind projects would be in locations designated for industrial or utility uses, and underground cable conduits would primarily be co-located with roads or other utilities, operation of substations and cable conduits would not affect the established and planned land uses for a local area. Additionally, the Project and other reasonably foreseeable future projects would be required to comply with local land use and zoning regulations, which would reduce impacts to land use and coastal infrastructure. Therefore, cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse on land use and coastal infrastructure.

<u>Light:</u> There would be temporary and permanent light impacts under the Proposed Action. Temporary lighting impacts would occur with Project construction, installation, and decommissioning. While most onshore construction and installation would be completed during daytime hours, some tasks could extend beyond daylight work hours and would require the use of portable floodlights that would face downward. There would also be long-term permanent light impacts associated with O&M. Operational lighting would be limited to the OnSS and ICF. All operational lighting would be required to comply with Quonset Development Corporation lighting regulations. Other reasonably foreseeable projects would also generate onshore lighting impacts similar in nature to the Proposed Action. While many of these lighting impacts would be short term and temporary during Project construction and installation, some lighting associated with onshore facilities would be permanent, resulting in long-term lighting impacts in the vicinity of the OnSS and ICF. Temporary and permanent onshore lighting impacts are expected during construction, installation, O&M, and decommissioning of reasonably foreseeable future projects, including any port upgrades at port facilities described in Appendix E. These impacts are expected to be similar in scale to the lighting impacts for the Proposed Action but distributed across port facilities along the Atlantic coast. Temporary and permanent lighting would require compliance with local development regulations at the port facilities and locations where reasonably foreseeable future projects would experience onshore lighting impacts. Therefore, cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse on land use and coastal infrastructure.

<u>Noise:</u> There would be noise impacts associated with the construction and installation of the Proposed Action. Construction and installation would be limited to daylight hours and noise impacts would consist of noise generated from heavy equipment used for clearing, grading, excavation, foundation installation, and heavy lifting of substation components. Noise modeling conducted for operations of the OnSS (VHB 2023b) indicates that predicted noise levels would be below the minimum disturbance thresholds specified by code (Article VI, Sec. 8-87[a]) (Town of North Kingstown, Rhode Island 2021b). No permanent noise-generating equipment would be associated with the onshore transmission cable, resulting in no impacts to current land uses from operational noise. The OnSS and ICF, as designed, would generate sound similar to or below existing ambient sound levels, as described in Section 3.14.2.2.2;

therefore, operational noise levels would have a direct but small impact on land use and coastal infrastructure by increasing noise levels in the vicinity of onshore elements of the Proposed Action. Additionally, O&M and maintenance vehicles could result in increased noise in the vicinity when maintenance is being performed. However, all equipment and O&M activities would be designed for and consistent with zoned land uses and appropriate ordinance restrictions, as described in Section 3.14.2.2.2. It is expected that noise impacts generated by other planned and foreseeable future actions would be generally similar to those generated under the Proposed Action, and those actions would similarly manage impacts consistent with local ordinances applicable to zoned land uses. Therefore, cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable future activities would have a **negligible** adverse effect on land use and coastal infrastructure.

#### 3.14.2.3.4 Conclusions

Proposed Action construction, installation, and decommissioning would temporarily generate noise, vibration, and vehicular traffic. Impacts during O&M would be expected to be similar, but in lower duration and extent. Therefore, BOEM expects the overall impact on land use and coastal infrastructure from the Proposed Action alone to be **minor** adverse. Proposed Action O&M would also generate long-term, **minor** beneficial impacts by supporting designated uses at ports and potentially promoting port improvements and/or redevelopment, though no port improvements are currently proposed as part of the Project.

Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to land use and coastal infrastructure. BOEM made this call because, although port use during construction and installation could result in moderate adverse impacts, the overall effect when impacts are considered over the entire GAA and analysis duration would be small and the resource would be expected to recover completely.

### 3.14.2.4 Alternatives C, D, E, and F

Table 3.14-1 provides a summary of IPF findings for these alternatives.

#### 3.14.2.4.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and possibly reduce the miles of IAC, these changes would not measurably affect land use and coastal infrastructure. Therefore, BOEM expects that the impacts to land use and coastal infrastructure resulting from the alternative would be similar to the Proposed Action and would result in **minor** adverse and **minor** beneficial impacts, which is the same impact determination as the Proposed Action.

The overall impacts of Alternatives C through F when combined with past, present, and reasonably foreseeable activities would therefore be the same as the Proposed Action: **minor** adverse.

### 3.14.2.5 Alternative G: Impacts of the Preferred Alternative on Land Use and Coastal Infrastructure

Table 3.14-1 provides a summary of IPF findings for this alternative.

#### 3.14.2.5.1 Conclusions

Although Alternative G would reduce the number of WTGs and the miles of IAC, these changes would not measurably affect land use and coastal infrastructure. Therefore, BOEM expects that the impacts to land use and coastal infrastructure resulting from Alternative G would be similar to the Proposed Action and would result in **minor** adverse and **minor** beneficial impacts, which is the same impact determination as the Proposed Action.

### 3.14.2.6 Mitigation

No potential additional mitigation measures for land use and coastal infrastructure are identified in Table F-2 or F-3 in Appendix F.

# 3.15 Marine Mammals (see section in main EIS)

# 3.16 Navigation and Vessel Traffic (see section in main EIS)

# 3.17 Other Marine Uses (see section in main EIS for Scientific Research and Surveys)

## 3.17.1 Description of the Affected Environment for Other Marine Uses

Geographic analysis area: The GAAs for Other Marine Uses are as follows (Figure 3.17-1):

Aviation and air traffic: Airspace and airports used by regional air traffic.

Land-based radar: Includes air space used by regional traffic.

Marine mineral resources and dredged material disposal: Areas within 0.25 mile of the Project and footprints of other cables and wind lease areas in the RI/MA WEA.

Military and national security: An area roughly bounded by Montauk, New York; Providence, Rhode Island; Provincetown, Massachusetts; and within a 10-mile buffer from wind lease areas in the RI/MA WEA.

Offshore energy uses: Other known wind energy project locations.

Undersea cables: Area within 1 mile of the Project and other undersea facilities and wind lease areas in the RI/MA WEA.

These areas encompass locations where BOEM anticipates direct and indirect impacts associated with Project construction and installation, O&M, and decommissioning. The scientific research survey area encompasses the locations where scientific research and surveys are anticipated to occur.

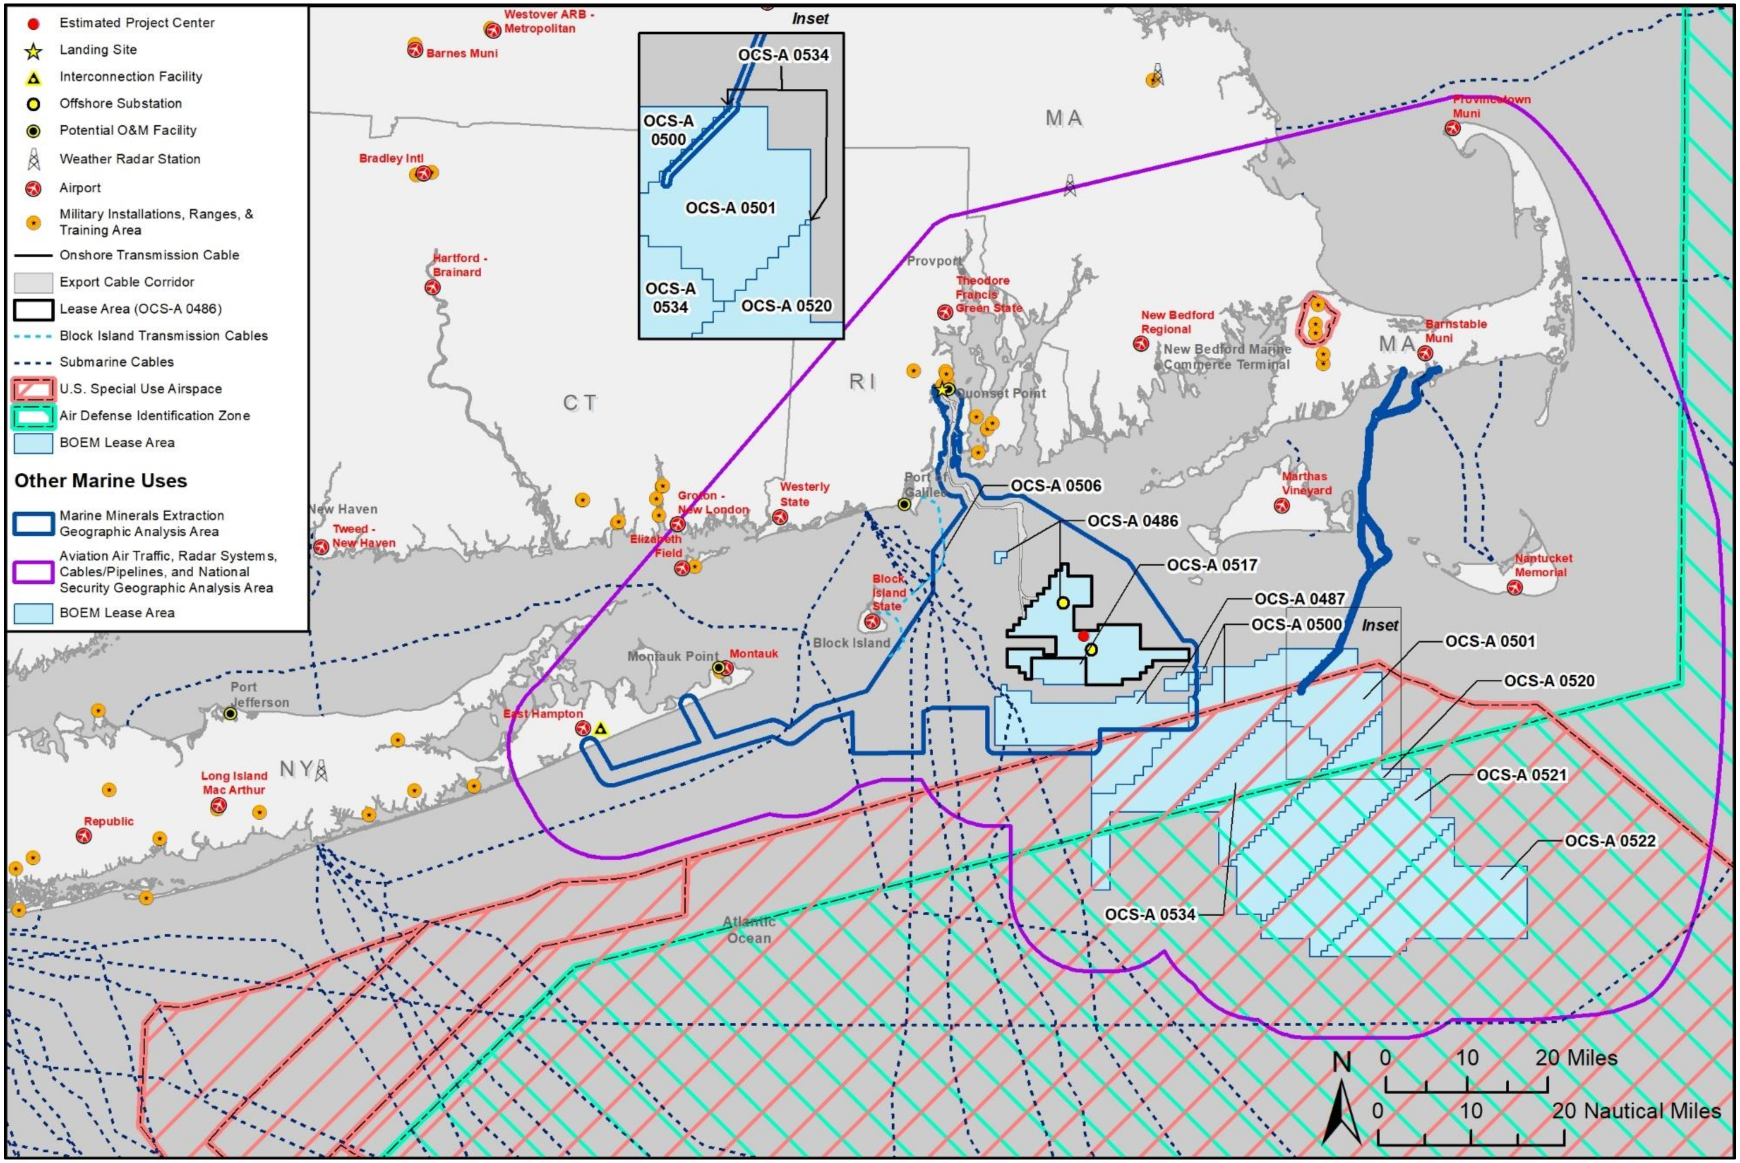

**Figure 3.17-1. Geographic analysis areas for other marine uses.**

#### 3.17.1.1 Aviation and Air Traffic

<u>Affected environment:</u> Numerous public and private airports serve portions of New York, Rhode Island, and Massachusetts in the GAA. Major airports serving the region include Boston Logan International Airport, located approximately 100 miles northeast of the Project; T.F. Green Airport in Providence, Rhode Island, located approximately 50 miles north of the Project; and Montauk Airport in Montauk, New York, approximately 30 miles west of the RWF and 9 miles north of the offshore RWEC. The closest public airports to the Project are Nantucket Memorial Airport, approximately 55 miles east on Nantucket; Martha's Vineyard Airport, approximately 32 miles northeast on Martha's Vineyard; and Block Island State Airport, approximately 20 miles west on Block Island.

#### 3.17.1.2 Land-Based Radar

<u>Affected environment:</u> Several radar systems supporting commercial air traffic control, national defense, weather forecasting, and ocean condition observation operate near the Project (Westslope Consulting, LLC [Westslope] 2021). Six high-frequency (HF) airport surveillance radar (ASR) sites are located near the Project: Boston ASR-9, Falmouth ASR-8, Nantucket ASR-9, North Truro ARSR-4, Providence ASR-9, and Riverhead ARSR-4. The study area is beyond the instrumented range of the Boston ASR-9.

Three navigational aid sites are near the Project: Martha's Vineyard VOR/DME, the Providence VOR/DME, and Sandy Point VOR/DME. Two NEXRAD weather radar systems, the Boston WSR-88D and Brookhaven WSR-88D, are located near the Project.

There are 13 HF radar sites located near the Project:

- Amagansett HF radar (operated by Rutgers University)
- Block Island Long Range HF radar (two radars operated by the University of Rhode Island and Rutgers University)
- Camp Varnum HF radar (operated by Woods Hole Oceanographic Institution)
- Horseneck Beach State Reservation HF radar (operated by Woods Hole Oceanographic Institution)
- Long Point Wildlife Refuge HF radar (operated by Woods Hole Oceanographic Institution)
- Martha's Vineyard HF radar
- Moriches HF radar (operated by Woods Hole Oceanographic Institution)
- Martha's Vineyard Coastal Observatory (MVCO) Meteorological Mast HF radar (operated by Woods Hole Oceanographic Institution)
- Nantucket Island HF radar (two radars operated by Rutgers University and Woods Hole Oceanographic Institution).
- Nauset HF radar (operated by the University of Massachusetts Dartmouth)
- Squibnocket Farms HF radar (operated by Woods Hole Oceanographic Institution)

#### 3.17.1.3 Military and National Security

Affected environment: The U.S. Navy, the USCG, and other military entities have numerous facilities in the region. Major onshore regional facilities include Naval Station Newport, the Naval Submarine Base New London, the Northeast Range Complex/Narragansett Bay Operation Area, Joint Base Cape Cod, and numerous USCG stations (Epsilon Associates, Inc. 2018). Onshore and offshore military use areas could have designated surface and subsurface boundaries and special use airspace. The Project is entirely within the Navy's Narragansett Operating Area in which national defense training exercises and system qualification tests are routinely conducted (MARCO 2021). This operating area extends approximately 100 miles south and 200 miles east of the Project. The Project is approximately 10 miles north of a Military Special Use Airspace (FK Facility Narragansett Bay) and 20 miles northeast of the closest submarine transit lanes. A DOD assessment of compatibility of offshore wind development with military assets and activities determined that potential conflicts exist in the area surrounding the Project and could require site-specific mitigation measures (OCM 2019).

#### 3.17.1.4 NOAA's Scientific Research and Surveys (see section in main EIS)

#### 3.17.1.5 Undersea Cables

Affected environment: There are existing submarine cables that run through the regional waters. Most pass through Green Hill, Rhode Island. In addition, there are NOAA nautical chart cable and pipeline areas that denote where such infrastructure may be located. The existence of these areas does not necessarily mean that actual cables or pipeline are present (BOEM 2013). Other than cables for other offshore wind projects, BOEM has not identified any publicly noticed plans for additional submarine cables or pipelines; therefore, no new cable installation is reasonably foreseeable for the purposes of this EIS.

### 3.17.2 Environmental Consequences

#### 3.17.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

The analysis presented in this section considers the impacts resulting from the maximum design scenario under the project design envelope (PDE) approach developed by BOEM to support offshore wind project development (Rowe et al. 2017). The maximum design size specifications defined in Appendix D, Table D-1, are PDE parameters used to conduct this analysis.

The following design parameters would result in different impacts relative to those generated by the design elements considered under the PDE:

- The selection of lower capacity WTG designs would reduce the total WTG height from 873 to as low as 648 feet, reducing impacts to aviation and air traffic, land-based radar, and military and national security.

See Appendix E1 for a summary of IPFs analyzed for other marine uses across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Appendix E1, Tables E2-15 to E2-21. Other marine uses subsections (NOAA's scientific research and surveys) are discussed in the main EIS.

Table 3.17-1 provides a summary of IPF findings carried forward for analysis in this section. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion. This comparison considers the implementation of all EPMs proposed by Revolution Wind to avoid and minimize adverse impacts on other marine uses. These EPMs are summarized in Appendix F, Table F-1.

A detailed analysis of the Proposed Action is provided following the table. Detailed analysis of other considered action alternatives is also provided below the table if analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4, to facilitate reader comparison across alternatives.

The Conclusion section within each alternative analysis discussion includes rationale for the effects determinations. The overall effect determination for each alternative is **minor** adverse impacts for aviation and air traffic; **moderate** adverse for land-based radar; **moderate** adverse for military uses; and **negligible** adverse for undersea cables.

*This page intentionally left blank.*

**Table 3.17-1. Alternative Comparison Summary for Other Marine Uses**

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| **Aviation and Air Traffic** | | | | | | | |
| Aviation and air traffic | **Offshore:** Future offshore wind activities without the Proposed Action could result in increased air traffic due to the use of helicopters and other aircraft during construction and installation, O&M, and decommissioning of future wind projects. With implementation of FAA-approved flight plans, however, impacts of the No Action Alternative on aviation and air traffic would be **negligible** adverse. | **Offshore:** The Proposed Action would result in an increase in air traffic related to construction and installation of offshore Project elements. A helicopter route plan would be developed to meet industry guidelines and best practices in accordance with FAA guidance. Additionally, all aviation operations, including flying routes and altitude, would be aligned with relevant stakeholders, such as the FAA. On this basis, the effects of Project-related aviation and air traffic on aviation and air traffic under the Proposed Action would be **minor** adverse.<br>Helicopter flights for Project O&M would represent a 0.1% increase in annual helicopter flight hours and a 0.01% increase in general aviation hours in the GAA. When estimation uncertainty is considered, this represents a **negligible** adverse effect on general aviation air traffic.<br>The Proposed Action and reasonably foreseeable future wind projects would be required to engage the FAA in flight planning to avoid impacts to civilian, commercial, government, and military aviation operations. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable project impacts would result in **negligible** adverse impacts on aviation and air traffic. | **Offshore:** This alternative could require fewer construction and O&M–related helicopter trips due to the reduction in the number of offshore elements, incrementally reducing the number of construction-related helicopter trips. While Alternatives C to F could result in slightly reduced air traffic, the effects of this IPF on aviation and air traffic under each alternative would otherwise be similar to those described for the Proposed Action: **minor** adverse for construction and **negligible** adverse for O&M and cumulative impacts. | | | | **Offshore:** Alternative G could require fewer construction and O&M–related helicopter trips due to the reduction in the number of offshore elements and shorter IAC. Although this alternative could result in slightly reduced air traffic, the effects of this IPF on aviation and air traffic would otherwise be similar to the Proposed Action: **minor** adverse for construction and **negligible** adverse for O&M and cumulative impacts. |
| Light | **Offshore:** Future offshore wind activities without the Proposed Action would result in an increase in permanent aviation warning lighting on WTGs offshore. The addition of up to 1,015 lighted structures represents a small increase in the combined vessel, navigation, housing, and port lights within the GAA; therefore, the effects of light on aviation and air traffic under the No Action Alternative would be **minor** adverse. | **Offshore:** During construction and installation and O&M, WTGs would be marked with appropriate lighting to meet FAA warning guidelines and would be visible on the radar systems of low-flying aircraft, similar to other large-scale sea surface activity. Therefore, impacts to aviation and air traffic would be **negligible** adverse.<br>BOEM estimates a maximum cumulative total of up to 1,117 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the RI/MA WEA. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidelines to minimize collision and allision risks. WTGs would also be visible on aircraft radar. Therefore, the cumulative impacts associated with the Proposed Action when combined with past, | **Offshore:** Under Alternatives C through F, fewer lighted WTG locations would be approved by BOEM when compared to the maximum-case scenario under the Proposed Action. However, this slight reduction in lighting would not be expected to measurably reduce aviation and air traffic impacts compared to those impacts described under the Proposed Action. Therefore, the impact on aviation and air traffic under each alternative would be **negligible** adverse for all Project phases. | | | | **Offshore:** Under Alternative G, fewer lighted WTG locations would be approved by BOEM when compared to the maximum-case scenario under the Proposed Action. However, this slight reduction in lighting would not be expected to measurably reduce aviation and air traffic impacts compared to the Proposed Action. Therefore, the impact on aviation and air traffic would be **negligible** adverse for all Project phases. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | | present, and reasonably foreseeable activities would have a **negligible** adverse impact on aviation and air traffic. | | | | | |
| | **Onshore:** See offshore analysis. | **Onshore:** Operational lighting onshore would be limited to the OnSS and ICF, which would have minimal yard lighting and task lighting. This lighting is minimal and would not result in impacts to aviation and air traffic. Decommissioning would have impacts similar to those during Project construction. Therefore, the effects of light on aviation and air traffic under the Proposed Action would be **negligible** adverse. | **Onshore:** Alternatives C through F would consist of the same onshore facilities and activities as those planned under the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** adverse. | | | | **Onshore**: Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** adverse. |
| Port utilization | **Offshore:** Port improvements and construction activities in or near ports may also require alteration of navigation patterns at nearby airports. However, vessel traffic would also be spread among multiple ports to ensure sufficient capacity exists at each port and in each waterway. Therefore, port utilization is expected to have a **negligible** adverse effect on aviation and air traffic. | **Offshore:** Port improvements and construction activities in or near ports may require alteration of navigation patterns at nearby airports. However, vessel traffic would also be spread among multiple ports to ensure that sufficient capacity exists at each port and in each waterway. Therefore, port utilization is expected to have a **negligible** adverse effect on aviation and air traffic. | **Offshore:** Alternatives C through F would require a shorter construction duration, a smaller construction footprint, and fewer offshore structures. While Alternatives C through F could result in a slight reduction in port utilization, the effects of this IPF on aviation and air traffic under Alternatives C through F would otherwise be similar to those described for the Proposed Action and would therefore be **negligible** adverse for all Project phases**.** | | | | **Offshore:** Alternative G would require a shorter construction duration, a smaller construction footprint, and fewer offshore structures. Although Alternative G could result in a slight reduction in port utilization for all Project phases, the effects of this IPF on aviation and air traffic would otherwise be similar to the Proposed Action and would therefore be **negligible** adverse. |
| | **Onshore:** See offshore analysis. | **Onshore:** Ports would be primarily used during construction and installation of the Proposed Action, as ports would be used for staging WTGs and mobilizing construction work. Decommissioning would have impacts similar to those during Project construction. There would be no impacts to aviation and air traffic from O&M and decommissioning of the Proposed Action; therefore, impacts would be **negligible** adverse.<br>Cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse on aviation and air traffic. | **Onshore:** Alternatives C through F would consist of the same onshore facilities and activities as those planned under the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** to **minor** adverse. | | | | **Onshore:** Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** to **minor** adverse. |
| Presence of structures | **Offshore:** Future offshore wind development could add up to 1,015 structures to the offshore environment in the GAA. BOEM assumes that offshore wind project operators would coordinate with aviation interests throughout the planning, construction and installation, O&M, and decommissioning process to avoid or | **Offshore:** The Proposed Action would add up to 100 WTGs with maximum blade tip heights of up to 853 feet amsl. The addition of these structures would increase navigational complexity and could change aircraft navigation patterns for aircraft flying at low altitudes and for airports in the vicinity, increasing collision risks for some aircraft during the Proposed Action's operational time frame. However, more than 90% of existing air traffic in the GAA would | **Offshore:** Under Alternatives C through F, fewer WTG locations would be approved by BOEM, which would result in a noticeably smaller offshore impact compared to the maximum-case scenario under the Proposed Action. The effects of this IPF would be the same or slightly reduced to those described for the Proposed Action and would therefore be **negligible** adverse for construction and O&M, and **minor** adverse for cumulative impacts. | | | | **Offshore:** Under Alternative G, fewer WTG locations would be approved by BOEM, which would result in a noticeably smaller offshore impact compared to the maximum-case scenario under the Proposed Action. The effects of this IPF would be the same or slightly reduced to those described for the Proposed Action and would therefore be **negligible** |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | minimize impacts on aviation activities and air traffic. For this reason, the effects of the increased presence of structures to aviation and air traffic under the No Action Alternative are anticipated to be **minor** adverse. | occur at altitudes that would not be impacted by the presence of WTGs (BOEM 2021). Therefore, the effects of the presence of structures on aviation and air traffic under the Proposed Action would be **negligible** adverse.<br>BOEM estimates a cumulative total of up to 1,117 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the RI/MA WEA. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable Project impacts would result in a **minor** adverse impact on aviation and air traffic. | | | | | adverse for construction and O&M, and **minor** adverse for cumulative impacts. |
| | **Onshore:** See offshore analysis. | **Onshore:** The O&M of onshore structures to support the Proposed Action would not impact aviation and air traffic. This IPF would result in a **negligible** adverse impact because there would be no effect on this resource. | **Onshore:** Alternatives C through F would consist of the same onshore facilities and activities as those planned under the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** adverse. | | | | **Onshore**: Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** adverse. |
| Vessel traffic | **Offshore:** Vessel traffic is expected to have a **negligible** adverse effect on aviation and air traffic because vessel traffic would be spread throughout a large geographic area, and while construction time frames may overlap, it is anticipated that the slight increase in vessel traffic would not impact aviation and air traffic. | **Offshore:** Vessel traffic associated with the Proposed Action would result in increased vessel traffic in the Lease Area and around ports. Construction of offshore structures would incrementally noticeably increase navigational complexity along transit routes between ports and construction sites, and locally around ports, due to increased vessel traffic. Increased vessel traffic is expected to have a **negligible** adverse effect on aviation and air traffic because vessel traffic would be spread throughout a large geographic area and would occur over a short period of time.<br>Vessel traffic associated with the Proposed Action and reasonably foreseeable future actions would result in increased vessel traffic in the GAA. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable project impacts would result in a **minor** adverse impact on aviation and air traffic. | **Offshore:** Under Alternatives C through F, fewer WTG locations would be approved by BOEM. Construction and installation vessel traffic may result in slightly reduced vessel traffic in the Lease Area and around ports given the smaller offshore footprint. Reduced navigational complexity combined with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to those described for the Proposed Action. Therefore, impacts would be **negligible** adverse for construction and O&M and **minor** adverse for cumulative impacts. | | | | **Offshore**: Under Alternative G, fewer WTG locations would be approved by BOEM. Construction and installation vessel traffic may result in slightly reduced vessel traffic in the Lease Area and around ports given the smaller offshore footprint. Reduced navigational complexity combined with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to the Proposed Action. Therefore, impacts would be **negligible** adverse for construction and O&M and **minor** adverse for cumulative impacts. |
| | **Onshore:** See offshore analysis. | **Onshore:** Onshore vehicle traffic may increase as a result of O&M and decommissioning of the Proposed Action but would not impact aviation and air traffic because aviation and air traffic uses are generally spatially separate from vehicular traffic and occur in different locations. Therefore, this IPF would result in a **negligible** adverse impact because minimal increases in vehicle traffic would not impact aviation and air traffic. | **Onshore:** Alternatives C through F would consist of the same onshore facilities and activities as those planned under the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** adverse. | | | | **Onshore:** Alternative G would consist of the same onshore facilities and activities as the Proposed Action. Therefore, onshore impacts to aviation and air traffic from Project activities would be **negligible** adverse. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| **Military and National Security (including search and rescue)** | | | | | | | |
| Anchoring and new cable emplacement/ maintenance | **Offshore:** Offshore energy facility construction of new cable emplacement and maintenance of cables would involve increased vessel traffic, which could impact military and national security uses by increasing the number of vessels within the GAA. Increased vessel traffic due to anchoring and cable maintenance of wind facilities could lead to course changes of military vessels, thereby increasing navigational complexity and risk of collisions. However, these impacts are expected to be limited as cable emplacement vessels would be restricted to emplacement corridors and activities would be of short duration for future offshore wind activities. Therefore, the effects of anchoring and new cable emplacement and maintenance under the No Action Alternative on military and national security would be **negligible** adverse. | **Offshore:** Anchoring and mooring activities would involve increased vessel traffic, which could impact military and national security uses by increasing the number of vessels within the GAA. However, the impacts are expected to be limited as cable emplacement vessels would be restricted to emplacement corridors and activities would be of short duration during construction and installation of offshore Project elements. Therefore, the effects of anchoring and new cable emplacement and maintenance under the Proposed Action on military and national security would be **negligible** adverse.<br>Project activities combined with reasonably foreseeable activities would result in a substantive and appreciable increase in vessel traffic during cable emplacement and maintenance, contributing to a **minor** adverse impact on military and national security. | **Offshore:** Because the impact would be slightly reduced regardless of the configuration selected, all offshore impacts under Alternatives C through F would be slightly reduced compared to the Proposed Action. The effects of this IPF would therefore be **negligible** to **minor** adverse. | | | | **Offshore:** Although the offshore footprint would be reduced, the effects of this IPF on military and national security uses under Alternative G would otherwise be similar to the Proposed Action. The effects of this IPF would therefore be **negligible** to **minor** adverse. |
| Aviation and air traffic | **Offshore:** Future offshore wind activities could result in increased air traffic due to the use of helicopters and other aircraft during construction and installation, O&M, and decommissioning of future wind projects. With implementation of FAA-approved flight plans, however, impacts of the No Action Alternative on military and national security would be **negligible** adverse. | **Offshore:** Construction and installation of the Proposed Action would result in a 7% increase in general aviation in the GAA. Therefore, the effects of this IPF on military and national security under the Proposed Action would be **minor** adverse.<br>O&M of the Proposed Action would result in a 0.01% increase in general aviation in the GAA. Therefore, the effects of this IPF on military and national security would be **negligible** adverse.<br>The Proposed Action and reasonably foreseeable future wind projects would be required to engage the FAA in flight planning to avoid impacts to civilian, commercial, government, and military aviation operations. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable project impacts would result in **minor** adverse impacts on military and national security. | **Offshore:** Alternatives C through F would require fewer construction and O&M–related helicopter trips due to the reduction in the number of offshore elements. However, the effects of this IPF on military and national security would otherwise be similar to those described for the Proposed Action: **negligible** adverse for O&M and **minor** adverse for construction and cumulative impacts. | | | | **Offshore:** Alternative G would require fewer construction and O&M–related helicopter trips due to the reduction in the number of offshore elements. However, the effects of this IPF on military and national security would otherwise be similar to the Proposed Action: **negligible** adverse for O&M and **minor** adverse for construction and cumulative impacts. |
| Light | **Offshore:** Future offshore wind activities would result in an increase in permanent | **Offshore:** The Proposed Action would result in an increase in temporary construction aviation warning | **Offshore:** Under these alternatives, fewer lighted WTG locations would be approved by BOEM. While Alternatives C through F could result in a reduction in construction lighting, | | | | **Offshore**: Under this alternative, fewer lighted WTG locations would be approved by BOEM. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |

| | delays at ports, and increased traffic along vessel transit routes. Therefore, the effects of vessel traffic on military and national security under the No Action Alternative would be **minor** adverse. | with military vessels. As a result, the effects of vessel traffic on military and national security uses under the Proposed Action would be **minor** adverse.<br>The Proposed Action represents approximately 2% of typical vessel traffic in the GAA. Therefore, the Proposed Action would result in a **minor** adverse impact for vessel traffic on military and national security. | structures would result in the effects of this IPF being the same or slightly reduced relative to those described for the Proposed Action. Therefore, impacts on military and national security would be **minor** adverse. | | | | with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to the Proposed Action. Therefore, impacts on military and national security would be **minor** adverse. |
| **Land-Based Radar** | | | | | | | |
| Presence of structures | **Offshore:** Construction of 1,015 structures in the RI/MA WEA could lead to long-term, **minor** adverse impacts to radar systems. However, these structures would be sited at such a distance from existing and proposed land-based radar systems to minimize interference to most radar systems. The final Massachusetts and Rhode Island port access route study (USCG 2020) concludes that general mitigation measures, such as properly trained radar operators, properly installed and adjusted vessel equipment, marked wind turbines, and the use of AIS all enable safe navigation with minimal loss of radar detection. | **Offshore:** Construction and installation and O&M of offshore Project components could result in impacts to land-based radar by introducing potential obstacles to radar coverage in the RI/MA WEA. The final Massachusetts and Rhode Island port access route study (USCG 2020) concludes that general mitigation measures, such as properly trained radar operators, properly installed and adjusted vessel equipment, marked wind turbines, and the use of AIS all enable safe navigation with minimal loss of radar detection. Therefore, the offshore Project components would result in **negligible** adverse impacts to land-based radar.<br>The Proposed Action and past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to land-based radar. | **Offshore:** Under Alternatives C through F, fewer WTG locations would be approved by BOEM. Because the impact would be slightly reduced regardless of configuration selected, all offshore impacts would be slightly reduced compared to the Proposed Action and would therefore be **negligible** to **minor** adverse. Radar line of sight backscatter effects may be altered or slightly reduced depending on which alternative configuration is selected, as all alternative configurations would reduce the number of WTGs. This could result in slightly reduced impacts to land-based radar at Falmouth ASR-8, Nantucket ASR-9, and the Providence ASR-9. | | | | **Offshore:** Under Alternative G, fewer WTG locations would be approved by BOEM. Because all offshore impacts would be slightly reduced compared to the Proposed Action, alternative impacts would therefore be **negligible** to **minor** adverse. Radar line-of-sight backscatter effects may be altered or slightly reduced because this alternative would reduce the number of WTGs. This could result in slightly reduced impacts to land-based radar at Falmouth ASR-8, Nantucket ASR-9, and the Providence ASR-9. |
| Vessel traffic | **Offshore:** Construction and operational vessel traffic from future offshore wind development is expected to increase. This could impact land-based radar by increasing the number of vessels in the analysis area. BOEM assumes that all offshore wind developments in the GAA would use the developer agreed upon 1 × 1–nm spacing that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This would allow more space for vessels to navigate and would help reduce potential interference on radar systems. As a result, the effects of vessel traffic on land-based radar under the No Action Alternative would be **minor** adverse. | **Offshore:** There would be increased construction and operational vessel and O&M traffic from the Proposed Action. This could impact land-based radar by increasing the number of vessels in the analysis area. The RWF's proposed 1 × 1–nm spacing would provide more space for vessels to navigate and would help reduce potential interference on radar systems. As a result, the effects of vessel traffic on land-based radar under the Proposed Action would be **negligible** adverse.<br>Reasonably foreseeable activities are expected to also generate vessel traffic that would increase the number of vessels in the RI/MA WEA. EPMs would reduce the cumulative impacts of increased vessel traffic to a **minor** adverse level. | **Offshore:** Vessel traffic associated with Alternatives C through F may result in slightly reduced vessel traffic in the Lease Area and around ports given the smaller offshore footprint Reduced navigational complexity combined with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to those described for the Proposed Action. Therefore, impacts on land-based radar would be **negligible** adverse for construction and O&M and **minor** adverse for cumulative impacts. | | | | **Offshore:** Vessel traffic associated with Alternative G may result in slightly reduced vessel traffic in the Lease Area and around ports given the smaller offshore footprint. Reduced navigational complexity combined with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to those described for the Proposed Action. Therefore, impacts on land-based radar would be **negligible** adverse for construction and O&M and **minor** adverse for cumulative impacts. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| **Undersea Cables** | | | | | | | |
| Presence of structures | **Offshore:** The future development of multiple wind energy projects could increase the complexity of undersea cable development by requiring routing around the facilities. Export cables are unlikely to preclude future undersea cable development because cable crossings can be protected using standard design techniques. Therefore, in the context of reasonably foreseeable environmental trends, the overall impacts from the presence of structures resulting from ongoing and planned actions are anticipated to be localized long term **negligible** because impacts can be avoided by routing design and standard cable protection techniques. | **Offshore:** The presence of the Project could preclude future submarine cable placement in the RWF and RWEC, although there are no future cables identified for location within this area. The impacts from foundation construction would be minor adverse while the installation of the RWECs would be **negligible** adverse. Once the foundations are constructed, impacts from foundation O&M and decommissioning would be **minor** adverse and O&M and decommissioning of RWECs would be **negligible** adverse. The overall impact from presence of structures on undersea cables would be **minor** adverse.<br>BOEM estimates a cumulative total of up to 1,117 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the RI/MA WEA. While these structures could increase the routing complexity of undersea cables associated, cable crossing can be protected using standard cable protections. The impacts from foundation construction from reasonably foreseeable future actions would be **negligible** adverse because impacts can be avoided by routing design and standard cable protection techniques. | **Offshore:** Because the impact would be slightly reduced regardless of configuration selected, all offshore impacts under Alternatives C through F would be slightly reduced compared to the Proposed Action. The effects of this IPF would be the same or slightly reduced relative to those described for the Proposed Action and would therefore be **negligible to minor** adverse for construction and O&M and **negligible** adverse for cumulative impacts. | | | | **Offshore:** Under Alternative G, fewer WTG locations would be approved by BOEM. Because all offshore impacts would be slightly reduced compared to the Proposed Action, the effects of this IPF would be the same or slightly reduced relative to the Proposed Action and would therefore be **negligible to minor** adverse for construction and O&M and **negligible** adverse for cumulative impacts. |
| Vessel traffic | **Offshore:** Increased vessel traffic due to construction and installation of future offshore wind activities could interfere with vessels used to install or maintain existing and future undersea cables, or lead to course changes of vessels used for undersea cable maintenance and installation and increased traffic along vessel transit routes. However, given the infrequency of required maintenance at any given location along a cable route, the effects of vessel traffic on undersea cables under the No Action Alternative would be **negligible** adverse. | **Offshore:** Increased vessel traffic due to construction and installation of the Proposed Action could interfere with vessels used to install or maintain existing and future undersea cables. Additionally, there would be increased risk for allisions with vessels used for construction and O&M of undersea cables. These effects are expected to be minimal and short term. Therefore, the effects of vessel traffic on undersea cables under the Proposed Action would be **negligible** adverse. The cumulative impact from vessel traffic on undersea cables would be **negligible** adverse. | **Offshore:** Vessel traffic associated with Alternatives C through F may result in slightly reduced vessel traffic in the Lease Area and around ports given the smaller offshore footprint. Reduced navigational complexity combined with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to those described for the Proposed Action. Therefore, impacts on undersea cables would be **negligible** adverse. | | | | **Offshore:** Alternative G may result in slightly reduced vessel traffic in the Lease Area and around ports given the smaller offshore footprint. Reduced navigational complexity combined with a smaller construction footprint and fewer offshore structures would result in the effects of this IPF being the same or slightly reduced relative to the Proposed Action. Therefore, impacts on undersea cables would be **negligible** adverse. |

### 3.17.2.2 Alternative A: Impacts of the No Action Alternative on Aviation and Air Traffic

#### 3.17.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for aviation and air traffic (see Section 3.17.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.17.2.2.2 Cumulative Impacts

This section discloses potential aviation and air traffic impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

<u>Aviation and air traffic:</u> Future offshore wind activities without the Proposed Action could result in increased air traffic due to the use of helicopters and other aircraft during construction and installation, O&M, and decommissioning of future wind projects. While the exact increase in future project-related flights is unknown, it is anticipated that future offshore wind activities would result in an increase in flight traffic for construction, ongoing wildlife surveys, and (search and rescue) SAR related to offshore wind project vessel traffic. Based on FAA (2022) data, the Proposed Action would conservatively add up to 7% to FAA-reported air traffic in the GAA for all aircraft types per year during the construction and decommissioning phases and 0.1% during O&M. It can be assumed, therefore, that other wind activities could result in similar air traffic increases, with future projects potentially overlapping in construction and/or decommissioning phases. These simplified assumptions are conservative, likely overestimate future air traffic, and do not account for aircraft concentration near New England region airports. Future offshore wind project air traffic would be required to engage the FAA in flight planning to avoid impacts to civilian, commercial, government, and military aviation operations. With implementation of FAA-approved flight plans, impacts of the No Action Alternative on aviation and air traffic would be **negligible** adverse.

<u>Light:</u> Future offshore wind activities without the Proposed Action would result in an increase in permanent aviation warning lighting on WTGs offshore. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidance to minimize collision risks and optimize aviation safety. The addition of up to 1,015 lighted structures represents a substantive increase in the number and extent of aviation and navigation safety lighting systems operating within the GAA, an area that includes lighting from military, commercial, and construction vessels; vessel-related lighting such as buoys and towers; and onshore lighting from housing and ports. Therefore, the effects of light on aviation and air traffic under the No Action Alternative would be **minor** adverse.

<u>Port utilization:</u> There may be a minimal increase in vessel use at ports associated with the No Action Alternative. The number of construction vessels would increase due to future offshore wind activities without the Proposed Action, which could result in delays and congestion at ports and lead to potential conflicts with air traffic due to increased activity in the vicinity of the airports listed in Section 3.17.1.1. Port improvements and construction activities in or near ports may require alteration of navigation patterns at nearby airports. Navigational hazards and collision risks at ports and in transit routes would be

reduced as construction is completed, and all navigation hazards and collision risks would be gradually eliminated during decommissioning as offshore WTGs are removed. In addition, vessel traffic would be spread among multiple ports to ensure sufficient capacity exists at each port and in each waterway. Therefore, port utilization is expected to have a **negligible** adverse effect on aviation and air traffic.

Presence of structures: Future offshore wind development could add up to 1,015 structures to the offshore environment in the analysis area. WTGs could have maximum blade tip height of 1,171 feet (357 m) amsl. Addition of these structures would noticeably increase navigational complexity and change aircraft navigation patterns in the region around the leased areas offshore Massachusetts and Rhode Island, along transit routes between ports and construction sites, and locally around ports (see Port Utilization). These changes could compress lower-altitude aviation activity into more limited airspace in these areas, leading to airspace conflicts or congestion, and increasing collision risks for low-flying aircraft. However, open airspace around the RI and MA Lease Areas would still be available over the open ocean, and ports used for offshore WTG construction would be planned and developed to accommodate tall structures.

Open airspace around the Lease Areas would still exist after all foreseeable future offshore wind energy projects are built. BOEM assumes that offshore wind project operators would coordinate with aviation interests throughout the planning, construction and installation, O&M, and decommissioning process to avoid or minimize impacts on aviation activities and air traffic. For this reason, the effects of increased presence of structures to aviation and air traffic under the No Action Alternative are anticipated to be **minor** adverse.

Vessel traffic: Although no future non–offshore wind stationary structures were identified within the Lease Area, vessel traffic associated with future offshore wind projects located outside the Lease Area would result in increased vessel traffic in the RI/MA WEA and surrounding ports. The impacts of increased vessel traffic are discussed above under Port Utilization and Presence of Structures. Vessel traffic is expected to have a **negligible** adverse effect on aviation and air traffic because vessel traffic would be spread throughout a large geographic area, and while construction time frames may overlap, it is anticipated that the increase in vessel traffic would not impact aviation and air traffic.

#### 3.17.2.2.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on other marine uses associated with the Project would not occur. However, ongoing and future activities would have **minor** adverse impacts on aviation uses due to the presence of structures that introduce navigational complexities.

BOEM anticipates that impacts to aviation uses from the combination of most ongoing activities and reasonably foreseeable activities other than offshore wind would be **negligible** adverse because any issues with aviation routes would be resolved through coordination with the FAA, as well as through implementation of navigational marking of structures according to FAA, USCG, and BOEM requirements and guidelines.

Considering all the IPFs together, BOEM anticipates that the impacts associated with future offshore wind activities in the GAA combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **minor** adverse impacts for aviation uses.

### 3.17.2.3 Alternative A: Impacts of the No Action Alternative on Land-Based Radar

#### 3.17.2.3.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for land-based radar (see Section 3.17.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.17.2.3.2 Cumulative Impacts

This section discloses potential aviation and land-based radar impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

<u>Presence of structures:</u> WTGs that are near or in direct line-of-sight to land-based radar systems can interfere with the radar signal causing shadows or clutter in the received signal. WTGs can also affect HF radar measurements of coastal ocean currents, oil spill tracking, and vessel drift tracking (BOEM 2020). Modeling completed on behalf of BOEM (2020) shows that small aircraft detection interference would occur in the vicinity of each WTG. Construction of 1,036 structures in the RI/MA WEA could lead to long-term, **minor** adverse cumulative impacts to radar systems. Although these structures would be sited at such a distance from existing and proposed land-based radar systems to minimize interference to most radar systems, event-based operational changes and modification of some land-based radar may be necessary. Event-based operational change may include wind farm curtailment agreements for BOEM lease areas that would cease wind farm operations when HF radar efficiency is essential, such as in the event of a severe hurricane/tropical storm or a large oil spill. Trockel et al. (2021) also developed the initial version of a software upgrade for land-based HF radar to minimize impacts from offshore wind energy facilities, and this software upgrade has been transferred to NOAA’s Integrated Ocean Observing System, which is currently testing the software for operational deployment. For vessel-based radar, the final Massachusetts and Rhode Island port access route study (USCG 2020) concludes that general mitigation measures, such as properly trained vessel-based radar operators, properly installed and adjusted vessel equipment, marked wind turbines, and the use of AIS would enable safe navigation in the GAA with minimal loss of radar detection.

<u>Vessel traffic:</u> Although no future non–offshore wind stationary structures were identified within the Lease Area, construction and operational vessel traffic from future offshore wind development outside the Lease Area is expected to increase. This could impact land-based radar by increasing the number of vessels in the analysis area. BOEM assumes that all offshore wind developments in the GAA would use the developer agreed upon 1 × 1–nm spacing that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This would allow more space for vessels to navigate and would help reduce potential interference on radar systems. As a result, the effects of vessel traffic on land-based radar under the No Action Alternative would be **minor** adverse.

#### 3.17.2.3.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on other marine uses associated with the Project would not occur. However, ongoing and future activities would have **minor** adverse impacts on other marine uses due to the presence of structures that increase radar interference.

BOEM anticipates that impacts to radar would be **negligible** adverse for any individual ongoing and reasonably foreseeable activity other than offshore wind because any issues with radar systems would be resolved through coordination with the Department of Defense (DOD) or FAA.

Considering all the IPFs together, BOEM anticipates that the impacts associated with future offshore wind activities in the GAA combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in notable and **moderate** adverse impacts to radar systems due to combined WTG interference.

### 3.17.2.4 Alternative A: Impacts of the No Action Alternative on Military and National Security (including Search and Rescue)

#### 3.17.2.4.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for military and national security (including search and rescue) (see Section 3.17.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.17.2.4.2 Cumulative Impacts

This section discloses potential military and national security (including search and rescue) impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

<u>Anchoring and new cable emplacement/maintenance:</u> Up to 19,976 acres could be affected by anchoring and mooring activities and cable installation during offshore wind energy development within the analysis area. This offshore energy facility construction of new cable emplacement and maintenance of cables would involve increased vessel traffic which could impact military and national security uses by increasing the number of vessels within the analysis area. Increased vessel traffic due to anchoring and cable maintenance of wind facilities could lead to course changes of military vessels, thereby increasing navigational complexity and risk of collisions. However, these impacts are expected to be low because military vessels would largely travel in transit lanes, with the exception of SAR operations, and short term due to the limited amount of cable emplacement and maintenance expected from future offshore wind activities. Therefore, the effects of anchoring and new cable emplacement and maintenance under the No Action Alternative on military and national security would be **negligible** adverse**.**

<u>Aviation and air traffic:</u> Future offshore wind activities could result in increased air traffic due to the use of helicopters and other aircraft during construction and installation, O&M, and decommissioning of future wind projects that in turn may increase the necessity for data collection and SAR operations. While

the exact increase in future project-related flights is unknown, it is anticipated that future offshore wind-related flight traffic would be low and would be unlikely to affect military use of the area in SAR and data collection activities. Future offshore wind projects would be required to engage the FAA in flight planning to avoid impacts to civilian, commercial, government, and military aviation operations. With implementation of FAA-approved flight plans, impacts of the No Action Alternative on military and national security would be **negligible** adverse**.**

Light: Future offshore wind activities would result in an increase in permanent aviation warning lighting on WTGs offshore. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidance to minimize allision risks. Implementation of navigational lighting and marking per FAA and BOEM requirements and guidelines would further reduce the risk of military aircraft collisions. This increase in lighting would add to vessel and navigational lighting, as well as onshore housing and port lighting, in the GAA, which could have a negative impact on military and national. Therefore, the effects of light on military and national security under the No Action Alternative would be **minor** adverse.

Presence of structures: Installation of up to 1,015 structures in the RI/MA WEA, which currently supports only five offshore wind turbines associated with the BIWF, as well as several meteorological buoys (see Appendix E1), would impact military and national security vessels primarily through risk of allision and collision with stationary structures and other vessels. Vessels could directly allide with WTG foundations. Vessel traffic would increase during project construction, and once the WTGs are operational, the artificial reef effect created by offshore structures could attract commercial and recreational fishing vessels. This would increase the risk of vessel collisions and increase navigation complexity, leading to potential use conflicts. In general, risks to military and national security vessels would increase over time as additional wind energy facilities are built.

Military and national security vessels could allide with WTG structures. However, deep-draft military vessels are not anticipated to transit outside of navigation channels unless necessary for SAR (of people or marine mammals) or nontypical operations. Allision risks for smaller vessels moving within or near offshore wind structures would be higher. However, these risks would be minimized by projects adhering to structural lighting requirements according to the USCG and BOEM, which would provide lighting at sea level. Additionally, allision would be further mitigated by following a fixed 1 × 1–nm WTG layout proposed by offshore wind leaseholders to facilitate safe navigation through the offshore wind energy Lease Areas (Geijerstam et al. 2019).

Additionally, risk of collision with recreational fishing vessels could indirectly increase as a result of the artificial reef effect around the offshore wind facility structures. New artificial reef effects could attract recreational fishing vessels farther offshore than currently occurs, adding to existing vessel traffic and subsequently increasing the risk of collision with military and national security vessels. Furthermore, an increase in recreational vessels in and around offshore wind projects could increase the demand for USCG SAR operations (of people or marine mammals).

In addition to allision or collision risks, military and national security vessels may be impacted by offshore wind energy structures by the need to change routes and navigate around both project footprints and project-associated vessels, particularly during the construction periods between 2021 and 2030.

Furthermore, military and national security vessels may experience congestion and delays in port due to the increase in offshore wind facility vessels.

Military and national security aircraft would be impacted by the presence of tall equipment necessary for offshore wind facility construction, such as stationary lift vessels and cranes, which would increase navigational complexity in the area. Warning area W-105A measures approximately 23,000 square miles, with approximately 4% (approximately 1,000 square miles) overlaying the GAA (BOEM 2021). Military and national security operations conducted within W-105A would be impacted during construction and operation periods. However, it is assumed all offshore wind energy project operators would coordinate with relevant agencies during the COP development process to identify and minimize conflicts with military and national security operations.

Measures mitigating risks would include operational protocol to stop WTG rotation during SAR aircraft operations and implementation of FAA- and BOEM-recommended navigational lighting and marking to reduce the risk of aircraft collisions. Wind energy structures would be visible on military and national security vessel and aircraft radar. Nonetheless, the presence and layout of large numbers of WTGs could make it more difficult for SAR aircraft to perform operations (of people or marine mammals), leading to less effective search patterns or earlier abandonment of searches. This could result in otherwise avoidable loss of life due to maritime incidents.

Navigational hazards would gradually be eliminated as structures are removed. Based on coordinating efforts and the anticipated mitigating measures discussed above, the overall impacts to military and national security uses are anticipated to be **moderate** adverse under the No Action Alternative.

<u>Vessel traffic:</u> Although no future non–offshore wind stationary structures were identified within the Lease Area, increased vessel traffic due to construction and decommissioning of future offshore wind facilities outside the Lease Area could lead to course changes of military and national security vessels, congestion and delays at ports, and increased traffic along vessel transit routes. Vessel activity could peak in 2025 with as many as 210 vessels involved in construction of reasonably foreseeable projects. While construction periods of various wind energy facilities may be staggered, some overlap would result in a cumulative impact to traffic loads. Therefore, the effects of vessel traffic on military and national security under the No Action Alternative would be **minor** adverse.

#### 3.17.2.4.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on other marine uses associated with the Project would not occur. However, ongoing and future activities would have **moderate** adverse impacts on military and national security uses due to the presence of structures that introduce navigational complexities and vessel traffic.

BOEM anticipates that impacts to military and national security uses from the combination of most ongoing activities and reasonably foreseeable activities other than offshore wind would be **negligible** adverse because BOEM anticipates that any issues with the military or national security would be resolved through coordination with the DOD, as well as through implementation of navigational marking of structures according to FAA, USCG, and BOEM requirements and guidelines.

Considering all the IPFs together, BOEM anticipates that the impacts associated with future offshore wind activities in the GAA combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **moderate** adverse impacts for military and national security uses.

### 3.17.2.5 Alternative A: Impacts of the No Action Alternative on Scientific Research and Surveys (see section in main EIS)

### 3.17.2.6 Alternative A: Impacts of the No Action Alternative on Undersea Cables

#### 3.17.2.6.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for undersea cables (including search and rescue) (see Section 3.17.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.17.2.6.2 Cumulative Impacts

This section discloses potential undersea cables impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

<u>Presence of structures:</u> Up to 1,015 structures could be installed between 2021 and 2030 in the RI/MA WEA as part of future offshore wind energy project infrastructure. The presence of future offshore wind energy structures could preclude future submarine cable placement, as discussed in Appendix E2 in "Anchoring and new cable emplacement/maintenance." Installed WTGs and OSSs and stationary lift vessels used during construction that are located near existing submarine cables could pose allision risks and navigational hazards to vessels conducting maintenance activities on these cables. The future development of multiple wind energy projects could increase the complexity of undersea cable development by requiring routing around the facilities. Export cables are unlikely to preclude future undersea cable development because cable crossings can be protected using standard design techniques. Therefore, in context of reasonably foreseeable environmental trends, the overall impacts from the presence of structures resulting from ongoing and planned actions are anticipated to be localized long term **negligible** adverse because impacts can be avoided by routing design and standard cable protection techniques.

<u>Vessel traffic:</u> Although no future non–offshore wind stationary structures were identified within the Lease Area, increased vessel traffic due to construction and installation of future offshore wind activities located outside the Lease Area could interfere with vessels used to install or maintain existing and future undersea cables. Increased vessel traffic due to Project construction and installation, O&M, and decommissioning could lead to course changes of vessels used for undersea cable maintenance and installation and increased traffic along vessel transit routes. The risk of allision to cable maintenance vessels could increase as more offshore wind energy projects are constructed. However, given the infrequency of required maintenance at any given location along a cable route, this risk is expected to be low. Therefore, the effects of vessel traffic on undersea cables under the No Action Alternative would be **negligible** adverse**.**

#### 3.17.2.6.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on other marine uses associated with the Project would not occur. Ongoing and future activities would have **negligible** adverse impacts on undersea cables due to the presence of offshore wind energy cables or structures that could preclude future submarine cable placement and vessel traffic.

BOEM anticipates that impacts to undersea cables from the combination of most ongoing activities and reasonably foreseeable activities other than offshore wind would be **negligible** adverse because BOEM anticipates that cables could be easily crossed by vessels and existing cables require minimal maintenance.

Considering all the IPFs together, BOEM anticipates that the impacts associated with future offshore wind activities in the GAA combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **negligible** adverse impacts on undersea cables.

### 3.17.2.7 Alternative B: Impacts of the Proposed Action on Aviation and Air Traffic

#### 3.17.2.7.1 Construction and Installation

##### Offshore Activities and Facilities

<u>Aviation and air traffic:</u> The Proposed Action would result in an increase in air traffic related to construction and installation of offshore Project elements. Project construction would result in one to two helicopter flights to and from the Lease Area per day for construction of the foundations. Helicopters would also be used for additional crew transfers during construction activities. Estimated helicopter use for the RWF during the construction phase is estimated to be less than 200 helicopter trips and approximately 8,832 hours of flight time over the 2-year construction period (COP Appendix T [Tech Environmental 2023]). Based on national aviation statistics (FAA 2020), general aviation aircraft logged an estimated 792,266 hours of total flight in the FAA's New England Region in 2019. Extrapolating from nationwide statistics, helicopters would account for approximately 93,000 hours of the New England Region total. The Proposed Action would require a total estimated 8,832 hours of helicopter flight time for Project construction and installation, or approximately 4,416 flight hours per year, over the 2-year construction period of the Project. The GAA represents approximately 8% of the 160,000 square miles of airspace in the FAA New England Region. Applying this proportion, helicopter flights for Project construction and installation would represent a 63% increase in annual helicopter flight hours and a 7% increase in general aviation hours in the GAA. The effect determination is based on the 7% increase in general aviation hours in the GAA, as the increase in helicopter hours specifically would not have a direct impact on aviation and air traffic compared to the general overall increase in aircraft in the GAA. When estimation uncertainty is considered, the 7% increase in Project-related air traffic over the 2-year construction period represents a **minor** adverse effect on general aviation air traffic. A helicopter route plan would be developed to meet industry guidelines and best practices in accordance with FAA guidance. Additionally, all aviation operations, including flying routes and altitude, would be aligned with relevant stakeholders, such as the FAA. On this basis, the effects of Project-related aviation and air traffic on aviation and air traffic under the Proposed Action would be **minor** adverse.

Lighting: During construction and installation, WTGs would be marked with appropriate lighting to meet FAA warning guidelines and would be visible on the radar systems of low-flying aircrafts, similar to other large-scale sea surface activity. Therefore, impacts to aviation and air traffic would be **negligible** adverse.

Port utilization: Various ports would be improved to support the Proposed Action (see Section 3.14). These improvements would occur within the boundaries of existing port facilities, would be similar to existing activities at the existing ports, and would support state strategic plans and local land use goals for the development of waterfront infrastructure. The number of construction vessels would increase due to future offshore wind activities without the Proposed Action which could result in delays and congestion at ports which could lead to potential conflicts with air traffic due to increased activity in the vicinity of the airports listed in Section 3.17.1. Port improvements and construction activities in or near ports may require alteration of navigation patterns at nearby airports; however, port improvements are anticipated to occur under the No Action Alternative to support regional offshore wind energy industry development. Navigational hazards and collision risks at ports and in transit routes would be reduced as construction is completed. However, vessel traffic would also be spread among multiple ports to ensure that sufficient capacity exists at each port and in each waterway. Therefore, port utilization is expected to have a **negligible** adverse effect on aviation and air traffic.

Presence of structures: The Proposed Action would add up to 100 WTGs with maximum blade tip heights of up to 853 feet amsl. The addition of these structures would increase navigational complexity and could change aircraft navigation patterns for aircraft flying at low altitudes and for airports in the vicinity, increasing collision risks for some aircraft during the Proposed Action's operational timeframe. However, more than 90% of existing air traffic in the analysis area would occur at altitudes that would not be impacted by the presence of WTGs (BOEM 2021).

For the air traffic that occurs at altitudes that could be impacted by the presence of WTGs, the FAA conducts aeronautical studies to ensure that proposed structures do not have an effect on air navigation safety and the ability of aircraft to efficiently use navigable airspace. Proposed structures are considered as having an adverse effect if they exceed obstacle clearance surfaces.

An air traffic flow analysis for the Project was completed (Capitol Airspace Group 2020). WTGs at a height of 873 above sea level (ASL) could affect Visual Flight Rules (VFR) routes, requiring an increase to a Block Island State Airport (BID) instrument approach minimum altitude, Boston Consolidated (A90) Terminal Radar Approach Control (TRACON) minimum vectoring altitudes (MVAs), and Providence (PVD) TRACON MVAs.

However, historical air traffic data indicates that 873-foot ASL wind turbines would not affect any regularly used VFR routes. Additionally, historical air traffic data indicates that the required changes to the BID instrument approach procedure, A90 TRACON MVA sectors and PVD TRACON MVA sectors, should not affect a significant volume of operations. As a result of these findings, it possible that the FAA would be willing to increase the affected altitudes in order to accommodate wind development up to 873 feet ASL. These mitigation options are available and subject to FAA approval. Therefore, the effects of the presence of structures on aviation and air traffic under the Proposed Action would be **negligible** adverse.

Vessel traffic: Vessel traffic associated with the Proposed Action would result in increased vessel traffic in the Lease Area and around ports. Construction of offshore structures would noticeably increase navigational complexity along transit routes between ports and construction sites, and locally around ports due to increased vessel traffic. Increased vessel traffic is expected to have a **negligible** adverse effect on aviation and air traffic because vessel traffic would be spread throughout a large geographic area and would occur over a short period of time.

#### 3.17.2.7.2 Operations and Maintenance and Decommissioning

### Offshore Activities and Facilities

Aviation and air traffic: The Proposed Action would result in an increase in air traffic related to O&M and decommissioning of the Proposed Action. A hoist-equipped helicopter may be used to support O&M (VHB 2023). Table 3.5-5 in the COP provides a summary of O&M support vessels that are currently being considered to support Project O&M. The type and number of vessels and helicopters would vary over the operational lifetime of the Project.

During O&M, helicopters would be used to provide supplemental means of access when vessel access is not practical or desirable. Flights would be currently restricted to daylight operations when visibility is good. Helicopters would be used for two different purposes to support O&M:

- Helicopter hoist operations: An integrated helicopter hoist platform located on the roof of each WTG nacelle would provide access for O&M. SOVs and the OSSs may also be fitted with helicopter hoist platforms. The purpose of this effort is primarily for transport and transfer of technical personnel and equipment on to/from the WTGs via hoist to the nacelle but can also be conducted for transport and transfer of personnel and equipment to offshore installations that do not have a helideck. This is the most common means of access in the O&M phase and is typically used to perform minor repairs and restarts.
- Transport and transfer operations: Transport helicopter operations are flights from an onshore airport or heliport to an offshore installation or vessel with a helideck and back. Transfer helicopter operations are flights within the WEA from an offshore installation or vessel with a helideck to another, and back.

All aviation operations, including flying routes and altitude, would be aligned with relevant stakeholders, such as the FAA. It is anticipated that there would be up to 800 helicopter trips and a total flight time of up to 252 hours of flight time for O&M of the Project (Tech Environmental 2023). Based on national aviation statistics (FAA 2020), general aviation aircraft logged an estimated 792,266 hours of total flight in the FAA's New England Region in 2019. Extrapolating from nationwide statistics, helicopters would account for approximately 93,000 hours of the New England Region total. The Proposed Action would require an estimated 252 hours of helicopter flight time for project O&M, or approximately 8.4 flight hours per year, over the 35-year operating period of the Project. The GAA represents approximately 8% of the 160,000 square miles of airspace in the FAA New England Region. Applying this proportion, helicopter flights for Project O&M would represent a 0.1% increase in annual helicopter flight hours and a 0.01% increase in general aviation hours in the GAA. When estimation uncertainty is considered, this represents a **negligible** adverse effect on general aviation air traffic. On this basis, the effects of Project-related aviation and air traffic on aviation and air traffic under the Proposed Action would be **negligible** adverse.

Light: During O&M, WTGs would be marked with appropriate lighting to meet FAA warning guidelines and would be visible on the radar systems of low-flying aircrafts, similar to other large-scale sea surface activity. Decommissioning would have impacts similar to those during Project construction. Therefore, impacts to aviation and air traffic would be **negligible** adverse**.**

Port utilization: Various ports could be improved to support the Proposed Action (see Section 3.14). These improvements would likely occur within the boundaries of existing port facilities, similar to existing activities at the existing ports, and would support state strategic plans and local land use goals for the development of waterfront infrastructure. Navigational hazards and collision risks at ports and in transit routes would be reduced as construction is completed, and all navigation hazards and collision risks would be gradually eliminated during decommissioning as offshore WTGs are removed. However, vessel traffic would also be spread among multiple ports to ensure that sufficient capacity exists at each port and in each waterway. Therefore, port utilization is expected to have a **negligible** adverse effect on aviation and air traffic.

Presence of structures: The Proposed Action would add up to 100 WTGs and two OSSs having maximum blade tip and structure heights of up to 853 feet and 180 feet amsl, respectively. The addition of these structures would increase navigational complexity and could change aircraft navigation patterns for aircraft flying at low altitudes and for airports in the vicinity, increasing collision risks for some aircraft during the Proposed Action's operational time frame. However, more than 90% of existing air traffic in the analysis area would occur at altitudes that would not be impacted by the presence of WTGs (BOEM 2021). An air traffic flow analysis completed by Capitol Airspace found that it is possible that the FAA would be willing to increase the affected altitudes in order to accommodate wind development up to 873 feet above sea level (ASL) (Capitol Airspace Group 2020). Decommissioning would have impacts similar to those during Project construction. Therefore, the effects of the presence of structures on aviation and air traffic under the Proposed Action would be **negligible** adverse**.**

Vessel traffic: Vessel traffic associated with the Proposed Action would result in increased vessel traffic in the Lease Area and around ports. Addition of offshore structures would noticeably increase navigational complexity along transit routes between ports and construction sites, and locally around ports. Increased vessel traffic is expected to have a **negligible** adverse effect on aviation and air traffic because vessel traffic would be spread throughout a large geographic area and would be short term.

### Onshore Activities and Facilities

Light: Operational lighting onshore would be limited to the OnSS and ICF, which would have minimal yard lighting and task lighting (see Section 3.14). This lighting is minimal and would not result in impacts to aviation and air traffic. Decommissioning would have impacts similar to those during Project construction. Therefore, the effects of light on aviation and air traffic under the Proposed Action would be **negligible** adverse**.**

Port utilization: Ports would be primarily used during construction and installation of the Proposed Action, as ports would be used for staging WTGs and for mobilizing construction work. Decommissioning would have impacts similar to those during Project construction. There would be no impacts to aviation and air traffic from O&M and decommissioning of the Proposed Action; therefore, impacts would be **negligible** adverse**.**

Presence of structures: The O&M of onshore structures to support the Proposed Action would not impact aviation and air traffic. This IPF would result in a **negligible** adverse impact because there would be no effect on this resource.

Vehicle traffic: Onshore vehicle traffic in and around ports and onshore facilities may increase as a result of O&M and decommissioning of the Proposed Action. Project-related vehicle traffic would not impact aviation and air traffic because these uses are generally spatially separate from vehicular traffic and occur in different locations. Therefore, this IPF would result in a **negligible** adverse impact because minimal increases in vehicle traffic would not impact aviation and air traffic.

#### 3.17.2.7.3 Cumulative Impacts

#### Offshore Activities and Facilities

Aviation and air traffic: The Proposed Action would result in approximately 4,416 construction flight hours per year during construction and installation over a 2-year construction period, then the flight hours would significantly decrease to approximately 8.4 flight hours per year during O&M and decommissioning of the RWF. During construction and installation this results in a 7% increase in general aviation air traffic in the GAA and during O&M and decommissioning this results in a 0.01% increase in general aviation air traffic in the GAA. In total, there would be an average of 303 flight hours per year over 32 years (2-year construction period and up to 35-year operational period). This represents a 4% yearly increase in helicopter flight hours in the GAA and a 1% yearly increase in general aviation flight hours. Future offshore wind activities without the Proposed Action could also result in increased air traffic due to the use of helicopters and other aircraft during construction and installation, O&M, and decommissioning of future wind projects. While the exact increase in future Project-related flights is unknown, it is anticipated that reasonably foreseeable future wind activities would also result in increases in flight traffic similar in scale to the Proposed Action. The Proposed Action and reasonably foreseeable future wind projects would be required to engage the FAA in flight planning to avoid impacts to civilian, commercial, government, and military aviation operations. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable project impacts would result in **negligible** adverse impacts on aviation and air traffic.

Light: The Proposed Action would add permanent lighting for up to 100 WTGs and 2 OSSs for the duration of the Project. BOEM estimates a maximum cumulative total of up to 1,117 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the GAA. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidelines to minimize collision and allision risks. WTGs would also be visible on aircraft radar. Therefore, the cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be similar to those impacts described under the No Action Alternative and would have a **negligible** adverse impact on aviation and air traffic.

Port utilization: The Proposed Action combined with reasonably foreseeable future actions could result in a very minimal increase in vessel use at ports, most of which would be during construction and decommissioning of the Project. The number of construction vessels would increase due to both the Proposed Action and reasonably foreseeable future actions, which could result in delays and congestion at ports and lead to potential conflicts with air traffic due to increased activity in the vicinity of the airports listed in the Affected Environment. Port improvements and construction activities in or near ports may require alteration of navigation patterns at nearby airports. Navigational hazards and collision risks at ports and in transit routes would be reduced as construction is completed, and all navigation hazards and collision risks would be gradually eliminated during decommissioning as offshore WTGs are removed. However, vessel traffic would also be spread among multiple ports to ensure sufficient capacity exists at each port and in each waterway. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable project impacts would result in a **negligible** adverse impact on aviation and air traffic.

<u>Presence of structures:</u> The Proposed Action structures represent a 10% increase over total estimated WTG and OSS foundations across the GAA under the No Action Alternative. BOEM estimates a cumulative total of up to 1,117 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the RI/MA WEA. WTGs could have maximum blade tip height of 1,171 feet amsl.

Addition of these structures would noticeably increase navigational complexity and change aircraft navigation patterns in the region around the leased areas offshore Massachusetts and Rhode Island, along transit routes between ports and construction sites, and locally around ports (see Port utilization). These changes could compress lower-altitude aviation activity into more limited airspace in these areas, leading to airspace conflicts or congestion, and increasing collision risks for low-flying aircraft. However, open airspace around the GAA would still be available over the open ocean, and ports used for offshore WTG construction would be planned and developed to accommodate tall structures.

Open airspace would continue to exist around all Lease Areas after the Proposed Action and reasonably foreseeable future offshore wind energy projects are built. BOEM assumes that offshore wind project operators would coordinate with aviation interests throughout the planning, construction and installation, O&M, and decommissioning process to avoid or minimize impacts on aviation activities and air traffic. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable Project impacts would result in a **minor** adverse impact on aviation and air traffic.

<u>Vessel traffic:</u> Vessel traffic associated with the Proposed Action and reasonably foreseeable future actions would result in increased vessel traffic in the GAA. The impacts of increased vessel traffic are discussed above under Port Utilization and Presence of Structures. Vessel traffic would be spread throughout a large geographic area, and while construction time frames may overlap, it is anticipated that the increase in vessel traffic would not impact aviation and air traffic. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable Project impacts would result in a **minor** adverse impact on aviation and air traffic.

### Onshore Activities and Facilities

<u>Lighting:</u> It is not anticipated that any of the onshore Project components for the Proposed Action or reasonably foreseeable future actions would require FAA-compliant lighting. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable Project impacts would result in **negligible** adverse impacts on aviation and air traffic from light.

<u>Port utilization:</u> WTG components located at staging ports could result in issuance of notices to airmen, causing some aircraft to reroute. WTG components would be in staging ports for brief periods. It is expected that reasonably foreseeable future actions would have similar port utilization impacts that

account for construction and installation, O&M, and decommissioning of future actions. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse on aviation and air traffic.

Presence of structures: The construction and installation, O&M, and decommissioning of the Proposed Action and other reasonably foreseeable onshore structures would not contribute to cumulative impacts on aviation and aircraft because onshore structures are sited in industrial and commercial areas away from aviation uses. The presence of onshore structures would also be limited to O&M facilities, the OnSS, and ICFs that are similar in nature to surrounding land uses and would not create impacts on aviation uses. It is expected that reasonably foreseeable future actions would have similar structure impacts that account for construction and installation, O&M, and decommissioning of future actions. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **negligible** adverse on aviation and air traffic.

Vehicle traffic: Onshore vehicle traffic surrounding ports and onshore facilities may increase as a result of the Proposed Action, but it would not impact aviation and air traffic because these uses are spatially separate from vehicular traffic and occur in different locations. Additionally, it is anticipated that vehicular traffic would also increase at onshore wind facilities and port facilities as a result of reasonably foreseeable future actions. It is expected that vehicular traffic increases would be commensurate with the impacts expected for the Proposed Action in scale, intensity, and duration. Therefore, the Proposed Action combined with reasonably foreseeable future actions would result in a **negligible** adverse impact because minimal increases in vehicle traffic would not impact aviation and air traffic.

#### 3.17.2.7.4 Conclusions

Project construction and installation, O&M, and decommissioning would affect ongoing aviation and air traffic occurring in the analysis area. Similar impacts from Project O&M would occur, although at a lesser extent and duration for aviation and air traffic. BOEM anticipates the impacts resulting from the Proposed Action alone would result in **negligible** adverse impacts on aviation and air traffic that would primarily be caused by installation of WTGs in the GAA due to potential changes in navigational patterns.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs range from **negligible** to **minor** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be **minor** adverse impacts for aviation and air traffic.

### 3.17.2.8 Alternative B: Impacts of the Proposed Action on Land-Based Radar

#### 3.17.2.8.1 Construction and Installation

#### Offshore Activities and Facilities

Presence of structures: Construction and installation of offshore Project components could result in impacts to land-based radar by introducing potential obstacles to radar coverage in the RI/MA WEA. These impacts would be less than those identified for Project O&M and discussed in Section 3.17.2.3.2 Therefore, the construction and installation of offshore Project components would result in **negligible** adverse impacts to land-based radar.

Vessel traffic: There would be increased construction and operational vessel traffic from the Proposed Action, but the increase would not represent a substantial change to vessel traffic volume, which includes numerous ports and extensive marine traffic related to shipping, fishing, and recreation. As a result, the effects of vessel traffic on land-based radar under the Proposed Action would be **negligible** adverse.

#### 3.17.2.8.2 Operations and Maintenance and Decommissioning

##### Offshore Activities and Facilities

Presence of structures: WTGs that are near or in direct line of sight to land-based radar systems can interfere with the radar signal by causing shadows or clutter in the received signal. Construction of 102 structures in the Lease Area could lead to impacts to land-based radar systems identified in Appendix S2 of the COP. The radar line of sight study (Westslope 2021) determined the following radar impacts by the presence of WTGs at a height of 873 amsl:

- For the Falmouth ASR-8, wind turbines in the northeastern two-thirds of the study area would be within the line of sight of and would interfere with this radar site at a blade-tip height of 873 feet above ground level (AGL).[2]
- For the Nantucket ASR-9, wind turbines in the eastern one-half of the study area would be within the line of sight of and would interfere with this radar site at a blade-tip height of 873 feet AGL.
- For the Providence ASR-9, wind turbines in the entire study area would be within the line of sight of and would interfere with this radar site at a blade-tip height of 873 feet AGL.
- For the North Truro ARSR-4 and the Riverhead ARSR-4, wind turbines in the study area would not be within the line of sight of and would not interfere with these radar sites at a blade-tip height of 873 feet AGL.
- The EWR LOS analysis for the Cape Cod AFS EWR shows that wind turbines in the majority of the study area will be within the line of sight of this radar site and could have a significant impact on this early warning radar at a blade-tip height of 873 feet AGL.

For the Falmouth ASR-8, Nantucket ASR-9, and the Providence ASR-9, without mitigation, the radar effects due to clutter could include a partial loss of primary target detection and a number of false primary targets over and in the immediate vicinity of wind turbines within the radar line of sight in the study area. Other radar effects include a partial loss of weather detection and false weather indications over and in the immediate vicinity of wind turbines within the line of sight in the study area.

The HF radar LOS analyses show the following:

- For the Amagansett HF radar, wind turbines in the western corners of the study area would be within the line of sight of this radar site at a blade-tip height of 873 feet AGL.
- For the Block Island Long Range HF radar, Camp Varnum HF radar, Horseneck Beach State Reservation HF radar, Long Point Wildlife Refuge HF radar, and the Martha's Vineyard HF radar, wind turbines in the entire study area would be within the line of sight of these radar sites at a blade-tip height of 873 feet AGL.

[2] Height AGL used by Westslope (2021) is equivalent to height amsl as defined in Section 2.1.2.1, Table 2.1-1.

- For the Block Island Standard Range HF radar, wind turbines in the western two-thirds of the study area would be within the line of sight of this radar site at a blade-tip height of 873 feet AGL.
- For the MVCO Meteorological Mast HF radar, wind turbines in the eastern one-fifth of the study area would be within the line of sight of this radar site at a blade-tip height of 873 feet AGL.
- For the Nantucket HF radar, wind turbines in the eastern one-third of the study area would be within the line of sight of this radar site at a blade-tip height of 873 feet AGL.
- For the Squibnocket Farms HF radar, wind turbines in the eastern one-fifth and along the northern edges of the study area would be within the line of sight of this radar site at a blade-tip height of 873 feet AGL.
- For the Moriches HF radar, Nantucket Island HF radar, and the Nauset HF radar, wind turbines in the study area would not be within the line of sight of these radar sites at a blade-tip height of 873 feet AGL. Although wind turbines in the study area would not be within the line of sight of these radar sites, radar effects are still possible beyond line-of-sight due to the propagation of HF electromagnetic waves over the ocean surface.

Westslope (2021) concluded that, without mitigation, the Proposed Action could result in measurable effects on radar systems within their study area, including clutter in the vicinity of line-of-sight turbines and possibly in the vicinity of wind turbines beyond line-of-sight due to the propagation of HF electromagnetic waves over the ocean surface. These impacts could affect the following radar systems; the Amagansett HF radar, Block Island Long Range HF radar, Block Island Standard Range HF radar, Camp Varnum HF radar, Horseneck Beach State Reservation HF radar, Long Point Wildlife Refuge HF radar, Martha's Vineyard HF radar, MVCO Meteorological Mast HF radar, Nantucket HF radar, and the Squibnocket Farms HF radar.

The VOR screening analysis for the Martha's Vineyard VOR/DME, Providence VOR/DME, and the Sandy Point VOR/DME shows that the study area is greater than 8 nm from these navigational aid sites. Although possible, Revolution Wind does not anticipate that the FAA would have concerns with wind turbines in the study area at a blade-tip height of 873 feet AGL based on impacts to these navigational aid sites.

The NEXRAD weather radar screening analysis for the Boston WSR-88D and the Brookhaven WSR-88D shows that wind turbines in the study area would not be within the line of sight of and would not interfere with these radar sites at a blade-tip height of 873 feet AGL. The results also show that wind turbines in the study area at a blade-tip height of 873 feet AGL would fall within a NOAA green No Impact Zone for these radar sites.

The TDWR screening analysis for the Boston TDWR shows that the study area is beyond the instrumented range of this radar site. As such, no additional analysis was considered necessary for this radar site. In summary, there would be a **minor** adverse impact to air defense and homeland security radar and a **negligible** adverse impact on weather radar.

To address these concerns, BOEM would include terms and conditions in the COP approval requiring 30- to 60-day advanced notification to the North American Aerospace Defense Command ahead of Project completion and when the Project is complete and operational for radar management (RAM) scheduling, funding of RAM execution, and curtailment for national security or defense purposes, as described in the leasing agreement. Any other impacts on radar systems are anticipated to be mitigated by overlapping coverage and radar optimization. The FAA would evaluate potential impacts on radar systems, as well as mitigation measures, when Revolution Wind refiles Form 7460-1 for individual WTGs located within U.S. territorial waters. Revolution Wind’s marine coordinator would remain on duty for the life of the Proposed Action to liaise with military, national security, civilian, and private interests to reduce potential radar conflicts. BOEM’s (2020) study of radar interference concludes that HF SeaSonde radars, which monitor ocean currents, follow oil spills, and track powered and adrift vessels, are the most heavily impacted radar by offshore wind projects because WTGs create a phenomenon in which turbine echo is processed by these radar as current echo, resulting in interference with ocean current measurements. General mitigation measures determined by BOEM (2020) to be effective for HF radar include event-based operational changes and modification of some land-based radar. Event-based operational change may include wind farm curtailment agreements for BOEM lease areas that would cease wind farm operations when HF radar efficiency is essential, such as in the event of a severe hurricane/tropical storm or a large oil spill. BOEM is also working on developing a land-based HF radar software upgrade (Trockel et al. 2021), which has since been transferred to NOAA's Integrated Ocean Observing System for further testing and operational deployment.

The Proposed Action includes 1 × 1–nm WTG spacing that reduces, but does not eliminate, navigational complexity and space use conflicts during the operation phases of the Project. Navigational complexity in the area would remain constant during simultaneous operations and would decrease as the Project is decommissioned and structures are removed. The final Massachusetts and Rhode Island Port Access Route Study (USCG 2020) concludes that general mitigation measures, such as properly trained radar operators, properly installed and adjusted vessel equipment, marked wind turbines, and the use of AIS all enable safe navigation with minimal loss of radar detection. Following the layout recommendations in the final Massachusetts and Rhode Island Port Access Route Study (USCG 2020) would improve safety, but it would not completely remove the risk of allisions or collisions with WTGs during SAR operations (of people or marine mammals), particularly in challenging weather or visibility conditions. Therefore, the effects of the presence of offshore structures on land-based radar under the Proposed Action would be **negligible** adverse**.**

<u>Vessel traffic:</u> Operational vessel traffic from the Proposed Action is expected to increase, although it would be less than during the construction and decommissioning phases. This could impact land-based radar by increasing the number of vessels in the analysis area. The Proposed Action includes 1 × 1–nm WTG spacing that allows more space for vessels to navigate and would help reduce potential interference on radar systems. As a result, the effects of vessel traffic on land-based radar under the Proposed Action would be **negligible** adverse**.**

#### 3.17.2.8.3 Cumulative Impacts

#### Offshore Activities and Facilities

<u>Presence of structures:</u> The Proposed Action would result in long-term negligible adverse impacts to land-based radar when compared to conditions under the No Action Alternative. These structures would increase the long-term risk of radar interference or clutter.

BOEM's radar study (2020) suggests general mitigation measures, including event-based operational changes and modification of some land-based radar through software upgrades to reduce impacts. For vessel-based radar, the final Massachusetts and Rhode Island port access route study (USCG 2020) concludes that general mitigation measures, such as properly trained radar operators, properly installed and adjusted vessel equipment, marked wind turbines, and the use of AIS, all enable safe navigation with minimal loss of radar detection. BOEM would include approval conditions in the COP regarding notification to North American Aerospace Defense Command of RAM scheduling, funding of RAM execution, and curtailment for national security or defense purposes, as needed.

Therefore, the Proposed Action and past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to land-based radar.

<u>Vessel traffic:</u> The Project Action would result in an increase of offshore vessels during every phase of the Project. The increase in vessels in the analysis area would result in long-term impacts to land-based radar due to increased potential for radar interference or clutter. Reasonably foreseeable activities are expected to also generate vessel traffic that would increase the number of vessels in the RI/MA WEA. Measures described under Presence of structures would reduce the cumulative impacts of increased vessel traffic to a **minor** adverse level when considering cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities.

#### 3.17.2.8.4 Conclusions

Project construction and installation, O&M, and decommissioning would affect land-based radar occurring in the analysis area. Similar impacts from Project O&M would occur, although at a lesser extent and duration for some uses. BOEM anticipates the impacts on land-based radar resulting from the Proposed Action alone would be **minor** adverse, as the overall effect would be managed through event-based operational changes and radar equipment upgrades.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from **negligible** to **minor** adverse. Considering all the IPFs together, BOEM anticipates that the overall cumulative impacts associated with the Proposed Action combined with past, present, and reasonably foreseeable activities, would be **moderate** adverse for land-based radar.

### 3.17.2.9 Alternative B: Impacts of the Proposed Action on Military and National Security (including search and rescue)

#### 3.17.2.9.1 Construction and Installation

#### Offshore Activities and Facilities

<u>Anchoring and new cable emplacement/maintenance:</u> Anchoring and mooring activities would occur during offshore wind energy development within the analysis area as part of the Proposed Action. This would involve increased vessel traffic which could impact military and national security uses by increasing the number of vessels within the analysis area. The presence of construction vessels could cause military vessels to change course or otherwise alter operations and could increase demand for SAR. These impacts are expected to be limited to cable emplacement corridors. Cable laying vessels are expected to travel slowly, typically at speeds of less than 1 knot, resulting in a low risk of collision with

other vessels. In addition, it is anticipated that the USCG would establish temporary 500-yard navigation safety zones around each WTG foundation and each cable laying vessel, further reducing risk of contact with other vessels. Therefore, the effects of anchoring and new cable emplacement and maintenance under the Proposed Action on military and national security would be **negligible** adverse**.**

<u>Aviation and aircraft traffic:</u> Construction and installation of the Proposed Action would result in a 7% increase in general aviation in the GAA. Please refer to Section 3.17.2.2.1 for analysis of the Project's construction and installation impacts. The effects of this IPF on military and national security under the Proposed Action would be **minor** adverse, as there would be increased air traffic that could increase navigational complexities for military aircraft in the GAA.

<u>Light:</u> The Proposed Action would result in an increase in temporary construction aviation warning lighting on WTGs offshore. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidance to minimize allision risks. Implementation of navigational lighting and marking per FAA and BOEM requirements and guidelines would further reduce the risk of military aircraft collisions. This would result in a general increase of lights in the analysis area, which could have **minor** adverse impacts on military and national security by increasing the amount of light in the geographical analysis area.

<u>Presence of structures:</u> Access by military vessels to the RWF and RWEC would be limited during installation; however, USCG air- and waterborne SAR activities would still occur as needed. The addition of up to 100 WTGs, two OSSs, and two RWECs would increase the risk of allisions for military vessels for up to 35 years during Project operations, particularly in bad weather or low visibility. Military vessel traffic within the RI/MA WEA has historically been relatively low (four vessels recorded in 2016 and 2017), and deep-draft military vessels are not anticipated to navigate outside navigation channels unless necessary for SAR operations (BOEM 2021). Additionally, construction of the Proposed Action could attract recreational fishing or sightseeing vessels, which would add to the number of vessels operating in the area to complete construction of these Project elements. The presence of construction-related vessels and additional recreational vessels would add to conflict or collision risks for military and national security vessels and could increase demand for SAR operations. *The Areas Offshore of Massachusetts and Rhode Island Port Access Route Study* (USCG 2020) examined potential navigation SAR issues associated with anticipated offshore wind development in the RI/MA WEA. The USCG report concluded that a wind turbine array that follows a standard and uniform grid pattern with three lines of orientation and standard spaces, as proposed for the Project, would maintain the Coast Guard's ability to conduct SAR operations within the Lease Area (USCG 2020). BOEM (2020) acknowledges, however, that some SAR operations are aided by land-based radar vessel tracking, as well as wind and current tracking to extrapolate disabled vessel distance and direction, which can be inhibited by the presence of WTGs, and suggests mitigation related to radar equipment and event-based operational changes to counteract these effects. The navigational safety risk assessment found there are an average of 1.5 missions expected per year in the Lease Area (DNV GL Energy USA 2020). Therefore, it is anticipated that the presence of Project-related structures would impact some future USCG SAR missions. The presence of offshore wind infrastructure could require adjusting the operational parameters for such missions; however, the impact is anticipated to be minimal based on the uniform spacing of structures for waterborne SAR and other vessel maneuverability and mitigation for land-based radar.

Construction of the Proposed Action would necessitate use of stationary lift vessels within the RWEC, cranes in ports during construction, and FAA-regulated structures temporarily in transit routes between port and the WEA, increasing navigational complexity and changing navigational patterns for vessels and aircraft operating in the area around the WEA during construction and operations. Increased navigational complexity would increase the risk of collisions and allisions for military and national security vessels or aircraft within the WEA, and could increase demand for SAR. Structures would be marked as a navigational hazard per FAA, BOEM, and USCG requirements, and risk would be consistent within the 35-year operational period. It is anticipated that the USCG would establish temporary 500-yard (457-meter) navigation safety zones around each WTG foundation and each installation vessel, reducing risk of contact with other vessels The Project's 1 × 1–nm spacing reduces some of the risk of collisions and allisions. Based on the above impacts, the Project would have **minor** to **moderate** adverse impacts on military operations, including SAR, and national security due to the presence of structures.

Vessel traffic: There would be increased construction and operational vessel traffic from the Proposed Action. This could impact military and national security uses by increasing the number of vessels in the analysis area. The RWF's proposed 1 × 1–nm spacing would result in sufficient space between foundations for vessels to navigate. USCG establishment of temporary safety zones around cable laying vessels and foundation construction sites would further minimize the potential for construction vessel conflicts with military vessels. As a result, the effects of vessel traffic on military and national security uses under the Proposed Action would be **minor** adverse**.**

#### 3.17.2.9.2 Operations and Maintenance and Decommissioning

##### Offshore Activities and Facilities

Anchoring and new cable emplacement/maintenance: Anchoring and mooring activities would occur during offshore wind energy O&M and decommissioning within the analysis area as part of the Proposed Action. This would involve increased vessel traffic which could impact military and national security uses by increasing the number of vessels within the analysis area. However, the impacts are expected to be small and infrequent during O&M and decommissioning of offshore Project elements. Therefore, the effects of anchoring and new cable emplacement/maintenance under the Proposed Action on military and national security would be **negligible** adverse.

Aviation and aircraft traffic: O&M of the Proposed Action would result in a 0.01% increase in annual general aviation traffic in the GAA. Please refer to Section 3.17.2.2.2 for analysis of the Project's O&M impacts. The increase in vessel traffic associated with Project O&M could result in an increased demand for SAR, and increased military aircraft traffic in and around the RWF. Therefore, the effects of this IPF on military and national security activities under the Proposed Action, including SAR, would be **negligible** adverse.

Light: The O&M and decommissioning of the Proposed Action would result in an increase in permanent lighting on WTGs offshore until decommissioning is complete. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidance to minimize collision risks. This would result in a general increase of lights in the analysis area, which could have a small impact on military and national security. The addition of permanent lighting would be an ongoing impact; therefore, the effects of light on military and national security under the Proposed Action would be **minor** adverse.

Presence of structures: The addition of up to 100 WTGs and up to two RWECs would increase risk of allisions for military vessels for up to 35 years during Project operations, particularly in bad weather or low visibility. Military traffic within the RI/MA WEA has historically been relatively low (four vessels recorded in 2016 and 2017), and deep-draft military vessels are not anticipated to navigate outside navigation channels unless necessary for SAR operations (BOEM 2021). Additionally, the Proposed Action could create an artificial reef effect until decommissioning is complete, attracting species of interest to recreational fishing or sightseeing, and attracting additional recreational fishing and sightseeing vessels that would be additive to existing vessel traffic in the area. The presence of additional recreational vessels would add to conflict or collision risks for military and national security vessels and could increase demand for SAR operations. Therefore, the Project would have **minor** adverse impacts on military operations and national security.

Vessel traffic: There would be increased operational vessel traffic from the Proposed Action. This could impact military and national security uses by increasing the number of vessels in the analysis area. The RWF's proposed 1 × 1–nm spacing would result in more space for vessels to navigate and would help reduce conflicts with military vessels. As a result, the effects of vessel traffic on military and national security uses under the Proposed Action would be **minor** adverse**.**

#### 3.17.2.9.3 Cumulative Impacts

#### Offshore Activities and Facilities

Anchoring and new cable emplacement/maintenance: Up to 25,019 acres could be affected by anchoring and mooring activities and cable installation during offshore wind energy development within the analysis area as part of the Proposed Action and other reasonably foreseeable future actions. This offshore energy facility construction of new cable emplacement and maintenance of cables would involve increased vessel traffic, which could impact military and national security uses by increasing the number of vessels within the analysis area. Increased vessel traffic due to anchoring and cable maintenance of wind facilities could lead to course changes of military vessels, thereby increasing navigational complexity and risk of collisions. However, these impacts are expected to be limited to cable emplacement corridors, which would result in contact with cable emplacement and maintenance vessels expected from the Proposed Action and future offshore wind activities. Therefore, the cumulative effects of anchoring and new cable emplacement and maintenance would be **minor** adverse on military and national security.

Aviation and aircraft traffic: The Proposed Action would result in a measurable increase in general aviation traffic in the GAA during construction and installation, as well as decommissioning, which is expected to be similar in aviation traffic volumes as during construction and installation. The Proposed Action would result in a negligible effect on aviation traffic during O&M of the RWF. Other planned and potential future offshore wind projects could also result in increased air traffic due to the use of helicopters and other aircraft during construction and installation, O&M, and decommissioning. While the aviation requirements of other reasonably foreseeable offshore wind activities are unknown, it is anticipated that the aviation requirements for construction and O&M of these projects would be similar to those for the Proposed Action. Construction of these projects may occur concurrently between now and 2030 and, with a conservative 7% increase in aircraft traffic for all aircraft types in the GAA, the cumulative increase in air traffic during the construction period would be additive. Once projects are operational, cumulative O&M air traffic would likely result in a 0.1% increase in aviation traffic for all aircraft. The Proposed Action and reasonably foreseeable future wind projects would be required to engage the FAA in flight planning to avoid impacts to civilian, commercial, government, and military aviation operations. Therefore, the Proposed Action when combined with past, present, and other reasonably foreseeable project impacts would result in **minor** adverse impacts on military and national security.

Light: The Proposed Action would result in an increase in permanent aviation warning lighting on WTGs offshore. All existing stationary structures would have navigation marking and lighting in accordance with FAA, USCG, and BOEM guidance to minimize collision risks and optimize aviation safety. This would result in a general increase of lighting in the GAA, adding to vessel, navigation, onshore housing, and port lighting, which could impact military and national security uses. The Project, in combination with other reasonably foreseeable future actions, could result in the addition of up to 1,117 lighted structures in the analysis area. Therefore, because Project activities combined with reasonably foreseeable activities would result in an increase in lighted structures offshore, the cumulative impacts of light on military and national security would be **minor** adverse.

Presence of structures and vessel traffic: The Proposed Action would require approximately 970 construction vessel trips per construction day over the 2-year construction period. This vessel activity would increase the risk of collisions, allisions, and spills. However, the Proposed Action represents approximately 2% of typical vessel traffic in the GAA. Therefore, the Proposed Action would result in **negligible** adverse impacts to military and national security uses.

BOEM estimates a peak of 262 vessels due to offshore wind project construction over a 10-year time frame. Although the number of construction vessels would represent a large portion of the traffic in the region, most vessels would remain in the maximum work area, with fewer vessels transporting materials back and forth from ports. With multiple offshore wind projects under construction, traffic would also be spread among multiple ports to ensure that sufficient capacity exists at each port and in each waterway. Additionally, BOEM also anticipates that coordination with military and national security interests would be ongoing during construction and installation, O&M, and decommissioning activity.

The Proposed Action would result in noticeable impacts to military and national security through the installation and operation of up to 100 WTGs and two OSSs, along with stationary lift vessels and cranes during construction, to conditions under the No Action Alternative, for a total of 1,117 structures within the GAA. The Proposed Action structures represents a 10% increase over total estimated WTG and OSS foundations across the GAA under the No Action Alternative.

Project structures are likely to generate artificial reef effects that lead to increased abundance of commercially and recreationally desirable fish and shellfish within wind farm boundaries. This could in turn lead to an increase in commercial and recreational vessel traffic and activity in and around wind farms. Increased vessel traffic and presence of structures would therefore contribute to an increase the short-term and long-term collision and allision risks for military and national security vessels, as well as search and rescue vessels. However, deep-draft military vessels are not anticipated to transit outside navigation channels unless needed for search and rescue. Potential allision risks if these vessels lost power would be minimized through the Proposed Action’s 1 ×1–nm WTG spacing. BOEM also anticipates that coordination with military and national security interests would be ongoing during construction and installation, O&M, and decommissioning.

Changing navigation patterns could also concentrate vessels within and around the outsides of the RI and MA Lease Areas, potentially causing space use conflicts in these areas or reducing the effectiveness of SAR operations. While the addition of Project structures and associated construction vessels would also increase navigational complexity or alter navigation patterns for military and national security aircraft operating in the region, Project structures would be marked as a navigational hazard per FAA, BOEM, and USCG guidelines and WTGs would be visible on military and national security vessel and aircraft radar. The Proposed Action would implement a 1 × 1–nm spacing, consistent with all other projects in the RI/MA WEA.

Therefore, the cumulative impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would consist predominately of impacts described under the No Action Alternative, which would be **moderate** adverse for presence of structures and **minor** adverse for vessel traffic on military and national security.

#### 3.17.2.9.4 Conclusions

Project construction and installation, O&M, and decommissioning would affect ongoing military uses in the analysis area. Similar impacts from Project O&M would occur, although at a lesser extent and duration for some uses. BOEM anticipates that the impacts resulting from the Proposed Action alone that range from interference with ongoing military and national security activities to an expected increase in demand for SAR would range from negligible to moderate adverse. Therefore, BOEM expects the overall impact on military and national security from the Proposed Action alone to be **minor** adverse.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from **negligible** adverse to **moderate** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be **moderate** adverse for military uses.

### 3.17.2.10 Alternative B: Impacts of the Proposed Action on Scientific Research and Surveys (see section in main EIS)

### 3.17.2.11 Alternative B: Impacts of the Proposed Action on Undersea Cables

#### 3.17.2.11.1 Construction and Installation

##### Offshore Activities and Facilities

<u>Presence of structures:</u> Up to 100 WTGs, two OSS foundations, and two RWECs would be installed as part of the Proposed Action. The RWEC would cross up to seven identified subsea assets within the installation corridor, including three telecommunications cables.

The presence of the Project could preclude future submarine cable placement in the RWF and RWEC, although there are no future cables identified for location within this area. The presence of the RWF would likely require routing of future undersea cables around the Lease Area. Cable crossings of the RWEC would necessarily include mapping and installation of cable protection at the crossing location, standard design techniques for undersea cable installation. The impacts from foundation construction would be **minor** adverse while the installation of the RWECs would be **negligible** adverse. The overall impact from presence of structures on undersea cables would be **minor** adverse.

Vessel traffic: Increased vessel traffic due to construction and installation of the Proposed Action could interfere with vessels used to install or maintain existing and future undersea cables. Increased construction vessel traffic due to Project construction could lead to course changes of vessels used for undersea cable maintenance and installation and increased traffic along vessel transit routes. Additionally, there would be increased risk for allisions with vessels used for construction of undersea cables. These effects during the construction and installation phase are expected to be minimal and short term. Therefore, the effects of vessel traffic on undersea cables under the Proposed Action would be **negligible** adverse.

#### 3.17.2.11.2 Operations and Maintenance and Decommissioning

##### Offshore Activities and Facilities

Presence of structures: Up to 100 WTGs, two OSS foundations and two RWECs would be installed as part of the Proposed Action. The presence of the Project could preclude future submarine cable placement. O&M of the Project would be less likely to interfere with future undersea cable development than construction and decommissioning. OSS and WTG foundations would have a larger footprint compared to the RWECs, which are buried, and therefore would be more likely to preclude future undersea cable development. Once the foundations are constructed, impacts from foundation O&M and decommissioning would be **minor** adverse and O&M and decommissioning of RWECs would be **negligible** adverse. The overall impact from presence of structures on undersea cables is **minor** adverse.

Vessel traffic: Increased vessel traffic due to O&M and decommissioning of the Proposed Action could interfere with vessels used to install or maintain existing and future undersea cables. Additionally, there is increased risk for allisions with vessels used for undersea cable O&M. However, given the infrequency of required maintenance at any given location along a cable route, this risk is expected to be low. These effects during the construction and installation phase are expected to be minimal and short in duration. Therefore, the effects of vessel traffic on undersea cables under the Proposed Action would be **negligible** adverse.

#### 3.17.2.11.3 Cumulative Impacts

##### Offshore Activities and Facilities

Presence of structures: The Proposed Action would result in long-term impacts to existing undersea cables through the installation of up to 100 WTGs and two OSSs to conditions under the No Action Alternative. BOEM estimates a cumulative total of up to 1,117 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the RI/MA WEA.

Construction of the foundations associated with the Proposed Action and reasonably foreseeable future actions could increase the complexity of undersea cable development by requiring routing around the facilities. Export cables are unlikely to preclude future undersea cable development because cable crossings can be protected using standard design techniques. Therefore, in context of reasonably foreseeable environmental trends, the overall impacts from the presence of structures resulting from the Proposed Action and planned actions are anticipated to be localized long term **negligible** because impacts can be avoided by routing design and standard cable protection techniques.

Vessel traffic: Vessel traffic related to construction and O&M of undersea cables is expected to increase if new undersea cables are constructed and as ongoing maintenance is required. Additionally, there would be increased vessel traffic due to the Proposed Action and reasonably foreseeable future actions. The risk of allision to cable maintenance vessels could increase as more offshore wind energy projects are constructed. However, given the infrequency of required maintenance at any given location along a cable route, this risk is expected to be low. Therefore, the cumulative impact from vessel traffic on undersea cables is **negligible** adverse.

#### 3.17.2.11.4 Conclusions

Project construction and installation, O&M, and decommissioning would affect undersea cables occurring in the GAA. Similar impacts from Project O&M would occur, although at a lesser extent and duration for some uses. BOEM anticipates the impacts resulting from the Proposed Action alone would be **negligible**. Therefore, BOEM expects the overall impact on other marine uses from the Proposed Action alone to be **negligible** adverse for undersea cables.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would be **negligible**. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would be **negligible** adverse impacts for undersea cables.

### 3.17.2.12 Alternatives C, D, E, and F: Aviation and Air Traffic

Table 3.17-1 provides a summary of IPF findings by alternative.

#### 3.17.2.12.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and their associated inter-array cables, which would have an associated reduction in associated vessel and equipment use and air emissions, BOEM expects that the impacts resulting from each alternative alone would be **negligible** adverse compared to the Proposed Action. The overall impacts of Alternatives C through F when combined with past, present, and reasonably foreseeable activities would therefore be the same as under the Proposed Action: **minor** adverse impacts for aviation and air traffic.

### 3.17.2.13 Alternatives C D, E, and F: Land-Based Radar

Table 3.17-1 provides a summary of IPF findings by alternative.

#### 3.17.2.13.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and their associated inter-array cables, which would have an associated reduction in associated vessel and equipment use and air emissions, BOEM expects that the impacts resulting from each alternative alone would be the same as the Proposed Action: **minor** adverse. The overall impacts of Alternatives C through F when combined with past, present, and reasonably foreseeable activities would therefore be the same as under the Proposed Action: **moderate** adverse impacts for land-based radar.

### 3.17.2.14 Alternatives C, D, E, and F: Military and National Security (including Search and Rescue)

Table 3.17-1 provides a summary of IPF findings by alternative.

#### 3.17.2.14.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and their associated inter-array cables, which would have an associated reduction in associated vessel and equipment use and air emissions, BOEM expects that the impacts resulting from each alternative alone would be similar to the Proposed Action: **minor** adverse. The overall impacts of Alternatives C through F when combined with past, present, and reasonably foreseeable activities would therefore be the same as under the Proposed Action: **moderate** adverse for military uses and national security.

### 3.17.2.15 Alternatives C, D, E, and F: Scientific Research and Surveys (see section in main EIS)

### 3.17.2.16 Alternatives C, D, E, and F: Undersea Cables

Table 3.17-1 provides a summary of IPF findings by alternative.

#### 3.17.2.16.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and their associated inter-array cables, which would have an associated reduction in associated vessel and equipment use and air emissions, BOEM expects that the impacts resulting from each alternative alone would be the same as the Proposed Action: **negligible** adverse. The overall impacts of Alternatives C through F when combined with past, present, and reasonably foreseeable activities would therefore be the same as under the Proposed Action: **negligible** adverse for undersea cables.

### 3.17.2.17 Alternative G: Impacts of the Preferred Alternative on Aviation and Air Traffic

Table 3.17-1 provides a summary of IPF findings for this alternative.

#### 3.17.2.17.1 Conclusions

Project construction and installation, O&M, and decommissioning under Alternative G would affect ongoing aviation and air traffic occurring in the analysis area through the same mechanisms described for the Proposed Action, including increased air traffic, vessel traffic, vehicle traffic, light, port utilization, and an increase in structures. Although the overall extent of impacts to aviation and air traffic would be reduced under Alternative G relative to the Proposed Action, the significance of those effects would be the same. Therefore, the impacts of Alternative G alone on aviation and air traffic would be **negligible** adverse.

In the context of other reasonably foreseeable environmental trends and planned actions, Alternative G impacts from individual IPFs range from **negligible** to **minor** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with Alternative G when combined with past, present, and reasonably foreseeable activities would be **minor** adverse impacts for aviation and air traffic.

#### 3.17.2.18 Alternative G: Impacts of the Preferred Alternative on Land-Based Radar

Table 3.17-1 provides a summary of IPF findings for this alternative.

##### 3.17.2.18.1 Conclusions

Construction and installation, O&M, and decommissioning under Alternative G would affect land-based radar in the analysis area. BOEM anticipates the impacts on land-based radar resulting from Alternative G alone would be **minor** adverse because the overall effect would be managed through event-based operational changes and radar equipment upgrades. Considering all the IPFs together, BOEM anticipates that the overall cumulative impacts associated with Alternative G when combined with past, present, and reasonably foreseeable activities would be **moderate** adverse for land-based radar.

#### 3.17.2.19 Alternative G: Impacts of the Preferred Alternative on Military and National Security (including Search and Rescue)

Table 3.17-1 provides a summary of IPF findings for this alternative.

##### 3.17.2.19.1 Conclusions

Project construction and installation, O&M, and decommissioning under Alternative G would affect ongoing military uses in the analysis area. Similar impacts from Project O&M would occur, although at a lesser extent and duration for some uses. BOEM anticipates that the impacts resulting from Alternative G alone that range from interference with ongoing military and national security activities to an expected increase in demand for SAR would range from **negligible** to **moderate** adverse. Therefore, BOEM expects the overall impact on military and national security from Alternative G alone to be **minor** adverse.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under Alternative G resulting from individual IPFs would range from **negligible** adverse to **moderate** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with Alternative G when combined with past, present, and reasonably foreseeable activities would be **moderate** adverse for military and national security.

#### 3.17.2.20 Alternative G: Impacts of the Preferred Alternative on Scientific Research and Surveys (see section in main EIS)

#### 3.17.2.21 Alternative G: Impacts of the Preferred Alternative on Undersea Cables

Table 3.17-1 provides a summary of IPF findings for this alternative.

##### 3.17.2.21.1 Conclusions

Project construction and installation, O&M, and decommissioning would affect undersea cables in the GAA. Similar impacts from Project O&M would occur, although at a lesser extent and duration for some uses. BOEM anticipates the impacts resulting from Alternative G alone would be **negligible**. Therefore, BOEM expects the overall impact on other marine uses from Alternative G alone to be **negligible** adverse for undersea cables.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts of Alternative G resulting from individual IPFs would be **negligible**. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with Alternative G when combined with past, present, and reasonably foreseeable activities would be **negligible** adverse impacts for undersea cables.

#### 3.17.2.22 Mitigation

Mitigation measures resulting from agency consultations for land-based radar and military and national security are identified in Appendix F, Table F-2, and summarized in Table 3.17-2. These measures, if adopted, would further define how the effectiveness and enforcement of EPMs would be ensured and would improve accountability for compliance with EPMs by requiring the submittal of plans for approval by the enforcing agency(ies) and by defining reporting requirements. Because these measures ensure the effectiveness of and compliance with EPMs that are already analyzed as part of the Proposed Action, implementation of these measures would not further reduce the impact level of the Proposed Action from what is described in Section 3.17.2. Aviation, air traffic, and undersea cables have no additional mitigation measures proposed.

**Table 3.17-2. Mitigation and Monitoring Measures Resulting from Consultations for Other Marine Uses (land-based radar and military and national security) (Appendix F, Table F-2)**

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| **Land-based Radar** | | |
| Operational mitigation for ARSR-4 and ASR-8/9 radar | Mitigation for ASR-8/9 radar:<br>Passive aircraft tracking using ADS-B or signal/transponder<br>Increasing aircraft altitude near radar<br>Sensitivity time control (range-dependent attenuation)<br>Range azimuth gating (ability to isolate/ignore signals from specific range-angle gates)<br>Track initiation inhibit, velocity editing, plot amplitude thresholding (limiting the amplitude of certain signals)<br>Modification mitigations for ARSR-4 and ASR-8/9 systems include using the dual beams of the radar simultaneously and using in-fill radar. Additional conditions for COP approval to mitigate potential impacts on ASR-8/9 include notifying the North American Aerospace Defense Command 30 to 60 days ahead of Project completion and when the Project is complete and operational for Radar Adverse-impact Management (RAM) scheduling, contributing funds toward execution of the RAM, and curtailment of operations for national security or defense purposes. | These measures would reduce the anticipated minor adverse impacts to air defense and homeland security radar systems. |
| Mitigation for oceanographic HF radar | WTG operators sharing real-time surface current telemetry, other oceanographic data, and wind turbine operational data with radar operators would serve to aid interference mitigation. | These measures would complement existing EPMs and further reduce anticipated negligible impacts to weather radar and minor adverse impacts on SAR activities. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | Mitigation would also include a wind farm curtailment agreement. Additional modifications identified for oceanographic HF radar systems include signal processing enhancements and antenna modifications. | |
| Mitigation for NEXRAD weather radar systems | Research is underway for potential to mitigate weather radar using phased array radars to achieve a null in the antenna radiation pattern in the direction of the wind turbine. Additional mitigation includes a wind farm curtailment agreement. | This measure would further reduce anticipated negligible impacts on weather radar systems. |
| **Military and National Security** | | |
| Fiber-optic sensing technology | Distributed fiber-optic sensing technology proposed for the Project or associated transmission cables would be reviewed by the DOD to ensure that distributed fiber-optic sensing technology is not used to detect sensitive data from DOD activities, to conduct any other type of surveillance of U.S. government operations, or to otherwise pose a threat to national security. | Although this measure would not reduce the minor to moderate adverse impacts to military operations and national security, it would prevent the potential for impacts resulting from the use of wind energy project structures for surveillance. |
| WTG shut-down mechanism | Equip all WTG rotors (blade assemblies) with control mechanisms operable from the Project control centers 24 hours a day, 7 days a week. The control mechanisms would enable control room operators to shut down the requested WTGs within an agreed-upon time of notification between the USCG and Revolution Wind. A formal shut-down procedure would be part of the standard operating procedures and periodically tested. Normally, USCG-ordered shut downs would be limited to those WTGs in the immediate vicinity of an emergency and for as short | This measure would reduce anticipated minor impacts by allowing the USCG to request shut down of WTGs as necessary to complete military and national security operations, maintain public safety, and conduct SAR. |

| **Mitigation Measure** | **Description** | **Expected Effect on Impacts from Action Alternatives** |
|---|---|---|
| | a period as is safely practicable under the circumstances, as determined by the USCG. | |
| WTG shut-down mechanism | Revolution Wind would participate in periodic USCG-coordinated training and exercises to test and refine notification and shut-down procedures and to provide SAR training opportunities for USCG vessels and aircraft. | This measure would reduce anticipated minor impacts by providing smooth WTG shut-down procedures through training and increased coordination. |
| WTG shut-down mechanism | Prior to operation of the Project, Revolution Wind would submit a written plan for O&M, which includes control center (or centers), for review by BOEM and the USCG. The plan must demonstrate that the control centers would be adequately staffed to perform standard operating procedures, communications capabilities, and monitoring capabilities. The plan would include the following topics that may be modified through ongoing discussions with the USCG:<br>Standard operating procedures: Methods for establishing and testing WTG rotor shut down; methods of lighting control; methods for notifying the USCG of mariners in distress or potential/actual SAR incidents; methods for notifying the USCG of any events or incidents that may impact maritime safety or security; and methods for providing the USCG with environmental data, imagery, communications, and other information pertinent to SAR or marine pollution response.<br>Staffing: Number of personnel intended to staff the control centers to ensure continuous monitoring of WTG operations, communications, and surveillance systems. | This measure would reduce anticipated minor impacts by providing a plan to support testing, training, and implementation of WTG shut down in emergency situations. The plan would also provide communication protocols for providing information on WTG operations and incidents that could affect military and national security uses. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | Communications: Capabilities to be maintained by the control centers to communicate with the USCG and mariners in and near the Lease Area. Communications capability would, at a minimum, include VHF marine radio and landline and wireless for voice and data.<br>Monitoring: The control centers would maintain the capability to monitor the Project installation and operations in real time (including night and periods of poor visibility) for determining the status of all PATONs and for detecting a survivor who has climbed to the survivor's platform, if installed, on any WTG or OSS. | |
| WTG shut-down mechanism | If the Project's OSSs include helicopter-landing platforms, those platforms would be designed and built to accommodate up to and including USCG H60 sized rescue helicopters. | This measure would reduce anticipated minor impacts by allowing military and national security uses to use wind energy structures during operations and for emergencies. |

#### 3.17.2.22.1 Measures Incorporated into the Preferred Alternative

Mitigation measures for other marine uses required through completed consultations, authorizations, and permits listed in Table 3.15-14 and in Appendix F, Table F-2, are incorporated into Alternative G (Preferred Alternative). BOEM has identified additional measures in Table 3.15-15 as incorporated into the Preferred Alternative. These measures, if adopted, would further define how the effectiveness and enforcement of EPMs would be ensured and would improve accountability for compliance with EPMs by requiring the submittal of plans for approval by the enforcing agency(ies) and by defining reporting requirements. Because these measures would ensure the effectiveness of and compliance with EPMs that are already analyzed as part of the Proposed Action, implementation of these measures would not further reduce the impact level of the Proposed Action from what is described in Section 3.17.2.

# 3.18 Recreation and Tourism

## 3.18.1 Description of the Affected Environment and Environmental Consequences of the No Action Alternative for Recreation and Tourism

Geographic analysis area: The GAA for recreation and tourism (Figure 3.18-1) comprises all Project components plus a 40-mile radius around the Lease Area. The area covers approximately 6,113 square miles of open ocean, 1,488 square miles of land, and over 1,008 miles of shoreline, and coincides with the Project's visual impact assessment (EDR 2023) to 1) address Project visibility from visually sensitive resources located within New York, Connecticut, Rhode Island, and Massachusetts and 2) encompass all locations where BOEM anticipates recreation impacts associated with Project construction and installation, O&M, and decommissioning.

Affected environment: Recreation and tourism play a major role in the leisure pursuits of local residents and the coastal economies of the states affected by the Project (see Section 3.9 and Section 3.11). NOAA collects economic data for six sectors dependent on the ocean and Great Lakes: living resources, marine construction, marine transportation, offshore mineral resources, ship and boat building, and tourism and recreation. Tourism and recreation statistics from NOAA's Economics: National Ocean Watch are good indicators of coastal and ocean tourism because they estimate the ocean-dependent portion of business for hotels and restaurants by including only those establishments located in shore-adjacent zip code areas, and they exclude all forms of sports and entertainment that are not ocean-related. A summary of economic data for counties and states that fall within the recreation and tourism analysis area is aggregated in Table 3.18-1. As of 2018, ocean economy sectors accounted for 3% to 22% of the total economy for affected counties and states. Tourism and recreation were the substantive sources of economic activity for most locations.

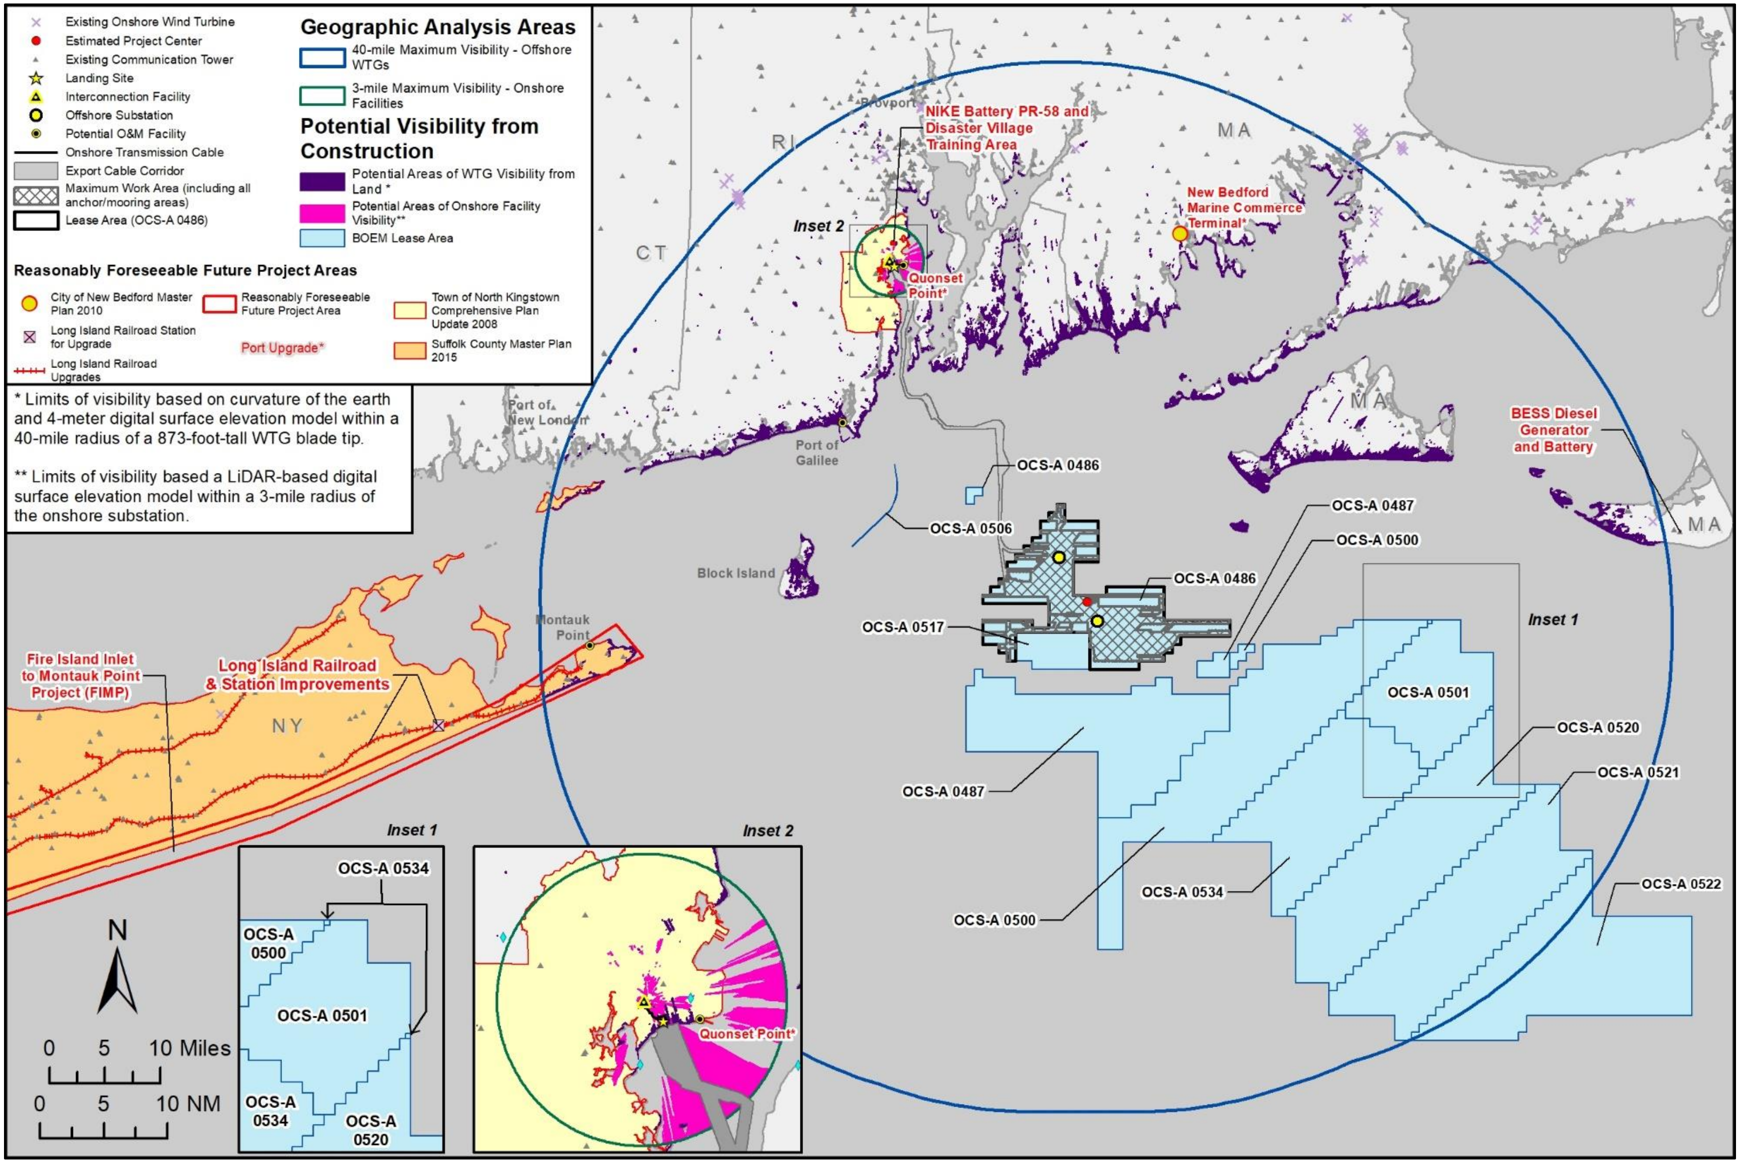

Figure 3.18-1. Geographic analysis area for recreation and tourism.

**Table 3.18-1. Ocean Economies for Counties and States that Would be Directly or Indirectly Affected by the Project**

| Location | % of Total Economy | Number of Employed Residents for Tourism and Recreation (% of total residents employed in ocean economy) | Total Wages for Tourism and Recreation (% of total wages generated by ocean economy) | Total Gross Domestic Product for Tourism and Recreation (% of total gross domestic product generated by ocean economy) |
|---|---|---|---|---|
| Suffolk County, NY | 6% | 36,385 (87.9%) | 921.1 million (70.1%) | 1.9 billion (73.4%) |
| New London, CT | 17% | 7,397 (36.2%) | 176.5 million (12.9%) | 374.3 million (15.5%) |
| Washington, RI | 21% | 6,032 (53.5%) | 145.2 million (31.6%) | 327.6 million (27.6%) |
| Kent, RI | 10% | 7,338 (96.4%) | 148.5 million (91.7%) | 321.8 million (93.0%) |
| Providence, RI | 6% | 14,803 (92.1%) | 326.3 million (84.8%) | 700.0 million (87.9%) |
| Bristol, RI | 17% | 1,977 (86.8%) | 46.5 million (76.8%) | 96.1 million (72.6%) |
| Bristol, MA | 3% | 2,963 (48.9%) | 55.0 million (19.1%) | 105.8 million (16%) |
| Newport, RI | 21% | 6,976 (82.0%) | 184.4 million (54.2%) | 444.1 million (56.8%) |
| Plymouth, MA | 5% | 9,180 (87.5%) | 203.8 million (71.2%) | 400.9 million (71.3%) |
| Barnstable, MA | 19% | 17,028 (94.0%) | 489.3 million (87.9%) | 1.1 billion (87.0%) |
| Dukes, MA | 16% | 1,394 (97.5%) | 52.9 million (96.1%) | 120.1 million (96.9%) |
| Nantucket, MA | 22% | 1,668 (99.5%) | 71.2 million (99.7%) | 159.7 million (99.8%) |

Source: NOAA (2020).

Notes: CT = Connecticut, MA = Massachusetts, NY = New York, RI = Rhode Island.

The analysis area for recreation and tourism supports a wide range of inland, shoreline or beach, and ocean-based recreation and tourist activities, including 16 water trails, more than 1,000 conservation areas, nearly 1,000 hiking trails, New Bedford Whaling National Historical Park, several hundred designated SCUBA diving areas, and 78 marinas (Northeast Ocean Data 2021). Recreational activities include beach-going, boating (for pleasure and competition), walking-hiking, swimming, surfing, metal detecting, horseback riding, camping, stand-up paddleboarding, cross-country skiing, kite sailing, and scenic-bird-nature viewing. The *Ocean State Outdoors Rhode Island's Comprehensive Outdoor Recreation Plan* (Rhode Island DEM 2019) identifies visiting coastal areas-beaches as one of the top three outdoor activities by Rhode Island residents. Likewise, Connecticut's statewide survey identifies beach activities as the top water-related recreation activity by residents (Center for Public Policy & Social Research 2017). Road or trail biking, birdwatching, and camping are also activities reported as displaying a relatively high degree of participation. Based on a broader study encompassing the northeast United States, the five most popular activities in the northeast region are beachgoing (61.9%), scenic enjoyment-sightseeing (50.2%), watching marine life (33.7%), photography (32.5%), and collecting non-living resources-beachcombing (27.4%) (Bloeser et al. 2015). The same study notes that surfing, stand-up paddleboarding, and triathlon typically occurred in nearshore bay-protected waters.

Locally, Blue Beach, a public beach, is approximately 500 feet west of the southwest corner of the Project's proposed 20-acre landfall envelope. Blue Beach is accessed via a trail located west of the Hayward Industries, Inc. building, which is just outside the landfall envelope. Compass Rose Beach, another public beach, is approximately 2,600 feet east of the southeast corner of the landfall envelope. The Martha's Vineyard Fast Ferry dock is directly east of Compass Rose Beach. The North Kingstown Golf Course is approximately 2,000 feet north of the northern edge of the landfall envelope and is separated by Roger Williams Way.

Boating in the analysis area includes ocean-going vessels down to small boats used by residents and tourists in sheltered waters. A 2012 survey of recreational boaters along the northeastern U.S. coast found that more than half (52.4%) of recreational boating occurred within 1 nm of the coastline (Starbuck and Lipsky 2013). In 2011, NOAA estimated that 93% of the 2011 recreational boating from Massachusetts occurred within 3 nm of shore (BOEM 2012). However, several long-distance sailboat races may pass through the offshore portions of analysis area, depending on the route selected for a particular year; these races include the Transatlantic Race, Marion to Bermuda Race, and Newport to Bermuda Race. Although these sailing events occur along the entire Long Island coastline, they are generally small (averaging less than 50 racing vessels). Larger sightseeing boats also travel to offshore locations where sightings of whales are more likely.

Recreational fishing along the shoreline and the pursuit of highly migratory species (HMS) such as tuna, shark, swordfish, and billfish are also popular recreational activities in the analysis area. In the nearby Vineyard Wind Lease Area, the recreational fishing effort for HMS occurs seasonally from June to October using a wide range of fishing methods, although mobile fishing methods predominate (Kneebone and Capizzano 2020). Coxes Ledge, The Fingers, and The Claw all support the highest level of recreational fishing for HMS (see Section 3.9 for additional discussion of recreational fishing activities and trends).

Although many of the above-listed publicly available recreation and tourism activities are free, local businesses also offer boat rentals and numerous recreation experiences such as private boat-cruise charters; canoe, kayak, and stand-up-paddleboard touring; whale watching; deep-sea fishing charters; and scuba diving in the analysis area. These tourism activities also support other local businesses, including non-ocean-related leisure, hotels, and restaurants.

Recreation and tourism in the GAA are noticeably higher in the spring, summer, and fall when the ambient air and water temperatures are comfortable (Parsons and Firestone 2018).

Historically, much of the fishing by the region's Native American tribes was concentrated in the nearshore marine and estuarine environment (Bennett 1955). Recent BOEM consultation with Native American tribes in lease areas adjacent to the Project indicate that tribal subsistence fisheries continue to occur predominately in inshore areas (BOEM 2020).

## 3.18.2 Environmental Consequences

### 3.18.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

This assessment analyzes the maximum-case scenario; however, there is the potential for variances in the proposed Project build-out, as defined in the PDE (see Appendix D). The Project design parameters that would influence the magnitude of the impacts on recreation and tourism consists of the number and type of WTGs installed. Impacts on recreational fishing and boating are based on the installation of 100 WTGs and two OSSs, for a total of 102 foundations in the GAA. If Revolution Wind were instead to install 59 12-MW WTGs, the maximum height of the blade tip for WTGs would be 873 feet above the surface, compared to 648 feet for the 8-MW WTGs. Because the WTGs would exceed 699 feet, FAA regulations require supplemental mid-tower lighting, in addition to lighting at the top of the nacelle (FAA 2018). The taller WTGs and additional lighting would result in greater visual impacts within the GAA. However, the 12-MW WTG option would reduce the number of WTGs and IAC; therefore, navigational complexity for offshore recreation users would be reduced compared to the 8-MW WTG option.

Revolution Wind has committed to implementing ADLS (as described in Appendix F) as a measure to reduce the duration of lighting impacts. Revolution Wind would also establish temporary safety zones around construction areas and work with the USCG to communicate these zones and other work areas to the boating public via local Notices to Mariners. These EPMs would be implemented across all alternatives; therefore, BOEM would not expect measurable potential variances in impacts across the alternatives.

See Appendix E1 for a summary of IPFs analyzed for recreation and tourism across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Appendix E1 Table E2-10.

Table 3.18-2 provides a summary of IPF findings carried forward for analysis in this section. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion.

A detailed analysis of the Proposed Action is provided following the table. Detailed analysis of other considered action alternatives is also provided below the table if analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4, to facilitate reader comparison across alternatives.

The Conclusion section within each alternative analysis discussion includes rationale for the effects determinations. All of the action alternatives would include both adverse and beneficial effects. Overall, these effects to recreation and tourism across all alternatives would be **minor** adverse because they would be small, and the resource would be expected to recover completely with no mitigating action required.

**Table 3.18-2. Alternative Comparison Summary for Recreation and Tourism**

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| Anchoring and new cable emplacement/ maintenance | **Offshore**: Most anchoring would occur outside the area most commonly used for recreational boating, which would prevent most conflicts for recreational uses. Anchoring activities would also be temporary and localized; therefore, construction-related anchoring impacts from future projects would be **minor** adverse.<br>Smaller vessel anchors would not penetrate to the typical target cable burial depth (4 to 6 feet), and recreational vessel anchoring is uncommon in water depths where offshore structures would be installed. However, scour protection for cables and foundations could hinder boat anchoring and result in gear entanglement or loss if recreational activity coincides with scour protection areas. If project-related seafloor hazards are not noted on charts, operators could lose anchors, leading to increased risks associated with drifting vessels that are not securely anchored. Therefore, new cable emplacement and maintenance would result in temporary to long-term **minor** adverse impacts. | **Offshore**: Installation of offshore cables and anchoring would temporarily restrict recreation access within the cable routes. Revolution Wind would implement a comprehensive communication plan during offshore construction to inform all mariners, including commercial and recreational fishermen and recreational boaters, of construction activities and vessel movements. Temporary safety zones around each WTG site and each cable-laying vessel (anticipated to be established and monitored by Revolution Wind) would minimize potential conflicts for recreational uses. Potential O&M anchoring impacts would be similar to the construction phase, but reduced due to fewer anchored vessels. Therefore, potential changes in navigation routes due to Proposed Action would constitute a temporary, **minor** adverse impact.<br>Cable installation could also affect fish and mammals of interest for recreational fishing and sightseeing through dredging and turbulence, although no population-level impacts are expected, resulting in short-term **minor** adverse impacts.<br>Up to approximately 6,550 acres of anchoring and 18,995 acres of cabling seafloor disturbance could occur from ongoing and planned actions, including the Proposed Action, in the recreation and tourism GAA. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** adverse cumulative impacts on recreation and tourism. | **Offshore**: Alternatives C through F would reduce the number of WTG foundations and scour protection associated with the IAC. This could reduce risks associated with gear entanglement or loss if recreational activity occurs in scour protection areas. Reduced IAC installation could also negligibly decrease turbidity that could alter the behavior of species important to recreational fishing (see Section 3.9) and marine mammal sightseeing. Differences in estimated acres of anchoring by alternative are disclosed in Appendix E4 and range from 1,814 acres (Alternative F) to 2,961 acres (Alternative D). Project design for IACs and the export cable has not occurred for Alternatives C through F; therefore, a comparison of cabling-related disturbance is not available. However, best professional judgment suggests that the footprint of the IAC, OSS-link cable, and RWEC would change and be slightly reduced to match the reduced number of WTGs.<br>During O&M, no impacts are anticipated because the RWEC, IAC, and OSS transmission cable typically have no maintenance requirements unless a fault or failure occurs.<br>Approximately 5,158 to 6,331 acres of anchoring and up to 18,995 acres of cabling seafloor disturbance could occur from ongoing and planned actions, including Alternatives C through F (see Appendix E4 for a comparison of cumulative anchoring acreage estimates). Project-related construction anchorages would noticeably add to disturbances of marine species and their habitats important to recreational fishing and could require recreational and tourism vessels to navigate around moving and anchored construction-related vessels while in transit. The buried cabling would also present short-term navigational hazards. Therefore, Alternatives C through F when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** adverse cumulative impacts on recreation and tourism. | | | | **Offshore**: Alternative G would reduce the number of WTG foundations and scour protection associated with the IAC. This could reduce risks associated with gear entanglement or loss if recreational activity occurs in scour protection areas. Reduced IAC installation could also negligibly decrease turbidity that could alter the behavior of species important to recreational fishing (see Section 3.9) and marine mammal sightseeing. Differences in estimated acres of anchoring by alternative are disclosed in Appendix E4 and would be 2,098 acres for Alternative G. A comparison of cabling-related disturbance is not available. However, best professional judgment suggests that the footprint of the IAC, OSS-link cable, and RWEC would change and be slightly reduced to match the reduced number of WTGs.<br>During O&M, no impacts are anticipated because the RWEC, IAC, and OSS transmission cable typically have no maintenance requirements unless a fault or failure occurs.<br>Approximately 5,444 acres of anchoring and 18,386 acres of cabling seafloor disturbance could occur from ongoing and planned actions, including Alternative G (see Appendix E4 for a comparison of cumulative anchoring acreage estimates). Project-related construction anchorages would noticeably add to disturbances of marine species and their habitats important to recreational fishing and could require recreational and tourism vessels to navigate around moving and anchored construction-related vessels while in transit. The buried cabling would also present short-term navigational hazards. Therefore, Alternative G when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** adverse cumulative impacts on recreation and tourism. |
| | **Onshore:** Onshore construction and installation of future wind facilities could affect recreation and tourism due to noise and activity at the landfall locations or | **Onshore:** Installation of onshore cables would be localized. No direct impacts to public parks, beaches, or other public recreational facilities would occur. Therefore, recreation and tourism | **Onshore:** Alternatives C through F would not impact onshore activities; therefore, impacts would be the same as those described for the Proposed Action: **negligible** adverse. | | | | **Onshore:** Alternative G would not impact onshore activities; therefore, impacts would be |

| **Impact-Producing Factor** | **No Action Alternative** | **Alternative B (Proposed Action) up to 100 WTG** | **Alternative C (Habitat Alternative) 64–65 WTGs** | **Alternative D (Transit Alternative) 78–93 WTGs** | **Alternative E (Viewshed Alternative) 64–81 WTGs** | **Alternative F (Higher Capacity Turbine Alternative) 56 WTGs** | **Alternative G (Preferred Alternative)** |
|---|---|---|---|---|---|---|---|
| | along the onshore cable route if these locations intersect recreational or commercial uses. These **minor** adverse impacts would be unavoidable during construction but would be temporary and localized. | impacts during construction would be temporary and **minor** adverse.<br>No onshore cable maintenance would be required unless a fault or failure occurs. Therefore, cumulative, O&M, and decommissioning impacts would represent a **negligible** adverse impact on recreational users. | | | | | the same as the Proposed Action: **negligible** adverse. |
| Light | **Offshore:** Visual impacts on recreation and tourism would be short term during construction and long term during O&M, with **negligible to moderate** adverse impacts, based on the observed distance and individual responses by recreationists and visitors to changes in the viewshed. | **Offshore:** Visual impact assessment prepared for Revolution Wind (see COP Appendix U3 [EDR 2023]) determined that the Project would not likely be easily detectable when viewed from a distance of 20 miles or more and that only 3% of the land area within the visual study area would contain views of the Project. Therefore, visual impacts on recreation and tourism would be temporary during construction, with **negligible** to **moderate** adverse impacts, based on the observed distance.<br>The Proposed Action's aviation warning lighting, when visible, would add a developed/industrial visual element to views that were previously characterized by dark, open ocean during O&M. Due to the limited duration and frequency of such events and the distance of WTGs from shore, however, visible aviation hazard lighting for the Proposed Action would result in a long-term intermittent **negligible** adverse impact on recreation and tourism.<br>Given the distance from recreational viewers and atmospheric interference, lighting from the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in long-term intermittent **minor** adverse cumulative impacts on recreation and tourism. | **Offshore:** Construction of offshore components would likely require less time under Alternatives C through F than under the Proposed Action, and could lead to reduced potential lighting impacts due to a smaller number of installed WTGs, ranging from 56 WTGs (Alternative F) to 93 WTGs (Alternative D). Therefore, Alternatives C through F would have **negligible** to **moderate** adverse impacts.<br>Alternatives C through F would also reduce nighttime O&M lighting as compared to the Proposed Action due to the required aviation hazard lighting of fewer WTGs and the addition of two OSSs. Because of the limited duration and frequency of such events and the distance of WTGs from shore, however, visible aviation hazard lighting would still only result in a long-term negligible adverse impact on recreation and tourism.<br>Offshore construction activities would add new WTGs and two OSSs to the No Action Alternative. Construction vessels would employ navigational safety lighting, and offshore structures would employ aviation and navigation hazard lighting. New lighting from Alternatives C through F would contribute a 6% to 10% increase to in-water lighting sources from past, present, and reasonably foreseeable future projects within the GAA by introducing built visual elements to views previously characterized by dark, open ocean. Given that impacts would depend on observed viewer distance and atmospheric interference, lighting from Alternatives C through F when combined with past, present, and reasonably foreseeable projects would result in long-term intermittent **minor** adverse cumulative impacts on recreation and tourism. | | | | **Offshore:** Construction of offshore components would likely require less time under Alternative G than under Proposed Action, and could lead to reduced potential lighting impacts due to a smaller number of installed WTGs as compared to the maximum-case scenario for the Proposed Action. Therefore, Alternative G would have **negligible** to **moderate** adverse impacts.<br>Alternative G would also reduce nighttime O&M lighting as compared to the Proposed Action due to the required aviation hazard lighting of fewer WTGs and the addition of two OSSs. Because of the limited duration and frequency of such events and the distance of WTGs from shore, however, visible aviation hazard lighting would still only result in a long-term negligible adverse impact on recreation and tourism.<br>Offshore construction activities would add new WTGs and two OSSs to the No Action Alternative. Construction vessels would employ navigational safety lighting, and offshore structures would employ aviation and navigation hazard lighting. New lighting from Alternative G would contribute a 7% increase to in-water lighting sources from past, present, and reasonably foreseeable future projects within the GAA by introducing built visual elements to views previously characterized by dark, open ocean. Given the distance from recreational viewers and atmospheric interference, lighting from Alternative G when combined with past, present, and reasonably foreseeable projects would result in long-term intermittent **minor** adverse cumulative impacts on recreation and tourism. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| | **Onshore:** Construction of some planned future onshore projects would require new visible structures or nighttime lighting on structures that could be visible by onshore recreational users and tourists. Onshore O&M impacts from future projects would be variable based on project type) but are anticipated to be long term with variable **minor** to **moderate** adverse impacts experienced based on the observed distance. | **Onshore**: Light from onshore construction activities could temporarily adversely impact the recreation experience of users if present or traveling on roads near the landing site, onshore cable route, and proposed onshore facilities. However, as previously noted, no public parks, beaches, or other public recreational facilities are within or immediately adjacent to this onshore route, OnSS, or ICF. For nighttime construction work, downward-facing portable floodlights would be used in compliance with all safety and security and local government requirements. Therefore, for most locals and tourists, any adverse impacts would be temporary, **minor**, and inconvenient but would not cause a loss to their overall experience.<br>Operational lighting for the OnSS and ICF would comply with Quonset Development Corporation lighting regulations and be mounted with the lamp horizontal to the ground (light facing straight down) or with a lamp tilt no more than 25 degrees from the horizon. As such, it is anticipated that the OnSS and ICF would result in long-term **negligible** adverse lighting impacts to the recreation and tourism activities in the GAA.<br>Construction associated with the Proposed Action could add temporary **minor** adverse light impacts experienced by onshore recreational users near the landfall work area, onshore transmission cable route, or onshore facilities or from the aviation hazard lighting on the new WTGs. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in temporary **minor** adverse cumulative impacts to onshore recreation and tourism. | **Onshore:** Alternatives C through F would not impact onshore activities; therefore, impacts would be the same as those described for the Proposed Action: **negligible** to **minor** and temporary to long term. | | | | **Onshore:** Alternative G would not impact onshore activities; therefore, impacts would be the same as the Proposed Action: **negligible** to **minor** and temporary to long term. |
| Noise | **Offshore**: Pile driving is the loudest aspect of most planned future projects. Most pile driving would occur far enough offshore that that work would be inaudible from onshore locations or from typical recreational fishing locations (within 1 mile of the coast). However, pile driving and other construction noise could cause some offshore boaters and recreational fishers to avoid areas of noise-generating activity, although the loudest noise would | **Offshore**: Construction noise could result in impacts on recreation and tourism through displacement of species important to recreational fishing and sightseeing in and around construction areas, resulting in a short-term **moderate** adverse impact to fishing, shellfishing, or whale-watching activities.<br>Offshore construction and onshore cable installation near the landfall area at Quonset Point in North Kingstown, Rhode Island, could have short-term **negligible** to **minor** adverse | **Offshore**: Alternatives C through F would negligibly decrease noise associated with pile driving for WTGs as compared to the Proposed Action, resulting in short-term **moderate** adverse impacts. Operational noise sources and levels would also be similar to, but slightly lower than, the Proposed Action, resulting in long-term **minor** adverse impacts.<br>Construction activities would add noise from pile driving for foundations proposed under Alternatives C through F and from offshore dredging for the export and inter-array cabling to the ambient noise levels of the No Action Alternative. Noise from construction could lead to the displacement of fish in and around construction sites, leading to spatial competition, depending on migrating patterns. Recreational boaters and tourists would not be permitted to approach active construction zones and would therefore not be expected to experience noise impacts from offshore construction. Because of the distance from receptors, | | | | **Offshore**: Alternative G would negligibly decrease noise associated with pile driving for WTGs as compared to the Proposed Action, resulting in short-term **moderate** adverse impacts. Operational noise sources and levels would also be similar to, but slightly lower than, the Proposed Action, resulting in long-term **minor** adverse impacts.<br>Construction activities would add noise from pile driving for foundations and from offshore dredging for the export and inter-array cabling |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| | be within the temporary safety zones (with restricted recreational and tourism vessel access) anticipated to be established for each project by offshore wind developers. Most of the anticipated offshore O&M noise from future projects would be from continuous WTG operations farther offshore. Field observations also concluded that WTG operational noise from the Block Island Wind Farm was not detectable from shore and further suggested that as wind speeds increase (causing increased ambient noise), the associated increase in operational noise of the WTG becomes less detectable (HDR 2019). Therefore, noise from offshore activities would result in temporary to long-term **minor** adverse impacts. | impacts on the recreational enjoyment of the marine and coastal environments.<br>Offshore operational noise from the WTGs would be similar to the noise described for other projects under the No Action Alternative and would thus have long-term **minor** adverse impacts.<br>Because of the distance from receptors, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in localized short-term **minor** to **moderate** adverse cumulative impacts on recreation and tourism due to construction activities, whereas noise from O&M activities would result in long-term **negligible** adverse cumulative impacts. | Alternatives C through F when combined with past, present, and reasonably foreseeable activities would result in localized, short-term **minor** to **moderate** adverse cumulative impacts on recreation and tourism due to construction activities, whereas noise from O&M activities would result in long-term **negligible** cumulative impacts. | | | | to the ambient noise levels of the No Action Alternative. Noise from construction could lead to the displacement of fish in and around construction sites, leading to spatial competition, depending on migrating patterns. Recreational boaters and tourists would not be permitted to approach active construction zones and would therefore not be expected to experience noise impacts from offshore construction. Because of the distance from receptors, Alternative G when combined with past, present, and reasonably foreseeable activities would result in localized, short-term **minor** to **moderate** adverse cumulative impacts on recreation and tourism due to construction activities, whereas noise from O&M activities would result in long-term **negligible** cumulative impacts. |
| | **Onshore**: Construction noise from planned future projects onshore would be variable based on project type, but many projects would include one or more noise-generating activities such as earth moving, pile driving, trenching, jackhammering, and other similar large equipment operations. Onshore O&M impacts from future projects would be variable based on project type but are anticipated to be adverse and long term with variable **minor** to **moderate** adverse impacts experienced based on the distance to the noise source. | **Onshore**: Noise from onshore construction activities could temporarily adversely impact the recreation experience of users if present or traveling on roads near the landing site, onshore cable route, and proposed onshore facilities. However, as previously noted, no public parks, beaches, or other public recreational facilities are within or immediately adjacent to this onshore route, OnSS, or ICF. Therefore, for most locals and tourists, any adverse impacts would be temporary**,** **minor**, and inconvenient but would not cause a loss to their overall experience.<br>Operations of onshore Project components (i.e., offshore to onshore transition joint bays, onshore transmission cable route, OnSS, and ICF) would have **negligible** adverse noise impacts intermittently over the life of the Project to onshore recreation and tourism because these components would only require periodic routine maintenance.<br>As with lighting, construction activities would add noise from the construction of onshore facilities to the ambient noise levels of the No Action Alternative. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in temporary | **Onshore**: Alternatives C through F would not impact onshore activities; therefore, impacts would be the same as those described for the Proposed Action: **negligible** to **minor** and temporary to long term. | | | | **Onshore**: Alternative G would not impact onshore activities; therefore, impacts would be the same as the Proposed Action: **negligible** to **minor** and temporary to long term. |

|---|---|---|---|---|---|---|---|
| | | **minor** adverse cumulative impacts to onshore recreation and tourism. | | | | | |
| Presence of structures | **Offshore**: Recreational impacts associated with in-water structures would include the risk of recreational vessel allision and collision, fishing gear entanglement, vessel damage or loss, increased navigation hazards, and visual impacts: The impact of visible structures on recreation would be long term and **moderate** adverse but unlikely to impact shore-based or marine recreation and tourism in the GAA as a whole. | **Offshore**: Offshore structures would impact recreation and tourism through increased navigational complexity, risk of allision or collision, attraction of recreational vessels to offshore wind structures for fishing and sightseeing, increased risk of fishing gear loss or damage by entanglement due to scour or cable protection, and potential difficulties in anchoring over scour or cable protection. Revolution Wind would minimize these **minor** to **moderate** adverse impacts through the navigation- and fishing-related EPMs listed in Appendix F.<br>Based on the duration of Project activity and observed distance, visual contrast associated with the Proposed Action could have a beneficial, adverse, or neutral impact on the quality of the recreation and tourism experience depending on the viewer's orientation, activity, and purpose for visiting the area. Additionally, construction of offshore Project components could elicit a long-term **minor** beneficial impact through an increase in curiosity, recreational fishing and diving activity.<br>New structures related to the Proposed Action would noticeably increase navigational complexity; risks of structure allision; route adjustments for races, sightseeing, and fishing; loss and damage of fishing gear to scour and cable protection; viewshed changes; and difficulty anchoring over scour and cable protection. However, new in-water structures from the Proposed Action could benefit recreation and tourism by attracting recreational vessels to WTGs for fishing and sightseeing activities. Therefore, new in-water structures from the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** to **moderate** adverse and long-term **minor** beneficial cumulative impacts on recreation and tourism. | **Offshore**: Alternatives C through F would reduce the number of WTGs, ranging from 56 WTGs (Alternative F) to 93 WTGs (Alternative D), potentially allowing for improved maneuverability for recreational vessels through the Lease Area. These alternatives could also negligibly reduce visual impacts as compared to the Proposed Action, depending on the observable distance and individual responses to a view of offshore wind farms (see Section 3.20 for details).<br>Alternatives C through F would add foundations to the 893 foundations estimated for the No Action Alternative within the GAA. New structures would add to the long-term impacts on recreation and tourism throughout the life of the Project (up to 35 years, plus up to an additional 2 years for decommissioning) by increasing navigational complexity; risks of structure allision; route adjustments for races, sightseeing, and fishing; loss and damage of fishing gear to scour and cable protection; and difficulty anchoring over scour and cable protection. Based on visual simulations from onshore locations, some seaside locations could experience reduced recreational and tourism activity as a result of visible in-water structures, but the visibility of large offshore structures is not expected to impact shore-based recreation and tourism as a whole.<br>New in-water structures could also benefit recreation and tourism by attracting recreational vessels to WTGs for fishing and sightseeing activities. Therefore, new in-water structures from Alternatives C to F when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** to **moderate** adverse and long-term **minor** beneficial cumulative impacts on recreation and tourism. | | | | **Offshore**: Alternative G would reduce the number of WTGs as compared to the maximum-case scenario for the Proposed Action, potentially allowing for improved maneuverability for recreational vessels through the Lease Area. This alternative could also negligibly reduce visual impacts as compared to the Proposed Action, depending on the observable distance and individual responses to a view of offshore wind farms (see Section 3.20 for details).<br>Alternative G would add foundations to the 893 foundations estimated for the No Action Alternative within the GAA. New structures would add to the long-term impacts on recreation and tourism throughout the life of the Project (up to 35 years, plus up to an additional 2 years for decommissioning) by increasing navigational complexity; risks of structure allision; route adjustments for races, sightseeing, and fishing; loss and damage of fishing gear to scour and cable protection; and difficulty anchoring over scour and cable protection. Based on visual simulations from onshore locations, some seaside locations could experience reduced recreational and tourism activity as a result of visible in-water structures, but the visibility of large offshore structures is not expected to impact shore-based recreation and tourism as a whole.<br>New in-water structures could also benefit recreation and tourism by attracting recreational vessels to WTGs for fishing and sightseeing activities. Therefore, new in-water structures from Alternative G when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** to **moderate** adverse and long-term **minor** beneficial cumulative impacts on recreation and tourism. |
| | **Onshore**: Not applicable | **Onshore**: Inland residential/commercial areas and recreational sites would generally be screened from construction views due to the presence of existing development combined with forested | **Onshore:** Alternatives C through F would not impact onshore activities; therefore, impacts would be the same as those described for the Proposed Action: **negligible** to **minor** adverse and temporary to long term. | | | | **Onshore:** Alternative G would not impact onshore activities; therefore, impacts would be the same as the Proposed Action: **negligible** to **minor** adverse and temporary to long term. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| | | areas (see COP Appendix U1 [EDR 2023]). Therefore, any adverse impacts to overall recreator experience would be temporary and **minor** adverse impacts, but would not cause a loss to the overall recreator experience.<br>The proposed OnSS and ICF would not be out of scale or character with the existing types of development currently present in the vicinity, such as the existing Davisville Substation or the structures at nearby Quonset Business Park. As such, it is anticipated that O&M of the OnSS and ICF would result in **negligible** adverse visual impacts to recreation and tourism activities in the GAA.<br>New onshore structures would only result in **minor** adverse visual impacts experienced by recreational users due to the existing settings at these locations. When considered cumulatively with past, present, and reasonably foreseeable activities, the Proposed Action would result in temporary **negligible** to **minor** adverse cumulative visual impacts on recreation and tourism. | | | | | |
| Vessel traffic | **Offshore**: Future projects would generate increased nearshore and offshore vessel traffic, primarily during construction, along routes between ports and the offshore wind construction areas. Although long-term increased traffic volumes from O&M of future projects would be low, they would add to existing in-water vessel traffic and therefore present **minor** long-term adverse impacts on recreational users. | **Offshore**: Construction would result in as many as 59 construction vessels per construction day in 2023 and 2024 present at offshore work areas on a daily basis. However, the majority of recreational boating occurs within 1 nm of shore. Therefore, most recreational boaters in the GAA would experience a temporary **minor** adverse inconvenience from construction-related vessel traffic.<br>The estimated low volume of O&M vessel traffic would not be anticipated to affect ongoing recreational use. O&M of the Proposed Action would therefore have **negligible** adverse impacts on onshore or offshore recreation and tourism.<br>Project vessels would add to disturbances of marine species and their habitats important to recreational fishing and could require recreational and tourism vessels to navigate around moving construction-related vessels while in transit. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** adverse cumulative impacts on recreation and tourism. | **Offshore**: Construction of offshore components would likely require less time for Alternatives C through F than anticipated for the Proposed Action, and could lead to reduced potential navigational impacts for recreational users due to a smaller number of WTGs. Therefore, Alternatives C through F would have **negligible** to **minor** adverse impacts. | | | | **Offshore**: Construction of offshore components would likely require less time for Alternative G than anticipated for the Proposed Action, and could lead to reduced potential navigational impacts for recreational users due to a smaller number of WTGs. Therefore, Alternative G would have **negligible** to **minor** adverse impacts. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative D (Transit Alternative) 78–93 WTGs | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| | **Onshore**: Future projects could increase onshore vehicle traffic or alter traffic patterns in a manner that inconveniences recreational users, primarily during construction near port facilities and on adjacent, existing roadways. Although long-term increased traffic volumes from O&M activities of future projects would be relatively low, they would add to the existing onshore traffic and therefore present **minor**, localized long-term adverse impacts on recreational users. | **Onshore**: No public parks, beaches, or other public recreational facilities are immediately adjacent to the onshore route, OnSS, or ICF. Additionally, Revolution Wind would coordinate with local authorities during onshore construction to minimize local traffic impacts. Therefore, any adverse impacts to tourism or overall recreator experience would be temporary to long term and **minor** adverse. | **Onshore**: Alternatives C through F would not impact onshore activities; therefore, impacts would be the same as those described for the Proposed Action: **minor** and temporary to long term. | | | | **Onshore**: Alternative G would not impact onshore activities; therefore, impacts would be the same as the Proposed Action: **minor** and temporary to long term. |

### 3.18.2.2 Alternative A: Impacts of the No Action Alternative on Recreation and Tourism

#### 3.18.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for recreation and tourism (see Section 3.18.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.18.2.2.2 Cumulative Impacts

This section discloses potential recreation and tourism impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

#### Offshore Activities and Facilities

<u>Anchoring and new cable emplacement/maintenance:</u> Construction of future projects would increase the number of anchored vessels and work platforms used for survey and construction purposes. Applying estimates developed by BOEM based on their 2019 study *National Environmental Policy Act Documentation for Impact-Producing Factors in the Offshore Wind Cumulative Impacts Scenario on the North Atlantic Outer Continental Shelf* (BOEM 2019), up to 3,346 acres of anchoring could occur under the No Action Alternative in the recreation and tourism GAA. The presence of anchored vessels could increase navigation complexity for recreational vessels. Increased turbidity from anchoring could also briefly alter the behavior of species important to recreational fishing (see Section 3.9) and sightseeing (primarily whales, but also dolphins and seals). However, most anchored construction-related vessels would be located within temporary safety zones (anticipated to be established and monitored by offshore wind developers). Likewise, most anchoring would occur outside the area most commonly used for recreational boating, which would prevent most conflicts for recreational uses. Anchoring activities would also be temporary and localized; therefore, construction-related anchoring impacts from future projects would be **minor** adverse. Anchoring impacts to fish species used for recreational fishing are addressed in Section 3.9.

Up to 14,986 acres of seafloor disturbance could occur from IAC and export cable installation within the recreation and tourism GAA (see Appendix E4, Table E4-1). As with anchoring, installation of offshore cables would temporarily increase navigation complexity for recreational vessels present around work areas and reduce recreational opportunities if individuals prefer to avoid the noise and disruption caused by installation. Cable installation could also have temporary impacts on individual fish and invertebrates of interest for recreational fishing due to dredging, turbulence, and disturbance; however, no population-level species impacts would occur. Once installed, buried cables typically have no maintenance unless a fault or failure occurs. Smaller vessel anchors would not penetrate to the typical target cable burial depth (4 to 6 feet), and recreational vessel anchoring is uncommon in water depths where offshore structures would be installed. However, scour protection for cables and foundations could hinder boat anchoring and result in gear entanglement or loss if recreational activity coincides with scour protection areas. If project-related seafloor hazards are not noted on charts, operators could lose anchors, leading to increased risks associated with drifting vessels that are not securely anchored. Therefore, new cable emplacement and maintenance would result in temporary to long-term **minor** adverse impacts.

Light: Construction of future planned offshore projects would require nighttime lighting on WTGs, vessels, and platforms that could be visible by onshore recreational users and tourists, as well as offshore boaters recreating at night or in low-light conditions. O&M of the estimated 876 WTGs in the GAA would require permanent aviation warning lights that could be visible from some beaches and coastlines and could impact recreation and tourism if recreation decisions are influenced by lighting. Field observations made from the mainland shoreline during WTG operations at the Block Island Wind Farm indicated that at nighttime and under clear skies, the turbine lights were visible with the naked eye up to 26.75 miles (23.2 nm) (HDR 2019). A University of Delaware study evaluating the impacts of visible offshore WTGs on beach use found that WTGs visible more than 15 miles from the viewer would have negligible adverse impacts on businesses dependent on recreation and tourism (Parsons and Firestone 2018). Likewise, a 2017 study on the impact of offshore wind facilities on vacation rental prices found that nighttime views of aviation hazard lighting (without ADLS) for WTGs close to shore (5 to 8 miles) would adversely impact the rental price of properties with ocean views (Lutzeyer et al. 2017). However, the study did not specifically address the relationship between lighting, nighttime views, and tourism for WTGs located farther from shore.

A 2013 BOEM study evaluated the impacts of WTG lighting on birds, bats, marine mammals, sea turtles, and fish. The study found that existing guidelines "appear to provide for the marking and lighting of [WTGs] that would pose minimal if any impacts on birds, bats, marine mammals, sea turtles or fish" (Orr et al. 2013). By extension, existing lighting guidelines or ADLS (if implemented) would not impact recreational fishing or wildlife viewing opportunities.

Lighting impacts would be most pronounced for views that can be currently characterized as undeveloped, where lighting from human infrastructure and activities is not dominant or even exists. However, less than 5% of the lighted WTG positions envisioned in the GAA would be within 15 miles from coastal locations. Therefore, visual impacts on recreation and tourism would be short term during construction and long term during O&M, with **negligible** to **moderate** adverse impacts, based on the observed distance and individual responses by recreationists and visitors to changes in the viewshed.

Noise: Construction noise from offshore activities from planned future projects such as pile driving, trenching, and construction-related vessels would intrude upon the natural sounds of the marine environment. Pile driving is the loudest aspect of most planned future projects. Most pile driving would occur far enough offshore that that work would be inaudible from onshore locations or from typical recreational fishing locations (within 1 mile of the coast). However, pile driving and other construction noise could cause some offshore boaters and recreational fishers to avoid areas of noise-generating activity, although the loudest noise would be within the temporary safety zones (with restricted recreational and tourism vessel access) anticipated to be established for each project by offshore wind developers. Additionally, because some fish species are sensitive to underwater sound, construction noise could cause fish to move away from the noise source, which could adversely affect recreational fishing opportunities near work areas. Construction noise could also contribute to impacts on marine mammals, with resulting impacts on marine sightseeing that relies on the presence of mammals, primarily whales. However, as noted in Section 3.15, no population-level marine mammal effects are anticipated.

Most of the anticipated offshore O&M noise from future projects would be from continuous WTG operations farther offshore. Sound pressure levels would be at or below ambient levels at relatively short distances from WTG foundations (Kraus et al. 2016). Field observations made during normal operations at the Block Island Wind Farm minimally exceeded ambient levels at 164 feet from the WTG base. These field observations also concluded that WTG operational noise from the Block Island Wind Farm was not detectable from shore and further suggested that as wind speeds increase (causing increased ambient noise), the associated increase in operational noise of the WTG becomes less detectable (HDR 2019). Therefore, noise from offshore activities would result in temporary to long-term **minor** adverse impacts.

Presence of structures: The placement and operation of up to 893 foundations (see Table E4-1 in Appendix E4) are proposed within the recreation and tourism GAA. Recreational impacts associated with in-water structures would include the risk of recreational vessel allision and collision, fishing gear entanglement, vessel damage or loss, increased navigation hazards, and visual impacts.

Offshore routes for recreational boaters, anglers, sailboat races, and sightseeing boats could require adjustment to avoid allision risks with in-water structures. Generally, the vessels more likely to allide with WTGs or OSSs would be smaller vessels capable of moving within and near wind installations. Examples include recreational fishing (especially HMS fishing), long-distance sailboat races, sightseeing boats, and large sailing vessels. Sailing vessels with tall masts that could be affected by in-water structures, like WTGs and associated platforms, could choose to avoid offshore in-water structures. However, the adverse impact of the future offshore wind structures on recreational boating would be limited by the distance offshore. As previously noted, a 2012 survey of recreational boaters along the northeastern United States coast found that the highest density of recreational vessels occurs within 1 nm of the coastline (Starbuck and Lipsky 2013). Likewise, a 2020 study of recreational boaters in the RI/MA WEA found that wind facilities are unlikely to have significant impacts on recreational boaters because those boaters prefer to use waters closer to the coast. Most recreational boaters from Rhode Island ports who choose to visit the RI/MA WEAs would likely keep their distance from new structures, and increased abundance of targeted fish species near offshore wind facilities would have beneficial impacts on recreational fishing (Dalton et al. 2020). Based on these findings, under the No Action Alternative, most recreational vessels would not interact with proposed WTGs and OSS(s). However, WTGs could also attract recreational boaters and sightseeing vessels. These conditions could increase the number of congregating vessels and increase collision or allision risks (see Section 3.16 for additional discussion of navigation impacts). The USCG would need to adjust their search and rescue planning and search patterns to allow aircraft to fly within the GAA, as described in greater detail in Section 3.17.

HMS fisheries are further offshore than most fisheries and therefore more likely to overlap with future offshore wind development. The greatest amount of recreational HMS fishing effort in southern New England from 2002 through 2018 occurred west of the RI/MA WEA (Kneebone and Capizzano 2020), although HMS fishing also occurred in specific locations within the RI/MA WEA, including The Dump, Coxes Ledge, The Fingers, and The Claw (see Section 3.9). Commonly used mobile methods for HMS angling such as trolling and drifting could be incompatible with the presence of WTGs and OSSs, depending upon weather conditions and specific techniques. For example, trolling could involve trailing many feet of lines and hooks behind the vessel and then following large pelagic fish once they are hooked, posing navigational and maneuverability challenges around WTGs. Scour protection used for in-water foundations would also increase risk of recreational fishing gear loss or damage by entanglement and present a hazard for anchoring (see new cable placement above). These concerns notwithstanding, new in-water structures could result in several long-term beneficial impacts including increased recreational fishing by introducing new aquatic habitats (see Section 3.9) and increased tourism by people interested in viewing the structures (see Section 3.18.2.2.2). New in-water structures could also create foraging opportunities for seals, small odontocetes, and sea turtles (see Sections 3.15 and 3.19), which could offer recreational sightseeing opportunities.

Visual impacts from the presence of vertical structures on the offshore horizon would create a visual contrast contrary to the horizontal plane of the ocean's water surface and the line at the visual horizon that separates the ocean from sky. Studies and surveys that have evaluated the impacts of offshore wind facilities on tourism found that established offshore wind facilities in Europe did not result in decreased tourist numbers, tourist experience, or tourist revenue, and that Block Island's WTGs provide excellent sites for fishing and shellfishing (Smythe et al. 2018). The proximity of WTGs to shore may be correlated to recreational experience. As noted in Parsons and Firestone (2018), different changes to beach experience occurred based on distance to visible WTGs. Reported trip loss (respondents who stated that they would visit a different beach without offshore wind) averaged 8% when wind projects were 12.5 miles (20 km) offshore, 6% when 15 miles (24.1 km) offshore, and 5% when 20 miles (32 km) offshore. Conversely, approximately 2.6% of respondents were more likely to visit a beach with visible offshore wind facilities at any distance. A 2019 survey of coastal recreation users in New Hampshire (Ferguson et al. 2020) also found that most users (77%) supported offshore wind development along the New Hampshire coast, 74% anticipated that offshore wind development would have a neutral to beneficial impact on their recreational activities, and 26% anticipated that offshore wind development would have an adverse impact (Ferguson et al. 2021).

Based on the currently available studies, portions of nearly all 876 WTGs associated with the No Action Alternative could be visible from shorelines (depending on vegetation, topography, weather, atmospheric conditions, and the viewers' visual acuity) (see Section 3.20 for details). WTGs visible from some shoreline locations in the GAA would have adverse impacts on visual resources when discernable because of the introduction of industrial elements in previously undeveloped views. Visual impacts would be more pronounced in views lacking development and outside of heavy recreation use times (i.e., when crowds of beachgoers do not impact the visitor's experience of the natural elements of the landscape). Based on the research cited above, the impact of visible structures on recreation would be long term and **moderate** adverse but unlikely to impact shore-based or marine recreation and tourism in the GAA as a whole. Visual impacts to tribes that may be present or travel to the GAA for recreation or tourism purposes are disclosed in Section 3.10.

Vessel traffic: Future projects would generate increased nearshore and offshore vessel traffic, primarily during construction, along routes between ports and the offshore wind construction areas. Applying vessel activity estimates developed by BOEM based on their 2019 study *National Environmental Policy Act Documentation for Impact-Producing Factors in the Offshore Wind Cumulative Impacts Scenario on the North Atlantic Outer Continental Shelf* (BOEM 2019), vessel activity could peak in 2025 with as many as 210 vessels involved in the construction of reasonably foreseeable projects (see Section 3.16.1.1). Increased vessel traffic would require increased alertness on the part of recreational or tourist-related vessels and could result in minor delays or route adjustments, particularly if more than one future offshore wind facility is under construction at the same time. The likelihood of vessel collisions would increase as a result of the higher volumes of vessel traffic during construction. However, most of the moving construction-related vessels would be located within temporary safety zones (anticipated to be established and monitored by offshore wind developers), which would prevent most conflicts for recreational uses. These activities would also be temporary and localized. Although long-term increased traffic volumes from O&M of future projects would be low, they would add to existing in-water vessel traffic and therefore present **minor** long-term adverse impacts on recreational users.

### Onshore Activities and Facilities

Anchoring and new cable emplacement/maintenance: No anchoring impacts would occur as a result of future onshore activities. However, onshore construction and installation of future wind facilities could affect recreation and tourism due to noise and activity at the landfall locations or along the onshore cable route if these locations intersect recreational or commercial uses. These **minor** adverse impacts would be unavoidable during construction but would be temporary and localized. No long-term cable impacts are anticipated because cables would be buried.

Light: Construction of some planned future onshore projects would require new visible structures or nighttime lighting on structures that could be visible by onshore recreational users and tourists. However, most onshore project components are anticipated to be in previously developed and lighted areas. Therefore, adverse effects of onshore lighting from construction would be short term and localized to discrete construction sites. Onshore O&M impacts from future projects would be variable based on project type (i.e., increased rail and road infrastructure use, increased port operational noise) but are anticipated to be long term with variable **minor** to **moderate** adverse impacts experienced based on the observed distance.

Noise: Construction noise from planned future projects onshore would be variable based on project type, but many projects would include one or more noise-generating activities such as earth moving, pile driving, trenching, jackhammering, and other similar large equipment operations. Recreational users could be subject to these construction noises anywhere future projects intersect public access areas, public recreational facilities, public roadways, or private and commercial facilities where tourism occurs (e.g., restaurants, shopping, and lodging establishments). Onshore construction noise from cable installation at the landfall locations, and inland if cable routes are near parkland, recreation areas, or other areas of public interest, would temporarily disturb the quiet enjoyment of the site (in locations where such quiet is an expected or typical condition). However, most of these onshore project components are anticipated to be in previously developed areas. Therefore, adverse effects of onshore noise from construction would be short term and localized to discrete construction sites. Onshore O&M impacts from future projects would be variable based on project type (i.e., increased rail and road infrastructure use, increased port operational noise) but are anticipated to be adverse and long term with variable **minor** to **moderate** adverse impacts experienced based on the distance to the noise source.

Vessel traffic: Future projects could increase onshore vehicle traffic or alter traffic patterns in a manner that inconveniences recreational users, primarily during construction near port facilities and on adjacent, existing roadways. Construction vehicles and construction areas would follow established safety guidelines that would prevent most conflicts for recreational uses. Impacts from onshore activities would be temporary and localized; therefore, construction impacts from future projects would not add to adverse impacts on recreational users. Although long-term increased traffic volumes from O&M activities of future projects would be relatively low, they would add to the existing onshore traffic and therefore present **minor**, localized long-term adverse impacts on recreational users.

#### 3.18.2.2.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on recreation and tourism associated with the Project would not occur. However, ongoing and future activities would have continuing short-term to long-term impacts on recreation and tourism, primarily due to the interruption of access and introduction of new offshore hazards, as well as new aquatic habitat and increased tourism/recreation opportunities.

BOEM anticipates that the range of individual IPF impacts for reasonably foreseeable offshore wind activities would be **negligible** to **moderate** adverse and **minor** beneficial, primarily due to the presence of offshore structures. As described in Appendix E1, BOEM anticipates that the range of individual IPF impacts for ongoing activities and reasonably foreseeable activities other than offshore wind would be **minor** to **moderate** adverse.

Considering all the IPFs together, BOEM anticipates that the overall impact associated with all reasonably foreseeable environmental trends and activities would result in **minor** adverse impacts on recreation and tourism because most adverse impacts could be avoided, would not disrupt normal or routine recreation and tourism functions, or would return to a condition with no measurable effects after activity ends.

### 3.18.2.3 Alternative B: Impacts of the Proposed Action on Recreation and Tourism

#### 3.18.2.3.1 Construction and Installation

**Offshore Activities and Facilities**

During construction, recreational offshore uses such as boating, fishing, diving, and wildlife and whale watching could be adversely impacted by Project activities. Detailed analysis by IPF is provided below. Construction EPMs would be implemented to minimize adverse impacts to recreators as practicable (see Table F-1 in Appendix F), including communication with vessel operators and implementation of ADLS.

<u>Anchoring and new cable emplacement/maintenance:</u> Anchoring could occur anywhere within the maximum work area under the Proposed Action, although impacts would be localized to specific anchoring sites and would be temporary in duration. The presence of as many as 59 construction vessels per construction day in 2023 and 2024 would increase navigation complexity for recreational vessels, requiring individual boats to navigate around Project vessels and work areas (see COP Table 3.3.10-2). Increased turbidity from anchoring could also briefly alter the behavior of species important to recreational fishing (see Section 3.9) and marine mammal sightseeing. However, temporary safety zones around each WTG site and each cable-laying vessel (anticipated to be established and monitored by Revolution Wind) would minimize potential conflicts for recreational uses. Anchoring activities would also be localized; therefore, construction impacts would represent a temporary, **minor** adverse impact on recreational users. Proposed Action anchoring impacts to fish species used for recreational fishing are addressed in Section 3.9.

Up to 4,009 acres of seafloor disturbance could occur from Proposed Action IAC and export cable installation within the recreation and tourism GAA. Installation of offshore cables would temporarily restrict recreation access within the cable routes. Recreational vessels traveling near the cable routes would also need to navigate around construction vessels. Revolution Wind would implement a comprehensive communication plan during offshore construction to inform all mariners, including commercial and recreational fishermen and recreational boaters, of construction activities and vessel movements. Communication would be facilitated through a fisheries liaison, a Project website, and public notices to mariners and vessel float plans (in coordination with the USCG). Therefore, potential changes in navigation routes due to Proposed Action construction would constitute a temporary, **minor** adverse impact.

Cable installation could also affect fish and mammals of interest for recreational fishing and sightseeing through dredging and turbulence, although no population-level impacts are expected (see Sections 3.13 and 3.9), resulting in short-term and **minor** adverse impacts on recreation and tourism.

<u>Light:</u> The Proposed Action would require nighttime lighting for construction vessels traveling to and working at the Project's offshore construction areas that could be visible by recreational users and tourists. The visual impact assessment prepared for Revolution Wind (see COP Appendix U3 [EDR 2023]) determined that the Project would not likely be easily detectable when viewed from a distance of 20 miles or more and that only 3% of the land area within the visual study area would contain views of the Project. Therefore, visual Impacts on recreation and tourism would be temporary during construction, with **negligible** to **moderate** adverse impacts, based on individual responses by recreationists and visitors to changes in the viewshed. Popular tourism locations near the Lease Area, such as Aquinnah Overlook, would have the potential for greater adverse impacts than more distant locations (see Section 3.20).

<u>Noise:</u> Construction noise could result in impacts on recreation and tourism through displacement of species important to recreational fishing and sightseeing in and around construction areas, resulting in a short-term **moderate** adverse impact to fishing, shellfishing, or whale-watching activities. Pile driving represents the loudest likely noise source during construction activities. Installation of a single monopile foundation is estimated to normally require 1 to 4 hours (6 to 12 hours maximum) of pile driving; up to three WTG monopile foundations would be installed in a 24-hour period. Therefore, recreational boaters near the RWEC and WTGs could also be temporarily inconvenienced by pile-driving noise.

Offshore construction and onshore cable installation near the landfall area at Quonset Point in North Kingstown, Rhode Island, could have short-term **negligible** to **minor** adverse impacts on the recreational enjoyment of the marine and coastal environments. This landing site is developed for military and industrial use; however, the closest public recreation area, Blue Beach, is located approximately 500 feet to the southwest of the Project's landfall envelope. Compass Rose Beach, another public beach, and Martha's Vineyard Fast Ferry are also located approximately 2,600 feet east of the southeast corner of the landfall envelope. Recreational users at these locations could experience temporary adverse impacts due to construction noise, if these noise levels exceed ambient noise conditions generated by ongoing industrial and port activities.

<u>Presence of structures:</u> The installation of up to 102 Project foundations are proposed within the recreation and tourism GAA. As also noted under the No Action Alternative, these offshore structures would impact recreation and tourism through increased navigational complexity, risk of allision or collision, attraction of recreational vessels to offshore wind structures for fishing and sightseeing, increased risk of fishing gear loss or damage by entanglement due to scour or cable protection, and potential difficulties in anchoring over scour or cable protection. Revolution Wind would minimize these **minor** to **moderate** adverse impacts through the navigation- and fishing-related EPMs listed in Appendix

F. As part of these EPMs, Revolution Wind would establish temporary safety zones around construction areas and work with the USCG to communicate these zones and other work areas to the boating public via local Notices to Mariners. Additionally, the majority of recreational boating would occur more than 10 miles from Proposed Action WTGs and OSSs.

WTG and OSS construction could also affect recreation and tourism through visual impacts. During construction, offshore boaters and visitors on the coastline would see the upper portions of tall equipment such as mobile cranes. This equipment would move from turbine to turbine as construction progresses and thus would not be long-term fixtures.

Further, a survey-based study of 1,725 participants who typically visit the coast suggested that (based on visual simulations for prospective offshore wind facilities) only 10% of respondents would experience adverse visual impacts at a distance of 10 miles from shore (Parsons and Firestone 2018). The study suggests that coastal visitors could experience adverse reactions approaching 0% from Project WTGs at approximately 25 to 30 miles offshore. Based on the duration of construction activity and observed distance, visual contrast associated with the Proposed Action would have a temporary **negligible** adverse impact on recreation and tourism, subject to individual responses by recreationists and visitors to changes in the viewshed. Popular tourism locations near the Lease Area, such as Aquinnah Overlook, would have the potential for greater adverse impacts than more distant locations (see Section 3.20).

Additionally, construction of offshore Project components could elicit a temporary beneficial impact through an increase in curiosity visits by individuals interested in WTG construction (Parsons and Firestone 2018). The PDE analyzed for the Project allows for installing wind turbines that may reach 873 feet to the tip of blade (52% taller than those studied by Parsons and Firestone) with a rotor diameter of 538 feet (9% larger rotor diameter than those studied by Parsons and Firestone). Although it is predictable that the percentage of social acceptance or change in choice may shift, the shift would not be proportional to the difference in the size and scale of the wind turbines in Parsons and Firestone's 2018 study and those analyzed in this EIS.

<u>Vessel traffic:</u> Construction would result in as many as 59 construction vessels per construction day in 2023 and 2024 present at offshore work areas (see COP Table 3.3.10-2) on a daily basis. This increase in vessel volume for the Proposed Action would contribute to increased vessel traffic and associated vessel collision risk along routes between ports and the offshore construction areas if recreational boaters cross or approach cable and WTG locations. However, the majority of recreational boating occurs within 1 nm of shore (Starbuck and Lipsky 2013). Therefore, most recreational boaters in the GAA would experience a temporary, **minor** adverse impact from construction-related vessel traffic.

### Onshore Activities and Facilities

<u>Anchoring and new cable emplacement/maintenance:</u> No anchoring impacts would occur as a result of onshore activities. Although onshore construction and installation would occur at the landing site during installation of the cable onshore/offshore transition vaults and during HDD or trenching in preparation for joining the onshore and offshore cables, the landfall work area is developed for non-recreational purposes. The Quonset Point Naval Air Station property is currently the home of the 14$^{3r}$d Airlift Wing of the Rhode Island Air National Guard and is in use as both a military base and a public airport with two active runways. A portion of the base has been converted into a business park. The onshore cable route would follow Circuit Drive to the OnSS. No public parks, beaches, or other public recreational facilities are

within or immediately adjacent to this onshore route. However, the route travels through the Wickford Historic District, which is primarily a residential community with some commercial buildings that support a seasonal recreation economy. Three potential recreation opportunities—the Wickford Village/Harbor State Scenic Area, the Quonset-Martha's Vineyard Ferries, and Narraganset Bay—are also located in the vicinity. Additionally, as noted above, two public beaches—Blue Beach and Compass Rose Beach—are within 500 to 2,600 feet of the landfall envelope. However, installation of onshore cables would be localized. No direct impacts to public parks, beaches, or other public recreational facilities would occur. Therefore, recreation and tourism impacts during construction would be temporary and **minor** adverse.

Light and Noise: Light and noise from onshore construction activities could temporarily adversely impact the recreation experience of users if present or traveling on roads near the landing site, onshore cable route, and proposed onshore facilities. However, as previously noted, no public parks, beaches, or other public recreational facilities are within or immediately adjacent to this onshore route, OnSS, or ICF. Additionally, the onshore construction schedule would be designed to minimize impacts to the local community during the summer tourist season, generally between Memorial Day and Labor Day. The majority of onshore construction would be completed during daytime hours. Revolution Wind would generally comply with North Kingstown's noise ordinance; however, certain construction tasks such as concrete pours, HDD and landfall installation, and cable pulling or splicing, once started, would be continued through to completion. For nighttime construction work, downward-facing portable floodlights with a maximum height of approximately 18 feet would be used in compliance with all safety and security and local government requirements. Therefore, for most locals and tourists, any adverse impacts would be temporary **minor** impacts, but would not cause a loss to their overall experience.

Presence of structures: A new OnSS and ICF adjacent to the existing Davisville Substation would be constructed to support interconnection of the Project to the existing electrical grid. Vegetation clearing and taller equipment (e.g., cranes) would be visible from certain vantage points during construction of these onshore structures. However, inland residential/commercial areas and recreational sites would generally be screened from construction views due to the presence of existing development combined with forested areas (see COP Appendix U1 [EDR 2023]). Therefore, any adverse impacts to overall recreator experience would be temporary and **minor** adverse impacts, but would not cause a loss to the overall recreator experience.

Vessel traffic: Vehicle and equipment traffic from onshore cable construction activities could temporarily adversely impact the recreation experience of users if present or travelling on roads near the landing site and onshore cable route and facilities. However, as previously noted, no public parks, beaches, or other public recreational facilities are immediately adjacent to the onshore route, OnSS, or ICF. Additionally, Revolution Wind would coordinate with local authorities during onshore construction to minimize local traffic impacts. Therefore, any adverse impacts to tourism or overall recreator experience would be temporary and **minor** adverse.

#### 3.18.2.3.2 Operations and Maintenance and Decommissioning

### Offshore Activities and Facilities

Anchoring and new cable emplacement/maintenance: During the O&M, a limited number of vessels would be present in the Lease Area or RWEC at any one time. Potential anchoring impacts would be similar to the construction phase, but reduced due to fewer anchored vessels. No cable impacts are anticipated as the RWEC, IAC, and OSS transmission cable typically have no maintenance requirements unless a fault or failure occurs. If cable repair or replacement or remedial cable protection is required, maintenance activities would be limited to the disturbance corridors previously defined for construction. Therefore, O&M and decommissioning impacts would represent a temporary **minor** adverse impact on recreational users. Proposed Action anchoring and cable impacts to fish species used for recreational fishing are addressed in Section 3.9.

Impacts during decommissioning would be similar to the impacts during construction and installation.

Light: During operations, the Proposed Action would contribution to nighttime lighting due to required aviation hazard lighting of up to 102 WTGs and OSSs. The visual impact assessment prepared for Revolution Wind (see COP Appendix U3 [EDR 2023]) determined that the Project would not likely be easily detectable when viewed from a distance of 20 miles or more, and that only 3% of the land area within the visual study area would contain views of the Project. Revolution Wind has also committed to implement ADLS (as described in Appendix F) as a measure to reduce the duration of lighting impacts. As noted in Section 3.20, the Proposed Action's aviation warning lighting, when visible, would add a developed/industrial visual element to views that were previously characterized by dark, open ocean. Due to the limited duration and frequency of such events and the distance of WTGs from shore, however, visible aviation hazard lighting for the Proposed Action would result in a long-term intermittent **negligible** adverse impact on recreation and tourism, subject to individual responses by recreationists and visitors to changes in the viewshed. Popular tourism locations near the Lease Area, such as Aquinnah Overlook, would have the potential for greater adverse impacts than more distant locations (see Section 3.20).

Impacts during decommissioning would be similar to the impacts during construction and installation.

Noise: Noise from O&M (predominately WTG operations) could result in impacts on recreation and tourism. Offshore operational noise from the WTGs would be similar to the noise described for other projects under the No Action Alternative and would thus have long-term **minor** adverse impacts. Impacts during decommissioning would be similar to the impacts during construction and installation.

Presence of structures: During O&M of the Proposed Action, the permanent presence of WTGs would create obstacles for recreational vessels. At their lowest point, WTG blades would be 94 feet above the surface. At this height, larger sailboats would need to navigate around the Lease Area, while smaller vessels could navigate through the Lease Area but would still need to adjust routes to bypass WTGs and OSS foundations. No restrictions on fishing or other recreational pursuits would occur during Project operations. However, some recreational anglers could avoid fishing in the Lease Area due to concerns about their ability to safely fish within or navigate through the area.

For recreational anglers harvesting HMS such as tunas, sharks, and billfish, the spacing of the WTGs could impact access to fishing locations. The fishing methods used and the size, strength, and swimming speed of these larger species require significantly more space for fishing compared to other species; as a result, the proposed separation between WTGs could be insufficient for this type of fishing. Anglers who do fish within the Lease Area would need to change their methods (i.e., they would not be able to allow their boats to drift and would need to correct course to avoid WTGs). See Section 3.9 for analysis on for-hire fishing impacts.

The presence of WTGs would also require the USCG to adjust their search and rescue planning and search patterns to allow aircraft to fly within the GAA, potentially leading to a less-optimized search pattern and a lower probability of success for lost or hurt recreationists (see Section 3.17).

The Proposed Action's WTGs would also affect recreation and tourism through visual impacts. When visible (i.e., on clear days in locations with unobstructed ocean views), WTGs would add a developed/industrial visual element to ocean views that were previously characterized by open ocean, broken only by transient vessels and aircraft passing through the view. However, the visual impact assessment prepared for Revolution Wind (see COP Appendix U3 [EDR 2023]) determined that the Project would not likely be easily detectable when viewed from a distance of 20 miles or more and that only 3% of the land area within the visual study area would contain views of the Project. Revolution Wind has voluntarily committed to use ADLS and non-reflective pure white or light gray paint color, as described in Appendix F to reduce impacts.

The visual contrast created by the WTGs could have a beneficial, adverse, or neutral impact on the quality of the recreation and tourism experience depending on the viewer's orientation, activity, and purpose for visiting the area. As discussed in Section 3.18.1, research suggests that at a distance of 15 miles, few beach visitors (only 6%) would select a different beach based on the presence of offshore wind turbines. An estimated 55 WTGs would fall within this distance, based on the proposed Project array. Considering these factors, BOEM expects the impact of visible WTGs on the use and enjoyment of recreation and tourist facilities and activities during O&M of the Proposed Action Alternative to be long term and **minor** adverse, subject to individual responses by recreationists and visitors to changes in the viewshed. Popular tourism locations near the Lease Area, such as Aquinnah Overlook, would have the potential for greater adverse impacts than more distant locations (see Section 3.20). Although some visitors to south-facing coastal or elevated locations could alter their behavior, this changed behavior is unlikely to meaningfully affect the recreation and tourism industry as a whole.

Additionally, increased beach visitation by individuals who view the WTGs as positive would offset some lost trips from visitors who consider views of WTGs to be negative (Parsons and Firestone 2018). As disclosed in Section 3.18.2.3.1, the PDE analyzed for the Project allows for installing wind turbines that may reach 873 feet to the tip of blade (52% taller than those studied by Parsons and Firestone) with a rotor diameter of 538 feet (9% larger rotor diameter than those studied by Parsons and Firestone). Although it is predictable that the percentage of social acceptance or change in choice may shift, the shift would not be proportional to the difference in the size and scale of the wind turbines in Parsons and Firestone's 2018 study and those analyzed in this EIS.

Overall, the impacts on most recreational pursuits would be long term but **minor** adverse, while the impact on for-hire fishing would be **moderate** adverse because these enterprises are more likely to be materially affected by displacement, competition for resources, and longer transit times in a manner similar to commercial fishing businesses.

Conversely, charter cruises could also choose to market the operational WTGs as a tourist destination, although their distance from shore could limit some interest. Scour protection around the WTG foundations would likely attract forage fish as well as game fish, which could provide new opportunities for certain recreational anglers. A 1989 survey of recreational fishermen and divers in the Gulf of Mexico found that fishermen were willing to travel up to 45 nm offshore and divers 77 nm offshore to visit abandoned platforms that have been reefed (Stanley and Wilson 1989). A subsequent 2002 study (Hiett and Milon 2002) also found that that there is substantial recreational activity associated with the presence of oil and gas structures in the Gulf of Mexico from Alabama through Texas. These structures range from directly offshore in 10-foot water depths to complex facilities in water depths up to almost 10,000 feet at more than 80 miles from shore (NOAA 2021). The report estimated a total of $324.6 million in economic output in coastal counties of the Gulf region associated with fishing and diving activities near oil and gas structures. A survey of United Kingdom offshore recreational fishermen by Hooper et al. (2017) found that respondents frequently fished at offshore wind farms, with a mean distance from shore of 10 nm. Approximately one quarter of the respondents reported having fished within or around the perimeter of wind farms. Likewise, evidence from Block Island Wind Farm indicates an increase in recreational fishing near the WTGs (Smythe et al. 2018). These surveys suggest that the Project could attract recreational fishing and diving activity, providing a long-term **minor** benefit. The Project could also increase tourism activity during peak tourism months (Carr-Harris and Lang 2019).

Impacts during decommissioning would be similar to the impacts during construction and installation.

<u>Vessel traffic:</u> For regularly scheduled maintenance and inspections, Revolution Wind anticipates that, on average, up to nine crew transfer vessels or service operation vessels would operate in the Lease Area. In other maintenance or repair scenarios, additional vessels could be required. However, this low volume of vessel traffic would not be anticipated to affect ongoing recreational use. O&M of the Proposed Action would therefore have **negligible** adverse impacts on onshore or offshore recreation and tourism.

Impacts during decommissioning would be similar to the impacts during construction and installation.

### Onshore Activities and Facilities

<u>Anchoring and new cable emplacement/maintenance:</u> No anchoring impacts would occur as a result of onshore activities. No onshore cable maintenance would be required unless a fault or failure occurs. If cable repair or replacement or remedial cable protection is required, maintenance activities would be limited to the disturbance corridors previously defined for construction. Therefore, O&M and decommissioning impacts would represent a **negligible** adverse impact on recreational users.

<u>Light:</u> Based results of the viewshed analysis (see COP Appendix U1 [EDR 2023]), portions of the lightning masts for OnSS and ICF features could be visible from some views. However, lighting at these facilities would be limited to yard and task lighting for emergency maintenance or repairs. Both categories would be switched lights and only in use if staff are present. Operational lighting for the OnSS and ICF would comply with Quonset Development Corporation lighting regulations and be mounted with the lamp horizontal to the ground (light facing straight down) or with a lamp tilt no more than 25 degrees from the horizon. As such, it is anticipated that the OnSS and ICF would result in **negligible** adverse lighting impacts to the recreation and tourism activities in the GAA. Impacts during decommissioning would be similar to the impacts during construction and installation.

<u>Noise:</u> Operations of onshore Project components (i.e., offshore to onshore transition joint bays, onshore transmission cable route, OnSS, and ICF) would have **negligible** adverse noise impacts intermittently over the life of the Project to onshore recreation and tourism because these components would only require periodic routine maintenance.

Impacts during decommissioning would be similar to the impacts during construction and installation.

Presence of structures: Based on results of the viewshed analysis (see COP Appendix U1 [EDR 2023]), it is anticipated that the OnSS and ICF could be visible from approximately 15% of the viewshed analysis area. However, the presence of existing landscape vegetation along roadways could further reduce the extent of visual impacts. For more distant views from Wickford Historic District and Wickford Harbor/Wickford Village State Scenic Area, and Narragansett Bay, visibility would only include the upper portions of a few proposed transmission structures. However, where visible at foreground distances, the proposed OnSS and ICF could introduce new industrial/utility structures into the landscape. Nevertheless, the proposed OnSS and ICF would not be out of scale or character with the existing types of development currently present in the vicinity, such as the existing Davisville Substation or the structures at nearby Quonset Business Park. As such, it is anticipated that the OnSS and ICF would result in **negligible** adverse visual impacts to recreation and tourism activities in the GAA.

Impacts during decommissioning would be similar to the impacts during construction and installation.

Vessel traffic: Potential traffic impacts would be similar to the construction phase but likely reduced due to fewer equipment and vehicle trips. Impacts during decommissioning would be similar to the impacts during construction and installation: temporary and **minor** adverse.

#### 3.18.2.3.3 Cumulative Impacts

### Offshore Activities and Facilities

Anchoring and new cable emplacement/maintenance: Up to approximately 6,550 acres of anchoring and 18,995 acres of cabling seafloor disturbance could occur from ongoing and planned actions, including the Proposed Action, in the recreation and tourism GAA. Project-related construction anchorages would noticeably add to disturbances of marine species and their habitats important to recreational fishing and could require recreational and tourism vessels to navigate around moving and anchored construction-related vessels while in transit. The buried cabling would also present short-term navigational hazards. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** adverse cumulative impacts on recreation and tourism.

Light: New lighting from the Proposed Action would contribute to a 11% increase in in-water lighting sources from past, present, and reasonably foreseeable future projects within the GAA by introducing built visual elements to views previously characterized by dark, open ocean.

Given the distance to most recreational viewers and potential for atmospheric interference, lighting from the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in long-term intermittent **minor** adverse cumulative impacts on recreation and tourism.

Noise: Noise from construction could lead to the displacement of fish in and around construction sites, leading to spatial competition, depending on migrating patterns. Recreational boaters and tourists would not be permitted to approach active construction zones and would therefore not be expected to experience noise impacts from offshore construction. Because of the distance from receptors, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in localized short-term **minor** to **moderate** adverse cumulative impacts on recreation and tourism due to construction activities, whereas noise from O&M activities would result in long-term **negligible** adverse cumulative impacts.

<u>Presence of structures:</u> The Proposed Action would noticeably add up to 102 foundations to the 893 foundations estimated for the No Action Alternative within the GAA. New structures related to the Proposed Action would add to the long-term impacts on recreation and tourism throughout the life of the Project (up to 35 years, plus up to an additional 2 years for decommissioning) by increasing navigational complexity; risks of structure allision; route adjustments for races, sightseeing, and fishing; loss and damage of fishing gear to scour and cable protection; and difficulty anchoring over scour and cable protection. However, new in-water structures from the Proposed Action could benefit recreation and tourism by attracting recreational vessels to WTGs for fishing and sightseeing activities. Therefore, new in-water structures from the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** to **moderate** adverse and long-term **minor** beneficial cumulative impacts on recreation and tourism.

Construction and O&M of the Project would also noticeably increase the visual impacts on recreational and tourism users by adding up to 100 WTGs and two OSSs to the No Action Alternative. Based on visual simulations described in Sections 3.18.1.1, 3.18.2.2.1, and 3.18.2.2.2, the visibility of large offshore structures is not expected to impact shore-based recreation and tourism as a whole. Cumulative visual impacts on recreation and tourism resulting from the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would be short term and **minor** adverse for onshore viewers at sensitive viewing locations because of the distance and natural atmospheric interference. Cumulative visual impacts on recreation and tourism resulting from the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would be short term **minor** to **moderate** adverse for offshore recreational users and would increase as users approach the WTGs. Impacts to viewers at sensitive viewing locations are addressed in Section 3.20.

<u>Vessel traffic:</u> Project vessels would noticeably add to disturbances of marine species and their habitats important to recreational fishing and could require recreational and tourism vessels to navigate around moving construction-related vessels while in transit. However, non-Project traffic would be able to adjust routes and avoid the work area and transiting construction vessels. BOEM estimates a peak of 210 vessels at sea on a daily basis due to offshore wind project construction and O&M over a 10-year time frame, with most of these vessels remaining in the vicinity of their respective lease areas. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in short-term and long-term **minor** adverse cumulative impacts on recreation and tourism.

### Onshore Activities and Facilities

<u>Anchoring and new cable emplacement/maintenance:</u> No anchoring impacts would occur as a result of onshore activities. No onshore cable maintenance would be required unless a fault or failure occurs. If cable repair or replacement or remedial cable protection is required, maintenance activities would be limited to the disturbance corridors previously defined for construction. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in temporary **negligible** adverse cumulative impacts to onshore recreation and tourism.

<u>Light:</u> Construction associated with the Proposed Action could add temporary minor adverse light impacts experienced by onshore recreational users near the landfall work area, onshore transmission cable route, or onshore facilities or from the aviation hazard lighting on the new WTGs. Long-term increases in operational lighting from the Proposed Action would be **negligible** adverse. Therefore, the Proposed

Action when combined with past, present, and reasonably foreseeable projects would result in temporary **minor** adverse cumulative impacts to onshore recreation and tourism.

Noise: As with lighting, construction activities would add noise from the construction of onshore facilities to the ambient noise levels of the No Action Alternative. Onshore construction noise would be localized to the source, short term **minor** to **moderate** adverse, depending on the distance of the receptor from the source. Long-term increases in operational noise from the Proposed Action would be **negligible** adverse. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in temporary **minor** adverse cumulative impacts to onshore recreation and tourism.

Presence of structures: Onshore construction and installation would add an O&M facility, an interconnection facility, and an OnSS to the No Action Alternative. These new onshore structures would only result in **minor** adverse visual impacts experienced by recreational users due to the existing settings at these locations (see Section 3.20 for details on potential visual impacts). When considered cumulatively with past, present, and reasonably foreseeable activities, the Proposed Action would result in temporary **negligible** to **minor** adverse cumulative visual impacts on recreation and tourism.

Vessel traffic: Construction vehicles associated with the Proposed Action could add traffic delays experienced by recreational travelers on local roadways. Long-term increases in operational traffic from the Proposed Action would be **negligible** adverse. Therefore, the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in temporary **minor** adverse cumulative impacts to onshore recreation and tourism.

#### 3.18.2.3.4 Conclusions

Project construction and installation and decommissioning would introduce noise, lighting, human activity, vehicles and vessels (increasing potential collision risk), and interruption to access points in the GAA. Noise, lighting, and human activity impacts from Project O&M would occur, although at lower levels than those produced during construction and decommissioning. BOEM anticipates that the impacts resulting from the Proposed Action alone would range from **negligible** to **minor** adverse and short term to long term. Project activities are expected to contribute to several IPFs, the most prominent being noise and vessel traffic during construction and the presence of offshore structures during operations. Noise and vessel traffic would have impacts on visitors, who may avoid onshore and offshore noise sources and vessels, and impacts on recreational fishing and sightseeing as a result of the impacts on fish, invertebrates, and marine mammals. BOEM expects the overall impact on recreation and tourism from the Proposed Action alone to be **minor** adverse; however, the overall effect would be small, and recreation and tourism would be expected to recover completely without remedial or mitigating action.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from **negligible** to **moderate** adverse and **minor** beneficial. Impacts would result from short-term impacts during construction: noise, anchored vessels, and hindrances to navigation; and the long-term presence of cable hard cover and structures in the GAA during operations, with resulting impacts on recreational vessel navigation and visual quality. Beneficial impacts would result from the reef effect and sightseeing attraction of offshore wind energy structures. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action, when combined with past, present, and reasonably foreseeable activities, would result in **minor** adverse impacts and **minor** beneficial impacts to recreation and tourism.

The overall effect would be small, and recreation and tourism would be expected to recover completely with no mitigating action required.

#### 3.18.2.4 Alternatives C, D, E, and F

Table 3.18-2 provides a summary of IPF findings for these alternatives.

##### 3.18.2.4.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and associated IACs, the presence of WTGs could still increase congestion, space conflicts, navigation risks, and the potential for collision, albeit at lower levels than the Proposed Action. The reduced number of WTGs under these alternatives could provide a long-term beneficial impact for some recreational viewers. Therefore, BOEM expects that the impacts resulting from each alternative alone would range from **negligible** to **moderate** adverse.

In the context of other reasonably foreseeable environmental trends and planned actions, BOEM also expects that each alternative's impacts would be similar to the Proposed Action (with individual IPFs leading to impacts ranging from **negligible** to **moderate** adverse and **minor** beneficial). The overall impacts of each alternative when combined with past, present, and reasonably foreseeable activities would therefore be the same as those under the Proposed Action: **minor** adverse and **minor** beneficial.

#### 3.18.2.5 Alternative G: Impacts of the Preferred Alternative on Recreation and Tourism

Table 3.18-2 provides a summary of IPF findings for this alternative.

##### 3.18.2.5.1 Conclusions

Although Alternative G would reduce the number of WTGs and associated IACs, the presence of WTGs could still increase congestion, space conflicts, navigation risks, and the potential for collision, albeit at lower levels than the Proposed Action. The reduced number of WTGs under this alternative could provide a long-term beneficial impact for some recreational viewers. Therefore, BOEM expects that the impacts resulting from this alternative alone would range from **negligible** to **moderate** adverse.

In the context of other reasonably foreseeable environmental trends and planned actions, BOEM also expects that this alternative's impacts would be similar to the Proposed Action (with individual IPFs leading to impacts ranging from **negligible** to **moderate** adverse and **minor** beneficial). The overall impacts of this alternative when combined with past, present, and reasonably foreseeable activities would therefore be the same as the Proposed Action: **minor** adverse and **minor** beneficial.

#### 3.18.2.6 Mitigation

There are no potential additional mitigation measures for recreation and tourism identified in Table F-2 or Table F-3 of Appendix F.

# 3.19 Sea Turtles

## 3.19.1 Description of the Affected Environment for Sea Turtles

Geographic analysis area: The GAA for sea turtles comprises the Northeast Shelf and Southeast Shelf Large Marine Ecosystems, as shown in Figure 3.19-1 and also described in Appendix G. This broad area captures the typical movement range within U.S. waters of most sea turtles that could occur within the Project vicinity during the construction and installation, O&M, and decommissioning of the Project. Thus, although Project-related impacts to sea turtle habitat are restricted to a relatively small GAA, the GAA for Project impacts to sea turtles is necessarily large due to their movement range.

The intent of the GAAs used in this EIS is to define a reasonable boundary for assessing the potential effects, including cumulative effects, resulting from the IPF with the maximum area of impact from the development of an offshore wind energy industry on the Mid-Atlantic OCS. GAAs for marine biological resources are necessarily large because marine populations range broadly and cumulative impacts can be expressed over broad areas. GAAs are not used as a basis for analyzing the effects of the Proposed Action, which represent a subset of these broader effects and expressed over a smaller area. These impacts are analyzed specific to each IPF.

Affected environment: Four species of sea turtles are known to occur in or near the proposed RWF and RWEC, and all are protected species under the ESA. These are the green sea turtle (*Chelonia mydas*), leatherback sea turtle (*Dermochelys coriacea*), loggerhead sea turtle (*Caretta caretta*), and Kemp's ridley sea turtle (*Lepidochelys kempii*). The potential impacts of the Proposed Action to these species are assessed in Section 3.19.2. The hawksbill sea turtle (*Eretmochelys imbricata*) is also protected under the ESA but is exceedingly rare in the Project vicinity (Kenney and Vigness-Raposa 2010) (see Figure 3.19-1). The proposed RWF and RWEC are considered outside the normal range of hawksbill turtles, which range predominantly in warmer waters to the south. Individual hawksbill turtles have occasionally occurred in and near the southern New England area after being stunned by exposure to unusual cold-water events and subsequently transported northward by the Gulf Stream into the region. These occurrences are not representative of normal behaviors or distribution. Hawksbill turtles are known to occur in potential construction vessel transit routes to the Gulf of Mexico, but the number of vessel trips being considered over the 2-year construction period (16–17 trips per year) is small compared to the existing baseline of tens of thousands of vessel trips. Should these vessel trips occur, their contribution to cumulative effects on this species would not be measurable. Therefore, while this species does occur in the GAA for sea turtles (defined in Appendix E), the Proposed Action is unlikely to contribute to any measurable cumulative effects, and hawksbill sea turtles are therefore not considered further in this EIS.

Sea turtles primarily inhabit tropical and subtropical seas throughout the world, with several species seasonally ranging into temperate zones to forage. Sea turtles are morphologically adapted for continuous swimming, and they can remain underwater for extended periods, ranging from several minutes to several hours, depending on factors such as daily and seasonal environmental conditions and specific behavioral activities associated with dive types (Hochscheid 2014; National Science Foundation [NSF] and USGS 2011). These adaptations are important because sea turtles often travel long distances between their feeding grounds and nesting beaches (Meylan 1995). There are no nesting beaches or other designated critical habitats near the RWF (Greater Atlantic Regional Fisheries Office [GARFO] 2020), meaning that individuals occurring in the proposed RWF and RWEC are either migrating or foraging. Given this, these individuals likely spend most of the time below the surface, although specifics are species dependent. Underwater observations of 73 sea turtles with 2,742 minutes of video in the Mid-Atlantic found that loggerhead sea turtles were within the near-surface region of the water column a median of 42% of the time (Patel et al. 2016).

The combination of sightings, strandings, tag, and bycatch data provides the best available information on sea turtle distribution. Information about species occurrence in the RWF and RWEC was obtained from various sources, including aerial surveys (Kraus et al. 2016; NEFSC and SEFSC 2018; North Atlantic Right Whale Consortium 2019), regional historical data (Kenney and Vigness-Raposa 2010), and sea turtle stranding records from the Ocean Biogeographic Information System Spatial Ecological Analysis of Megavertebrate Populations (OBIS-SEAMAP) database (Halpin et al. 2009). Table 3.19-1 summarizes potential sea turtle occurrence in the southern New England coastal waters off Rhode Island and Massachusetts. Potential effects to sea turtles, which are discussed in Section 3.19.2, are based on the likelihood of occurrence.

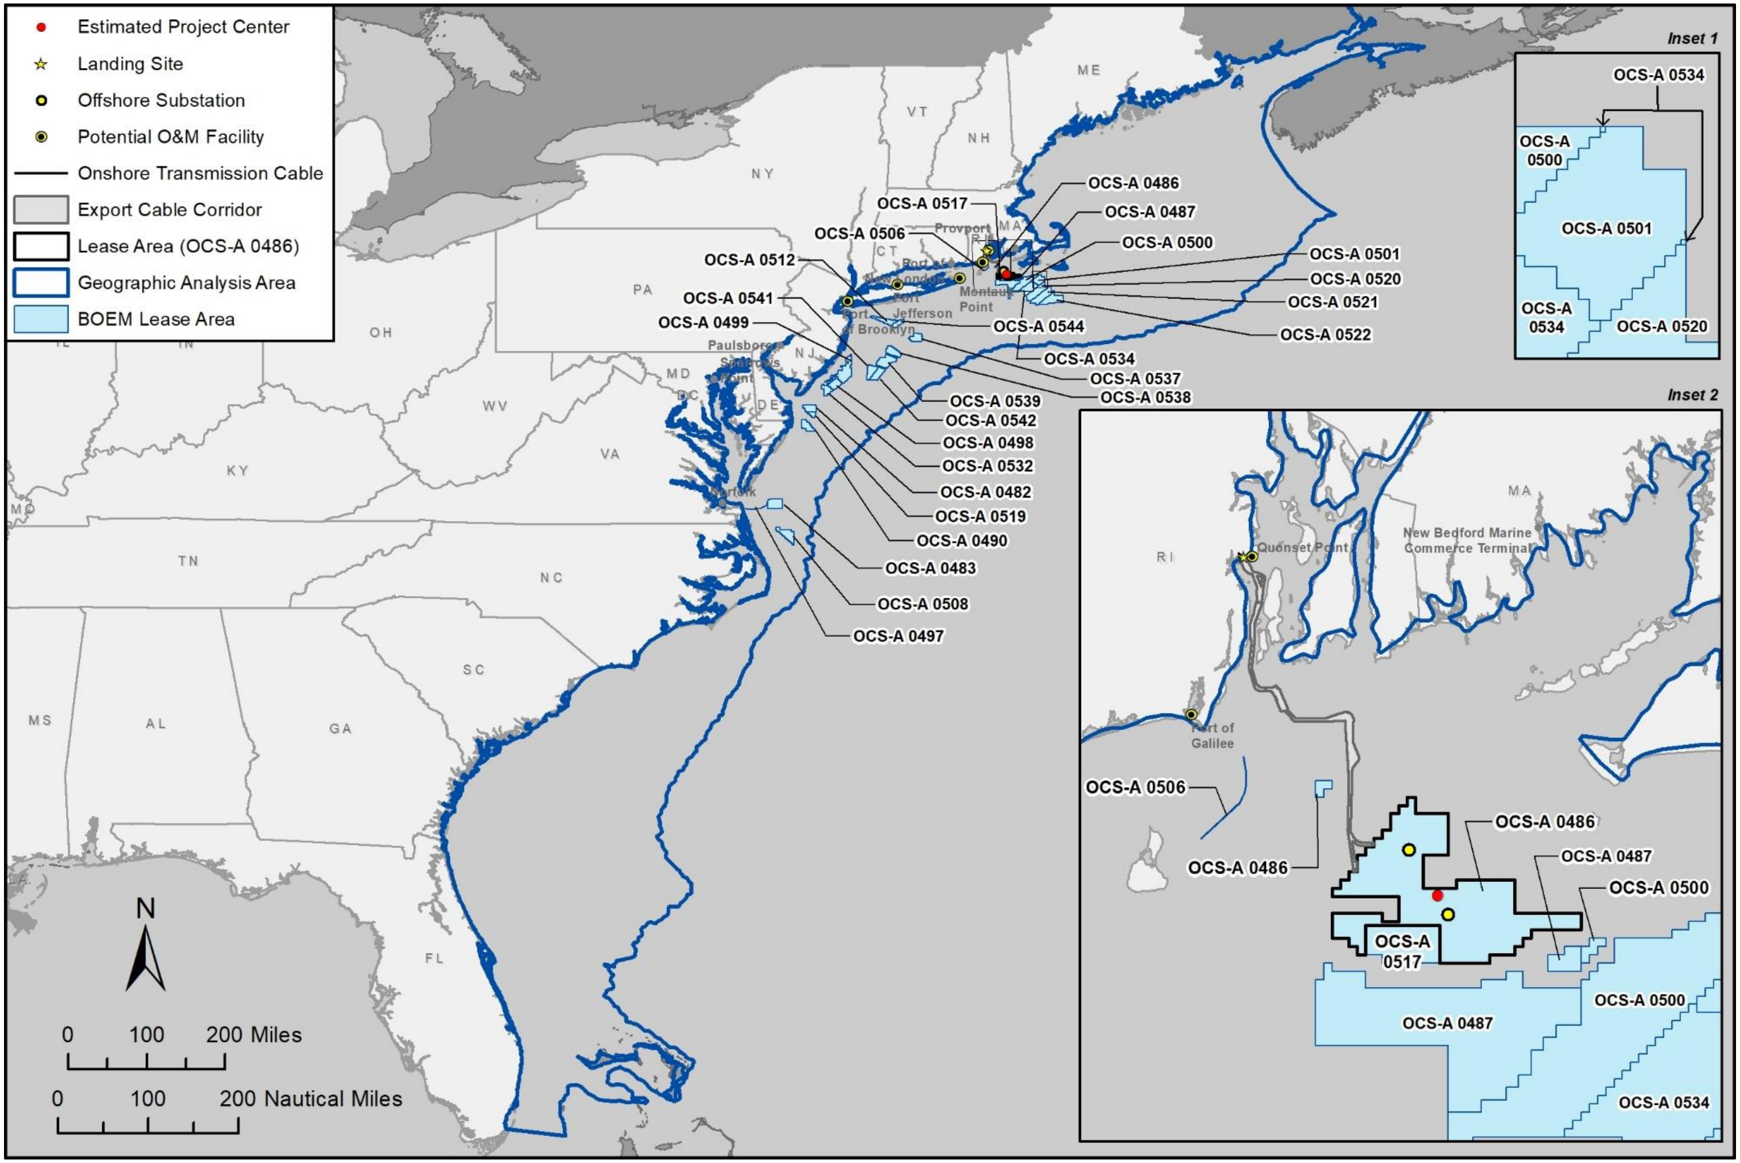

**Figure 3.19-1. Geographic analysis area for sea turtles.**

**Table 3.19-1. Frequency of Sea Turtle Species Occurrence in the Revolution Wind Farm and Revolution Wind Export Cable**

| Common Name | Scientific Name | Distinct Population Segment*/Population | Endangered Species Act Status* | Frequency of Occurrence†, ¶ | Seasonal Occurrence‡,§ | Likelihood of Occurrence§,¶ | Included in Impact Analysis? |
|---|---|---|---|---|---|---|---|
| Green sea turtle | *Chelonia mydas* | North Atlantic | T | Regular, limits of range | May to November | Unlikely/ uncommon | Yes |
| Hawksbill sea turtle | *Eretmochelys imbricata* | Throughout range | E | Rare, outside range | May to November | Exceedingly unlikely | No, outside limits of range |
| Leatherback sea turtle | *Dermochelys coriacea* | Atlantic‡‡ | E | Common | May to November | Likely | Yes |
| Loggerhead sea turtle | *Caretta caretta* | Northwest Atlantic | T | Common | May to November | Likely | Yes |
| Kemp's ridley sea turtle | *Lepidochelys kempii* | Throughout range | E | Regular | May to November | Likely but infrequent | Yes |

* DPS = distinct population segment, E = endangered, T = threatened.

† Data from Kenney and Vigness-Raposa (2010). Common = fewer than 100 observations, regular = 10–100 observations; rare = fewer than 10 observations.

‡ Data from GARFO (2020). Sea turtles may also occur in the Lease Area outside these months.

§ Data from NEFSC and SEFSC (2018). Based on density estimates from Kot et al. (2018) and observations by Kraus et al. (2013, 2014, 2016), O'Brien et al. (2021a, 2021b), and Quintana et al. (2019).

‡‡ A Northwest Atlantic DPS to be listed as threatened has been proposed for leatherback sea turtles (85 *Federal Register* 48332). The Atlantic population considered herein includes this proposed DPS.

**Green sea turtle:** Green sea turtles are found in tropical and subtropical waters around the globe. They are most commonly observed feeding in the shallow waters of reefs, bays, inlets, lagoons, and shoals that are abundant in algae or marine grass (NMFS and USFWS 2007). In U.S. waters, they are typically found in the Gulf of Mexico or coastal waters south of Virginia (USFWS 2021). Juveniles and subadults are occasionally observed in Atlantic coastal waters as far north as Massachusetts (NMFS and USFWS 1991), including the waters of Long Island Sound and Cape Cod Bay (Cetacean and Turtle Assessment Program 1982). The species' primary nesting beaches are located in Costa Rica, Mexico, the United States (Florida), and Cuba. According to Seminoff et al. (2015), nesting trends are generally increasing for this population. Based on feeding and habitat preferences, the species is less likely to occur in the RI/MA WEA and MA WEA. Kenney and Vigness-Raposa (2010) recorded one confirmed sighting within the RI/MA WEA in 2005. The STSSN reported one offshore and 20 inshore green sea turtle strandings between 2017 and 2019, and green sea turtles are found each year stranded on Cape Cod beaches (NMFS STSSN 2020; Wellfleet Bay Wildlife Sanctuary [WBWS] 2018). Five green sea turtle sightings were recorded off the Long Island shoreline 10 to 30 miles southwest of the RI/MA WEA in aerial surveys conducted from 2010 to 2013 (NEFSC and SEFSC 2018), but none were positively identified in multiseason aerial surveys of the RI/MA WEA from October 2011 to June 2015 (Kraus et al. 2016).

Juvenile green sea turtles represented 6% of 293 cold-stunned turtle stranding records collected in the inshore waters of Long Island Sound from 1982 to 1997 (Gerle et al. 2000). These and other sources of information indicate that juvenile green sea turtles occur at least periodically in the shallow nearshore waters of Long Island Sound and the coastal bays of New England (Morreale et al. 1992).

Based on the available information, green sea turtle occurrence in the RWF and RWEC appears to be unlikely but cannot be ruled out. They are most likely to occur as juveniles or subadults in the shallow coastal waters of Rhode Island and Massachusetts and in Narragansett Sound within and adjacent to the RWEC corridor.

**Hawksbill sea turtle:** Hawksbill sea turtles are a circumtropical species that in the Atlantic Ocean is most observed between 30°N and 30°S latitude. In the western Atlantic, hawksbills are typically found in the Caribbean Sea and the Gulf of Mexico off the coasts of Florida and Texas. No nesting beaches exist in the northeast United States, and records of species occurrence near the Lease Area are rare. This species is likely to occur elswhere in the GAA, specifically in vessel transit routes to ports in the Gulf of Mexico (see Appendix B). The OBIS-SEAMAP database (Halpin et al. 2009) contains only six hawksbill sea turtle observation records for the region. These comprise two verified stranding records, both from Martha's Vineyard in 1911, and four shipboard survey records at and seaward of the shelf break to the east and south of the Lease Area. The species was not observed in recent multiyear aerial and shipboard surveys of the RI/MA WEA and vicinity (Kraus et al. 2016). Therefore, although individual hawksbills could conceivably occur in the Project vicinity, they would be extralimital and outside their normal range. Hawksbill sea turtle occurrence within the Lease Area and RWEC corridor is unlikely. The species could be encountered along potential construction vessel transit routes between the Lease Area and ports in the Gulf of Mexico (see Appendix B) and the southeast United States, but the number of vessel transits to these distant ports would be limited. At-sea vessels transiting from non-local ports traveling greater than 10 knots (5.1 m per second) would employ PSOs or NMFS-approved visual detecting devices. Given the low density of hawksbill sea turtles and the low number of vessel transits from non-local ports, the likelihood of an encounter resulting in a ship strike is very low. Additionally, the measures proposed in the *Protected Species Mitigation and Monitoring Plan* (Revolution Wind 2022a) and adherence to NOAA guidelines for turtle strike avoidance measures (see Appendix F) would further reduce the chance of any adverse effects to the species from the Proposed Action. Therefore, due to the very low probability of an encouter with a hawksbill sea turtle, this species is not considered further in this analysis.

**Leatherback sea turtle:** The leatherback is the most globally distributed sea turtle species, ranging broadly from tropical and subtropical to temperate regions of the world's oceans (NMFS and USFWS 1992). Leatherbacks are a pelagic species, but they are commonly observed in coastal waters along the OCS (NMFS and USFWS 1992). The breeding population estimate (total number of adults) in the North Atlantic is 34,000 to 95,000, and, aside from the western Caribbean, nesting trends at all other Atlantic nesting sites are generally stable or increasing (NMFS and USFWS 2013; Turtle Expert Working Group 2007). Atlantic Marine Assessment Program for Protected Species surveys conducted from 2010 through 2013 routinely documented leatherbacks in New England waters, including the RI/MA WEA, during the summer months (NEFSC and SEFSC 2018). Kraus et al. (2016) recorded 153 observations in monthly aerial surveys, all between May and November, with a strong peak in August. Monthly aerial surveys on the New York Bight from 2017 through 2020 documented a total of 37 leatherback sea turtles, with an additional 503 unidentified sea turtles observed (Tetra Tech and LGL Ecological Research Associates, Inc. 2020). During the summer (June–August) and fall (September–November) months; leatherback density within the RI/MA WEA (refer to Figure 1.1-2) was estimated to be 0.0063 animals per $km^2$ and 0.0087 animals per $km^2$, respectively, compared to densities of 0.00588 animals per $km^2$ for the winter and spring months (December–May) (Kot et al. 2018; Kraus et al. 2016). The STSSN reported 19 offshore and 77 inshore leatherback sea turtle strandings between 2017 and 2019, the highest number among all turtle species reported (NMFS STSSN 2020). Kraus et al. (2016) data indicated that leatherbacks would be the most abundant sea turtle species in the RWF and RWEC, which is consistent with the other information on sea turtle occurrence in the vicinity presented here. Based on this information, leatherback sea turtles are expected to occur commonly in the RWF and RWEC between May and November, with the highest probability of occurrence from July through October (Sherrill-Mix et al. 2008).

**Loggerhead sea turtle:** Foraging loggerhead sea turtles range widely and have been observed along the entire Atlantic Coast as far north as Canada (Brazner and McMillan 2008; Ceriani et al. 2014; Shoop and Kenney 1992). Regional abundance on the northwest Atlantic, corrected for unidentified turtles in proportion to the ratio of identified turtles, estimates about 801,000 loggerheads (NEFSC and SEFSC 2011). The three largest nesting subpopulations responsible for most of the production in the western North Atlantic (peninsular Florida, northern United States, and Quintana Roo, Mexico) have all been declining since at least the late 1990s, thus indicating a downward trend for this population (Turtle Expert Working Group 2009). In southern New England, loggerhead sea turtles can be found seasonally, primarily during the summer and fall, but are typically absent during the winter (Kenney and Vigness-Raposa 2010; Shoop and Kenney 1992). Atlantic Marine Assessment Program for Protected Species surveys reported loggerhead sea turtles as the most commonly sighted sea turtles on the shelf waters from New Jersey to Nova Scotia, Canada. During the December 2014 to March 2015 aerial abundance surveys, 280 individuals were recorded (Palka et al. 2017). Large concentrations were regularly observed south and east of Long Island near the RI/MA WEA (NEFSC and SEFSC 2018). Kraus et al. (2016) observed loggerhead sea turtles within the RI/MA WEA in the spring, summer, and fall, with the greatest density of observations in August through September. The density of loggerhead sea turtles within the RI/MA WEA was estimated to be 0.00755 animals per $km^2$ at peak occurrence during the fall months, 0.00206 animals per $km^2$ during the summer months, and 0.035 animals per $km^2$ for the rest of the year (Kot et al. 2018; Kraus et al. 2016). The STSSN reported six offshore and 58 inshore loggerhead sea turtle strandings between 2017 and 2019 (NMFS STSSN 2020). In New York State waters, the New York Marine Rescue Center (NYMRC) documented 816 strandings of loggerhead sea turtles from 1980 to 2018 (NYMRC 2021). Winton et al. (2018) estimated densities using data from 271 satellite tags deployed on loggerhead sea turtles between 2004 and 2016 and found that tagged loggerheads primarily occupied the OCS from Long Island, New York, south to Florida, but relative densities in the RI/MA WEA increased during the period between July and September. Collectively, available information indicates that loggerhead sea turtles are expected to occur commonly in the RWF and RWEC as adults, subadults, and juveniles from the late spring through fall, with the highest probability of occurrence from July through September (Winton et al. 2018).

**Kemp's ridley sea turtle:** Kemp's ridley sea turtles are most commonly found in the Gulf of Mexico and along the U.S. Atlantic Coast. The species is primarily associated with habitats on the OCS, with preferred habitats consisting of sheltered areas along the coastline, including estuaries, lagoons, and bays (Burke et al. 1994; NMFS 2019), and nearshore waters less than 120 feet (37 m) deep (Seney and Landry 2008; Shaver et al. 2005; Shaver and Rubio 2008), although they can also be found in deeper offshore waters. Kemp's ridley sea turtle nesting is largely limited to the beaches of the western Gulf of Mexico, primarily in Tamaulipas, Mexico. Nesting also occurs in Veracruz, and a few historical records exist for Campeche, Mexico. In the United States, nesting occurs primarily in Texas and occasionally in Florida, Alabama, Georgia, South Carolina, and North Carolina (NMFS and USFWS 2015). Nesting outside of Gulf of Mexico states is rare but has been observed as far north as New York State (NPS 2018). Recent data show that the total number of recorded nests from all beaches in Mexico peaked in 2012 at 22,458 but declined to 12,060 in 2014, the last year for available data (NMFS and USFWS 2015). Juvenile and subadult Kemp's ridley sea turtles are known to travel as far north as Cape Cod Bay during summer foraging (NMFS et al. 2011). Visual sighting data are limited because this small species is difficult to observe using typical aerial survey methods (Kraus et al. 2016). In all, five observations were recorded in the RI/MA WEA during 4 years of aerial surveys, all in August and September 2012 (Kraus et al. 2016). The species has been sighted near the proposed RWF in other survey efforts, mostly to the south and west of the RI/MA WEA (North Atlantic Right Whale Consortium 2019).

The density of Kemp's ridley sea turtles within the RI/MA WEA was conservatively estimated to be 0.00925 animals per $km^2$ throughout the year for exposure modeling purposes (Kot et al. 2018; Kraus et al. 2016). However, this estimate does not accurately reflect seasonality of occurrence. Like all sea turtle species occurring in the region, the Kemp's ridley sea turtle is most commonly observed from late spring through early fall when suitable water temperatures are present, with occurrences later in the year limited to individuals that have been cold stunned and are outside their normal seasonal range. The STSSN reported six offshore and 69 inshore Kemp's ridley sea turtle strandings between 2017 and 2019 (NMFS STSSN 2020), and the NYMRC has documented the stranding of 620 Kemp's ridley sea turtles within New York State waters between 1980 and 2018 (NYMRC 2021). Cold-stunned Kemp's ridley sea turtles are often found stranded on the beaches of Cape Cod (Lui et al. 2019; WBWS 2019). Based on this information, Kemp's ridley sea turtles could occur infrequently as juveniles and subadults from July through September. The highest likelihood of occurrence within the Project limits is along the RWEC corridor in the protected waters of Narragansett Bay. Occurrence in the RWF is possible the likelihood of occurrence is difficult to assess from available data because this species is difficult to detect in visual surveys (Kraus et al. 2016). On this basis, Kemp's ridley sea turtles could occur in the RWF and RWEC in low numbers on an annual basis throughout the life of the Project.

## 3.19.2 Environmental Consequences

### 3.19.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

The analysis presented in this section considers the impacts resulting from the maximum-case scenario under the PDE approach developed by BOEM to support offshore wind project development (Rowe et al. 2017). The maximum design size specifications defined in Appendix D, Table D-1 are PDE parameters used to conduct this analysis. Several Project parameters could change during the development of the final Project configuration, potentially reducing the extent and/or intensity of impacts resulting from the associated IPFs.

The following design parameters would result in reduced impacts relative to those generated by the design elements considered under the PDE:

- The permitting and installation of fewer WTGs, resulting in fewer offshore structures and reduced IAC cable length. This would reduce the extent of temporary to long-term impacts on marine mammals by
    - reducing the extent and duration of underwater noise impacts from WTG foundation installation; and
    - reducing the extent of reef and hydrodynamic effects resulting from structure presence.
- The Project could use a casing pipe method to construct the RWEC sea-to-shore transition, which would result in less acoustic impact than vibratory pile driving to construct a cofferdam (Zeddies 2021).
- The use of a temporary cofferdam for RWEC sea-to-shore transition construction would reduce suspended sediment effects on sea turtles.

See Appendix E2 for a summary of IPFs analyzed for sea turtles across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Appendix E, Table E2-6.

Table 3.19-2 provides a summary of IPF findings carried forward for analysis in this section. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion. This comparison considers the implementation of all EPMs proposed by Revolution Wind to avoid and minimize adverse impacts on sea turtles. These EPMs are summarized in Appendix F, Table F-1.

A detailed analysis of the Proposed Action is provided following the table. Detailed analysis of other considered action alternatives is also provided below the table if analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4, to facilitate reader comparison across alternatives.

The conclusion section within each alternative analysis discussion includes rationale for the overall effect determination. Overall impacts associated with the each alternative would result in **minor** adverse impacts on sea turtles in the GAA because unavoidable adverse impacts on individual sea turtles could occur, but those impacts are unlikely to measurably affect the viability of any sea turtle species at the population level.

*This page intentionally left blank.*

**Table 3.19-2. Alternative Comparison Summary for Sea Turtles**

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| Accidental releases and discharges | **Offshore**: While marine vessels are an inherent source of accidental releases of trash, debris, and contaminants, existing regulatory requirements would effectively avoid and minimize these impacts such that the resulting effects to sea turtles would be **negligible** adverse.<br>All future offshore wind projects would be required to comply with regulatory requirements related to the prevention and control of accidental spills administered by the USCG and the BSEE Oil spill response plans are required for each project and would provide for rapid spill response, clean-up, and other measures that would help to minimize potential impacts on affected resources. Given the low probability of a large spill event, impacts to sea turtles are likely to be **negligible** adverse. | **Offshore**: BOEM prohibits the discharge or disposal of solid debris into offshore waters during any activity associated with the construction and operation of offshore renewable energy facilities (30 CFR 585.105(a)). The USCG similarly prohibits the dumping of trash or debris capable of posing entanglement or ingestion risk (MARPOL, Annex V, Public Law 100−220 (101 Stat. 1458)). The Project would comply with these requirements (VHB 2023). Given these restrictions, the short-term impacts to sea turtles from trash and debris from the Project would be **negligible** adverse.<br>Project EPMs, permit requirements, controls, and procedures would be implemented as part of the Project to reduce the potential or extent of offshore spills, thereby avoiding or minimizing impacts on water quality. Should a spill occur, response and containment procedures would limit the reach of the spill to a localized area, where changes to water quality would be detectable and would exceed water quality standards. Given the low potential for spills and minimal risk of exposure to small temporary spills, the risk from construction-related spills is **negligible** to **minor** adverse. Impacts on sea turtles from accidental spills or releases of pollutants are considered **minor** adverse during O&M because of the low probability of the risk and EPMs.<br>Cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **negligible** to **minor** adverse because of the regulatory protections and limited likelihood of sea turtle exposure. | **Offshore:** Effects on sea turtles from accidental releases and discharges under Alternatives C through F would be similar to those described for the Proposed Action. Alternatives C through F would include the same EPMs to avoid and minimize impacts to sea turtles from accidental releases and discharges. Effects on sea turtles would therefore be **negligible** adverse and short term. While unlikely, vessels collision or allisions could occur during Project construction, presenting the potential risk of larger spills, potentially harmful to sea turtles. Alternatives C through F would slightly reduce total chemical and lubricant uses relative to the Proposed Action, but this effect would be small in comparison to projected chemical use on the Mid-Atlantic OCS. When combined with other offshore wind projects, up to approximately 34 million gallons of coolants, fuels, oils, and lubricants could cumulatively be stored within WTG foundations and OSSs. However, all future offshore energy development projects would comply with BOEM and USCG regulations that prohibit dumping of trash and debris and require measures to avoid and minimize accidental spills. Cumulative impacts associated with Alternative C when combined with past, present, and reasonably foreseeable future activities would be **negligible** to **minor** adverse. | | | | **Offshore:** Similar to Alternatives C through F, effects on sea turtles from accidental releases and discharges under Alternative G would be similar to those described for the Proposed Action. Alternative G would include the same EPMs to avoid and minimize impacts to sea turtles from accidental releases and discharges. Effects on sea turtles would therefore be **negligible** adverse and short term. Cumulative impacts associated with Alternative G when combined with past, present, and reasonably foreseeable future activities would be **negligible** to **minor** adverse. |
| Climate change | **Offshore**: Over time, climate change, in combination with coastal and offshore development, would alter existing habitats, potentially rendering some areas unsuitable for certain species and more suitable for others. However, sea turtle populations likely to be impacted by the Project are stable or generally increasing from historic lows. Therefore, | **Offshore**: Northward shifts in sea turtle distributions due to warming waters could result in magnification of the anticipated impacts due to increased exposure. However, this magnification includes potential benefits associated with the creation of artificial reef habitat and could represent an increasing impact over the life of the Project. Therefore, the Proposed Action when combined with other past, present, and reasonably foreseeable actions is expected to result in **minor** | **Offshore:** The types of impacts from global climate change described for the No Action Alternative would occur under Alternatives C through F, but as with the Proposed Action, this alternative could also contribute to a long-term net decrease in GHG emissions. However, northward shifts in sea turtle distributions due to warming waters could result in magnification of the anticipated impacts due to increased exposure. This magnification includes potential benefits associated with the creation of artificial reef habitat and could represent an increasing impact over the life of the Project. Therefore, Alternatives C through F when combined with other past, present, and reasonably foreseeable actions and ongoing environmental trends is expected to result in **minor** adverse cumulative impacts to sea turtles. | | | | **Offshore:** Similar to Alternatives C through F, the types of impacts from global climate change described for the No Action Alternative would occur under Alternative G, but as with the Proposed Action, this alternative could also contribute to a long-term net decrease in GHG emissions. Alternative G when combined with other past, present, and reasonably foreseeable actions and ongoing environmental trends is |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | potential climate change impacts would be **minor** adverse. | adverse cumulative impacts to sea turtles due to the anticipated shifts in distributions. | | | | | expected to result in **minor** adverse cumulative impacts to sea turtles. |
| Noise | **Offshore**: Under the No Action Alternative, human activities would continue to generate underwater noise with the potential to affect sea turtles. These short-term impacts on individuals are not expected to result in population-level effects; the effects of impulsive noise on sea turtles would therefore be **minor** adverse, while effects of non-impulsive noise on sea turtles would be **negligible** adverse because of the patchy distribution of sea turtles and limited likelihood of behavioral responses to expected noise levels. | **Offshore**: A temporary increase in underwater noise could impact sea turtles if they are present in the area during the time of RWF and offshore RWEC construction. Sea turtles that are close to impact pile driving or UXO detonations could experience a temporary or permanent loss of hearing sensitivity. Sea turtles could also respond to vessel approach and/or noise with a startle response and a temporary stress response.<br>Based on the combination of minimization measures and the low numbers of sea turtles expected in the RWF and RWEC, however, impacts to sea turtles from impact pile driving and UXO detonations are expected to be **negligible** to **minor** adverse and impacts to sea turtles from vessel noise would be **negligible** adverse. Likewise, underwater noise impacts from HRG surveys are expected to be **minor** adverse and aircraft noise impacts sea turtles are expected to be **negligible** adverse because exposures would be limited in extent and temporary in duration.<br>Project decommissioning would require the use of construction vessels of similar number and class as those used during construction, and would therefore range from **negligible** to **minor** adverse.<br>Sea turtle hearing is largely within the frequency range (< 1,200 Hz) of operational wind turbines; therefore, it is possible that wind turbine noise could be heard by sea turtles, although behavioral responses are unlikely based on the established threshold, resulting in **negligible** adverse effects.<br>Based on the above findings, noise-related impacts of the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts to sea turtles, depending upon the noise source. | **Offshore:** See Section 3.19.2.3.1 for construction analysis.<br>Alternatives C through F would include the same, or similar, operational and decommissioning noise-producing activities as those described for the Proposed Action but would be reduced based on the reduction in the number of WTGs and other operational elements. Thus, the impacts of operational and cumulative noise are also considered **negligible** to **minor** adverse. | | | | **Offshore:** See Section 3.19.2.3.1 for construction analysis.<br>Similar to Alternatives C through F, Alternative G would include the same, or similar, operational and decommissioning noise-producing activities as those described for the Proposed Action but would be reduced based on the reduction in the number of WTGs and other operational elements. Thus, the impacts of operational and cumulative noise are also considered **negligible** to **minor** adverse. |
| Presence of structures | **Offshore**: The addition of up to 3,113 new offshore foundations in the GAA could increase sea turtle prey availability by creating new hard-bottom habitat, increasing pelagic productivity in local areas, or promoting | **Offshore**: Construction and installation of offshore structures would have temporary **negligible** to **minor** adverse effects on sea turtles, varying in significance by species, due to underwater noise impacts related to impact pile driving and noise and disturbance from associated vessel activity. | **Offshore**: Alternatives C through F would result in impacts to sea turtles associated with the presence of WTG and OSS foundations that are similar to those described for the Proposed Action, but those effects would be reduced in extent. This would reduce the extent of long-term impacts on benthic habitat, water flow, prey aggregation, and fishing activity. This would also reduce the extent of antcipated hydrodynamic and reef effects. But given the offsetting nature of anticipated effects, the differences between alternatives on sea turltes | | | | **Offshore**: Similar to Alternatives C through F, Alternative G would result in impacts to sea turtles associated with the presence of WTG and OSS foundations that are similar to those described for the Proposed Action, but those effects would be reduced in extent. The overall |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | fish aggregations at foundations (Bailey et al. 2014). In contrast, broadscale hydrodynamic impacts could alter zooplankton distribution and abundance and concentrate recreational and commercial fishing around foundations, which could indirectly increase the potential for sea turtle entanglement in both lines and nets. Therefore, associated effects of structures on sea turtles through potential reef effects, hydrodynamic impacts, and concentration of fishing would be **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects. | Potential long-term, intermittent impacts could persist until decommissioning is complete and structures are removed. These O&M impacts would be **negligible** to **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects.<br>BOEM estimates a cumulative total of 3,190 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the GAA. For similar reasons as described above, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts and potential **minor** beneficial cumulative impacts to sea turtles. | would be uncertain. As with the Proposed Action, the overall impact to sea turtles from the presence of structures is not expected to be biologically significant due to the patchy distribution of sea turtles within the RWF and RWEC. Indirect effects on the prey base of some sea turtle species (i.e., invertebrates) from the presence of structures would occur. Potential long-term, intermittent impacts would persist until decommissioning is complete and structures are removed. These impacts would be **negligible** to **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects. | | | | impact to sea turtles from the presence of structures is not expected to be biologically significant due to the patchy distribution of sea turtles within the RWF and RWEC. Indirect effects on the prey base of some sea turtle species (i.e., invertebrates) from the presence of structures would occur. Potential long-term, intermittent impacts would persist until decommissioning is complete and structures are removed. These impacts would be **negligible** to **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects. |
| Vessel traffic | **Offshore**: Increased vessel traffic could result in sea turtle injury or mortality; however, the proportional increase in vessel traffic from baseline would be minimal. Despite the unlikely potential for individual fatalities, no population-level impacts on sea turtles are expected based on occurrence and potential exposure. Assuming other offshore wind projects employ similar minimization measures included in this Project (see Table F-1 in Appendix F), impacts would be further reduced and would be considered **negligible** to **minor** adverse. | **Offshore**: Vessel collisions with individual turtles could occur, resulting in mortalities. Because the abundance of sea turtles is anticipated to be generally low with patchy distribution, and the proportional increase in vessel traffic is also low, the number of sea turtles injured or killed by vessel strikes during Project construction would be low and would have negligible effects at the population level. Therefore, the potential effects of construction and decomissioning vessel collisions on sea turtles would be **minor** adverse.<br>O&M vessel use would represent a minimal increase in regional vessel traffic over the life of a facility and the effects to sea turtles are expected to be **negligible** to **minor** adverse.<br>An increase in vessel traffic poses an increased likelihood of collision-related injury and mortality relative to existing baseline conditions. Some sea turtles could be injured or killed as a result, but the number of individuals impacted is not likely to significantly increase the existing mortality rate from vessel strikes. Additionally, BOEM expects that similar EPMs would be included in future offshore wind projects, helping to minimize the vessel strike risk. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse; BOEM does not expect the viability of sea turtle populations to be affected. | **Offshore:** Alternative C to F would require the same types and number of construction O&M and decommissioning vessels producing the similar impacts to those described for the Proposed Action, but the number of vessel trips and overall duration of construction activity would be reduced. The risk of collisions, disturbance, and other associated effects on sea turtles would similarly be reduced consistent with the overall reduction in vessel trips required to construct each alternative configuration. Thus, vessel traffic associated with the RWF would be expected to increase less than those estimated for the Proposed Action. For the Proposed Action, Revolution Wind (Tech Environmental 2023) has estimated that Project O&M would involve up to four CTV and two SOV trips per month for wind farm O&M, or 2,280 vessel trips over the life of the Project. It can be assumed that Alternative D would require similar or slightly fewer vessel trips during O&M.<br>Therefore, the potential effects of vessel collisions on sea turtles would be **minor** adverse for the life of the Project; BOEM does not expect the viability of sea turtle populations to be affected. | | | | **Offshore:** Similar to Alternatives C through F, Alternative G would require the same types and number of construction, O&M, and decommissioning vessels producing similar impacts to those described for the Proposed Action, but the number of vessel trips and overall duration of construction activity would be reduced. The potential effects of vessel collisions on sea turtles would be **minor** adverse for the life of the Project; BOEM does not expect the viability of sea turtle populations to be affected. |

### 3.19.2.2 Alternative A: Impacts of the No Action Alternative on Sea Turtles

#### 3.19.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for sea turtles (including search and rescue) (see Section 3.19.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the sea turtles GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.19.2.2.2 Cumulative Impacts

This section discloses potential sea turtles impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

#### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> BOEM prohibits the discharge or disposal of solid debris into offshore waters during any activity associated with the construction and operation of offshore renewable energy facilities (30 CFR 585.105(a)). The USCG similarly prohibits the dumping of trash or debris capable of posing entanglement or ingestion risk (MARPOL, Annex V, Public Law 100−220 (101 Stat. 1458)). BOEM also requires applicants to develop spill response and containment plans to quickly address accidental spills of fuels, lubricants, and other contaminants. While marine vessels are an inherent source of accidental releases of trash, debris, and contaminants, these requirements would effectively avoid and minimize these impacts such that the resulting effects to sea turtles would be **negligible** adverse.

Trash or water quality contaminants could be accidentally released as a result of increased human activity associated with future offshore wind construction activities. All species of sea turtles have been documented ingesting plastic fragments (Bugoni et al. 2001; Hoarau et al. 2014; Nelms et al. 2016) and a variety of other anthropogenic waste (Tomás et al. 2002), likely mistaking debris for potential prey items (Schyuler et al. 2014). Ingesting trash or exposure to aquatic contaminants can be lethal to sea turtles. However, turtles may also be affected sublethally in a variety of ways, which could include experiencing depressed immune system function; poor body condition; and reduced growth rates, fecundity, and reproductive success (Gall and Thompson 2015; Hoarau et al. 2014; Nelms et al. 2016; Schuyler et al. 2014). Sea turtles could additionally become entangled in debris, causing lethal or injurious impacts. Entanglement in lost fishing gear is a significant cause of mortality in both juvenile and adult sea turtles and was noted as a threat to recovery for multiple ESA-listed turtles in the marine environment (NMFS and USFWS 1991, 1992; NMFS et al. 2011). Based on a recent global review, 5.5% of encountered sea turtles were found to be entangled, and 90.6% of these were dead (Duncan et al. 2017). Lost or discarded fishing gear was associated with most of these entanglements, and many experts believed that these impacts could be causing population-level impacts in some areas. Aquatic contaminant exposure could also result in mortality, and sublethal effects could impact many of the species' physiological systems during all life stages (Bembenek-Bailey et al. 2019; Mitchelmore et al. 2017; Shigenaka et al. 2010; Vargo et al. 1986). Furthermore, accidental releases could indirectly impact sea turtles by impacting prey species. However, all vessels would comply with USCG regulations, and wind farm construction projects would comply with additional BOEM requirements that would avoid and minimize accidental releases of trash or other debris. Therefore, potential accidental releases of trash or debris would not appreciably contribute to adverse impacts to sea turtles and would be **negligible** adverse.

Impacts to sea turtles from accidental spills and releases associated with ongoing future non–offshore wind activities are likely to increase over the next 30 years commensurate with increases in vessel traffic. Future offshore wind activities would contribute to this increased risk. A total of approximately 34 million gallons of coolants, fuels, oils, and lubricants could be stored within WTG foundations and OSSs across all projected offshore wind projects along the Atlantic Coast. A high-volume spill of toxic materials (fuels, lubricants, and other contaminants) could potentially injure or kill several individual sea turtles and adversely affect habitat suitability. Given that the affected habitats would be at or outside the northern limit of range of most species, the number of individuals impacted would be small relative to population size. In the unlikely event of a high-volume spill, impacts of this magnitude would constitute a moderate effect on sea turtles. BOEM anticipates that the likelihood of a major spill of petroleum products and other toxic substances during construction is very low (a 1 in 1,000 chance per year) due to vessel allisions, collisions, O&M activities, or weather events (Bejarano et al. 2013). WTGs and OSSs are generally self-contained and would not generate discharge. All future offshore wind projects would be required to comply with regulatory requirements related to the prevention and control of accidental spills administered by the USCG and the BSEE Oil spill response plans are required for each project and would provide for rapid spill response, clean-up, and other measures that would help to minimize potential impacts on affected resources. Given the low probability of a large spill event, impacts to sea turtles from this IPF are likely to be **negligible** adverse.

<u>Climate change:</u> Global climate change is an ongoing potential risk to sea turtles, although the associated impact mechanisms are complex, not fully understood, and difficult to predict with certainty. This is particularly true when considering how the effects of climate change may interact with other IPFs. Possible impacts to sea turtles due to climate change include increased storm severity and frequency; changes in nearshore habitat suitability caused by increased erosion from upland sources; exposure to disease; ocean acidification; and altered habitat, prey availability, ecology, and migration patterns (Hawkes et al. 2009).

However, some of these potential impacts could also contribute to potential benefits associated with the creation of artificial reef habitat and could represent an increasing impact over the life of the Project. The potential implications of these and other related environmental changes and how they interact with the effects of regional offshore wind development are complex and uncertain. For example, the distribution of leatherback sea turtles in the North Atlantic is shifting northward in response to changes in water temperature (McMahon and Hays 2006). Should this trend continue it could lead to increased interactions between this species and offshore wind farms on the mid-Atlantic OCS, potentially magnifying the impacts and benefits described above. Over time, climate change, in combination with coastal and offshore development, would alter existing habitats, potentially rendering some areas unsuitable for certain species and more suitable for others. As described in Section 3.19.1, sea turtle populations likely to be impacted by future offshore wind activities are stable or generally increasing from historic lows. Therefore, potential climate change impacts would be **minor** adverse.

<u>Noise:</u> Under the No Action Alternative, human activities would continue to generate underwater noise with the potential to affect sea turtles. Existing and future sources of anthropogenic underwater noise

include commercial, government and military, research, and recreational vessel activity; military sonar; geophysical surveys; and the development and operation of other wind energy projects on the OCS. Several wind energy projects could be developed between 2022 to 2030, and their construction periods could overlap, adding several new sources of underwater noise to baseline levels generated by vessel traffic. As discussed in Section 2.1.3, some projects could be constructed concurrently or could involve concurrent construction activities (e.g., impact pile driving) at two or more locations in proximity, creating the potential for larger and/or overlapping areas of underwater noise effects.

Existing and potential future anthropogenic noise sources generally fall into two categories: 1) impulsive noise, defined as the instantaneous change in sound pressure over a short period of time; and 2) non-impulsive noise, which could be intermittent or remain constant and stable over a given time period. Impulsive and non-impulsive noise sources associated with offshore wind projects are discussed in the sections below.

*Impulsive noise*: Existing and potential future sources of impulsive underwater noise in the GAA include impact pile driving used in nearshore and offshore construction activities and geological and geophysical surveys.

Sea turtles could experience any of the following three potential exposure scenarios under the No Action Alternative:

1. Concurrent exposure to noise from two or more impact hammers, operating within the same project or in adjacent projects
2. Non-concurrent exposure to noise from multiple pile-driving events within the same year
3. Exposure to two or more concurrent or non-concurrent pile-driving events over multiple years

The reader is referred to Section 3.15 for a discussion of these concurrent noise exposure scenarios.

Geological and geophysical surveys generate high-intensity impulsive sound with the potential to result in short-term and long-term impacts on sea turtles if they are present in the ensonified area. Offshore wind surveys typically involve HRG equipment, which can generate non-impulsive noise that is generally less intense than noise generated from other geological and geophysical survey methods. Potential impacts from HRG equipment include sub-bottom profilers (e.g., boomer and sparker categories of equipment) that could be audible to sea turtles.

None of the equipment being operated for these surveys that overlaps with the hearing range (30 Hz to 2 kHz) for sea turtles has source levels loud enough to result in PTS or TTS based on the peak or cumulative exposure criteria. Therefore, physical effects are extremely unlikely to occur. Sea turtles could exhibit a behavioral response when exposed to received levels of 175 dB re 1 µPa (rms), and some HRG is within their hearing range (below 2 kHz). For boomers and bubble guns, the distance to this threshold is 40 m, and is 90 m for sparkers. Thus, a sea turtle would need to be within 90 m of the source to be exposed to potentially disturbing levels of noise. We expect that sea turtles would react to this exposure by swimming away from the sound source; this would limit exposure to a short time period—just the few seconds it would take an individual to swim away to avoid the noise. The risk of exposure to potentially disturbing levels of noise is reduced by the use of PSOs to monitor for sea turtles. At the start of a survey, equipment cannot be turned on until the exclusion zone is clear for at least 30 minutes. This condition is expected to reduce the potential for sea turtles nearby to be exposed to noise that could be disturbing.

However, even in the event that a sea turtle is submerged and not seen by the PSO, in the worst case, it is expected that sea turtles would avoid the area ensonified by the survey equipment that they can perceive. Because the area where increased underwater noise would be experienced is transient and increased underwater noise would only be experienced in a particular area for only seconds, BOEM expects any effects to behavior to be minor and limited to a temporary disruption of normal behaviors, temporary avoidance of the ensonified area, and minor additional energy expenditure spent while swimming away from the noisy area. If foraging or migrations are disrupted, BOEM expects that they would quickly resume once the survey vessel has left the area. No sea turtles would be displaced from a particular area for more than a few minutes. While the movements of individual sea turtles would be affected by the sound associated with the survey, these effects would be temporary (seconds to minutes) and localized (avoiding an area no larger than 90 m), and there would be only a minor and temporary impact on foraging, migrating, or resting sea turtles as the vessel continues along a survey line. Effects to individual sea turtles from brief exposure to potentially disturbing levels of noise are expected to be minor and limited to a brief startle, a short increase in swimming speed, and/or short displacement and would be so small that they cannot be meaningfully measured, detected, or evaluated; therefore, effects are negligible.

BOEM has concluded that disturbance of sea turtles from underwater noise generated by site characterization and site assessment activities would likely result in temporary displacement and other behavioral or nonbiologically significant physiological consequences (i.e., no injury or mortality would occur), and impacts on sea turtles would be negligible adverse.

Impulsive underwater noise from impact pile driving during planned offshore wind development, due to the anticipated frequency and spatial extent of effects, represents the highest likelihood for exposure of individual sea turtles to adverse impacts from noise. Although these potential impacts are acknowledged, their potential extent and magnitude is unclear because sea turtle sensitivity and behavioral responses to underwater noise are a subject of ongoing study. Potential behavioral impacts could include altered submergence patterns, temporary disturbance, startle response (diving or swimming away), and temporary displacement of feeding/migrating and a temporary stress response, if present within the ensonified area (NSF and USGS 2011; Samuel et al. 2005). The accumulated stress and energetic costs of avoiding repeated exposure to pile-driving noise over a season or a life stage could have long-term impacts on survival and fitness (Navy 2018). Conversely, sea turtles could become habituated to repeated noise exposure over time and not suffer any long-term consequences (O'Hara and Wilcox 1990; Hazel et al. 2007). This type of noise habituation has been demonstrated even when the repeated exposures were separated by several days (Bartol and Bartol 2011; Navy 2018).

Sea turtles that are close to impact pile driving could experience a temporary or permanent loss of hearing sensitivity. In theory, reduced hearing sensitivity could limit the ability to detect predators and prey or find potential mates, reducing the survival and fitness of affected individuals. However, the role and importance of hearing in these biological functions for sea turtles remain poorly understood (Lavender et al. 2014). Impacts to sea turtles from construction-related noise would likely be limited to minor or moderate short-term impacts on a small number of individuals. These short-term impacts on individuals are not expected to result in population-level effects; the effects of impulsive noise on sea turtles would therefore be **minor** adverse overall.

*Non-impulsive noise*: Non-impulsive underwater noise sources in the GAA include baseline noise levels from activities not regulated by BOEM, such as commercial, military and government, research, and recreational vessel traffic; aircraft; and offshore development activities. The planned development of other wind energy facilities would contribute additional new sources of intermittent non-impulsive underwater noise, including helicopters and fixed-wing aircraft, construction and O&M vessels, and vibratory pile driving during construction. Operational noise from WTGs would constitute a low-level, non-impulsive underwater noise source throughout the life of a given project.

Helicopters and fixed-wing aircraft could be used during initial site surveys, protected species monitoring prior to and during construction, and facility monitoring. Sea turtle responses to aircraft noise and disturbance is not well documented. Bevan et al. (2018) observed no evident behavioral responses from sea turtles exposed to drones flown directly overhead at altitudes ranging from 60 to 100 feet. Helicopters and aircraft would operate at altitudes of 1,000 feet or more except when helicopters are landing or departing from service vessels. In development of American National Standards Institute (ANSI) guidelines for fishes and sea turtles, Popper et al. (2014) did not consider aircraft noise because it was not considered to pose a great risk. Based on this information, cumulative effects on sea turtles from aircraft used for wind energy development on the OCS would be expected to be negligible.

Vibratory pile driving used during submarine cable construction is the most intensive source of intermittent, non-impulsive underwater noise expected to result from planned offshore wind energy development. Vibratory pile-driving noise can exceed levels associated with behavioral disturbance in sea turtles but only within a short distance (i.e., less than 200 feet) from the source. Given this low exposure probability to vibratory pile-driving noise and the fact that vibratory pile-driving activities would be limited in extent, temporary in duration, and widely separated, vibratory pile-driving noise effects on sea turtles would be negligible adverse.

Construction and operational vessels are the most broadly distributed source of intermittent non-impulsive noise associated with offshore wind projects. Sea turtle exposure to underwater vessel noise would correspondingly increase as a result of planned offshore wind projects, especially during construction periods. Applying vessel activity estimates developed by BOEM based on its 2019 study *National Environmental Policy Act Documentation for Impact-Producing Factors in the Offshore Wind Cumulative Impacts Scenario on the North Atlantic Outer Continental Shelf* (BOEM 2019), vessel activity could peak in 2025, with as many as 210 vessels involved in the construction of reasonably foreseeable projects (see Section 2.1.3 for details). However, this increase must be considered relative to the baseline level of vessel traffic. The relatively low frequency range of turtle hearing (100–1,200 Hz) (Ketten and Bartol 2006; Lavender et al. 2014) overlaps the broad frequency spectrum of intermittent non-impulsive noise produced by vessels (10–1,000 Hz). Sea turtles could respond to vessel approach and/or noise with a startle response and a temporary stress response (NSF and USGS 2011). Overall, impacts to sea turtles from vessel noise would be negligible. Although sea turtles could become habituated to repeated noise exposure over time (Hazel et al. 2007), vessel noise effects for other wind farm development projects are expected to be broadly similar to noise levels from existing vessel traffic in the region. Nonetheless, periodic localized, intermittent, and temporary behavioral impacts on sea turtles could occur. Underwater noise generated by construction vessels would not exceed injury thresholds for turtles, as noise levels produced by vessels in general are below levels that could cause potential auditory threshold shifts. Behavioral responses to vessels have been reported but are thought to be more associated with visual cues, as opposed to auditory cues (Hazel et al. 2007), although both senses likely play a role in avoidance. A conservative assumption is that construction and support vessels could elicit behavioral changes in individual sea turtles near the vessels. It is assumed that these behavioral changes would be limited to evasive maneuvers such as diving, changes in swimming direction, or changes in swimming speed to distance themselves from vessels. Based on sea turtle responses to other types of disturbance (e.g., Bevan et al. 2018), turtle behavior is expected to return to normal when vessel noise dissipates. Given limited turtle sensitivity to underwater noise produced by vessels, the short-term nature of any behavioral responses, and the patchy distribution of sea turtles in the GAA, the effects of vessel noise from future activities on sea turtles would be negligible adverse.

Tougaard et al. (2020) summarized available monitoring data on wind farm operational noise, including both older generation geared turbine designs and quieter modern direct-drive systems like those proposed for the RWF. They determined that operating turbines produce underwater noise on the order of 110 to 125 $dB_{RMS}$, occasionally reaching as high as 128 $dB_{RMS}$, in the 10-Hz to 8-kHz range. This is consistent with the noise levels observed at the BIWF (110 to 125 dB re 1 µPa SPL rms) (Elliot et al. 2019) and the range of values observed at European wind farms and is therefore representative of the range of operational noise levels likely to occur from future wind energy projects. Sea turtle hearing is largely within the frequency range (< 1,200 Hz) for operational wind turbines; therefore, it is possible that wind turbine noise could be heard by sea turtles, although behavioral responses are unlikely based on the established threshold (175 $dB_{RMS}$ re 1 µPa). This indicates that operational noise effects from other future actions would likely be negligible adverse.

Overall, effects of non-impulsive noise on sea turtles would be **negligible** adverse because of the patchy distribution of sea turtles and limited likelihood of behavioral responses to expected noise levels.

Presence of structures: The addition of up to 3,088 new offshore foundations in the GAA could increase sea turtle prey availability by creating new hard-bottom habitat, increasing pelagic productivity in local areas, or promoting fish aggregations at foundations (Bailey et al. 2014). The artificial reefs created by these structures form biological hotspots that could support species range shifts and expansions and changes in biological community structure (Degraer et al. 2020; Methratta and Dardick 2019; Raoux et al. 2017). Section 3.13 discusses reef creation and altered water flow in detail. The significance of these ecological changes to sea turtles is unknown, but the biological productivity generated by reef effects could result in improved foraging opportunities for some species at project scales. For example, loggerhead turtles may benefit from the increased abundance of crustaceans and other prey species concentrated around offshore structures. On this basis, the presence of structures could produce permanent minor beneficial effects on sea turtles that would persist over the life of the Project.

In contrast, broadscale hydrodynamic impacts could alter zooplankton distribution and abundance (van Berkel et al. 2020). There is considerable uncertainty as to how these broader ecological changes would affect sea turtles in the future and how those changes will interact with other human-caused impacts. The effect of reef effects and hydrodynamic impacts on sea turtles and their habitats under the No Action Alternative could be adverse or beneficial, varying by species, and their extent and magnitude is unknown.

The presence of structures could also concentrate recreational and commercial fishing around foundations, which could indirectly increase the potential for sea turtle entanglement in both lines and nets (Gall and Thompson 2015; Nelms et al. 2016; Shigenaka et al. 2010). Entanglement in both lines and nets could lead to injury and mortality due to abrasions, loss of limbs, and increased drag, leading to reduced foraging efficiency and ability to avoid predators (Barreiros and Raykov 2014; Gregory 2009; Vegter et al. 2014). Between 2016 and 2018, 186 sea turtles were documented as hooked or entangled with recreational fishing gear (BOEM 2021a). Due to the high number of foundations in a given lease area, it is likely that recreational and for-hire fisheries would avoid overcrowding structures by dispersing effort across many WTG foundations. However, the risk of entanglement and hooking or ingestion of marine debris could slightly increase from recreational and for-hire fishing since both fishers and turtles may be attracted to the same areas.

If structures result in vessel displacement or gear shifts, the potential impact to sea turtles is uncertain. Increased risk would not be expected by vessel displacement due to the patchy distribution of sea turtles. However, it could result in a potential increase in the number of vertical lines in the water column if there is no commensurate reduction in fixed-gear types as compared to mobile gear. In such circumstances of a greater shift from mobile gear to fixed gear, there would be a potential increase in the number of vertical lines, resulting in an increased risk of sea turtle interactions with fishing gear. Therefore, associated effects of structures on sea turtles through potential reef effects, hydrodynamic impacts, and concentration of fishing would be **minor** adverse.

<u>Vessel traffic:</u> Vessel strike is an increasing concern for sea turtles. The percentage of loggerhead sea turtles stranded with injuries consistent with vessel strikes increased from approximately 10% in the 1980s to 20.5% in 2004, although an unknown number may have been struck postmortem (NMFS and USFWS 2007). Sea turtles are expected to be most susceptible to vessel collision in shelf waters, where they forage. Furthermore, they cannot reliably avoid being struck by vessels exceeding 2 knots (Hazel et al. 2007); typical vessel speeds in the GAA could exceed 10 knots. Up to 210 vessels associated with offshore wind development could be operating in the GAA during the peak construction period in 2025. Additional fishing vessels could also be present in the vicinity due to the expected increase in fish biomass around the WTG structures. Increased vessel traffic could result in sea turtle injury or mortality; however, the proportional increase in vessel traffic from baseline would be minimal (refer to Section 3.16 and COP Appendix R [DNV GL Energy USA, Inc. 2020]). Despite the unlikely potential for individual fatalities, no population-level impacts on sea turtles are expected based on occurrence and potential exposure. Assuming other offshore wind projects employ the same minimization measures included in this Project (see Table F-1 in Appendix F), impacts would be further reduced and would be considered **minor** adverse.

#### 3.19.2.2.3 Conclusions

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts associated with the Project to sea turtles would not occur. However, ongoing and future activities would have continuing temporary to long-term impacts on sea turtles, primarily through, but not limited to, construction-related lighting, noise, habitat alternation, collision risk, and the artificial reef effect.

Based on the current science, BOEM anticipates that the impacts of ongoing activities, especially vessel traffic, commercial and recreational fisheries gear interaction, and climate change, would be **minor**. In addition to ongoing activities, reasonably foreseeable activities other than offshore wind development include increased vessel traffic; new submarine cables and pipelines; channel-deepening activities; and the installation of new towers, buoys, and piers. BOEM anticipates that the impacts of reasonably foreseeable activities other than offshore wind would be minor. BOEM expects that the combination of ongoing activities and reasonably foreseeable activities other than offshore wind development to result in minor impacts on sea turtles, driven primarily by increasing vessel traffic and interactions with commercial and recreational fisheries gear.

The combined impact-level criteria in Table 3.3-2 and Table 3.3-3 in Chapter 3 are used to characterize the combined effects of all IPFs likely to occur in the GAA under the No Action Alternative. BOEM anticipates that the impacts associated with future offshore wind activities in the GAA combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **minor** adverse impacts from construction and operational noise and exposure to vessel traffic and **minor** beneficial impacts to sea turtles from increased biological productivity created by reef effects. Those impacts would range from short term to long term in duration. Future offshore wind activities are expected to contribute considerably to several IPFs, the most prominent being the presence of structures—namely foundations, scour/cable protection, and pile-driving noise.

The No Action Alternative would forgo any monitoring that Revolution Wind has committed to perform, the result of which could provide an understanding of the effects of offshore wind development, benefit future management of sea turtles, and inform planning of other offshore developments. However, other ongoing and future surveys could provide similar data.

### 3.19.2.3 Alternative B: Impacts of the Proposed Action on Sea Turtles

#### 3.19.2.3.1 Construction and Installation

##### Offshore Activities and Facilities

Construction impacts to sea turtles could occur from accidental releases and discharges, artificial lighting, seafloor disturbance, entrainment and impingement, underwater and airborne noise, vessel traffic (strikes and noise), and water quality degradation. The potential for these impacts to occur are discussed in detail by IPF.

<u>Accidental releases and discharges:</u> During construction of the RWF and RWEC, there could be a short-term risk of sanitary and other waste fluids or fuels and other petrochemicals accidentally entering the water. If sea turtles were to be exposed to an oil spill or a discharge of waste material, studies indicate that respiration, skin, some aspects of blood chemistry and composition, and salt gland function could be significantly impacted in exposed individuals (Vargo et al. 1986). Any nonroutine spills or accidental releases that could result in negligible and short-term impacts to surface water resources would be avoided or minimized through the implementation of the Project SPCC plan and other EPMs (see Table F-1 in Appendix F). Impacts on sea turtles from accidental spills or releases of pollutants are considered negligible because of the low probability of the risk and EPM implementation.

Trash and debris that enter the water represent a risk factor to sea turtles because the turtles could ingest or become entangled in debris, causing lethal or injurious impacts. Pollution (e.g., plastic) is often mistaken for food such as jellyfish and ingested, which can block intestinal tracts, causing injury or mortality. See Section 3.15.2 for additional debris and entanglement analysis. Personnel working offshore would receive training on sea turtle and marine debris awareness. Impacts on sea turtles from accidental deposits of trash or debris associated with RWF are considered minor because implementation of proposed EPMs would lower the probability of such risk.

BOEM prohibits the discharge or disposal of solid debris into offshore waters during any activity associated with the construction and operation of offshore energy facilities (30 CFR 585.105(a)). The USCG similarly prohibits the dumping of trash or debris capable of posing entanglement or ingestion risk (MARPOL, Annex V, Public Law 100−220 (101 Stat. 1458)). The Project would comply with these requirements (VHB 2023). Given these restrictions, the short-term impacts to sea turtles from trash and debris from the Project would be **negligible** adverse.

Construction vessels also pose a potential risk for Project-related accidental spills. As described in Section 3.21.2.2.1, the chance of a spill occurring due to vessel allisions or collisions would be low (once per 1,000 years). In the unlikely event an allision or collision involving Project vessels or components resulted in a high-volume spill, impacts on water quality would be minor to moderate adverse and temporary to long term, depending on the type and volume of material released and the specific conditions (e.g., depth, currents, weather conditions) at the location of the spill. Project EPMs, permit requirements, controls, and procedures would be implemented as part of the Project to reduce the potential or extent of offshore spills, thereby avoiding or minimizing impacts on water quality. Should a spill occur, response and containment procedures would limit the reach of the spill to a localized area, where changes to water quality would be detectable and would exceed water quality standards. Given the low potential for spills and minimal risk of exposure to small temporary spills, the risk from construction-related spills is **negligible** to **minor** adverse.

Noise: A temporary increase in underwater noise is the most likely construction-related factor that could impact sea turtles if they are present in the area during the time of RWF and offshore RWEC construction. Construction noise sources include impact and vibratory pile driving, UXO detonation, HRG surveys, construction vessels, and helicopters and fixed-wing aircraft.

The current literature and effect analysis guidance regarding sensitivity to underwater noise effects vary depending on the source. Popper et al. (2014) reviewed available data and suggested the threshold levels of 207 peak decibels (dB re 1 µPa) and 210 decibels referenced to the sum of cumulative pressure in micropascals squared, normalized to 1 second (dB re 1 $\mu Pa^2s$) for injurious (i.e., hearing loss) underwater noise for sea turtles. These recommended criteria are for mortality and potential mortal injury. NMFS has considered injury onset for PTS (i.e., permanent hearing injury) beginning at 232 dB re 1 µPa and 204 dB re 1 $\mu Pa^2s$ and TTS (i.e., a temporary and recoverable loss of hearing sensitivity) beginning at 226 peak dB re 1 µPa and 189 cumulative dB re 1 $\mu Pa^2s$ (Navy 2017). Exposure modeling for the extent of injurious effects from impulsive underwater noise was completed by Kusel et al. (2023) using the Navy (2017) thresholds, including a behavioral response SPL threshold of 175 rms dB re 1 µPa. These thresholds apply to juvenile, subadult, and adult life stages.

Table 3.19-3 summarizes thresholds for underwater noise effects and the maximum distances to injurious and behavioral effects from construction-related underwater noise levels from construction-related activities, including impact pile driving (Kusel et al. 2023), UXO detonation (Hannay and Zykov 2022), and HRG surveys (LGL 2022). These effects are described in greater detail below.

**Table 3.19-3. Distances to Sea Turtle Underwater Noise Injury and Behavioral Thresholds for Wind Turbine Generator and Offshore Substation Foundation Installation**

| Activity† | Number of Sites | Total Days | Noise Exposure Type | Exposure Threshold*,¥ | Range of Threshold Distances (feet)‡ |
|---|---|---|---|---|---|
| 12-m WTG monopile foundation installation | 100 | 33 | Peak injury | 232 | – |
| | | | Cumulative injury | 204 | 98–689 |
| | | | Behavioral or TTS | 175 | 1,903–2,920 |
| 15-m OSS monopile foundation installation | 2 | 2 | Peak injury | 232 | – |
| | | | Cumulative injury | 204 | 0–820 |
| | | | Behavioral or TTS | 175 | 2,362–3,182 |
| Temporary cofferdam installation | 1 | 14 | Cumulative injury | 220 | 102 |
| | | | Behavioral or TTS | 189 | 175 |
| UXO detonation | Undeter-mined€ | Undeter-mined€ | Peak injury | 232 | 112–689 |
| | | | Cumulative injury | 204 | 207–1,699 |
| | | | TTS | 189 | 354–8,235 |
| HRG surveys | 10,779 | 248 | Behavioral | 189 | 0–300 |
| Construction vessel operation | N/A | ~730 | Behavioral or TTS | 189 | – |

* Peak injury thresholds are SPL in dB re 1 μPa; cumulative injury thresholds are frequency-weighted SEL in dB re 1 $\mu Pa^2 \cdot s$ based on 24 hours of continuous exposure. The peak injury threshold is not recommended for estimating risk of injury from UXO detonation (Hannay and Zykov 2022).

† Installation scenario for 12-m monopile is 10,740 strikes/pile at installation rate of three piles/day. Installation scenario for 15-m monopile is 11,563 strikes/pile at installation rate of one pile/day. All piles installed with a 4,000-kJ hammer with an attenuation system achieving 10 dB sound source reduction. Sound source scenario for UXOs assumes detonation of thirteen 1,000-pound explosives with 10 dB of sound source attenuation.

‡ Pile-driving values are maximum threshold distances modeled by Kusel et al. (2023) for winter conditions. UXO detonation values are the range of maximum distances modeled by Hannay and Zykov (2022) for 5- to 1,000-pound explosive devices. Both sets of values assume 10 dB of sound attenuation.

¥ Navy (2017)

€ The 16 UXOs identified as of February 2023, all within in the RWEC corridor, can be safely avoided by rerouting the cable route (Orsted 2023). However, additional devices could be identified prior to and during construction that cannot be safely avoided or relocated. Therefore, the need for UXO detonation cannot be entirely ruled out.

As shown in Table 3.19-3, impact pile driving and UXO detonation produce sufficient underwater noise to cause permanent hearing injury and behavioral effects on sea turtles. The combined impact area for pile driving is sufficiently large that the potential for hearing injury to some sea turtles cannot be discounted. As of February 2023, 16 UXOs have been identified in the RWEC corridor. Revolution Wind (Orsted 2023) has determined that all 16 devices can be safely avoided by shifting the cable route within the approved installation corridor without the need for detonation. However, it is possible that additional devices could be discovered in preconstruction surveys or during construction that cannot be avoided or safely relocated. BOEM has concluded that the need for UXO detonation cannot be entirely ruled out and therefore the potential effects of this activity on invertebrates are considered herein. UXO surveys completed to date have not identified any UXOs within the Lease Area or near the proposed foundation positions and have only identified UXOs within the RWEC corridor in state waters at the mouth of and outside Narragansett Bay (Revolution Wind 2022b). The locations where UXOs are most likely to be encountered are within the central portion of the RWF and on the RWEC corridor at the mouth and outside of Narragansett Bay (Ordtek, Inc. [Ordtek] 2021). Although to date there are no identified UXOs directly influencing the technical feasibility assessment of the foundation positions proposed in the RWF, the risk of emergent finds will continue to be a consideration in the continued design and refinement of the RWF. The extent and duration of exposure to potential injury-level effects from UXO detonation shown in Table 3.19-3 assumes the possible detonation of thirteen 1,000-pound devices. It is now understood that this is likely an overestimate and relatively small in comparison to pile driving. Even though it is improbable, should UXO detonation be required under the maximum impact scenario considered in this analysis, the risk of permanent hearing injury to sea turtles is relatively low.

Little is known about the role of sound perception in the sea turtle's typical activities. Although sea turtles have relatively unspecialized ears relative to other vertebrate species, their auditory organs appear to be specifically adapted to underwater hearing (Dow Piniak et al. 2012). Studies indicate that hearing in sea turtles is confined to lower frequencies, below 1,200 Hz, with the range of highest sensitivity between 100 and 700 Hz (Dow Piniak et al. 2012), with some variation between species (Bartol and Ketten 2006; Dow Piniak et al. 2012; Martin et al. 2012; Piniak et al. 2016). In captive enclosures and during NSF-funded at-sea seismic monitoring programs, sea turtles generally respond to seismic survey sound with behavioral changes such as startling, increasing swimming speed, and swimming away from and/or locally avoiding the source (McCauley et al. 2000; NSF and USGS 2011). The majority of pile-driving activities are expected to take place during daylight hours. However, pile driving could occur at any time during the night under specific circumstances,[3] and EPMs are incorporated to appropriately minimize the risks associated with this activity (see Appendix F). Sea turtles migrating through the area when pile driving occurs are expected to adjust their course to avoid the area where noise is elevated above 175 dB re 1 μPa. Depending on how close the individual is to the pile being driven, this could involve swimming a mile or more to avoid stressful noise levels. Such behavioral alterations could cause turtles to cease foraging or expend additional effort and energy avoiding the area. Presumably, turtles could continue foraging activities outside the area of elevated noise levels as adjacent habitat provides similar foraging opportunities. The sea turtle may experience physiological stress during this avoidance behavior, but this stressed state would be anticipated to dissipate over time once the turtle is outside the ensonified area. Either a temporary or permanent reduction in hearing sensitivity could be harmful for sea turtles, but the potential extent and magnitude is unclear because the role that hearing plays in sea turtle survival (e.g., for predator avoidance, prey capture, and navigation) is poorly understood (NSF and USGS 2011). The use of PSOs, exclusion and monitoring zones, and pile-driving soft start measures (see Table F-1 in Appendix F) would minimize the risk of sea turtle exposure to elevated underwater noise levels. PSO effectiveness will be enhanced using clearly defined requirements and guidance, including nighttime and low-visibility PSO protocols (see Appendix F). However, the efficacy of exclusion and monitoring zones

[3] Nighttime pile driving may be required under specific circumstances where foundation installation takes longer than anticipated and delaying installation until daylight could present risks to safety and/or structural stability.

would be less during periods of nighttime pile driving, potentially exposing more individuals to elevated underwater noise.

Foraging disruptions due to displacement would be temporary and are not expected to last longer than a few hours per day when pile driving occurs. This displacement would result in a relatively small energetic consequence that would not be expected to have long-term impacts on sea turtles. Construction activities could temporarily displace animals into areas that have a lower foraging quality or result in higher risk of interactions with ships or fishing gear. However, the duration of disturbance is limited to active pile driving, and displaced individuals are expected to have suitable foraging opportunities throughout the Lease Area outside the influence of noise disturbance. WTG and OSS monopile installation would require 1 to 4 hours of active pile driving per pile under typical circumstances, with difficult installations requiring up to 12 hours. The maximum installation rate for WTG installation is three piles per day. The installation rate for OSS monopiles is one per day.

Impact pile driving during construction is the loudest potential impulsive underwater noise source associated with the Project and would produce the most extensive effects. As discussed in Section 3.19.1.1, the potential significance of impulsive underwater noise is unclear because sea turtle sensitivity and behavioral responses to underwater noise are a subject of ongoing study. Potential behavioral impacts could include altered submergence patterns, temporary disturbance, startle response (diving or swimming away), and temporary displacement of feeding/migrating and a temporary stress response, if present within the ensonified area (NSF and USGS 2011; Samuel et al. 2005). The accumulated stress and energetic costs of avoiding repeated exposure to pile-driving noise over a season or life stage could have long-term impacts on survival and fitness (Navy 2018). Conversely, sea turtles could become habituated to repeated noise exposure over time and not suffer long-term consequences (O'Hara and Wilcox 1990). This type of noise habituation has been demonstrated even when the repeated exposures were separated by several days (Bartol and Bartol 2011; Navy 2018).

Kusel et al. (2023) developed estimates of the number of sea turtles that could be exposed to potential adverse noise-related effects from WTG and OSS foundation installation. They used a sophisticated exposure model to estimate the number of individuals by species that could be exposed to PTS, TTS, and other temporary physiological and behavioral effects from construction noise exposure. The analysis used a conservative construction schedule in which the WTG and OSS installation was concentrated during the highest density months for each species, with up to three piles per day for 30 days. Based on the established timing restrictions to protect marine mammal species (i.e., NARWs), construction would occur primarily during the summer months when sea turtles (especially loggerheads and leatherbacks) have a higher likelihood of being present. The density estimates supporting the analysis are therefore likely representative of densities when construction activities would occur. The exposure estimates presented in Table 3.19-4 assume a broadband attenuation of 10 dB and a Project construction duration of approximately 35 days, assuming an aggressive installation schedule of three WTG and one OSS foundations per day.

Hannay and Zykov (2022) used a similar model to estimate the threshold distances for PTS and TTS exposure from UXO detonation with 10 dB of sound attenuation. Turtles within 689 feet of UXO detonation could experience injury based on the threshold of 232 dB re 1 $\mu Pa^2 s$. Turtles within 1,699 feet exposed to multiple UXO detonations in a single day could experience accumulated injury from based on the 204 dB SEL dB re 1 $\mu Pa^2 s$. Turtles within 8,235 feet of UXO detonation could experience behavioral impacts based on the threshold of 189 dB re 1 $\mu Pa^2s$. The UXO detonation plan would include the same or similar sound attenuation, PSOs, and site exclusion EPMs used for pile driving (see Table F-1, Appendix F) to avoid and minimize adverse impacts to sea turtles. These exposure estimates do not consider the benefits to sea turtles from avoiding accidental uncontrolled UXO detonations that could occur in the absence of the Project. Zykov (2022) developed an exposure model to estimate the number of individuals by species that could be exposed to PTS and TTS from UXO detonation. The exposure scenario for UXOs assumes that thirteen 1,000-pound devices would require detonation within the RWF and RWEC work areas and that the devices are distributed such that the exposure areas would not overlap. Zykov (2022) determined that less than one individual leatherback and less than one individual loggerhead sea turtle could be exposed to PTS or TTS effects from UXO detonation in the RWEC corridor, and none would be exposed to these effects from detonations in the RWF. No Kemp's Ridley or green sea turtles are likely to be exposed to PTS or TTS effects in either area.

**Table 3.19-4. Estimated Number of Sea Turtles Experiencing a Permanent Threshold Shift and Temporary Threshold Shift or Behavioral Effects from Construction-Related Impact Pile Driving**

| Species | Source | PTS Cumulative Sound Exposure (number of indivuals) | PTS from Peak Sound Pressure Exposure (number of indivuals) | TTS or Behavioral Effects (number of indivuals) | Effect Significance* |
|---|---|---|---|---|---|
| Kemp's ridley turtle | Impact pile driving | < 0.01 | 0 | < 1 | Negligible |
| | UXO detonation† | – | 0 | 0 | |
| Leatherback turtle | Impact pile driving | < 1 | 0 | 8 | Minor |
| | UXO detonation† | – | < 1 | 0.8 | |
| Loggerhead turtle | Impact pile driving | < 1 | 0 | 4 | Minor |
| | UXO detonation† | – | < 1 | 0.7 | |
| Green turtle ‡ | Impact pile driving | < 0.01 | 0 | < 1 | Negligible |

Source: Kusel et al. (2023), Zykov (2022)

Note: Modeled exposure estimates based on impact hammer installation of one hundred 12-m and two 15-m monopiles. Installation scenario assumes use of a noise attenuation system achieving 10-dB effectiveness. Values < 1 indicate a modeled exposure estimate of greater than 0 but less than 0.5 affected individual, which is considered a result of zero for regulatory purposes.

* See impact significance criteria definitions in Chapter 3, Table 3.3-2.

† Take estimates assume potential exposure to detonation of thirteen 1,000-pound devices in the RFW and RWEC.

‡ Kraus et al. (2016) did not observe any green sea turtles in the RI/MA WEA. Densities of Kemp's ridley sea turtles are used as a conservative estimate.

Sea turtles that are close to impact pile driving could experience a temporary or permanent loss of hearing sensitivity. However, the potential effects on sea turtles are reduced through the implementation of EPMs and additional minimization measures (see Appendix F), including PSOs, soft starts, and noise attenuation systems. Reduced hearing sensitivity could limit the ability to detect predators and prey or find potential mates, reducing the survival and fitness of affected individuals, but the role and importance of hearing in these biological functions for sea turtles remain poorly understood (Lavender et al. 2014). Based on the combination of minimization measures and the low numbers of sea turtles expected in the RWF and RWEC, impacts to sea turtles from impact pile driving are expected to be **negligible** to **minor** adverse.

Vibratory pile driving could be used to install cofferdams for the RWEC sea-to-shore transition at Quonset Point. Similar to the effects of the impulsive impact hammer, only minor impacts to sea turtles from vibratory pile driving are expected because of the combination of minimization measures used and the low densities of sea turtles in the RWF and RWEC. Noise from vibratory pile driving at the sea-to-shore transition would be constrained within the natural geography of Narragansett Bay. Vibratory pile-driving noise is unlikely to exceed recommended sea turtle injury thresholds and would only exceed behavioral thresholds within 175 feet of the source (Kusel et al. 2023). Given the limited spatial extent of these potential effects, sea turtles are more likely to respond to disturbance from construction vessels staging on-site before pile driving begins. This suggests that the potential for exposure to vibratory pile-driving noise is limited at best, with vessel noise and disturbance being the more likely source of potential behavioral effects.

HRG surveys use a combination of sonar-based methods to map shallow geophysical features. Up to 10,779 linear miles of preconstruction surveys would be conducted to support Project installation. The equipment is towed behind a moving survey vessel attached by an umbilical cable. HRG equipment operating at frequencies below 2,000 Hz (typically sub-bottom profilers) may be audible to sea turtles. Equipment such as echosounders and side-scan sonars operate at higher frequencies andwould be outside the hearing range of sea turtles,therefore having no effect on these species. The equipment only operates when the vessel is moving along a survey transect, meaning that the ensonified area is intermittent and constantly moving. BOEM (2021b) evaluated evaluated potential underwater noise effects on sea turtles from HRG surveys and concluded there is no possibility of PTS in sea turtles from HRG sound sources because of the brief and intermittent disturbances that a vessel could have on individuals. Some HRG survey noise sources would exceed the behavioral effects threshold up to 300 feet from the source, depending on the type of equipment used, but given the limited extent of potential noise effects and the EPMs used in this Project (e.g., soft start measures, shutdown procedures, protected species monitoring protocols, use of qualified and NOAA-approved PSOs, and noise attenuation systems), adverse impacts to sea turtles are unlikely to occur. While low-level behavioral exposures could occur, these would be limited in extent and temporary in duration (Kusel et al. 2023). Therefore, underwater noise impacts from HRG surveys are expected to be **minor** adverse.

The relatively low frequency range of turtle hearing (100–1,200 Hz) (Ketten and Bartol 2006; Lavender et al. 2014) overlaps the broad frequency spectrum of noise produced by vessels (10–1,000 Hz). Sea turtles could respond to vessel approach and/or noise with a startle response and a temporary stress response (NSF and USGS 2011). However, Hazel et al. (2007) suggested that turtles could habituate to vessel sounds in marine areas that experience regular vessel traffic. This could reduce the behavioral impacts of vessel noise but could increase the potential for vessel collision (refer to Vessel traffic below).

Underwater noise generated by construction vessels would not exceed injury thresholds for turtles, as noise levels produced by vessels in general are below levels that could cause potential auditory threshold shifts. Behavioral responses to vessels have been reported but are thought to be more associated with visual cues, as opposed to auditory cues (Hazel et al. 2007), although both senses likely play a role in avoidance. A conservative assumption is that construction and support vessels could elicit behavioral changes in individual sea turtles near the vessels. It is assumed that these behavioral changes would be limited to evasive maneuvers such as diving, changes in swimming direction, or changes in swimming speed to distance themselves from vessels. Overall, impacts to sea turtles from vessel noise would be **negligible** adverse.

Fixed-wing aircraft could be used during construction for marine mammal monitoring, and helicopters could be used for crew transport to and from construction vessels. Monitoring aircraft would operate at an altitude of 1,000 feet. Noise levels generated by helicopters and propeller-driven aircraft at this altitude range from 65 to 85 dBA (Behr and Reindel 2008; Brown and Sutherland 1980). Noise from crew transport helicopters would increase during approach and departure from vessel landing pads. Currently, no published studies describe the impacts of aircraft overflights on sea turtles, although anecdotal reports indicate that sea turtles respond to aircraft by diving (BOEM 2017). While helicopter traffic could cause some temporary non-biologically significant behavioral reactions, including startle responses (diving or swimming away), altered submergence patterns, and a temporary stress response (BOEM 2017; NSF and USGS 2011; Samuel et al. 2005), these brief responses would be expected to dissipate once the aircraft has left the area. The potential effects of aircraft noise and disturbance on sea turtles are therefore expected to be **negligible** adverse.

Overall, based on the limited likelihood of exposure and implementation of effective EPMs and minimization measures, the noise effects on sea turtles during construction would be **negligible** to **minor** adverse.

<u>Presence of structures:</u> Effects on sea turtles from the construction and installation of WTG and OSS foundations would result primarily from underwater noise impacts related to impact pile driving and noise and disturbance from associated vessel activity. These impacts are described under the applicable IPFs for each type of disturbance. Indirect effects on sea turtles, such as reduced availability of forage or prey, could also result from impacts on benthic habitat and invertebrate prey species. These effects, including the anticipated acreages of benthic habitat affected by the presence of structures, are described in Sections 3.6.2.2.1 and 3.6.2.3.1. While indirect effects to invertebrate prey resources would occur, these impacts are not likely to significantly affect the availability of prey and forage resources for sea turtles because of their broad resource base and the minimal anticipated adverse effect to invertebrates during the construction phase. Therefore, construction and installation of offshore structures would have temporary, **negligible** to **minor** adverse effects on sea turtles, varying in significance by species.

<u>Vessel traffic:</u> Changes in vessel traffic resulting from the Proposed Action are a potential source of adverse effects on sea turtles. Propeller and collision injuries from boats and ships are common in sea turtles and an identified source of mortality (Hazel et al. 2007; Shimada et al. 2017). Hazel et al. (2007) also reported that individuals may become habituated to repeated exposures over time, when not accompanied by an overt threat. Project construction vessels could collide with sea turtles, posing a temporary increase in the risk of injury or death to individual sea turtles. However, implementation of a range of EPMs to avoid vessel collisions (see Appendix F, Table F-1) are expected to minimize the risk of

collisions with sea turtles. These include adherence to NOAA guidance for collision avoidance and a combination of additional measures, including approved speed restrictions for all vessels within marine mammal SMAs and DMAs. All vessel crews would receive training to ensure these EPMs are fully implemented for vessels in transit. Once on station, the construction vessels either remain stationary when installing the monopiles and WTG/OSS equipment or move slowly (i.e., at less than 10 knots) when traveling between foundation locations. Cable laying and HRG survey vessels also move slowly, with typical operational speeds of less than 1 and approximately 4 knots, respectively.

Based on information provided by Revolution Wind (Tech Environmental 2023), BOEM estimates that Project construction would require up to 1,407 one-way trips by various classes of vessels between the RWF and regional ports in Rhode Island, Massachusetts, Connecticut, New Jersey, Virginia, and Maryland, as well as ports in Europe, over the 2-year construction period. This equates to approximately 59 trips per month, or 704 trips per year. Large construction vessels and barges would account for an estimated 23% of these one-way trips, with the remainder comprising CTVs and other small support vessels. The construction and installation vessels used for Project construction and installation are described in COP Tables 3.11, 3.12, and 10-3 and include jack-up WTG construction and installation vessels, foundation construction and installation vessels, supply vessels and feeder barges, bunkering vessels, cable-laying vessels, crew transport vessels, and various safety and support craft. Typical large construction and installation vessels used in this type of project range from 325 to 350 feet in length, from 60 to 100 feet in beam, and draft from 16 to 20 feet (Denes et al. 2021). Crew transport and various support vessels range in size from 20 to 100 feet. In addition, approximately 10,779 linear miles of preconstruction HRG surveys are anticipated to support micrositing of the WTG foundations and cable routes. HRG surveys could occur during any month of the year and would require a maximum of 248 total vessel days.

BOEM developed a representative analysis of construction vessel effects on regional traffic volume by evaluating the potential increase in transits across a set of analysis cross sections relative to baseline levels of vessel traffic. These cross sections were developed by DNV GL Energy USA, Inc. (2020) to support the COP and are shown in Figure 3.15-2. Using the port of origin information provided by Revolution Wind (Tech Environmental 2023), the estimated 704 construction vessel trips per year would cross transects 13-17 when leaving the RWF and could cross several different transects depending on the destination port. This would equate to a 30% increase in vessel transits across these transects. However, the Automatic Identification System (AIS) data used in transect analysis do not include many recreational vessels and virtually all commercial fishing vessels when actively fishing. These vessel types account for the vast majority of vessel activity. For example, DNV GL Energy USA, Inc. (2020) estimated over 19,000 one-way trips per year by commercial fishing vessels between the RWF and area ports. When these vessel trips are included, Project construction would result in a 3.1% increase in vessel transits per year across transects 13-17. In summary, this assessment indicates that construction vessels would likely increase vessel traffic to some degree, and large vessel traffic would measurably increase during the 2-year construction period. This indicates the potential for increased risk of sea turtle collisions in the absence of planned EPMs and other requirements.

Revolution Wind anticipates that up to 33 RWF construction vessel trips could originate from ports in the Gulf of Mexico. Although no specific ports have been identified for construction support, the travel distance from the Lease Area to the Gulf of Mexico region can be estimated from broad vessel traffic patterns observable in AIS data (BOEM et al. 2022). The minimum travel distance from the Lease Area to an observable area of traffic separation approximately 150 miles due west of Key West, Florida, is approximately 1,550 miles. Travel distance from this point to Gulf of Mexico non-local ports ranges from approximately 475 miles (to the Port of Mobile, Alabama) to 850 miles (to the Port of Corpus Christi, Texas). This equates to total travel distances ranging from 1,925 to 2,400 miles.

Sea turtles are likely to be most susceptible to vessel collision in coastal foraging areas crossed by construction vessels traveling between the RWF and offshore RWEC and area ports. Hazel et al. (2007) indicated that sea turtles may not be able to avoid being struck by vessels at speeds exceeding 2 knots, and collision risk increases with increasing vessel speed. Habituation to noise may also increase the risk of vessel collision. However, avoidance behaviors observed suggest that a turtle's ability to detect an approaching vessel is more dependent on vision than sound, although both may play a role in eliciting behavioral responses. Construction vessel speeds could periodically exceed 10 knots during transits to and from area ports, posing an increase in collision risk relative to baseline levels of vessel traffic. During construction, vessels generally either remain stationary when installing the monopiles and WTG/OSS equipment or move slowly (i.e., at less than 10 knots) when traveling between foundation locations. Cable-laying vessels move slowly, on the order of 3 to 30 miles per day, with a maximum speed of approximately 1.2 miles per hour. Project EPMs include the implementation of NOAA vessel guidelines (see Appendix F) for marine mammal and sea turtle strike avoidance measures, including vessel speed restrictions. Nevertheless, collisions with individual turtles could occur, resulting in mortalities. Because the abundance of sea turtles is anticipated to be generally low with patchy distribution, and the proportional increase in vessel traffic is also low, the number of sea turtles injured or killed by vessel strikes during Project construction would be low and would have negligible effects at the population level. Therefore, the potential effects of construction vessel collisions on sea turtles would be **minor** adverse.

#### 3.19.2.3.2 Operations and Maintenance and Decommissioning

### Offshore Activities and Facilities

Accidental releases and discharges: The RWF would undergo maintenance as needed, which would necessitate vessels and other equipment at the facility for the life of the Project. This presents an opportunity for accidental discharge or spills of fuels and/or fluids during maintenance activities. Spill response EPMs (see Table F-1 in Appendix F) employed during construction would be implemented during maintenance activities. These EPMs are expected to avoid or minimize water quality impacts from accidental spills or releases of pollutants during O&M activities. Impacts on sea turtles from accidental spills or releases of pollutants are considered **minor** adverse because of the low probability of the risk and EPMs (refer to Section 3.21 for additional details).

Noise: WTG operations, O&M and monitoring vessels, and postconstruction HRG surveys would generate underwater noise detectable by sea turtles. Tougaard et al. (2020) summarized available monitoring data on wind farm operational noise, including both older generation geared turbine designs and quieter modern direct-drive systems like those proposed for the RWF. They determined that operating turbines produce underwater noise on the order of 110 to 125 $dB_{RMS}$, occasionally reaching as high as 128 $dB_{RMS}$, in the 10-Hz to 8-kHz range. This is consistent with the noise levels observed at the BIWF (110 to 125 dB re 1 µPa SPL rms) (Elliot et al. 2019) and the range of values observed at European wind farms and is therefore representative of the range of operational noise levels likely to occur from future wind energy projects. More recently, Stober and Thomsen (2021) used monitoring data and modeling to estimate operational noise from larger (10 MW) current generation direct-drive WTGs and concluded that these designs could generate higher operational noise levels than those reported in earlier research. This suggests that operational noise effects on sea turtles could be greater than those considered herein, but these findings have not been validated. The Project would generate operational noise throughout the life of the RWF. As noted previously, sea turtle hearing is largely within the frequency range (< 1,200 Hz) for operational wind turbines; therefore, it is possible that wind turbine noise could be heard by sea turtles, although behavioral responses are unlikely based on the established threshold.

Little is known currently about how sea turtles use hearing in their natural environment (Lavender et al. 2014); therefore, it is difficult to interpret the potential effects of long-term, non-impulsive noise generated by the WTGs. O'Hara and Wilcox (1990) reported that loggerheads avoid sources of low-frequency sound in the 25- to 1,000-Hz range. The sound levels produced during operation are less than the behavioral and injurious thresholds defined by NMFS for sea turtles. However, potential responses to underwater noise generated by WTG operation could include avoidance of the noise source. Operational noise levels would not cause injury to sea turtles but could alter the behavior of individuals close to the structure. Localized behavioral long-term effects from operational noise would be **negligible** adverse because of the limited likelihood of behavioral effects.

While sea turtles would likely be able to detect O&M vessels in the vicinity, this would not necessarily translate to biologically significant effects. For example, Hazel et al. (2007) concluded that sea turtles appear to be relatively insensitive to vessel noise, relying on their vision to detect approaching vessels. Sea turtles may respond to vessel approach and/or noise with a startle response (diving or swimming away) and a temporary stress response (NFS and USGS 2011). In contrast, Samuel et al. (2005) indicated that vessel noise can affect sea turtle behavior, especially their submergence patterns. BOEM anticipates that the potential effects of noise from O&M vessels would elicit brief responses to the passing vessel that would dissipate once the vessel or the turtle left the area. For these reasons, BOEM anticipates that sea turtle exposure to vessel noise would be minimal, and responses if any, would be temporary and biologically insignificant, with individuals returning to normal behaviors once the vessel has passed.

Up to 1,062 linear miles of postconstruction HRG surveys could be conducted each year for the first 4 years of Project operations to ensure transmission cables are maintaining desired burial depths. This equates to approximately 25 days of HRG survey activity per year. The related effects on sea turtles would be similar in nature to those described for construction-related HRG surveys in Section 3.19.2.2.1 but reduced in extent and duration. The limited behavioral responses to HRG survey equipment and vessels would be similar to those described above for general O&M vessel noise.

Project decommissioning would require the use of construction vessels of similar number and class as those used during construction. Underwater noise and disturbance levels generated during decommissioning would be similar to those described above for construction, with the exception that pile driving would not be required. The monopiles would be cut below the bed surface for removal using a cable saw or abrasive waterjet. Noise levels produced by this type of cutting equipment are generally indistinguishable from engine noise generated by the associated construction vessel (Pangerc et al. 2016). Therefore, this decommissioning equipment would not contribute to additional noise effects above and beyond those already considered for construction vessel noise. The short-term effects of Project decommissioning on sea turtles would therefore range from **negligible** to **minor** adverse.

<u>Presence of structures:</u> The WTG and OSS foundations, exposed portions of the offshore RWEC, and associated scour protection would result in a long-term conversion of existing complex and non-complex bottom habitat to new stable, hard surfaces. Once construction is complete, these surfaces would be available for colonization by sessile organisms and would draw species that are typically attracted to hard-bottom habitat (Causon and Gill 2018; Langhamer 2012). Refer to Section 3.6.2.2.2, 3.6.2.3.2, and 3.13.2.2 for a detailed overview of potential changes in food web dynamics caused by reef effects. Over time, this reef effect would increase the amount of forage and shelter available for sea turtles.

The WTG and OSS foundations constitute potential obstacles in the water column for the life of the Project until decommissioning. Given that sea turtles are highly mobile and the structures are only 36 to 45 feet in diameter and would be separated by approximately 1 mile, the structural alterations of the water column are unlikely to pose a direct barrier to foraging, migration, or other behaviors of sea turtles. However, the presence of WTG structures could indirectly affect sea turtles by potentially altering prey distribution or promoting fish aggregations and thus concentrating fishing vessels at the foundations. This range of potential impacts is discussed in the following paragraphs.

Human-made structures, especially tall, vertical structures like WTG and OSS foundations, may also alter local water flow at a fine scale and could result in localized impacts on sea turtle prey distribution and abundance. These localized effects typically dissipate within a relatively short distance from the structure (Miles et al. 2017); effects would likely dissipate within 300 to 400 feet of each monopile foundation. However, there is potential for regional impacts to wind wave energy, mixing regimes, and upwelling (van Berkel et al. 2020), and these changes in water flow caused by the presence of the WTG structures could influence sea turtle prey distribution at a broader spatial scale. The distribution of fish, invertebrates, and other marine organisms on the OCS is determined by the seasonal mixing of warm surface and cold bottom waters, which determines the primary productivity of the system (Chen et al. 2018; Lentz 2017; Matte and Waldhauer 1984). Although there is a high degree of uncertainty, the presence of WTG structures could affect conditions in ways that alter these dynamics, potentially increasing primary productivity near the structures by disrupting vertical stratification and bringing nutrient-rich waters to the surface (Carpenter et al. 2016; Schultze et al. 2020a). However, this increase in primary productivity may not translate to a beneficial increase in sea turtle prey abundance if the increased productivity is consumed by filter feeders, such as mussels, that colonize the surface of the structures (Slavik et al. 2019). Considering the largely localized nature of potential effects to primary production surrounding WTGs (van Berkel et al. 2020), the likelihood of broader benefits for sea turtles is minimal.

The overall effects of offshore structure development on ocean productivity, sea turtle prey species, and, therefore, sea turtles, are difficult to predict with certainty and are expected to vary by location, season, and year, depending on broader ecosystem dynamics. The addition of up to 102 new offshore foundations could increase sea turtle prey availability by creating new hard-bottom habitat, increasing pelagic productivity in local areas, or promoting fish aggregations at foundations (Bailey et al. 2014). These aterations may increase foraging opportunities for loggerhead and Kemp's ridley sea turtles with preferences for more bottom-dwelling invertebrate prey. Increased primary and secondary productivity in proximity to structures could also increase the abundance of jellyfish, a prey species for leatherback sea turtles (English et al. 2017; NMFS and USFWS 1992). The artificial reefs created by these structures form biological hotspots that could support species range shifts and expansions and changes in biological community structure (Degraer et al. 2020; Methratta and Dardick 2019; Raoux et al. 2017).

In contrast, broadscale hydrodynamic impacts could lead to localized changes in zooplankton distribution and abundance (van Berkel et al. 2020). A growing body of research has demonstrated that offshore wind farms could have observable effects on oceanographic conditions at scales ranging to tens of miles down field from wind farm sites (e.g., Christiansen et al. 2022; Daewel et al. n.d. [2023]; Dorell et al. 2022; Floeter et al. 2022; Raghukumar et al. 2022), although the extent of these effects and the resulting significance on biological processes are likely to vary considerably between different oceanographic environments (van Berkel et al. 2020). Van Berkel et al. (2020) and Schultze et al. (2020b) note that environments characterized by strong seasonal stratification, such as the Mid-Atlantic Bight, are likely to be less sensitive to changes and disruptions to oceanographic processes from wind farm effects. As discussed in Section 3.6.2.3.2, hydrodynamic modeling conducted by Johnson et al. (2021) indicated project-related shifts in larval transport and settlement density, but these shifts are not expected to have broad-scale impacts on invertebrate populations. There is considerable uncertainty as to how these localized ecological changes would affect sea turtles and how those changes would interact with other human-caused impacts. The effect of these IPFs on sea turtles and their habitats could be positive or negative, varying by species, and their extent and magnitude is unknown. Recent studies have also found increased biomass for benthic fish and invertebrates, and possibly for pelagic fish, sea turtles, and birds, around offshore wind facilities (Pezy et al. 2018; Raoux et al. 2017; Wang et al. 2019), translating to potential increased foraging opportunities for sea turtle species. However, an increase in biomass could result in limited benefits to higher trophic levels, depending on species composition and prey preferences (Pezy et al. 2018).

Increased fish biomass around the structures could also attract commercial and recreational fishing activity, creating an elevated risk of injury or death from gear entanglement and ingestion of debris (Barreiros and Raykov 2014; Gregory 2009; Vegter et al. 2014). As noted above, lost/discarded fishing gear was associated with a majority of sea turtle entanglements in a global review (Duncan et al. 2017). However, through implementation of EPMs related to management of debris surrounding the WTGs (see Table FF-1 in Appendix FF), the increase in entanglement risk is expected to be minimal.

The presence of structures could result in multiple types of impacts, with potentially opposing outcomes for sea turtles. The presence of structures could indirectly concentrate recreational fishing around foundations, which could indirectly increase the potential for sea turtle ingestion of or entanglement in lines, nets, and other lost or discarded fishing gear (Gall and Thompson 2015; Nelms et al. 2016; Shigenaka et al. 2010). However, the addition of structures could benefit sea turtles by locally increasing pelagic productivity and prey availability for sea turtles. The overall impact to sea turtles is not expected to be biologically significant due to the patchy distribution of sea turtles in the northern portion of the GAA where the RWF and RWEC are located. Potential long-term, intermittent impacts could persist until decommissioning is complete and structures are removed. These impacts would be **negligible** to **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects.

Decommissioning would remove the structures from the water column and effectively eliminate any operational effects of the presence of structures. No specific methods for decommissioning and removal of structures have been proposed, as the planned removal would occur at the end of the Project lifetime. The COP provides no indication that decommissioning would involve lines, rigging, or other equipment that could pose a potential entanglement risk to sea turtles. The Project would develop a decommissioning plan that specifies the methods and equipment proposed for structure removal. That plan would be subject to independent environmental compliance and regulatory review.

Vessel traffic: Revolution Wind (Tech Environmental 2023) has estimated that Project O&M would involve up to one CTV trip each week and one SOV trip every other week to the RWF over the life of the Project. CTV trips shared between the RWF and other offshore energy projects and daughter craft activity could account for an additional 23 vessel trips per year. In total, Project O&M would require an estimated 3,030 vessel trips over the life of the Project. These trips would originate either from an O&M facility located either in Montauk, New York, or Davisville, Rhode Island. One or more CTVs ranging from 62 to 95 feet in length would be purpose built to service the RWF over the life of the Project. SOVs are larger mobile work platforms, on the order of 215 to 305 feet long and 60 feet in beam, equipped with dynamic positioning systems used for more extensive, multiday maintenance activities (Ulstein 2021). Larger vessels similar to those used for construction could be required for unplanned maintenance, such as repairing scour protection or replacing damaged WTGs. Those activities would occur on an as-needed basis. Additional vessel trips would be required over the life of the Project forseafloor surveys and subsurface inspections. A minimum of three postconstruction seafloor bathymetry surveys would be conducted to assess foundation scour and correct if needed. Project fishery monitoring and benthic habitat monitoring surveys would also be conducted annually, as discussed above. Vessels used would be similar to those used for preconstruction HRG surveys.

In general, O&M-related vessel activities would represent a small increase in regional vessel traffic compared to existing conditions. Project O&M could involve up to 10 one-way vessel trips between the RWF and O&M facility or other area ports each month. By comparison, hundreds of large vessels and thousands of smaller vessels, many of the latter comparable in size to a CTV, travel through the areas between the wind farm and proposed O&M facility locations each month (Section 3.15.2.2.1). O&M vessel use would therefore represent a minimal increase in regional vessel traffic over the life of a facility and the effects to sea turtles are expected to be negligible adverse.

As detailed in Appendix F, all survey vessels would comply with speed restrictions and other minimization measures to minimize risk of collision with sea turtles, making the risk of vessel strikes from Project monitoring vessels unlikely. As described in the previous section, the applicant has voluntarily committed to specific EPMs, including vessel timing and speed restrictions, to avoid and minimize vessel-related risks to sea turtles (see Appendix F, Table F-1). Based on the generally low density of sea turtles in the Lease Area and the anticipated vessel trips during operations, there is a low risk of encountering a sea turtle. The operational conditions combined with planned EPMs (see Appendix F for all vessel strike avoidance measures) would minimize collision risk during construction and installation. During periods of low visibility, trained crew would use increased vigilance to avoid sea turtles. Because vessel strikes are not an anticipated outcome given the relatively low number of vessel trips and implementation of effective monitoring and EPMs. BOEM concludes vessel strikes have a low probability of occurrence and therefore would have a minor anticipated effect on sea turtles. In the unlikely event of a sea turtle strike by any vessel supporting the Project, Revolution Wind must immediately cease the activities until BOEM is able to review the circumstances of the incident and determine what, if any, additional measures are appropriate to ensure compliance with all applicable laws (e.g., ESA) and COP approval conditions.

As with construction, a similar increase in vessel round trips during decommissioning is expected to increase the relative risk of vessel strike for sea turtles. The implementation of NOAA guidelines (see Appendix F) as an EPM is intended to minimize the potential of vessel strikes for sea turtles by reducing vessel speed and maintaining a separation distance from sighted turtles. Collisions, if they do occur, are expected to be fatal to individuals. Because the abundance of sea turtles in the RWF and RWEC is anticipated to be generally low with patchy distribution, and the proportional increase in vessel traffic is also low, the number of sea turtles injured or killed by vessel strikes as a result of Project decommissioning would be low and would have negligible effects at the population level. Therefore, potential effects of vessel strikes on sea turtles from vessels supporting Project decommissioning would be minor adverse. Overall, the anticipated effect to sea turtles from vessel traffic associated with O&M and decommissioning would be **minor** adverse.

#### 3.19.2.3.3 Cumulative Impacts

### Offshore Activities and Facilities

Accidental releases and discharges: Toxic contaminants and marine debris are recognized as significant sources of sea turtle injury and mortality and are leading threats to successful species conservation and recovery. The Proposed Action would increase commercial vessel activity on the OCS, creating a potential source for accidental spills, trash, and debris. BOEM estimates that the Project would result in a negligible, up to a 2% increase in total chemical usage in the GAA relative to the No Action Alternative. When combined with other offshore wind projects, up to approximately 34 million gallons of coolants, oils, fuels, and lubricants could cumulatively be stored within WTG foundations and the OSS within the GAA. Compliance with USCG regulations and BOEM requirements to minimize the risk of accidental spills and/or release of trash and debris would limit the volume and extent of Project-related trash/debris or invasive species potentially released accidentally. Additionally, as discussed in Section 3.19.1.1, the volumes of trash/debris potentially released accidentally under the No Action Alternative would be negligible and would not contribute to potential adverse impacts. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **negligible** to **minor** adverse because of the regulatory protections and limited likelihood of sea turtle exposure.

Climate change: The types of impacts from global climate change described for the No Action Alternative would occur under the Proposed Action, but the Proposed Action could also contribute to a long-term net decrease in GHG emissions. As described in Section 3.19.1.1, the interactions between climate change and other potential impacts associated with the Proposed Action are complex and difficult to predict with certainty. Northward shifts in sea turtle distributions due to warming waters could result in magnification of the anticipated impacts due to increased exposure. However, this magnification includes potential benefits associated with the creation of artificial reef habitat and could represent an increasing impact over the life of the Project. Based on the potential for increased exposure to the various effects of the Proposed Action described above, the Proposed Action when combined with other past, present, and reasonably foreseeable actions is expected to result in **minor** adverse cumulative impacts to sea turtles due to the anticipated shifts in distributions.

Noise: The Proposed Action would result in localized, temporary, negligible to minor impacts to sea turtles through the generation of impulsive and non-impulsive underwater noise associated with offshore wind construction activities. BOEM estimates a cumulative total of 3,190 offshore WTGs and OSS foundations could be developed in the GAA for sea turtles between 2022 and 2030. Sea turtles are anticipated to occur at generally low densities (see Section 3.19.1) near wind farms in the region, reducing the probability of individual exposure to noise effects. Noise sources associated with the

Proposed Action could add to the ambient noise environment under the No Action Alternative if noise sources overlap temporally or geographically. Pile driving would represent the most significant source of noise. As noted in Section 3.19.1.1, there are three possible exposure scenarios for pile-driving noise: 1) concurrent exposure from two or more impact hammers for the same or adjacent projects; 2) non-concurrent exposure from multiple pile-driving events in the same years; 3) exposure to concurrent and non-concurrent pile-driving events over multiple years. Although the extent, duration, and magnitude of exposure would vary based on Project -specific factors, the effects would be similar in nature to those described for the Proposed Action. Although exposure to pile-driving noise could disrupt behaviors of individual sea turtles, it is not expected to impair essential behavioral patterns. This is due to the temporary, localized nature of the effects and because normal behaviors are expected to resume once the sea turtle is no longer exposed to the noise. Permanent hearing impairment could occur to some individuals, but science has not determined whether changes in hearing ability would negatively impact the ability of sea turtles to feed, navigate, find suitable habitats, and reproduce. Due to the limited information about noise-related stress responses in sea turtles, physiological stress responses may likely occur concurrently with any other response, such as hearing impairment or behavioral disruptions.

For impulsive noise, BOEM anticipates that projects would employ soft starts during pile driving to allow the small number of turtles in the region to leave the area before underwater noise increases to injurious levels. Additionally, the implementation of sound attenuation systems, PSO exclusion and shutdown zones, and other planned EPMs (see Appendix F) would further reduce the likelihood of injury from the potential moderate cumulative impacts associated with pile driving. Vibratory pile driving associated with the sea-to-shore transition would create non-impulsive underwater noise, but similar to the effects of the impulsive impact hammer, only minor impacts to sea turtles are expected because of the combination of minimization measures used and the low densities of sea turtles in the RWF and RWEC. Potential behavioral effects are more likely to be related to vessel noise and disturbance than the vibratory pile driving itself.

With regard to other non-impulsive noise sources, potential behavioral impacts on sea turtles from vessel traffic noise would be intermittent and temporary as animals and vessels pass near each other. During construction and operation, helicopter traffic could cause some temporary behavioral reactions in sea turtles, but energy expenditures would be minimal.

Based on the above findings, noise-related impacts of the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts to sea turtles, depending upon the noise source.

<u>Presence of structures</u>: The Proposed Action would result in long-term negligible and minor beneficial impacts to sea turtles through the installation of 102 structures (100 WTGs and two OSSs) to conditions under the No Action Alternative. The installation of monopile foundations would alter the character of the ocean environment, and their presence could affect sea turtle behavior. Increased prey availability, attraction to structures, and/or displacement could occur as a result of the installation of WTG facilities. As described in Section 3.19.2.2.2, structures associated with offshore wind farms are expected to provide some level of reef effect and could benefit sea turtle foraging by creating new hard-bottom habitat, increasing pelagic productivity in local areas, or promoting prey aggregations on foundations.

Some level of displacement of sea turtles out of the Lease Area and into areas with a higher potential for interactions with ships or recreational or commercial fishing gear could occur, particularly during construction phases, when elevated underwater noise levels occur. These intermittent impacts would persist until decommissioning is complete and structures are removed. Impacts could occur as a result of increased interaction with fishing gear, although annual monitoring, reporting, and cleanup of fishing gear around the base of the WTGs would reduce the extent of these impacts.

BOEM estimates a cumulative total of 3,190 offshore WTGs and OSS foundations for the Proposed Action plus all other future offshore wind projects in the GAA. For similar reasons as described above, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts and potential **minor** beneficial cumulative impacts to sea turtles.

Vessel traffic: The Proposed Action would result in minor impacts to sea turtles through the addition of construction and maintenance vessels within the GAA. This increased offshore wind-related vessel traffic during construction, and associated noise impacts, could result in localized, intermittent impacts on sea turtles, resulting in brief minor behavioral responses that would be expected to dissipate once the vessel or the individual has left the area. However, BOEM expects that these brief responses of individuals to passing vessels would be unexpected given the patchy distribution of sea turtles; no stock- or population-level effects would be expected. Additionally, the Proposed Action would implement EPMs (see Table F-1 in Appendix F) to minimize vessel strikes.

BOEM estimates a peak of 262 vessels supporting offshore wind development will be operating in the GAA over the next decade, of which up to 59 would be associated with the Proposed Action construction and six would be associated with O&M. This increase in vessel traffic poses an increased likelihood of collision-related injury and mortality relative to existing baseline conditions. Some sea turtlescould be injured or killed as a result, but the number of individuals impacted is not likely to significantly increase the existing mortality rate from vessel strikes. Additionally, BOEM expects that similar EPMs will be included in future offshore wind projects, helping to minimize the vessel strike risk. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse; however, BOEM does not expect the viability of sea turtle populations to be affected.

#### 3.19.2.3.4 Conclusions

Project construction and installation, O&M, and decommissioning would impact sea turtles through exposure to vessel traffic, underwater noise impacts, temporary habitat disturbance, and long-term habitat conversion. Individual sea turtles could be injured or killed by vessel collisions and underwater noise exposure during ProjectP construction, but the exposure risk is low and the number of individuals impacted would likely be small. Temporary habitat disturbance, including alteration of the seafloor and suspended sediment and burial effects, would be limited in extent and well below levels likely to have biologically significant effects on any sea turtle species. Reef effects created by the presence of offshore wind structures could beneficially increase foraging opportunities for species, such as loggerhead sea turtles, that forage on benthic crustaceans and other invertebrates.

On this basis, BOEM anticipates that the Proposed Action would result in **negligible** to **minor** adverse impacts to sea turtles, including **minor** beneficial impacts for species that are able to exploit the increased biological productivity created by reef effects on offshore wind structures. Overall, the impacts of the Proposed Action alone on sea turtles would likely be **minor** beneficial to **minor** adverse. Although some of the proposed activities and/or IPFs analyzed could overlap, BOEM does not anticipate that these combined effects would alter the overall significance determination because they would not alter impacts on any species to such a degree that measurable population-level effects would occur.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from negligible to minor adverse and minor beneficial for some sea turtle species. The impact-level criteria are used to characterize effects of all IPFs. Applying these criteria, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in **minor** adverse impacts on sea turtles in the GAA because unavoidable adverse impacts on individual sea turtles could occur that coincide with other adverse effects resulting from climate change, but those impacts are unlikely to measurably affect the viability of any sea turtle species at the population level.

### 3.19.2.4 Alternatives C, D, E, and F

#### 3.19.2.4.1 Construction and Installation

#### Offshore Activities and Facilities

<u>Noise:</u> Construction of Alternatives C through F would result in similar underwater noise impacts on sea turtles from foundation installation to those described for the Proposed Action in Section 3.19.2.2.1, but those impacts would be reduced in extent and duration because fewer structures would be installed. This would reduce the number of days of impact pile driving required to construct the Project and the associated extent and duration of underwater noise. Reducing the number of structures would also reduce the required extent of HRG surveys under each alternative relative to the Proposed Action. Compared to the spatial and temporal extent of HRG surveys for the Proposed Action (10,779 miles over 248 days), the maximum extent of HRG surveys would be reduced for Alternative C (7,616 miles over 175 days), Alternative D (10,142 miles over 233 days), and Alternative E (8,846 miles over 204 days). Alternative F would be equivalent to any of the selected configurations of Alternatives C through E. The potential distribution of UXOs within the RWF is not currently known, but the largest devices are most likely to be encountered within the central portion of the RWF and in state waters on the RWEC corridor at the mouth of and outside of Narragansett Bay (Ordtek 2021). The RWEC configuration would remain the same across all alternatives, and the probable area of occurrence within the RWF is sufficiently large that it is not possible to determine how changes in alternative configuration would affect the likelihood of UXO encounters. Therefore, impacts to sea turtles from UXO detonation are considered to be the same across all alternatives.

Differences in the extent and duration for the Proposed Action and the different configurations proposed for Alternatives C through E are summarized in Tables 3.19-5, 3.19-6, and 3.19-7, respectively, based on the total number of WTG and OSS foundations requiring pile driving and underwater noise injury and behavioral effects thresholds. These tables display the number of structures installed and estimated days of pile-driving activity required to construct each alternative. As shown, while the extent and duration of potential noise exposure from impact pile-driving activities would vary between layouts, these effects would be similar in magnitude and general scale to the Proposed Action. Therefore, noise effects on sea turtles from the construction phase of each alternative would likewise vary by species and range from

**negligible** to **minor** adverse. The potential use of larger capacity WTGs under Alternative F could result in more extensive operational noise impacts than the Proposed Action, but insufficient information is available to characterize differences in effect.

**Table 3.19-5. Comparison of Maximum Underwater Noise Injury and Behavioral Effects Exposure Extent and Duration (number of sites/days) to Sea Turtles from Revolution Wind Farm Foundation Installation for the Proposed Action and Proposed Configurations for Alternative C***

| Exposure Type | Threshold Distance (feet)† | Proposed Action | C1 | C2 |
|---|---|---|---|---|
| Peak injury | – | 100 sites/ 35 days | 64 sites/ 22 days | 65 sites/ 22 days |
| Cumulative injury | 98–689 | | | |
| Behavioral or TTS | 1,903–2,920 | | | |

* Installation scenario for 12-m monopile is 6,500 strikes/pile at installation rate of three piles/day. All piles installed with a 4,000-kJ hammer with an attenuation system achieving 10 dB sound source reduction.

† Threshold distances are the distance in feet from the sound source where the identified type of exposure could occur. WTG values are the range threshold distances for monopile installation modeled by Kusel et al. (2023) across modeled sites and seasonal conditions.

**Table 3.19-6. Comparison of Maximum Underwater Noise Injury and Behavioral Effects Exposure Extent and Duration (number of sites/days) for Sea Turtles from Revolution Wind Farm Foundation Installation for the Proposed Action and Proposed Configurations for Alternative D***

| Exposure Type | Threshold Distance (feet)† | Proposed Action | D1 | D1+D2 | D1+D2+D3 | D1+D3 | D2 | D2+D3 | D3 |
|---|---|---|---|---|---|---|---|---|---|
| Peak injury | – | 100 sites/ 35 days | 93 sites/ 31 days | 92 sites/ 31 days | 93 sites/ 31 days | 85 sites/ 28 days | 86 sites/ 29 days | 85 sites/ 28 days | 78 sites/ 26 days |
| Cumulative injury | 98–689 | | | | | | | | |
| Behavioral | 1,903–2,920 | | | | | | | | |

* Installation scenario for 12-m monopile is 6,500 strikes/pile at installation rate of three piles/day. All piles installed with a 4,000-kJ hammer with an attenuation system achieving 10 dB sound source reduction.

† Threshold distances are the distance in feet from the sound source where the identified type of exposure could occur. WTG values are the range threshold distances for monopile installation modeled by Kusel et al. (2023) across modeled sites and seasonal conditions.

**Table 3.19-7. Comparison of Maximum Underwater Noise Injury and Behavioral Effects Exposure Extent and Duration (number of sites/days) for Sea Turtles from Revolution Wind Farm Foundation Installation for the Proposed Action and Proposed Configurations for Alternative E***

| Exposure Type | Threshold Distance (feet)† | Proposed Action | E1 | E2 |
|---|---|---|---|---|
| Peak injury | – | 100 sites/5 days | 64 sites/21 days | 81 sites/27 days |
| Cumulative injury | 98–689 | | | |
| Behavioral | 1,903–2,920 | | | |

* Installation scenario for 12-m monopile is 6,500 strikes/pile at installation rate of three piles/day. All piles installed with a 4,000-kJ hammer with an attenuation system achieving 10 dB sound source reduction.

† Threshold distances are the distance in feet from the sound source where the identified type of exposure could occur. WTG values are the range threshold distances for monopile installation modeled by Kusel et al. (2023) across modeled sites and seasonal conditions.

Presence of structures: The presence of WTG and OSS monopile foundations associated with Alternatives C through F would result in similar impacts to sea turtles as those described for the Proposed Action in Section 3.19.2.2.2, but those impacts would be reduced in extent and would vary depending on the alternative selected. Refer to the tables in Section 3.6.2.4.2 for a summary of the number of structures proposed by alternative and configuration. Impacts of the presence of structures are expected to be relative to the total number of structures proposed (i.e., fewer structures would result in a smaller extent of impacts).

As with the Proposed Action, the overall impact to sea turtles from the presence of structures is not expected to be biologically significant due to the patchy distribution of sea turtles within the RWF and RWEC. Impacts from the presence of structures are expected to vary in relation to the total number of foundations proposed (i.e., fewer structures would result in less extensive impacts). For example, both configurations of Alternative C and Alternative E1 propose noticeably fewer WTG and OSS foundations compared to the Proposed Action and most configurations of Alternative D. Therefore, these alternatives would be expected to produce noticeably reduced impacts from this IPF by comparison. In general, presence of structures effects on sea turtles under Alternatives C through F would likely be less extensive compared to those resulting from the Proposed Action. Reef effects would be reduced commensurate with the number of foundations constructed under each alternative configuration.

At present, insufficient information is available to determine if differences in Project configuration between alternatives, specifically where foundations are located relative to sensitive benthic habitats, would contribute to a measurable difference in reef effects on sea turtles beyond those resulting from a simple reduction in the number of structures. As stated in Section 3.15.2.2.3, hydrodynamic effects are likely to lead to localized changes in the distribution of planktonic organisms (e.g., jellyfish) for certain sea turtle species, but shifts in prey distribution on the order of miles to tens of miles are unlikely to be biologically significant for species that migrate thousands of miles between seasonal habitats every year. Increased biological productivity resulting from reef effects could concentrate recreational fishing around foundations, which could theoretically increase the potential for harmful interactions with fishing gear. However, these reef effects would also benefit certain sea turtle species by increasing and concentrating prey availability. Therefore, while Alternatives C through F would likely alter and reduce the extent of measurable reef and hydrodynamic effects relative to the Proposed Action, those effects are likely to remain biologically insignificant. Potential long-term intermittent impacts would persist until decommissioning is complete and structures are removed. These impacts would also be **negligible** to **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects.

Vessel traffic: Construction of Alternatives C through F would result in a similar level of vessel traffic as the Proposed Action commensurate with the reduction in construction activities associated with fewer foundations and would vary depending on the alternative selected. An estimate of the reduced vessel trips per year associated with Alternatives C through F construction is not available; however, it is expected to be slightly less than the Proposed Action. Therefore, the potential effects of construction vessel collisions on sea turtles from each alternative would be **minor** adverse.

#### 3.19.2.4.2 Cumulative Impacts

### Offshore Activities and Facilities

The cumulative impacts analysis for Alternatives C, D, E, and F is provided in Table 3.19-2.

#### 3.19.2.4.3 Conclusions

The construction and installation, O&M, and decommissioning of Alternatives C through F would impact sea turtles through the same IPFs described for the Proposed Action. These impacts include exposure to increased vessel traffic, underwater noise impacts from Project construction and O&M, temporary habitat disturbance, and long-term habitat conversion. These adverse impacts would be avoided and minimized using the same EPM's as described in the Proposed Action (see Table F-1 in Appendix F). Alternatives C through F would also generate similar beneficial reef effects but over a smaller area and with a reduced number of reef-forming structures. The resulting effects to sea turtles would therefore be similar to those described for the Proposed Action but reduced in extent and/or duration. However, the overall reduction in impacts would not be sufficient to alter the impact determinations for any sea turtle species. On this basis, BOEM concludes that Alternatives C through F would result in **minor** adverse effects to sea turtles, with those effects partially offset by **minor** beneficial impacts for some sea turtle species.

### 3.19.2.5 Alternative G: Impacts of the Preferred Alternative on Sea Turtles

#### 3.19.2.5.1 Construction and Installation

##### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> Construction of Alternative G would result in a similar potential for accidental relaeases and discharges as the Proposed Action commensurate with the reduction in construction activities associated with 21 to 35 fewer foundations. Although expected to be slightly less than the Propsed Action, the risk from construction-related releases and discharges from Alternative G would be **negligible** to **minor** adverse.

<u>Noise:</u> Construction of Alternative G would result in similar underwater noise impacts on sea turtles from foundation installation to those described for the Proposed Action in Section 3.19.2.3.1, but those impacts would be reduced in extent and duration because 21 fewer structures would be installed. This would reduce the number of days of impact pile driving required to construct the Project and the associated extent and duration of underwater noise. The maximum extent of HRG surveys would be reduced (9,457 miles over 219 days) relative to the Proposed Action (10,779 miles over 248 days). The potential distribution of UXOs within the RWF is not currently known, but the largest devices are most likely to be encountered within the central portion of the RWF and in state waters on the RWEC corridor at the mouth of and outside Narragansett Bay (Ordtek 2021). The RWEC configuration would remain the same across all alternatives, and the probable area of occurrence within the RWF is sufficiently large that it is not possible to determine how changes in alternative configurations would affect the likelihood of UXO encounters. Therefore, impacts to sea turtles from UXO detonation are considered to be the same across all alternatives.

Differences in the number of sites and duration associated with foundation installation noise impacts between the Proposed Action and Alternative G are summarized in Table 3.6-8. These tables display the number of structures installed and estimated days of pile-driving activity required to construct each alternative. These effects would be roughly 35% less in magnitude and general scale to the Proposed Action. Therefore, noise effects on sea turtles from the construction phase of Alternative G would likewise vary by species and range from **negligible** to **minor** adverse.

**Table 3.19-8. Comparison of Maximum Underwater Noise Injury and Behavioral Effects Exposure Extent and Duration (number of sites/days) to Sea Turtles from Revolution Wind Farm Wind Turbine Generator and Offshore Substation Foundation Installation under the Proposed Action and Alternative G***

| Exposure Type | Threshold Distance (feet)† | Proposed Action | Alternative G | Alternatives G1–G3 |
|---|---|---|---|---|
| Peak injury | – | 102 sites/<br>35 days | 81 sites/<br>28 days | 67 sites/<br>24 days |
| Cumulative injury | 98–820 | | | |
| Behavioral or TTS | 1,903–2,920 | | | |

* Installation scenario for a 12-m monopile is 10,740 strikes/pile at an installation rate of three piles/day. Installation scenario for a 15-m monopile is 11,563 strikes/pile at an installation rate of up to two piles/day. All piles installed with a 4,000-kJ hammer with an attenuation system achieving 10 dB sound source reduction.

† Threshold distances are the distance in feet from the sound source where the identified type of exposure could occur. WTG values are the range threshold distances for monopile installation modeled by Kusel et al. (2023) across modeled sites and seasonal conditions. Maximum threshold distances for WTG and OSS monopiles are 689 and 820 feet, respectively.

Presence of structures: The presence of WTG and OSS monopile foundations associated with Alternative G would result in similar impacts to sea turtles as those described for the Proposed Action in Section 3.19.2.3.2, but those impacts would be reduced in extent because 35 fewer structures would be installed. Refer to the tables in Section 3.6.2.4.2 for a summary of the number of structures proposed by alternative and configuration. Impacts of the presence of structures are expected to be relative to the total number of structures proposed (i.e., fewer structures would result in a smaller extent of impacts).

As with the Proposed Action, the overall impact to sea turtles from the presence of structures is not expected to be biologically significant due to the patchy distribution of sea turtles within the RWF and RWEC. Impacts from the presence of structures are expected to vary in relation to the total number of foundations proposed (i.e., fewer structures would result in less extensive impacts). Therefore, Alternative G would be expected to produce roughly 35% less impact from this IPF by comparison. Reef effects would be reduced commensurate with the fewer number of foundations constructed under Alternative G.

At present, insufficient information is available to determine if differences in Project configuration between alternatives, specifically where foundations are located relative to sensitive benthic habitats, would contribute to a measurable difference in reef effects on sea turtles beyond those resulting from a simple reduction in the number of structures. However, the proposed configuration of Alternative G was specifically selected to avoid and minimize impacts to large-grained complex and complex habitats of particular value for certain fish species of concern, which could benefit bottom-feeding loggerhead sea turtles. As stated in Section 3.15.2.2.3, hydrodynamic effects are likely to lead to localized changes in the distribution of planktonic organisms (e.g., jellyfish) for certain sea turtle species, but shifts in prey distribution on the order of miles to tens of miles are unlikely to be biologically significant for species that migrate thousands of miles between seasonal habitats every year. Potential reef effects from increased biological productivity concentrating recreational fishing around foundations and concentrating prey availability would similarly be reduced. Therefore, while Alternative G would reduce the extent of measurable reef and hydrodynamic effects relative to the Proposed Action, those effects are likely to remain biologically insignificant. Potential long-term intermittent impacts would persist until decommissioning is complete and structures are removed. These impacts would also be **negligible** to **minor** adverse, offset by **minor** beneficial impacts to sea turtle species that benefit from reef effects.

Vessel traffic: Construction of Alternative G would result in a similar level of vessel traffic as the Proposed Action commensurate with the reduction in construction activities associated with 35 fewer foundations. An estimate of the reduced vessel trips per year associated with Alternative G construction is not available; however, it is expected to be slightly less than the Proposed Action. Therefore, the potential effects of construction vessel collisions on sea turtles from Alternative G would be **minor** adverse.

#### 3.19.2.5.2 Cumulative Impacts

#### Offshore Activities and Facilities

Accidental releases and discharges: Alternative G would increase commercial vessel activity on the mid-Atlantic OCS, creating a potential source for accidental spills, trash, and debris. As with the Proposed Action, BOEM estimates that Alternative G would result in a negligible, up to 2%, increase in total chemical usage in the GAA relative to the No Action Alternative. When combined with other offshore wind projects, up to approximately 34 million gallons of coolants, oils, fuels, and lubricants could cumulatively be stored within WTG foundations and the OSS within the sea turtles GAA. Compliance with USCG regulations and BOEM requirements to minimize the risk of accidental spills and/or release of trash and debris would limit the volume and extent of Project-related trash/debris or invasive species potentially released accidentally. Additionally, as discussed in Section 3.19.1.1, the volumes of trash/debris potentially released accidentally under the No Action Alternative would be negligible and would not contribute to potential adverse impacts. Therefore, cumulative impacts associated with Alternative G when combined with past, present, and reasonably foreseeable future activities would be **negligible** to **minor** adverse because of the regulatory protections and limited likelihood of sea turtle exposure.

Climate change: The types of impacts from global climate change described for the No Action Alternative would occur under Alternative G, but Alternative G could also contribute to a long-term net decrease in GHG emissions. As described in Section 3.19.1.1, the interactions between climate change and other potential impacts associated with Alternative G are complex and difficult to predict with certainty. Northward shifts in sea turtle distributions due to warming waters could result in magnification of the anticipated impacts due to increased exposure. However, this magnification includes potential benefits associated with the creation of artificial reef habitat and could represent an increasing impact over the life of the Project. Based on the potential for increased exposure to the various effects of Alternative G described above, Alternative G when combined with other past, present, and reasonably foreseeable actions is expected to result in **minor** adverse cumulative impacts to sea turtles due to the anticipated shifts in distributions.

Noise: Alternative G would generate underwater noise effects during Project construction, throughout the operational life of the Project, and during Project decommissioning. Those impacts would be similar in magnitude and distribution but reduced in extent relative to the Proposed Action. These effects would combine with similar effects resulting from the construction, O&M, and decommissioning of other planned offshore wind projects on the mid-Atlantic OCS.

BOEM estimates a cumulative total of 3,155 offshore WTGs and OSS foundations could be developed by Alternative G in the GAA for sea turtles between 2022 and 2030. Sea turtles are anticipated to occur at generally low densities (see Section 3.19.1) near wind farms in the region, reducing the probability of individual exposure to noise effects. Noise sources associated with the Proposed Action could add to the ambient noise environment under the No Action Alternative if noise sources overlap temporally or geographically. Pile driving would represent the most significant source of noise. As noted in Section 3.19.2.2.2, there are three possible exposure scenarios for pile-driving noise: 1) concurrent exposure from two or more impact hammers for the same or adjacent projects; 2) non-concurrent exposure from multiple pile-driving events in the same years; and 3) exposure to concurrent and non-concurrent pile-driving events over multiple years. Although the extent, duration, and magnitude of exposure would vary based on Project-specific factors, the effects would be similar in nature to those described for the Proposed Action. Although exposure to pile-driving noise could disrupt behaviors of individual sea turtles, it is not expected to impair essential behavioral patterns. This is due to the temporary, localized nature of the effects and because normal behaviors are expected to resume once the sea turtle is no longer exposed to the noise. Permanent hearing impairment could occur to some individuals, but science has not determined whether changes in hearing ability would negatively impact the ability of sea turtles to feed, navigate, find suitable habitats, and reproduce. Due to the limited information about noise-related stress responses in sea turtles, physiological stress responses may likely occur concurrently with any other response, such as hearing impairment or behavioral disruptions.

For impulsive noise, BOEM anticipates that projects would employ soft starts during pile driving to allow the small number of turtles in the region to leave the area before underwater noise increases to injurious levels. Additionally, the implementation of sound attenuation systems, PSO exclusion and shutdown zones, and other planned EPMs (see Appendix F) would further reduce the likelihood of injury from the potential moderate cumulative impacts associated with pile driving. Vibratory pile driving associated with the sea-to-shore transition would create non-impulsive underwater noise, but similar to the effects of the impulsive impact hammer, only minor impacts to sea turtles are expected because of the combination of minimization measures used and the low densities of sea turtles in the RWF and RWEC. Potential behavioral effects are more likely to be related to vessel noise and disturbance than the vibratory pile driving itself.

With regard to other non-impulsive noise sources, potential behavioral impacts on sea turtles from vessel traffic noise would be intermittent and temporary as animals and vessels pass near each other. During construction and operation, helicopter traffic could cause some temporary behavioral reactions in sea turtles, but energy expenditures would be minimal.

Based on the above findings, noise-related impacts of Alternative G when combined with past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse cumulative impacts to sea turtles depending upon the noise source.

<u>Presence of structures</u>: Alternative G would result in long-term negligible and minor beneficial impacts to sea turtles through the installation of 67 structures (65 WTGs and two OSSs) under Alternatives G1 to G3 relative to the No Action Alternative. The installation of monopile foundations would alter the character of the ocean environment, and their presence could affect sea turtle behavior. Increased prey availability, attraction to structures, and/or displacement could occur as a result of the installation of WTG facilities. As described in Section 3.19.2.2.2, structures associated with offshore wind farms are expected to provide

some level of reef effect and could benefit sea turtle foraging by creating new hard-bottom habitat, increasing pelagic productivity in local areas or promoting prey aggregations on foundations.

Some level of displacement of sea turtles out of the Lease Area and into areas with a higher potential for interactions with ships or recreational or commercial fishing gear could occur, particularly during construction phases, when elevated underwater noise levels occur. These intermittent impacts would persist until decommissioning is complete and structures are removed. Impacts could occur as a result of increased interaction with fishing gear, although annual monitoring, reporting, and cleanup of fishing gear around the base of the WTGs would reduce the extent of these impacts.

BOEM estimates a cumulative total of 3,155 offshore WTGs and OSS foundations for Alternative G plus all other future offshore wind projects in the sea turtles GAA. For similar reasons as described above, Alternative G when combined with past, present, and reasonably foreseeable projects would result in negligible to minor adverse cumulative impacts and potential minor beneficial cumulative impacts to sea turtles.

Vessel traffic: Alternative G would result in minor impacts to sea turtles through the addition of construction and maintenance vessels within the GAA for sea turtles. Those impacts would be similar, but reduced, in magnitude relative to the Proposed Action. This increased offshore wind–related vessel traffic during construction, and associated noise impacts, could result in localized, intermittent impacts on sea turtles, resulting in brief, minor behavioral responses that would be expected to dissipate once the vessel or the individual has left the area. However, BOEM expects that these brief responses of individuals to passing vessels would be unexpected given the patchy distribution of sea turtles; no stock- or population-level effects would be expected. Additionally, Alternative G would implement EPMs (see Table F-1 in Appendix F) to minimize vessel strikes.

BOEM estimates a peak of 262 vessels supporting offshore wind development will be operating in the sea turtles GAA over the next decade, of which up to 59 would be associated with Alternative G construction and six would be associated with O&M. This increase in vessel traffic poses an increased likelihood of collision-related injury and mortality relative to existing baseline conditions. Some sea turtlescould be injured or killed as a result, but the number of individuals impacted is not likely to significantly increase the existing mortality rate from vessel strikes. Additionally, BOEM expects that similar EPMs will be included in future offshore wind projects, helping to minimize the vessel strike risk. Therefore, cumulative impacts associated with the Project when combined with past, present, and reasonably foreseeable future activities would be **minor** adverse; however, BOEM does not expect the viability of sea turtle populations to be affected.

#### 3.19.2.5.3 Conclusions

The construction and installation, O&M, and decommissioning of Alternative G would impact sea turtles through the same IPFs described for the Proposed Action. These impacts include exposure to increased vessel traffic, underwater noise impacts from Project construction and O&M, temporary habitat disturbance, and long-term habitat conversion. These adverse impacts would be avoided and minimized using the same EPMs as described in the Proposed Action (see Table F-1 in Appendix F). Alternative G would also generate similar beneficial reef effects but over a smaller area and with a reduced number of reef-forming structures. The resulting effects to sea turtles would therefore be similar to those described for the Proposed Action but reduced in extent and/or duration. However, the overall reduction in impacts would not be sufficient to alter the impact determinations for any sea turtle species. On this basis, BOEM concludes that Alternative G would result in **minor** adverse effects to sea turtles, with those effects partially offset by **minor** beneficial impacts for some sea turtle species.

#### 3.19.2.6 Mitigation

Mitigation measures for sea turtles required through completed consultations, authorizations, and permits listed in Table 3.19-9 and in Appendix F, Table F-2, are incorporated into the Preferred Alternative (Alternative G). Additional mitigation measures identified by BOEM and cooperating agencies as a condition of state and federal permitting, or through agency-to-agency negotiations, are listed in Appendix F, Table F-3 and summarized here in Table 3.19-10. These measures, if adopted, would further define how the effectiveness and enforcement of EPMs would be ensured and improve accountability for compliance with EPMs by requiring the submittal of plans for approval by the enforcing agency(ies) and by defining reporting requirements. Because these measures ensure the effectiveness of and compliance with EPMs that are already analyzed as part of the Proposed Action, implementation of these measures would not further reduce the impact level of the Proposed Action from what is described in Section 3.19.2. BOEM and cooperating agencies have identified additional mitigation measures that could apply to the Project (Appendix F, Table F-3).

**Table 3.19-9. Mitigation and Monitoring Measures Resulting from Consultations for Sea Turtles (Appendix F, Table F-2)**

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| DRAFT NMFS BiOp Reasonable and Prudent Measures (RPMs) and Terms and Conditions (T&Cs)* | Draft NMFS Biological Opinion Proposed Reasonable and Prudent Measures were issued to BOEM for consideration on June 16, 2023.<br>Final NMFS Biological Opinion Proposed Reasonable and Prudent Measures to be issued to BOEM for consideration on July 21, 2023.<br>RPMs and Terms and Conditions to minimize the impact of incidental take of ESA-listed species were documented in the draft NMFS Biological Opinion dated June 16, 2023. These measures include adherence to mitigation measures specified in the final MMPA ITA to minimize impacts during pile driving and UXO detonation; compliance with requirements for vessel operations within the Delaware River and Delaware Bay included in the Incidental Take Statements provided with the Paulsboro Marine Terminal Biological Opinion (dated July 19, 2022); reporting requirements related to effects to, or interactions with, ESA-listed species; submittal of required plans (e.g., PSO Training Plan for Trawl Surveys, Passive Acoustic Monitoring Plan, Marine Mammal and Sea Turtle Monitoring Plan, Cofferdam Installation and Removal Monitoring Plan, Alternative Monitoring Plan/Night Time Pile Driving Monitoring Plan, Sound Field Verification Plan, North Atlantic Right Whale Vessel Strike Avoidance Plan) to NMFS GARFO with sufficient time for review, comment and approval; and conducting on-site observation and inspection to gather information on the effectiveness and implementation of measures to minimize and monitor incidental take. | These RPMs and Terms and Conditions would minimize the exposure of ESA-listed marine mammals to underwater noise impacts from impact and vibratory pile driving, UXO detonation, and HRG surveys. These RPMs and Terms and Conditions would also ensure that all incidental take that occurs is documented and reported to NMFS in a timely manner. Reporting requirements to document take would improve accountability for documenting take associated with the Proposed Action. In some cases, these RPMs and Terms and Conditions provide additional detail or clarification of measures that are included as part of the Proposed Action. Implementation of these RPMs and Terms and Conditions would provide incremental reductions in impacts on sea turtles but would not alter the overall impact determination of the Proposed Action. |
| Marine debris awareness training | The Lessee must ensure that vessel operators, employees, and contractors engaged in offshore activities pursuant to the approved COP complete marine trash and debris awareness training annually. The training consists of two parts: 1) viewing a marine trash and debris training video or slide show (described below) and 2) receiving an explanation from management personnel that emphasizes their commitment to the requirements. The marine trash and debris training videos, training slide packs, and other marine debris related educational material may be obtained at https://www.bsee.gov/debris or by | These measures would complement existing EPMs and regulatory requirements, ensuring that impacts from the accidental releases and discharges IPF would remain negligible adverse. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | contacting BSEE. The training videos, slides, and related material may be downloaded directly from the website. Operators engaged in marine survey activities must continue to develop and use a marine trash and debris awareness training and certification process that reasonably assures that their employees and contractors are in fact trained. The training process must include the following elements:<br>• Viewing of either a video or slide show by the personnel specified above<br>• An explanation from management personnel that emphasizes their commitment to the requirements<br>• Attendance measures (initial and annual)<br>• Recordkeeping and the availability of records for inspection by DOI<br>By January 31 of each year, the Lessee must submit to the DOI an annual report that describes its marine trash and debris awareness training process and certifies that the training process has been followed for the previous calendar year. The Lessee must send the reports via email to BOEM (at renewable_reporting@boem.gov) and to BSEE (at marinedebris@bsee.gov). | |
| Marine debris elimination | Materials, equipment, tools, containers, and other items used in Outer Continental Shelf (OCS) activities which could be lost or discarded overboard must be clearly marked with the vessel or facility identification. All markings must clearly identify the owner and must be durable enough to resist the effects of the environmental conditions to which they may be exposed. Materials, equipment, tools, containers, and other items used in OCS activities which could be lost or discarded overboard must be properly secured to prevent loss overboard. | These measures would complement existing EPMs and regulatory requirements, ensuring that impacts from the accidental releases and discharges IPF would remain negligible adverse. |
| Pile driving monitoring plan | BOEM, BSEE, and USACE would ensure that Revolution Wind prepares and submits to BSEE (via TIMSWeb and notification email at protectedspecies@bsee.gov) and BOEM (at renewable_reporting@boem.gov) for review and concurrence preferably 180 days but no later than 120 days before start of pile | Revolution Wind has committed to implementing passive acoustic monitoring, pile driving monitoring, PSO coverage, sound field verification, and shutdown zones as part of the Proposed Action. Compliance with these EPMs would be enforced by |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | driving. Reporting to BSEE would follow JOINT NTL 2023-N01, Appendix B. The Lessee must not conduct pile driving operations at any time when lighting or weather conditions (e.g., darkness, rain, fog, sea state) prevent visual monitoring of the full extent of the clearance and shutdown zones including not initiating pile driving earlier than 1 hour after civil sunrise or later than 1.5 hours prior to civil sunset.<br>Pile driving at night may only occur with prior approval of an Alternative Monitoring Plan (AMP). The Lessee must submit an AMP to BOEM and NMFS for review and approval at least 6 months prior to the planned start of pile-driving. This plan may include deploying additional observers, alternative monitoring technologies such as night vision, thermal, and infrared technologies, or use of PAM and must demonstrate the ability and effectiveness to maintain all clearance and shutdown zones during daytime as outlined below in Part 1 and nighttime as outlined in Part 2 to BOEM's and NMFS's satisfaction.<br>The AMP must include two stand-alone components as described below:<br>Part 1 – Daytime when lighting or weather (e.g., fog, rain, sea state) conditions prevent visual monitoring of the full extent of the clearance and shutdown zones. Daytime being defined as one hour after civil sunrise to 1.5 hours before civil sunset.<br>Part 2 – Nighttime inclusive of weather conditions (e.g., fog, rain, sea state). Nighttime being defined as 1.5 hours before civil sunset to one hour after civil sunrise.<br>If a protected marine mammal or sea turtle is observed entering or found within the shutdown zones after impact pile-driving has commenced, the Lessee would follow shutdown procedures outlined in the Protected Species Mitigation Monitoring Plan (PSMMP; Appendix B). The Lessee would notify BOEM and NMFS of any shutdown occurrence during piling driving operations within 24 hours of the occurrence unless otherwise authorized by BOEM and NMFS.<br>The AMP should include, but is not limited to the following information:<br>• Identification of night vision devices (e.g., mounted thermal/IR camera systems, hand-held or wearable NVDs, IR spotlights), if | BOEM, BSEE, and NMFS as indicated in Table F-2. Implementation and enforcement of these EPMs would minimize the potential for noise exposure sufficient to cause hearing injury and/or behavioral effects to sea turtles during of impact pile driving, vibratory pile driving, HRG surveys, and UXO detonation, as disclosed in the analysis of the Proposed Action. This agency-proposed mitigation measure specifies plan review and reporting requirements necessary to ensure pile driving monitoring plan effectiveness and enforcement. While adoption of these measures would increase accountability and ensure the effectiveness of EPMs, it would not alter the impact determination for any sea turtle species as analyzed herein. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | proposed for use to detect protected marine mammal and sea turtle species.<br>• The AMP must demonstrate (through empirical evidence) the capability of the proposed monitoring methodology to detect marine mammals and sea turtles within the full extent of the established clearance and shutdown zones (i.e., species can be detected at the same distances and with similar confidence) with the same effectiveness as daytime visual monitoring (i.e., same detection probability). Only devices and methods demonstrated as being capable of detecting marine mammals and sea turtles to the maximum extent of the clearance and shutdown zones will be acceptable.<br>• Evidence and discussion of the efficacy (range and accuracy) of each device proposed for low visibility monitoring must include an assessment of the results of field studies (e.g., Thayer Mahan demonstration), as well as supporting documentation regarding the efficacy of all proposed alternative monitoring methods (e.g., best scientific data available).<br>• Procedures and timeframes for notifying NMFS and BOEM of Revolution Wind's intent to pursue nighttime pile-driving.<br>• Reporting procedures, contacts and timeframes.<br>BOEM may request additional information, when appropriate, to assess the efficacy of the AMP. For mammals see Appendix B MMPA rule. | |
| PSO coverage | BOEM, BSEE, and the USACE must ensure that PSO coverage is sufficient to reliably detect sea turtles at the surface in exclusion and shutdown zones to execute any pile-driving delays or shutdown requirements. If, at any point prior to or during construction, the PSO coverage that is included as part of the Proposed Action is determined not to be sufficient to reliably detect ESA-listed whales and sea turtles within the clearance and shutdown zones, additional PSOs and/or platforms must be deployed. Determinations prior to construction must be based on review of the pile driving monitoring plan. Determinations during | Revolution Wind has committed to implementing passive acoustic monitoring, pile driving monitoring, PSO coverage, sound field verification, and shutdown zones as part of the Proposed Action. Compliance with these EPMs would be enforced by BOEM, BSEE, and NMFS as indicated in Table F-2. Implementation and enforcement of these EPMs would minimize the potential for noise exposure sufficient to cause hearing injury and/or behavioral effects to sea turtles during of impact pile driving, |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | construction must be based on review of the weekly pile driving reports and other information, as appropriate. | vibratory pile driving, HRG surveys, and UXO detonation, as disclosed in the analysis of the Proposed Action. This agency-proposed mitigation measure specifies plan review and reporting requirements necessary to ensure pile driving monitoring plan effectiveness and enforcement. While adoption of these measures would increase accountability and ensure the effectiveness of EPMs, it would not alter the impact determination for any sea turtle species as analyzed herein. |
| Sound field verification (SFV) | BOEM, BSEE, and NMFS may consider adjustments in the pre-start clearance and/or shutdown zones based on the initial SFV measurements. Revolution Wind will provide the initial results of each SFV measurement to BOEM, BSEE, and NMFS in an interim report after each monopile installation. Interim reports must be submitted as soon as they are available but no later than 48 hours after each installation.<br>Revolution Wind will conduct an SFV to empirically determine the distances to the isopleths corresponding to sea turtle hearing injury and behavioral effect thresholds, including at the locations corresponding to the modeled distances to those thresholds. If initial SFV measurements indicate distances to the isopleths are less than the distances predicted by modeling assuming 10-decibel (dB) attenuation, Revolution Wind may request a modification of the clearance and shutdown zones for impact pile driving. For a modification request to be considered, Revolution Wind must have conducted SFV on at least three piles to verify that zone sizes are consistently smaller than predicted by modeling. If initial SFV measurements from any foundation indicate distances to the isopleths are greater than the distances predicted by modeling, Revolution Wind would implement additional sound attenuation measures prior to conducting additional pile driving. Additional measures may include improving the efficacy of the implemented noise attenuation technology and/or modifying the piling schedule to reduce the sound source. If modeled zones cannot be achieved by these corrective actions, Revolution Wind must install an | Revolution Wind has committed to implementing passive acoustic monitoring, pile driving monitoring, PSO coverage, sound field verification, and shutdown zones as part of the Proposed Action. Compliance with these EPMs would be enforced by BOEM, BSEE, and NMFS as indicated in Table F-2. Implementation and enforcement of these EPMs would minimize the potential for noise exposure sufficient to cause hearing injury and/or behavioral effects to sea turtles during of impact pile driving, vibratory pile driving, HRG surveys, and UXO detonation, as disclosed in the analysis of the Proposed Action. This agency-proposed mitigation measure specifies plan review and reporting requirements necessary to ensure pile driving monitoring plan effectiveness and enforcement. While adoption of these measures would increase accountability and ensure the effectiveness of EPMs, it would not alter the impact determination for any sea turtle species as analyzed herein. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
| --- | --- | --- |
| | additional noise mitigation system to achieve the modelled ranges. Each sequential modification would be evaluated empirically by SFV of three additional foundations with the new sound attenuation technology. Additionally, in the event that SFV measurements continue to indicate distances to isopleths corresponding to hearing injury and behavioral effects thresholds are consistently greater than the distances predicted by modeling, BOEM, BSEE, or NMFS may expand the relevant clearance and shutdown zones and associated monitoring measures. | |
| Shutdown zone and pre-start clearance zone adjustment | BOEM, BSEE, and NMFS may consider adjustments in the pre-start clearance and/or shutdown zones based on the initial SFV measurements. Revolution Wind would provide the initial results of the SFV measurements to NMFS in an interim report after each monopile installation for the first three piles as soon as they are available but no later than 48 hours after each installation.<br>Revolution Wind would conduct an SFV to empirically determine the distances to the isopleths corresponding to hearing injury and behavioral effects thresholds for sea turtles, including at the locations corresponding to the modeled distances to these thresholds. If initial SFV measurements indicate distances to the isopleths are less than the distances predicted by modeling assuming 10-decibel (dB) attenuation, Revolution Wind may request a modification of the clearance and shutdown zones for impact pile driving. Additionally, in the | This measure would not modify the impact determination for noise effects on sea turtles but would provide the information necessary to ensure that these effects do not exceed the levels analyzed herein. |

| **Mitigation Measure** | **Description** | **Expected Effect on Impacts from Action Alternatives** |
|---|---|---|
| | event that SFV measurements continue to indicate distances to isopleths corresponding to hearing injury and behavioral effects thresholds are consistently greater than the distances predicted by modeling, NMFS may expand the relevant clearance and shutdown zones and associated monitoring measures. | |
| Monitoring zones for sea turtles | BOEM, BSEE, and the USACE would ensure that Revolution Wind would monitor a 500 m clearance and shutdown zone for sea turtles for the full duration of all pile-driving activities and for 30 minutes following the cessation of pile-driving activities and record all observations in order to ensure that all take that occurs is documented. | This measure would not modify the impact determination for noise effects on sea turtles but would provide the information necessary to ensure that these effects do not exceed the levels analyzed herein. |
| Vessel strike avoidance measures for sea turtles | Between June 1 and November 30, Revolution Wind must have a trained lookout posted on all vessel transits during all phases of the Project to observe for sea turtles. The trained lookout must communicate any sightings, in real time, to the captain so that the requirements in (e) below can be implemented.<br>a. The trained lookout must monitor https://seaturtlesightings.org/ prior to each trip and report any observations of sea turtles in the vicinity of the planned transit to all vessel operators/captains and lookouts on duty that day.<br>b. The trained lookout must maintain a vigilant watch and monitor a vessel strike avoidance zone (500 m) at all times to maintain minimum separation distances from ESA-listed species. Alternative monitoring technology (e.g., night vision and thermal cameras) must be available to ensure effective watch at night and in any other low-visibility conditions. If the trained lookout is a vessel crew member, this must be their designated role and primary responsibility while the vessel is transiting. Any designated crew lookouts would receive training on protected species identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements.<br>c. If a sea turtle is sighted within 100 m or less of the operating vessel's forward path, the vessel operator must slow down to 4 | Revolution Wind has committed to implementing a vessel strike avoidance policy, vessel separation distances, and vessel speed restrictions as part of the Proposed Action and as described in Table F-4. These measures include maintaining specified separation distances for NARW and unidentified large marine mammals, other large whales, and dolphins, porpoises, seals, and sea turtles. Revolution Wind's vessel strike avoidance policy directs that if an animal is sighted in the vessel's path, the vessel will divert or reduce speed and shift gears to neutral. Project design criteria to minimize vessel interactions with listed species would further clarify the distance at which vessels would divert their path and the distance at which vessels would reduce speed and shift to neutral. Adoption of these measures would further clarify requirements for vessel strike avoidance under the Proposed Action but would not alter the impact determinations for any sea turtle species as analyzed herein. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | knots (unless unsafe to do so) and then proceed away from the turtle at a speed of 4 knots or less until there is a separation distance of at least 100 m at which time the vessel may resume normal operations. If a sea turtle is sighted within 50 m of the forward path of the operating vessel, the vessel operator must shift to neutral when safe to do so wait for the turtle to pass beyond 50m and then engage engines and travel proceed away from the turtle at a speed of 4 knots until a separation distance of 100 m is observed The vessel may resume normal operations once it has passed the turtle.<br>d. Vessel captains/operators would avoid transiting through areas of visible jellyfish aggregations or floating sargassum lines or mats. In the event that operational safety prevents avoidance of such areas, vessels must slow to 4 knots while transiting through such areas.<br>e. All vessel crew members must be briefed in the identification of ESA-listed species of sea turtles and in regulations and best practices for avoiding vessel collisions. Reference materials must be available aboard all Project vessels for identification of sea turtles. The expectation and process for reporting of sea turtles (including live, entangled, and dead individuals) must be clearly communicated and posted in highly visible locations aboard all Project vessels, so that there is an expectation for reporting to the designated vessel contact (such as the lookout or the vessel captain), as well as a communication channel and process for crew members to do so.<br>f. The only exception is when the safety of the vessel or crew necessitates deviation from these requirements on an emergency basis. If any such incidents occur, they must be reported to NMFS and BSEE within 24 hours.<br>g. If a vessel is carrying a PSO or trained lookout for the purposes of maintaining watch for North Atlantic right whales, an additional lookout is not required and this PSO or trained | |

| **Mitigation Measure** | **Description** | **Expected Effect on Impacts from Action Alternatives** |
|---|---|---|
| | lookout must maintain watch for whales, giant manta rays, and sea turtles. | |
| Sampling gear | All sampling gear would be hauled out at least once every 30 days, and all gear must be removed from the water and all gear must be removed from the water and stored on land between survey seasons to minimize risk of entanglement. | Revolution Wind has committed to EPMs to avoid and minimize potential entanglement risk to sea turtles from implementation of the Fisheries and Benthic Monitoring Plan. BOEM and BSEE would enforce compliance with these EPMs to ensure that impacts to sea turtles from monitoring activities remain negligible. |
| Lost survey gear | If any survey gear is lost, all reasonable efforts that do not compromise human safety must be undertaken to recover the gear. All lost gear must be reported to NMFS (nmfs.gar.incidental-take@noaa.gov) and BSEE BSEE (via TIMSWeb and notification email at marinedebris@bsee.gov)) within 24 hours of the documented time of missing or lost gear. This report must include information on any markings on the gear and any efforts undertaken or planned to recover the gear. | Revolution Wind has committed to EPMs to avoid and minimize potential entanglement risk to sea turtles from implementation of the Fisheries and Benthic Monitoring Plan. This measure would complement existing EPMs and ensure that entanglement risk associated with survey activities and potential impacts on sea turtles remain negligible. |
| Sea turtle disentanglement | Vessels deploying fixed gear (e.g., pots/traps) would have adequate disentanglement equipment (i.e., knife and boathook) onboard. Any disentanglement would occur consistent with the Northeast Atlantic Coast STDN disentanglement guidelines (https://www.reginfo.gov/public/do/DownloadDocument?objectID=102486501) and the procedures described in *Careful Release Protocols for Sea Turtle Release with Minimal Injury* (NOAA Technical Memorandum 580; https://repository.library.noaa.gov/view/noaa/3773) (NOAA 2008). | Revolution Wind has committed to EPMs to avoid and minimize potential entanglement risk to sea turtles from implementation of the Fisheries and Benthic Monitoring Plan. This measure would complement existing EPMs and ensure that entanglement risk associated with benthic monitoring gear and potential impacts on sea turtles remains negligible. |
| Sea turtle/Atlantic sturgeon identification and data collection | Any sea turtles or Atlantic sturgeon caught and/or retrieved in any fisheries' survey gear must first be identified to species or species group. Each ESA-listed species caught and/or retrieved must then be properly documented using appropriate equipment and data collection forms. Biological data, samples, and tagging must occur as outlined below. Live, uninjured animals should be returned to the water as quickly as possible after completing the required handling and documentation. | Revolution Wind has committed to EPMs to avoid and minimize potential entanglement risk to sea turtles from implementation of the Fisheries and Benthic Monitoring Plan. This measure would not modify the impact determination for sea turtles but would provide the information necessary to ensure |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | a. The *Sturgeon and Sea Turtle Take Standard Operating Procedures* must be followed (NOAA 2021a; https://media.fisheries.noaa.gov/dammigration/sturgeon_&_sea_turtle_take_sops_external.pdf).).<br>b. Survey vessels must have a passive integrated transponder (PIT) tag reader onboard capable of reading 134.2-kilohertz and 125-kilohertz encrypted tags (e.g., Biomark GPR Plus Handheld PIT Tag Reader), and this reader be used to scan any captured sea turtles and sturgeon for tags. Any recorded tags must be recorded on the take reporting form (see below).<br>c. Genetic samples must be taken from all captured Atlantic sturgeon (alive or dead) to allow for identification of the distinct population segment (DPS) of origin of captured individuals and tracking of the amount of incidental take. This must be done in accordance with the *Procedure for Obtaining Fin Clips from Sturgeon for Genetic Analysis* (NOAA 2019; https://media.fisheries.noaa.gov/dammigration/sturgeon_genetics_sampling_revised_june_2019.pdf).<br>i. Fin clips must be sent to a NMFS-approved laboratory capable of performing genetic analysis and assignment to DPS of origin. To the extent authorized by law, BOEM is responsible for the cost of the genetic analysis. Arrangements must be made for shipping and analysis in advance of submission of any samples; these arrangements must be confirmed in writing to NMFS within 60 days of the receipt of this incidental take statement (ITS). Results of genetic analysis, including assigned DPS of origin, must be submitted to NMFS within 6 months of the sample collection.<br>ii. Subsamples of all fin clips and accompanying metadata forms must be held and submitted to a tissue repository (e.g., the Atlantic Coast Sturgeon Tissue Research Repository) on a quarterly basis. The Sturgeon Genetic Sample Submission Form is available | that these effects do not exceed the levels analyzed herein. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | for download at https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-take-reporting-programmatics-greater-atlantic.<br>d. All captured sea turtles and Atlantic sturgeon must be documented with required measurements and photographs. The animal's condition and any marks or injuries mustbe described. This information must be entered as part of the record for each incidental take. A NMFS Take Report Form would be filled out for each individual sturgeon and sea turtle (download at: https://media.fisheries.noaa.gov/2021-11/Sturgeon-Sea-Turtle-Take-SOPs-external-11032021.pdf). | |
| Sea turtle/Atlantic sturgeon handling and resuscitation guidelines | Any sea turtles or Atlantic sturgeon caught and retrieved in gear used in fisheries surveys must be handled and resuscitated (if unresponsive) according to established protocols and whenever at-sea conditions are safe for those handling and resuscitating the animal(s) to do so. Specifically:<br>a. Priority mustbe given to the handling and resuscitation of any sea turtles or sturgeon that are captured in the gear being used, if conditions at sea are safe to do so. Handling times for these species should be minimized (i.e., kept to 15 minutes or less) to limit the amount of stress placed on the animals.<br>b. All survey vessels must have copies of the sea turtle handling and resuscitation requirements found at 50 CFR 223.206(d)(1) prior to the commencement of any on-water activity (download at: https://media.fisheries.noaa.gov/ dammigration/sea_turtle_handling_and_resuscitation_measures.pdf). These handling and resuscitation procedures must be carried out any time a sea turtle is incidentally captured and brought onboard the vessel during the proposed actions.<br>c. If any sea turtles that appear injured, sick, or distressed, are caught and retrieved in fisheries survey gear, survey staff must immediately contact the Greater Atlantic Region Marine Animal Hotline at 866-755-6622 for further instructions and guidance | This measure would not modify the impact determination for sea turtles but would provide the information necessary to ensure that these effects do not exceed the levels analyzed herein. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | on handling the animal, and potential coordination of transfer to a rehabilitation facility. If unable to contact the hotline (e.g., due to distance from shore or lack of ability to communicate via phone), the USCG should be contacted via VHF marine radio on Channel 16. If required, hard-shelled sea turtles (i.e., non-leatherbacks) may be held on board for up to 24 hours following handling instructions provided by the Hotline, prior to transfer to a rehabilitation facility.<br>d. Attempts must be made to resuscitate any Atlantic sturgeon that are unresponsive or comatose by providing a running source of water over the gills as described in the sturgeon resuscitation guidelines (NOAA 2020; https://media.fisheries.noaa.gov/dammigration-miss/Resuscitation-Cards-120513.pdf).<br>e. Provided that appropriate cold storage facilities are available on the survey vessel, following the report of a dead sea turtle or sturgeon to NMFS, and if NMFS requests, any dead sea turtle or Atlantic sturgeon must be retained on board the survey vessel for transfer to an appropriately permitted partner or facility on shore as safe to do so.<br>f. Any live sea turtles or Atlantic sturgeon caught and retrieved in gear used in any fisheries survey must ultimately be released according to established protocols and whenever at-sea conditions are safe for those releasing the animal(s) to do so. | |
| Take notification | GARFO Protected Resources Division (PRD) and BSEE must be notified as soon as possible of all observed takes of sea turtles and Atlantic sturgeon occurring as a result of any fisheries survey. Specifically:<br>a. GARFO PRD and DOI (BOEM and BSEE) must be notified within 24 hours of any interaction with a sea turtle or sturgeon (nmfs.gar.incidental- take@noaa.gov and DOI via TIMSWeb and notification email at protectedspecies@bsee.gov). The report must include at a minimum 1) survey name and applicable information (e.g., vessel name, station number); 2) GPS | This measure would not modify the impact determination for sea turtles but would provide a reporting and enforcement mechanisms to ensure that impacts to sea turtles do not exceed the levels analyzed herein. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | coordinates describing the location of the interaction (in decimal degrees); 3) gear type involved (e.g., bottom trawl, longline); 4) soak time, gear configuration, and any other pertinent gear information; 5) time and date of the interaction; and 6) identification of the animal to the species level. Additionally, the email must transmit a copy of the NMFS Take Report Form (download at: https://media.fisheries.noaa.gov/2021-07/Take%20Report%20Form%2007162021.pdf?null) and a link to or acknowledgement that a clear photograph or video of the animal was taken (multiple photographs are suggested, including at least one photograph of the head scutes). If reporting within 24 hours is not possible due to distance from shore or lack of ability to communicate via telephone, fax, or email, reports must be submitted as soon as possible; late reports must be submitted with an explanation for the delay.<br>b. At the end of each survey season, a report must be sent to NMFS that compiles all information on any observations and interactions with ESA-listed species. This report must also contain information on all survey activities that took place during the season including location of gear set, duration of soak/trawl, and total effort. The report on survey activities must be comprehensive of all activities, regardless of whether ESA-listed species were observed. | |
| Monthly/ annual reporting requirements | BOEM and BSEE would ensure that Revolution Wind submits regular reports (in consultation with NMFS) necessary to document the amount or extent of take that occurs during all phases of the proposed action. Details of reporting must be coordinated between Revolution Wind, NMFS, BOEM, and BSEE. All reports would be sent to: nmfs.gar.incidental- take@noaa.gov and BSEE via TIMSWeb and notification email at protectedspecies@bsee.gov. | This measure would not modify the impact determination for sea turtles but would provide a reporting and enforcement mechanisms to ensure that impacts to sea turtles do not exceed the levels analyzed herein. |
| Data collection | BOEM and BSEE would ensure that all Project design criteria and BMPs incorporated in the Atlantic data collection consultation for offshore | This measure would not modify the impact determination for sea turtles but would provide the |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | wind activities (Baker and Howson 2021) shall be applied to activities associated with the construction, maintenance and operations of the Revolution Wind Project as applicable. | information necessary to ensure that these effects do not exceed the levels analyzed herein. |
| Periodic underwater surveys, reporting of monofilament and other fishing gear around WTG foundations | BOEM would require the Lessee to monitor potential loss of fishing gear WTG foundations by surveying at least ten percent of the total installed foundations annually. Survey design and effort may be modified based upon previous survey results after review and concurrence by BOEM. The Lessee must conduct surveys by remotely operated vehicles, divers, or other means to determine the locations and amounts of marine debris. The Lessee must submit annual reports to BOEM and BSEE by no later than April of the year following the survey. Survey reports would meet all requirements specified in Appendix F, Table F-2. Required data and reports may be archived, analyzed, published, and disseminated by BOEM. | This measure would not modify the impact determination for sea turtles, but it would provide the information necessary to ensure that effects do not exceed the levels analyzed herein. |

* Information in these rows was taken directly from the final biological opinion (NMFS 2023) and has not been edited.

**Table 3.19-10. Additional Mitigation and Monitoring Measures Under Consideration for Sea Turtles (Appendix F, Table F-3)**

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| Federal survey mitigation | There are 14 NMFS scientific surveys that overlap with wind energy development in the northeast region and eight of these surveys overlap with the Project. As per NMFS and BOEM Survey Mitigation strategy actions 1.3.1, 1.3.2, 2.1.1, and 2.1.2 (Hare et al. 2022), within 120 calendar days of COP Approval, the Lessee must submit to BOEM a draft survey mitigation agreement between NMFS and the Lessee. The survey mitigation agreement will describe how the Lessee will mitigate the Project impacts on the eight NMFS surveys. If after consultation with NMFS NEFSC, BOEM deems the survey mitigation agreement acceptable, the mitigation will be considered required as a term and condition of the Project's COP approval.<br>As soon as reasonably practicable, but no later than 30 days after the issuance of the Project's COP Approval, the Lessee will initiate | This measure provides a mechanism to avoid and minimize adverse impacts of project O&M on scientific surveys used to monitor the status of sea turtle populations and their forage and prey organisms. The implementation of this measure would ensure that federal surveys continue to provide the data and information necessary to monitor sea turtle population status. Federal survey data will be used to ensure that impacts to sea turtles remain within the levels considered in this FEIS, and to address uncertainties identified in impact analysis. |

| Mitigation Measure | Description | Expected Effect on Impacts from Action Alternatives |
|---|---|---|
| | coordination with NMFS NEFSC to develop the survey mitigation agreement described above. Mitigation activities specified under the agreement will be designed to mitigate the Project impacts on the following NMFS NEFSC surveys: (a) Spring Bottom Trawl survey; (b) Autumn Multi-species Bottom Trawl survey; (c) Ecosystem Monitoring survey; (d) NARW aerial survey; (e) Aerial marine mammal and sea turtle survey; (f) Shipboard marine mammal and sea turtle survey; (g) Atlantic surfclam and ocean quahog survey; and (h) Atlantic sea scallop survey. At a minimum, the survey mitigation agreement will describe actions needed and the means to address impacts on the affected surveys due to the preclusion of sampling platforms and impacts on statistical designs. In terms of statistical design, the project will be viewed as a discrete stratum in surveys that use a random stratified design. Other anticipated Project impacts on NMFS surveys such as changes in habitat and increased operational costs due to loss of sampling efficiencies may also be addressed in the agreement.<br><br>The survey mitigation agreement will identify activities that will result in the generation of data equivalent to data generated by NMFS's affected surveys for the duration of the Project. The survey mitigation agreement will describe the implementation procedures by which the Lessee will work with NEFSC to generate, share, and manage the data required by NEFSC for each of the surveys impacted by the Project, as mutually agreed upon between the Lessee and NMFS/NEFSC. The survey mitigation agreement must also describe the Lessee's participation in the NMFS NEFSC Northeast Survey Mitigation Program to support activities that address regional-level impacts for the surveys listed above. | |

#### 3.19.2.6.1 Measures Incorporated into the Preferred Alternative

Mitigation measures required through completed consultations, authorizations, and permits listed in Table 3.19-9 and in Appendix F, Table F-2, are incorporated into Alternative G (Preferred Alternative). BOEM has identified additional measures in Table 3.19-10 as incorporated in the Preferred Alternative. These measures, if adopted, would further define how the effectiveness and enforcement of EPMs would be ensured and improve accountability for compliance with EPMs by requiring the submittal of plans for approval by the enforcing agency(ies) and by defining reporting requirements. Because these measures ensure the effectiveness of and compliance with EPMs that are already analyzed as part of the Proposed Action, implementation of these measures would not further reduce the impact level of the Proposed Action from what is described in Section 3.19.2.

# 3.20 Visual Resources (see section in main EIS)

# 3.21 Water Quality

## 3.21.1 Description of the Affected Environment and Environmental Consequences of the No Action Alternative for Water Quality

### 3.21.1.1 Offshore Water Quality

Geographic analysis area: The GAA for offshore water quality impacts comprises coastal and marine waters within 10 miles of Project components and within 15.5 miles of waterways for ports that could be used during the Project (Figure 3.21-1). This analysis area was chosen by analyzing a worst-case scenario of an incidental oil discharge under the Project, which would equate to the simultaneous release of all oils used by all Project components and vessels.

Affected environment: Offshore waters in the offshore water quality analysis area comprise coastal waters (e.g., ports and harbors, bays, and estuaries; marine waters) located within the state territory (within 3 nm of shore) and within federal waters. The coastal waters, including the Long Island Sound, Block Island Sound, Rhode Island Sound, Narragansett Bay, and Atlantic Ocean, are located offshore and include existing port facilities in New York, Connecticut, Rhode Island, Virginia, Massachusetts, Maryland, and New Jersey that could be used for the Project. Because of their highly seasonal variations in temperature, stratification, and productivity, marine waters are considered temperate. Water currents near the shoreline of the landing site flow predominantly southwest and northeast, and water currents in the northern and southeastern portions of the offshore portion of the Lease Area flow predominantly south and east (RPS 2022). Along the proposed RWEC, currents were measured up to approximately 0.2 m/s, which increased to approximately 0.4 m/s at Narragansett Bay (RPS 2022).

Near the Lease Area, NOAA reported annual increases in relative sea level trends at seven tide stations (NOAA 2021a, 2021b, 2021c, 2021d, 2021e, 2021f, 2021g), including four along the Long Island coast (Bridgeport, Port Jefferson, New London, and Montauk), two along the Rhode Island coast (Newport and Providence), and one along the Massachusetts coast (Woods Hole) with increases ranging from approximately 2.4 millimeters per year at Providence, Rhode Island, to 3.41 millimeters per year at Montauk, New York. These increasing sea levels in addition to storm surges that are increasing in both frequency and magnitude have contributed to coastal erosion that has led to eroded shorelines and increased susceptibility to flooding (New York Sea Grant 2018; Rhode Island Coastal Resources Management Council 2014).

Offshore water quality is characterized by dissolved oxygen (DO), chlorophyll *a*, nutrients (phosphorus and nitrogen), pathogens, contaminants (metals, polychlorinated biphenyls [PCBs], and organic and inorganic pollutants), turbidity, and point and nonpoint source pollution. These parameters, which are described in COP Section 4.2.2, influence coastal and marine environments and are indicators of ecosystem health. In general, salinity levels in the region have low variability. Salinity ranged from 23.7 to 28.4 practical salinity unit (psu) in Narragansett Bay from 2005 through 2015, as well as 32 to 33 psu in the broader New England lease area between 1980 and 2007 (BOEM 2021a).

As described in COP Section 4.2.4, surface water temperatures fluctuate up to 59 degrees Fahrenheit (°F) seasonally, with bottom waters experiencing smaller seasonal temperature fluctuations of approximately 41°F. Water temperatures are highest in July and August when the water column becomes stratified; RWF surface water temperatures are close to 68°F, while bottom waters are approximately 50°F. During the winter, average surface water temperatures range from approximately 39°F to 41°F, with bottom waters staying slightly warmer at the southern edge of Rhode Island Sound.

The Project, including offshore facilities and ports, would be located within the northeast and mid-Atlantic regions of the United States, as defined by the EPA (2012). Overall water quality along the Atlantic coast has been rated “fair” to “good” (EPA 2012). The Mid-Atlantic region’s water quality has been rated as generally “good,” and the northeast region’s water quality has been rated “fair” (EPA 2012). Water quality in the Long Island Sound from the Port Jefferson area eastward has generally improved or remained “very good” over the past decade (University of Maryland 2018). In general, water quality improves north to south from Narragansett Bay to the OCS (EPA 2012). Seventy percent of Rhode Island coastal waters are categorized as Type 1 (i.e., waters abut shorelines in natural undisturbed conditions) and Type 2 (i.e., waters are adjacent to predominantly residential areas; docks are allowed but other more intensive uses are not) (Rhode Island Division of Planning 2016). The water quality of estuarine waters off the coast of Rhode Island, including Narragansett Bay and nearby coastal ponds, has experienced degradation from nutrients and stormwater runoff carrying contaminants, although overall water quality in the area is generally good (Rhode Island Division of Planning 2016).

DO concentrations for offshore waters along the Atlantic coast and in the northeast region have been rated as generally “fair” (EPA 2012). DO concentrations have been rated as “good” within the Mid-Atlantic region (EPA 2012). Low DO concentrations have been measured at Long Island Sound monitoring stations (EPA 2012); however, water quality surveys at stations in the Rhode Island Sound revealed DO concentrations in surface and bottom waters above established levels for the “highest quality marine waters” (RI CRMC 2010). The upper reaches of Narragansett Bay and urbanized tidal rivers and embayments have been more heavily impacted by urbanized areas, which has led to continued water quality degradation, including low DO levels from excess nutrient (nitrogen) runoff (Rhode Island Division of Planning 2016). Chlorophyll *a* concentrations in samples from Rhode Island Sound and Block Island Sound were variable but representative of oceanic systems and comparable to each other and other coastal systems (RI CRMC 2010; RPS 2022). In Narragansett Bay, chlorophyll *a* concentrations were slightly higher compared to the overall northeast coast region (RI CRMC 2010; VHB 2023).

Pathogens and nutrients, which are transported from point and nonpoint sources of pollution to coastal waters through stormwater and wastewater discharges (RI CRMC 2016), are the most prevalent pollutants degrading water quality in Rhode Island (Rhode Island Division of Planning 2016). There have been no documented reports of harmful algal blooms or waterborne pathogen outbreaks in the Block Island Sound or Rhode Island Sound (EPA 2012; RI CRMC 2010); however, excess nutrients (nitrogen) in Narragansett Bay have led to oxygen depletion events (hypoxia and anoxia) that have degraded water quality conditions (EPA 2012; Rhode Island Division of Planning 2016). Dissolved nutrients from Narragansett Bay, in addition to those from Long Island Sound, reach OCS waters and contribute to degraded water quality conditions (VHB 2023). Nutrient levels in Rhode Island waters have decreased over the past 15 years (RI CRMC 2016; VHB 2023), and Rhode Island’s southern shoreline waters have overall remained acceptable for both swimming and shellfishing (Rhode Island Division of Planning 2016). Dissolved inorganic phosphorus (a form of phosphorus in fertilizers) concentrations at monitoring stations in the Long Island Sound and Narragansett Bay were rated as “poor” (0.05–0.20 milligram per liter) (EPA 2012).

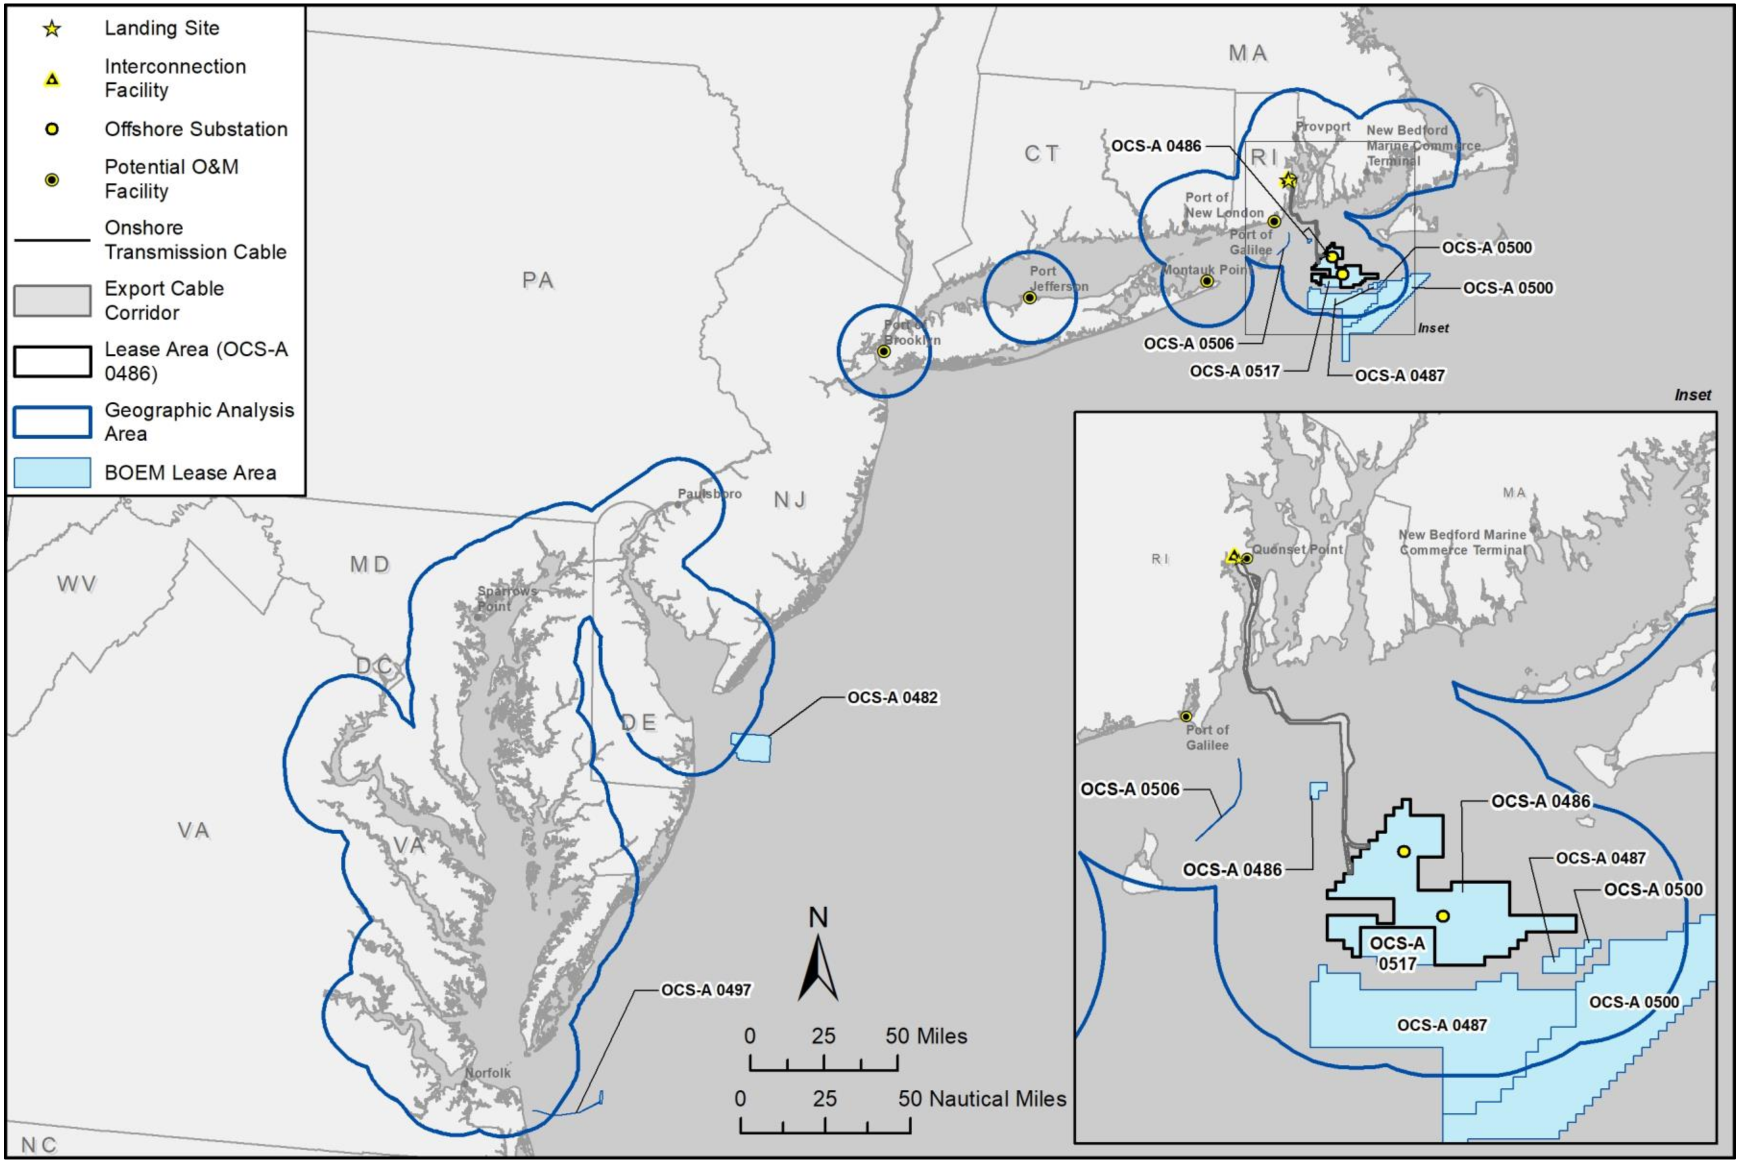

**Figure 3.21-1. Geographic analysis area for offshore water quality.**

Data are limited for water-column contaminant levels. In the Rhode Island Sound, organic contaminants were below detectable limits (USACE 2004; VHB 2023). Higher concentrations of heavy metals and PCBs have been identified in the northern reaches of Narragansett Bay compared to lower reaches (VHB 2023). Past investigations in and around the analysis area have not identified metal, PCB, or organic and inorganic pollutant concentrations above ambient water quality criteria (RI CRMC 2010). Contaminants could also reside within the sediment column and contribute to water quality conditions if disturbed. The Narragansett Bay is rated as “poor” for sediment toxicity (EPA 2012).

Turbidity is influenced by currents and storms, which lead to the resuspension of clay, silt, and fine-grained sand that comprise the sediment. Federal marine waters typically have very low concentrations of total suspended solids. Past investigations in the Rhode Island Sound revealed a range of turbidity levels from 0.1 to 7.4 milligram per liter of total suspended solids (USACE 2004; VHB 2023). Within the Narragansett Bay, annual average visibility depth in 2017–2019 ranged from 1.7 to 2.3 meters. See COP Section 4.2 for additional information regarding physical oceanographic and meteorological conditions within the analysis area.

#### 3.21.1.2 Onshore Water Quality

Geographic analysis area: The GAA for onshore water quality impacts comprises the watersheds and groundwater basins that cross or fall within the Lease Area (Figure 3.21-2). This analysis area was chosen to capture the extent of the natural network of waterbodies that could be affected by construction and operations activities of the Project.

Affected environment: The onshore analysis area for surface water encompasses the Lower West Passage subwatershed (Hydrologic Unit Code 010900040908), where all Project components would be located (see Figure 3.21-2). The Lower West Passage subwatershed includes more than 500 surface water features (USGS 2004). The Project’s onshore facilities would not cross surface waterbodies. The nearest surface water features to the Lease Area that would contribute to flows to and from the Lease Area include 10 perennial streams/rivers, three artificial paths, 16 swamps/marshes, and 12 perennial lakes/ponds. These waterbodies, which are identified in Figure 3.21-2, would have the greatest influence on or from the Project and are therefore the focus of this analysis of onshore water quality impacts.

Surface water quality within the onshore water quality analysis area is generally good. None of the surface waterbodies near the Lease Area are currently listed as impaired (Rhode Island DEM 2021a). There is only one named waterbody—Mill Creek—near the Lease Area. Mill Creek, including its tributaries, is designated as Class B (Rhode Island DEM 2021b), which includes waters that are designated for fish and wildlife habitat and primary and secondary contact recreational activities (250 RICR 150.05 (Rhode Island Department of State 2018).

Groundwater resources are limited in the analysis area. The Project would be located (at its closest point) approximately 0.1 mile west of the Conanicut Island Aquifer, which is a sole source aquifer (URI Environmental Data Center and Rhode Island GIS 2016a). At its nearest points, the Project would be located approximately 1.2 miles east of the nearest groundwater recharge area and 2 miles east of the Pettaquamscutt groundwater reservoir, which is classified as a Class GAA groundwater (URI Environmental Data Center and Rhode Island GIS 2016b, 2016c). Class GAA groundwaters are known or presumed suitable for drinking water use without treatment and fall within a water supply priority for the area (Rhode Island DEM 2009).

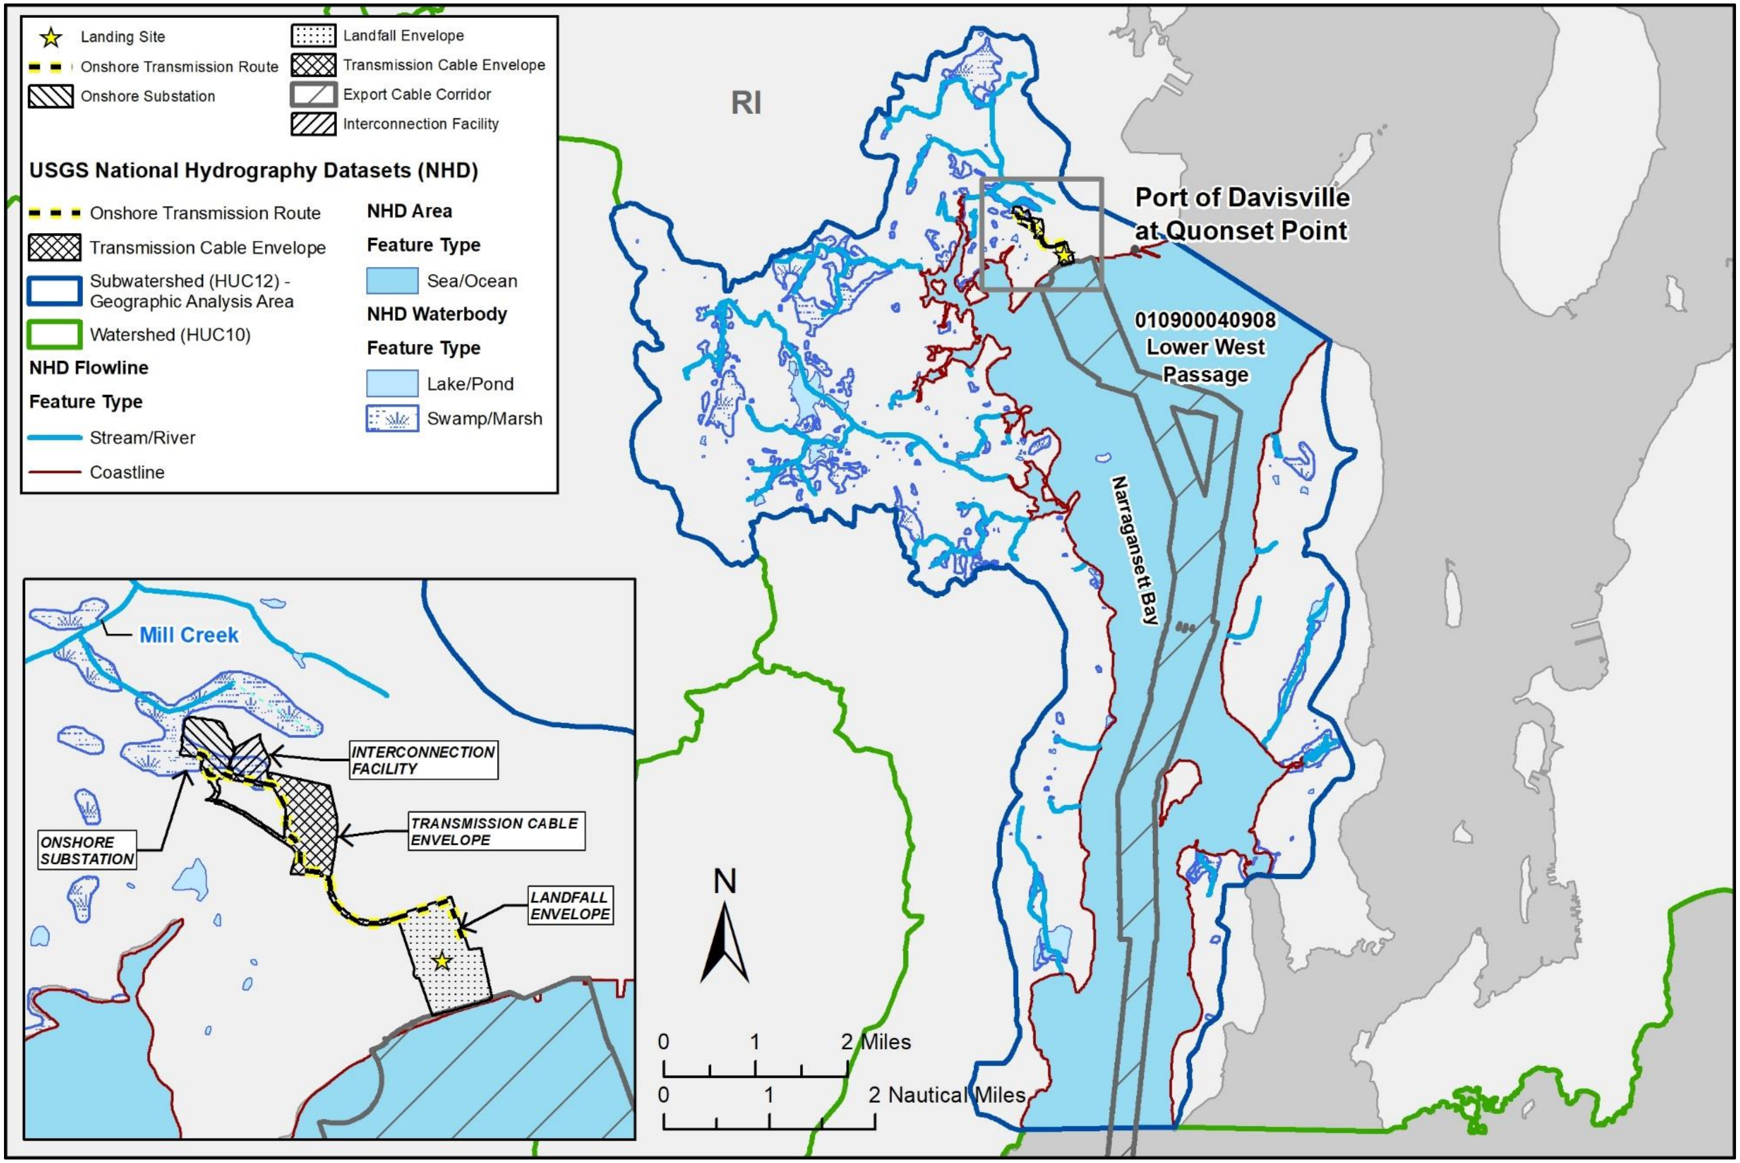

**Figure 3.21-2. Geographic analysis area for onshore water quality.**

There are 12 hazardous waste generating facilities near the Project (EPA 2021a). One of these facilities, the Senesco Marine Repair Yard, is approximately 0.7 mile from the eastern edge of the Project and 0.5 mile from the northeast corner of the cable corridor. The Senesco Marine Repair Yard has a current CWA violation within the past 12 months due to a violation of their NPDES permit (EPA 2021b). There is one hazardous waste cleanup site (EPA ID#: RID063900690) that includes the landfall work area (EPA 2021c). The waste storage container areas and tanks at this site have been "clean closed" in accordance with Resource Conservation and Recovery Act regulations, and there are no current identified violations at the facility (EPA 2021c, 2021d).

### 3.21.2 Environmental Consequences

#### 3.21.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

This assessment analyzes the maximum-case scenario; however, there is the potential for variances in the proposed Project build-out, as defined in the PDE (see Appendix D). The Project design parameters that would influence the magnitude of the impacts on offshore waters include the number of WTGs and distance of installed IAC. Construction and operations activities for fewer WTGs and a shorter IAC distance could result in similar or lower impacts than described in Section 3.21.2.2. For onshore waters, the Project design parameters that would influence the magnitude of the impacts include the location of and construction of or within the OnSS, ICF, and landfall work area. However, EPMs implemented during both construction and decommissioning, as well as a facility-specific spill plan implemented during O&M, would decrease the potential for impacts to onshore waters. Likewise, the implementation of the Project OSRP would help minimize impacts on offshore water quality from spills. These EPMs would be implemented across all alternatives; therefore, BOEM would not expect measurable potential variances in impacts across the alternatives.

See Appendix E1 for a summary of IPFs analyzed for water quality across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Table E1-4 in Appendix E1.

Table 3.21.1 discloses IPF findings carried forward for analysis in this section. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion.

A detailed analysis of the Proposed Action follows the table. Detailed analysis of other considered action alternatives is also provided below the table if the analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4 to facilitate reader comparison across alternatives.

The conclusion section within each alternative analysis discussion includes a rationale for the overall impact determination. The overall impact of any alternative would be **minor** adverse because the effects would be small, and the resource would be expected to recover completely without remedial or mitigating action.

**Table 3.21-1. Alternative Comparison Summary for Water Quality**

<table>
<tr>
<th>Impact-Producing Factor</th>
<th>No Action Alternative</th>

<th>Alternative E<br>(Viewshed Alternative)<br>64 or 81 WTGs</th>
<th>Alternative F<br>(Higher Capacity Turbine Alternative)<br>56 WTGs</th>
<th>Alternative G<br>(Preferred Alternative)<br>65 WTGs</th>
</tr>
<tr>
<td>Accidental releases and discharges</td>
<td>Offshore: Routine spills would result in little change to water quality and would therefore be localized, short term, and minor adverse. In the unlikely event an allision or collision involving Project vessels or components resulted in a large spill, impacts on water quality would be minor to moderate adverse, and would range from short term to long term, depending on the type and volume of material released, the specific conditions (e.g., depth, currents, weather conditions) at the location of the spill, and effectiveness of the cleanup techniques deployed.<br><br>Vessel operators would be required to comply with federal and international requirements for the management of shipboard trash and the USCG ballast water management requirements outlined in 33 CFR 151 and 46 CFR 162. Accidental releases of trash and debris would be infrequent and negligible adverse, and any allowed vessel discharges, such as bilge and ballast water, would be restricted to uncontaminated or appropriately treated liquids.</td>
<td>Offshore: Fuels and oils would be required for Proposed Action offshore equipment, vessels, and infrastructure. The volumes of fuels and oils and number of vessels required during O&M and decommissioning would be less than that required during construction and installation. Should a spill occur, response and containment procedures would limit the reach of the spill to a localized area, where changes to water quality would be detectable and would exceed water quality standards. As a result, adverse impacts on water quality would be short term, with spills generally dispersing within days (BOEM 2015), and minor to moderate adverse, depending on the severity of the spill.<br><br>In the unlikely event an allision or collision involving Project vessels or components results in a large spill, impacts on water quality would also be minor to moderate adverse, and short term to long term, depending on the type and volume of material released and the specific conditions (e.g., depth, currents, weather conditions) at the location of the spill.<br><br>Accidental releases of trash and debris would be infrequent and negligible adverse because Project actions would comply with federal and international requirements for management of shipboard trash and USCG regulations regarding waste and discharge.<br><br>The Proposed Action could add accidental releases of fuels, oils, or hazardous material; sediment; and/or trash and debris to conditions under the No Action Alternative. BOEM estimates that the Project would result in an up-to-20% increase in total chemical usage over the No Action Alternative within the offshore water quality GAA. All vessels associated with the Proposed Action and other offshore wind projects would comply with the USCG requirements for the prevention and control of oil and fuel spills. Additionally, training and awareness of EPMs (see Table F-1 in Appendix F) proposed for waste management and mitigation of marine debris would be required of Revolution Wind Project personnel. For this reason, the Proposed Action</td>
<td colspan="4">Offshore: Alternatives C through F would reduce the number of WTG foundations. This would require less fuels and oils associated with equipment, vessels, and infrastructure; less fuels and oils stored at WTGs; and less volumes of associated trash and debris. Differences in estimated total fuel and oil storage by alternative are disclosed in Appendix E4 and range from 444,000 gallons (Alternative F) to 563,000 gallons (Alternative D). These alternatives would also likely reduce the number and duration of vessels required during construction and installation, O&M, and decommissioning activities. Under all action alternatives, Project EPMs (see Table F-1 in Appendix F), permit requirements, controls, and procedures would be implemented as part of the Project to reduce the potential or extent of offshore spills, thereby avoiding or minimizing impacts on water quality. Therefore, impacts under these alternatives would be similar to the Proposed Action: short term to long term negligible to moderate adverse.<br><br>Ongoing and planned actions, including those under Alternatives C through F, would require fuels and oils. Any Project-related accidental spills or discharges, including those associated with vessel allisions or collisions, would add to water quality impacts from other planned actions, albeit at potentially slightly lower volumes than the Proposed Action under these alternatives. Therefore, Alternatives C through F when combined with past, present, and reasonably foreseeable activities would result in short-term to long-term and minor to moderate adverse cumulative impacts on water quality.</td>
<td>Offshore: Alternative G would reduce the number of WTG foundations. This would require less fuels and oils associated with equipment, vessels, and infrastructure; less fuels and oils stored at WTGs; and less volumes of associated trash and debris as compared to the Proposed Action. Alternative G is estimated to result in a total fuel and oil storage of 473,000 gallons (see Appendix E4). This alternative would also likely reduce the number and duration of vessels required during construction and installation, O&M, and decommissioning activities. Project EPMs (see Table F-1 in Appendix F), permit requirements, controls, and procedures would be implemented as part of the Project to reduce the potential or extent of offshore spills, thereby avoiding or minimizing impacts on water quality. Therefore, impacts under this alternative would be similar to the Proposed Action: short term to long term negligible to moderate adverse.<br><br>Ongoing and planned actions, including those under Alternative G, would require fuels and oils. Any Project-related accidental spills or discharges, including those associated with vessel allisions or collisions, would add to water quality impacts from other planned actions, albeit at potentially slightly lower volumes than the Proposed Action under these alternatives. Therefore, Alternative G when combined with past, present, and reasonably foreseeable activities would result in short-term to long-term and minor to moderate adverse cumulative impacts on water quality.</td>

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) Up to 100 WTGs | Alternative C (Habitat Alternative) 64 or 65 WTGs | Alternative D (Transit Alternative) 78 to 93 WTGs | Alternative E (Viewshed Alternative) 64 or 81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) 65 WTGs |
|---|---|---|---|---|---|---|---|
| | | when combined with other past, present, and reasonably foreseeable projects would result in short-term to long-term **minor** to **moderate** adverse impacts. | | | | | |
| | **Onshore:** Surface and groundwater bodies would be monitored and managed to meet water quality standards and drinking water resource protections. As a result, adverse impacts from future onshore wind activities supporting OSW on onshore water quality under the No Action Alternative would be short term to long term **negligible** to **minor** adverse. | **Onshore:** Revolution Wind would comply with all permit and regulatory requirements related to water quality. As a result, the adverse impact on water quality would be short term **negligible** to **minor** adverse. | **Onshore:** Alternatives C through F would not change Project onshore activities; therefore, impacts would be the same as the Proposed Action: short term **negligible** to **minor** adverse. | | | | **Onshore:** Alternative G would not change Project onshore activities; therefore, impacts would be the same as the Proposed Action: short term **negligible** to **minor** adverse. |
| Anchoring and new cable emplacement/ maintenance | **Offshore:** Disturbances to the seafloor during anchoring would temporarily increase suspended sediment and turbidity levels in and immediately adjacent to the anchorage area. BOEM anticipates that future offshore wind projects would use dredging only when necessary and would rely on other cable-laying methods for reduced impacts (such as jet plow or mechanical plow) where feasible. Furthermore, these impacts from individual projects would not overlap with one another spatially or temporally. As a result, adverse impacts on offshore water quality under the No Action Alternative would be **minor** adverse and temporary. | **Offshore**: Changes to water quality would be detectable but would not result in degradation of water quality that would exceed water quality standards. As a result, adverse impacts on offshore water quality from anchoring, potential in situ munitions and explosives of concern (MEC)/UXO disposal, and cable placement activities under the Proposed Action would be **minor** adverse and temporary.<br>BOEM estimates a cumulative total of 10,158 acres of cabling-related disturbance for the Proposed Action plus all other future offshore wind projects and 5,066 acres of anchoring-related disturbance for the Proposed Action plus all other future offshore wind projects. Suspended sediment concentrations during activities other than dredging would be within the range of natural variability typical for the affected area. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in short-term **minor** adverse cumulative impacts to water quality. | **Offshore:** Alternatives C through F would reduce the number of WTGs and scour protections associated with IACs. This would reduce seafloor disturbances during construction and installation, O&M and decommissioning. Differences in estimated acres of anchoring by alternative are disclosed in Appendix E4 and range from 1,812 acres (Alternative F) to 2,985 acres (Alternative D). Project design for IACs and the export cable has not occurred for Alternatives C through F; therefore, a comparison of cabling-related disturbance is not available. However, best professional judgment suggests that the footprint of the IAC, OSS-link cable, and RWEC would change and be slightly reduced to match the reduced number of WTGs. EPMs in Table F-1 in Appendix F would be implemented to avoid or minimize impacts to water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As a result, impacts to water quality under these alternatives would be similar to the Proposed Action: **minor** adverse and temporary.<br>Total anchoring and cabling seafloor disturbance that could occur from ongoing and planned actions, including those actions under Alternatives C through F, would be similar but slightly reduced from the Proposed Action (see Appendix E4 for a comparison of cumulative anchoring acreage estimates). Project-related seafloor disturbances would add to water quality impacts. Therefore, Alternatives C through F when combined with past, present, and reasonably foreseeable activities would result in short-term and **minor** adverse cumulative impacts on water quality. | | | | **Offshore:** Alternative G would reduce the number of WTGs and scour protections associated with IACs. This would reduce seafloor disturbances during construction and installation, O&M, and decommissioning. Alternative G would result in 2,098 acres of anchoring and 3,400 acres of cabling disturbance (see Appendix E4). EPMs in Table F-1 in Appendix F would be implemented to avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As a result, impacts to water quality under this alternative would be similar to the Proposed Action: **minor** adverse and temporary.<br>Total anchoring and cabling seafloor disturbance that could occur from ongoing and planned actions, including those actions under Alternative G, would be similar but slightly reduced from the Proposed Action (see Appendix E4 for a comparison of cumulative anchoring acreage estimates). Project-related seafloor disturbances would add to water quality impacts. Therefore, Alternative G when combined with past, present, and reasonably foreseeable activities would result in short-term and **minor** adverse cumulative impacts on water quality. |

### 3.21.2.2 Alternative A: Impacts of the No Action Alternative on Water Quality

#### 3.21.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for water quality (see Section 3.21.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.21.2.2.2 Cumulative Impacts

##### Offshore Water Quality

This section discloses potential offshore water quality impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

Accidental releases and discharges: Future offshore wind activities could contribute to changes in offshore water quality from a spill or release during routine vessel or equipment use, a spill at an offshore wind facility, a spill during construction and installation due to a vessel allision or collision, or the accidental discharge of trash and debris.

Numerous offshore wind projects could occur with overlapping construction schedules between 2022 and 2032 (see Appendix E). This EIS estimates that up to approximately 2.9 million gallons of coolants, fuels, oils, and lubricants could be stored within WTG foundations and the OSS within the offshore water quality GAA. Other chemicals, including grease, paints, and sulfur hexafluoride, would also be used at the offshore wind projects. BOEM anticipates that the likelihood of a major spill of these chemicals during construction due to vessel allisions, collisions, O&M activities, or weather events is very low (once per 1,000 years) (Bejarano et al. 2013). All future offshore wind projects would be required to comply with regulatory requirements related to the prevention and control of accidental spills administered by the USCG and BSEE. OSRPs are required for each project and would provide for rapid spill response, cleanup, and other measures that would help to minimize potential impacts on affected resources from spills. WTGs and OSSs are generally self-contained and would not generate discharge (see COP Appendix D). Vessels would also have onboard containment measures that would further reduce the impact of a spill in the event of an allision or collision.

A release during construction or operations of offshore wind projects would generally be classified as “routine” and minor adverse because of the size of the release (i.e., spills less than 10 barrels, or 420 gallons) and its rapid dispersion (BOEM 2015). Routine spills would result in little change to water quality and would therefore be localized, short term, and **minor** adverse. In the unlikely event an allision or collision involving Project vessels or components resulted in a large spill, impacts on water quality would be **minor** to **moderate** adverse, and would range from short term to long term, depending on the type and volume of material released, the specific conditions (e.g., depth, currents, weather conditions) at the location of the spill, and effectiveness of the cleanup techniques deployed.

Vessel operators would be required to comply with federal and international requirements for the management of shipboard trash and the USCG ballast water management requirements outlined in 33

CFR 151 and 46 CFR 162. Accidental releases of trash and debris would be infrequent and **negligible** adverse, and any allowed vessel discharges, such as bilge and ballast water, would be restricted to uncontaminated or appropriately treated liquids.

Anchoring and new cable emplacement/maintenance: Offshore wind activities would contribute to changes in offshore water quality from resuspension and deposition of sediments during anchoring. BOEM estimates that approximately 1,862 acres of seafloor could be impacted by anchoring under the No Action Alternative within the offshore water quality GAA. Disturbances to the seafloor during anchoring would temporarily increase suspended sediment and turbidity levels in and immediately adjacent to the anchorage area. Currents and storms currently contribute to turbidity throughout the water column from the resuspension of clay, silt, and fine-grained sand making up the sediment. As a result, adverse impacts on offshore water quality under the No Action Alternative would be **minor** adverse and temporary.

BOEM estimates that approximately 6,149 acres of seafloor could be impacted by cable placement under the No Action Alternative within the offshore water quality GAA due to reasonably foreseeable offshore wind development. Similar to anchoring, these activities would contribute to changes in offshore water quality from the resuspension and deposition of sediment. Sediment suspension and deposition from offshore wind projects would be limited in terms of extent and duration.

BOEM anticipates that future offshore wind projects would use dredging only when necessary and would rely on other cable laying methods for reduced impacts (such as jet plow or mechanical plow) where feasible. Furthermore, these impacts from individual projects would not be expected to overlap with one another spatially or temporally. For these reasons, sediment suspension associated with other wind projects would be localized, **minor** adverse, and temporary.

Port utilization: Offshore wind development would use nearby ports as described in Chapter 2 and could also require port expansion or modification, resulting in increased vessel traffic or increased suspension and turbidity from in-water work. These activities could also increase the risk of accidental spills or discharges. However, these actions would be localized, and port improvements would comply with all applicable permit requirements to minimize, reduce, or avoid impacts on water quality. As a result, adverse impacts on offshore water quality under the No Action Alternative would be short term to long term **minor** adverse.

Presence of structures: Reasonably foreseeable offshore wind projects are estimated to result in no more than 181 structures by 2030 within the offshore water quality GAA. These structures could disturb up to 228 acres of seafloor within the water quality GAA from foundation and scour protection installation and disrupt bottom current patterns, leading to increased movement, suspension, and deposition of sediments. Scouring, which could lead to impacts on water quality through the formation of sediment plumes (Harris et al. 2011), would generally occur in shallow areas with tidally dominated currents. Structures could reduce wind-forced mixing of surface waters, whereas water flowing around the foundations could increase vertical mixing (Carpenter et al. 2016; Cazenave et al. 2016). Results from a recent BOEM (2021b) hydrodynamic model of four different WTG build-out scenarios of the offshore RI/MA WEA found that offshore wind projects could alter local and regional physical oceanic processes (e.g., currents, temperature stratification) through their influence on currents from WTG foundations and by extracting energy from the wind. The results of the hydrodynamic model study show that the introduction of offshore wind structures into the offshore area modifies the oceanic responses of current magnitude, temperature, and wave heights by 1) reducing the current magnitude through added flow resistance, 2) influencing the temperature stratification by introducing additional mixing, and 3) reducing current magnitude and wave height by extracting of energy from the wind by the OSW turbines. Alterations in currents and mixing would affect water quality, including DO, but would vary seasonally and regionally. WTGs and OSSs associated with reasonably foreseeable offshore wind projects would be placed in average water depths of 100 to 200 feet where current speeds are relatively low, and offshore cables would be buried where possible. Cable armoring would be used where burial is not possible, such as in hard-bottomed areas. BOEM anticipates that developers would implement best management practices to minimize seafloor disturbance from foundations, scour, and cable installation. As a result, impacts on offshore water quality under the No Action Alternative would be localized, short term, and **minor** adverse.

The exposure of offshore wind structures, which are mainly made of steel, to the marine environment can result in corrosion to the structures without protective measures. Corrosion is a general problem for offshore infrastructures, and corrosion protection systems are necessary to maintain the structural integrity. Protective measures for corrosion (e.g., coatings, cathodic protection systems) are often in direct contact with seawater and have different potentials for emissions, e.g., galvanic anodes emitting metals, such as aluminum, zinc, and indium, and organic coatings releasing organic compounds due to weathering and/or leaching. The current understanding of chemical emissions for offshore wind structures is that emissions appear to be low, suggesting a low environmental impact, especially if compared to other offshore activities, but these emissions may become more relevant for the marine environment with increased numbers of offshore wind projects and a better understanding of the potential long-term effects of corrosion protection systems (Kirchgeorg et al. 2018).

#### *Conclusions*

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts to offshore water quality associated with the Project would not occur. However, ongoing and future activities would have continuing temporary to long-term impacts on water quality from offshore spills or discharge, resuspension and deposition of sediments, scouring, or changes to current patterns and mixing.

BOEM anticipates that the range of impacts for reasonably foreseeable offshore wind activities would be minor to moderate adverse due to short-term erosion and sedimentation, discharges, and dispersal of contaminants during routine spills. As described in Appendix E1, BOEM anticipates that the range of impacts for ongoing activities and reasonably foreseeable offshore activities other than offshore wind would be minor to moderate adverse due to temporary or short-term disturbance to sediments during construction activities.

BOEM anticipates that the impacts associated with future offshore wind activities in the GAA combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **minor** adverse impacts because the effects would be small and the resource would recover completely.

### Onshore Water Quality

This section discloses potential onshore water quality impacts associated with future offshore wind development (without the Proposed Action). The cumulative impact analysis for the No Action

Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

Accidental releases and discharges: Reasonably foreseeable onshore activities supporting OSW could contribute to changes in water quality from accidental releases and discharges, dispersal of contaminants during routine spills, or accidental releases of contaminated or hazardous materials or debris if surface water bodies are intersected. Routine spills that reach surface water would be expected to disperse rapidly (BOEM 2015).

Future onshore activities supporting OSW would be expected to comply with any applicable permit requirements, including spill controls, to minimize, reduce, or avoid impacts on surface water and groundwater quality. Degradations to onshore water quality from future onshore activities are expected to be localized and temporary to long term, depending on the nature of the activities, although overall water quality is expected to continue to meet Rhode Island water quality standards (250 RICR 150.05) (Rhode Island Department of State 2018). Surface and groundwater bodies would be monitored and managed to meet water quality standards and drinking water resource protections. As a result, adverse impacts from future onshore activities supporting OSW on onshore water quality under the No Action Alternative would be short term to long term **negligible** to **minor** adverse.

New cable emplacement/maintenance: Future onshore activities supporting OSW could result in changes to water quality from cable-related land disturbance, such as surficial digging, land clearing, trenching, HDD, and use of vehicles, that could contribute to erosion and sedimentation. These activities would be expected to comply with any applicable permit requirements to implement erosion and stormwater controls to minimize, reduce, or avoid impacts on water quality. Degradations to onshore water quality from future onshore activities are expected to be localized and temporary to long term, depending on the nature of the activities, although overall water quality is expected to continue to meet Rhode Island water quality standards (250 RICR 150.05). Waterbodies would be monitored and managed to meet water quality standards and drinking water resource protections. As a result, adverse impacts from future activities on onshore water quality under the No Action Alternative would be temporary to long term **negligible** to **minor** adverse.

Port utilization: Future onshore activities supporting OSW are expected to continue to use ports and would likely require expansion or modification of existing onshore port facilities in the analysis area. These port-related activities would include land disturbance.

Future expansion or modification of existing ports in addition to increased use could also increase the risk of accidental spills or discharges. However, these actions would be localized, and port improvements would comply with all applicable permit requirements to minimize, reduce, or avoid impacts on water quality. As a result, adverse impacts on onshore water quality under the No Action Alternative would be short to long term but **negligible** to **minor** adverse. Port activities would not include surficial digging that could encounter groundwater; as a result, there are no potential impacts on groundwater from port use (Rhode Island Department of State 2018).

Presence of structures: The presences of structures from future onshore activities supporting OSW would result in an increase in impervious surfaces that could contribute to stormwater runoff to nearby waterbodies. These activities would be expected to comply with any applicable permit requirements to implement erosion and stormwater controls to minimize, reduce, or avoid impacts on water quality. As a result, adverse impacts on onshore water quality under the No Action Alternative would be short term to long term **negligible** to **minor** adverse.

### *Conclusions*

Under the No Action Alternative, BOEM would not approve the COP; Project construction and installation, O&M, and decommissioning would not occur; and potential impacts on onshore water quality associated with the Project would not occur. However, ongoing and future activities would continue to contribute temporary to long-term impacts on water quality from onshore erosion and sedimentation, or discharges, dispersal of contaminants during routine spills.

BOEM anticipates that the range of impacts for reasonably foreseeable offshore wind activities and connected onshore activities would be **negligible** to **minor** adverse due to short-term erosion and sedimentation, discharges, and dispersal of contaminants during accidental and routine spills. As described in Appendix E1, BOEM anticipates that the range of impacts for ongoing and reasonably foreseeable offshore activities other than offshore wind would be **negligible** to **minor** adverse primarily due to temporary or short-term disturbance to sediments during port expansion and other onshore construction and installation activities (e.g., beach and coastal restoration projects). Other reasonably foreseeable non–offshore wind IPFs with potential for routine and/or accidental releases or sediment disturbance are either 1) not expected to overlap with the GAA spatially and temporally or 2) would not be expected to have measurable impacts on the overall water quality in the GAA as discussed in Appendix E1.

BOEM anticipates that the impacts associated with future offshore wind activities in the GAA for onshore water quality combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **minor** adverse impacts because the effects would be small and the resource would recover completely without remedial or mitigating action.

## 3.21.2.3 Alternative B: Impacts of the Proposed Action on Water Quality

### 3.21.2.3.1 Construction and Installation

### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> Fuels and oils would be required for Proposed Action offshore construction and installation equipment, vessels, and infrastructure over the approximately 15-month construction and installation period. In the event of a spill or release during construction and installation activities, offshore water quality would be degraded. Most inadvertent spills of fuels and oils used during construction and installation would be classified as routine and minor adverse because of their size (i.e., spills less than 10 barrels, or 420 gallons) and rapid dispersion (BOEM 2015). As described in Section 3.21.1.2, the likelihood of a spill due to construction and installation activities and weather events is low (once per 1,000 years). A draft OSRP has been prepared for the Project and includes processes for rapid spill response, containment, cleanup, and other measures that would help minimize impacts on water quality from spills (see COP Appendix D).

Fuels and oils would be used and stored at WTGs and OSSs. A maximum of approximately 3,204 gallons of coolants, fuels, oils and lubricants would be stored at each WTG (or a total of approximately 320,400 gallons for the maximum 100 proposed WTGs), and a maximum of 132,400 gallons of fuels, oils, and lubricants would be stored at each OSS (or a total of approximately 264,800 gallons for the two proposed OSSs). Secondary containment measures would be implemented for all diesel tanks at WTGs (VHB 2023). Under the Proposed Action, the highest possible spill would be the inadvertent release of fuels and oils stored at WTGs and OSSs, which would contain up to 585,200 gallons of fuels and oils. Project EPMs (see Table F-1 in Appendix F), permit requirements, controls, and procedures would be implemented as part of the Project to reduce the potential or extent of offshore spills, thereby avoiding or minimizing impacts on water quality. Should a spill occur, response and containment procedures would limit the reach of the spill to a localized area, where changes to water quality would be detectable and would exceed water quality standards. As a result, adverse impacts on water quality would be short term, with spills generally dispersing within days (BOEM 2015), and **minor** to **moderate** adverse, depending on the severity of the spill.

Construction of the Proposed Action would require as many as 59 vessels. Vessels would be equipped with spill containment and cleanup materials, and any accidental spill or release of fuels, oils, or other hazardous materials would be managed through the Project’s OSRP (VHB 2023). All construction-related vessels would be required to comply with regulatory requirements related to the prevention and control of spills and discharges (VHB 2023). The chance of a spill occurring due to vessel allisions or collisions would be low (once per 1,000 years). In the unlikely event an allision or collision involving Project vessels or components results in a large spill, impacts on water quality would be **minor** to **moderate** adverse, and short term to long term, depending on the type and volume of material released and the specific conditions (e.g., depth, currents, weather conditions) at the location of the spill.

The Proposed Action could also result in accidental releases of trash and debris from vessels or in situ MEC/UXO disposal into offshore waters. EPMs in Table F-1 in Appendix F would be implemented to avoid or minimize impacts on water quality from releases of trash or debris. Accidental releases of trash and debris would be infrequent and **negligible** adverse because vessels would comply with federal and international requirements for management of shipboard trash and USCG regulations regarding waste and discharge. Foreign-flagged vessels would also have a USCG-compliant and certified ballast water management system. Any allowed vessel discharges, such as bilge and ballast water, would be restricted to uncontaminated or appropriately treated liquids. Should an accidental release occur, it would be limited to the localized area; adverse impacts on water quality would be short term **minor** to **moderate** adverse.

Existing restoration and protection initiatives established for offshore areas, including those developed as part of the Long Island Sound Study initiative (Long Island Sound Study 2021), Bay Assessment & Response Team (Rhode Island DEM 2021c), Rhode Island Beach Monitoring Program (Rhode Island Department of Health 2021), and Rhode Island Environmental Monitoring Collaborative (RIEMC 2021), would help identify and manage water quality degradations, should they occur.

<u>Anchoring and new cable emplacement/maintenance:</u> Approximately 3,178 acres and 4,009 acres of seafloor could be impacted by anchoring and cable placement, respectively, under the Proposed Action within the offshore water quality GAA. Potential in situ MEC/UXO disposal could also result in sediment suspension and disturbance. Disturbances to the seafloor would temporarily increase suspended sediment and turbidity levels in and immediately adjacent to the anchorage, disposal, or cable placement area. Sediment modeling completed for the Proposed Action indicates that sediment suspension and deposition would occur during in-water offshore activities (RPS 2022). The modeling showed that in most locations

the total suspended solids plumes are limited to the bottom 10 feet of the water column and are temporary at any given location. Suspended sediments would settle within hours or days, including up to 6.7 hours in the RWF IAC, 61 hours in the RWEC-OCS, approximately 70 hours along the RWEC-RI, and 70 hours at the landing site where HDD would occur.

EPMs in Table F-1 in Appendix F would avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. Changes to water quality would be detectable but would not result in degradation of water quality that would exceed water quality standards. As a result, adverse impacts on offshore water quality from anchoring and cable placement activities under the Proposed Action would be **minor** adverse and temporary.

Port utilization: The Project would use nearby ports for a construction hub, for WTG storage and pre-commissioning, and for foundation marshalling and fabrication. These activities would result in increased vessel traffic and increased in-water activities, which would contribute to increased suspension and turbidity. As many as 59 vessels would be required during construction and installation. These activities could also increase the risk of accidental spills or discharges. Port-related actions would be localized, and port activities would comply with all applicable permit requirements to minimize, reduce, or avoid impacts on water quality. In addition, EPMs in Table F-1 in Appendix F would avoid or minimize impacts on water quality. As a result, adverse impacts on offshore water quality under the Proposed Action would be short to long term but **minor** adverse.

It is not known at this time if port expansions or modifications would be required for the Proposed Action (VHB 2023). If so, these activities would require in-water work, including vessel use, that would increase sediment suspension and turbidity. Impacts from these activities would be similar to those described above for port uses.

Presence of structures: The Proposed Action would result in up to 100 monopile foundations for WTGs and two monopile foundations for OSSs within the GAA for offshore water quality. These structures could temporarily disturb up to approximately 3,172 acres (31.1 acre per foundation) during seafloor preparation. Foundations would encompass a total footprint of approximately 71 acres (0.7 acre per foundation) of seafloor disturbance and scour protection. Seafloor disturbance would occur from foundation and scour protection installation, and the presence of structures would disrupt bottom current patterns and lead to increased movement, suspension, and deposition of sediments. Project-related scouring could impact water quality through the formation of sediment plumes, and structures could reduce wind-forced mixing of surface waters. Flows around foundations could increase vertical mixing of the water column. These changes in currents and mixing would affect water quality but would vary seasonally and regionally. EPMs in Table F-1 in Appendix F would be implemented to minimize seafloor disturbance from foundations and scour, including the installation of scour protection and cable armoring where burial is not possible, that would avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As a result, adverse impacts on offshore water quality under the Proposed Action would be localized, short term, and **minor** adverse.

### Onshore Activities and Facilities

Accidental releases and discharges: Onshore facilities would not cross surface waterbodies. Onshore construction equipment, vehicles, and infrastructure under the Proposed Action would require fuels and oils during the construction and installation period. Although unlikely due to distance to closest stream of 200 feet, any inadvertent spills occurring during construction and installation, such as the release of fuels and oils from vehicles or infrastructure, would be classified as routine and minor adverse (BOEM 2015).

Table F-1 in Appendix F includes EPMs to avoid or minimize potential spill impacts on water quality, to comply with all general construction permit requirements, and to implement runoff controls and buffers. In addition, Revolution Wind would develop and implement a stormwater pollution prevention plan and HDD inadvertent release plan to protect nearby surface waters. Although these procedures would reduce the likelihood and extent of routine spills, spills in or near surface waterbodies would contribute to detectable changes that could result in an exceedance of water quality standards. Therefore, the adverse impact on water quality would be short term **minor** adverse.

There are no groundwater resources crossed by the Project. As described in Section 3.21.1.3, the nearest groundwater recharge area would be approximately 1.2 miles from the Project. At this distance, the risk of any inadvertent spill or release to groundwater during construction and installation of the Project would be **negligible** adverse.

New cable emplacement/maintenance: The Project would require the installation of permanent (over the life of the Project) onshore export cable (i.e., the RWEC). This activity would require temporary (up to 18 months) ground-disturbing activities including surficial digging, land clearing, trenching, HDD, and use of equipment and vehicles. The RWEC route does not directly intersect any surface waterbody; however, surface disturbance associated with installation could contribute to erosion and sedimentation in nearby surface waterbodies, thereby leading to changes in water quality. Overall construction activities and Project infrastructure would disturb more than 1 acre, and discharges would therefore need to be permitted through a general construction permit under the NPDES program. Revolution Wind would also develop a stormwater pollution prevention plan as part of the permitting process that would result in implementation of erosion and sediment controls prior to and during construction and installation. EPMs in Table F-1 in Appendix F would avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As a result, adverse impacts on onshore water quality under the Proposed Action would be localized, short term, and **negligible** to **minor** adverse.

The distance between Project-related land-disturbing activities and the nearest groundwater recharge area (1.2 miles) would result in **negligible** adverse risks of a spill or release reaching groundwater resources.

Port utilization: The Project would use nearby ports to support construction and installation of the Proposed Action. Increased use and related activities at ports could increase the risk of accidental spills or discharge to nearby surface waterbodies. Inadvertent spills or releases during construction and installation would be classified as routine and would be localized, short term, and minor adverse. It is not known at this time if port expansions or modifications would be required. If so, these activities would require surface disturbances that would contribute to erosion and sedimentation in nearby surface waterbodies, thereby leading to changes to water quality.

EPMs in Table F-1 in Appendix F would avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As a result, adverse impacts on onshore surface water quality under the Proposed Action would be temporary and **negligible** to **minor** adverse. No impacts on groundwater are anticipated from port use during onshore construction and installation because there would be no required surface disturbance that could encounter groundwater or result in water quality degradations through runoff into groundwater recharge areas.

<u>Presence of structures:</u> The presence of structures from the Proposed Action would result in an increase in impervious surfaces (20 acres) that could contribute to stormwater runoff to nearby surface waterbodies. The OSS would encompass approximately 16 acres, and the onshore ICF would temporarily encompass approximately 4 acres. Fill materials would be used for installation of structures. None of the onshore facilities of the RWEC route directly intersect any surface waterbody; however, surface disturbance associated with installation of onshore facilities could contribute to erosion and sedimentation in nearby surface waterbodies, thereby leading to changes in water quality. EPMs in Table F-1 in Appendix F would avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As described under the new cable emplacement/maintenance IPF, discharges would be permitted through a general construction permit under the NPDES program. Revolution Wind would also develop a stormwater pollution prevention plan as part of the permitting process that would result in implementation of erosion and sediment controls prior to and during construction and installation. As a result, impacts on onshore water quality under the Proposed Action would be localized, short term, and **negligible** to **minor** adverse. The distance between Project-related land-disturbing activities and the nearest groundwater recharge area (1.2 miles) would result in minimal risk of runoff reaching groundwater resources; **negligible** adverse impacts on groundwater are anticipated from the presence of structures during onshore construction and installation.

### 3.21.2.3.2 Operations and Maintenance and Decommissioning

### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> O&M and decommissioning of the offshore portion of the Project would lead to similar adverse impacts on water quality from inadvertent spills or releases that could occur during construction and installation. The volumes of fuels and oils and number of vessels required during O&M and decommissioning would be less than that required during construction and installation (VHB 2023). The same Project features and EPMs described for offshore construction and installation (see Section 3.21.2.2.1) would be implemented during O&M and decommissioning to avoid or minimize potential spill impacts on water quality. Most inadvertent spills of fuels and oils used during O&M and decommissioning would be classified as routine and minor adverse. Should a routine spill occur, it would be temporarily detectable and would disperse rapidly, thereby limiting the magnitude and extent of changes to water quality. Therefore, changes to water quality would be localized, short term, and **minor to moderate** adverse, depending on the severity of potential spills or releases.

<u>Anchoring and new cable emplacement/maintenance:</u> Anchoring and cable-related activities during O&M and decommissioning would contribute to changes in offshore water quality from the resuspension and deposition of sediment. O&M and decommissioning of the offshore portion of the Project would lead to similar minor adverse and temporary adverse impacts on water quality from anchoring and new cable emplacement and maintenance that would occur during construction and installation. Fewer anchoring

activities would occur during O&M and decommissioning activities compared to construction and installation. Cable activities would also be less frequent during O&M and decommissioning and would typically include maintenance activities that would result in less seafloor disturbance than installation activities during construction and installation. EPMs in Table F-1 in Appendix F would avoid or minimize impacts on water quality, and Revolution Wind would comply with all permit and regulatory requirements related to water quality. As described for construction and installation (see Section 3.21.2.2.1), suspended sediments would typically settle within hours or days, and the extent of deposition would be limited. Changes to water quality from anchoring and cable activities would be detectable but would not result in degradation of water quality that would exceed water quality standards. As a result, adverse impacts on offshore water quality under the Proposed Action would be **minor** adverse and temporary.

<u>Port utilization:</u> The Project would use nearby ports to support O&M and decommissioning of the Project. As described under offshore construction and installation, these activities would result in increased vessel traffic and increased in-water activities, which would contribute to increased suspension and turbidity. Up to 16 vessels would be required during O&M and decommissioning. These activities could also increase the risk of accidental spills or discharges. See offshore activities and facilities analysis in Section 3.21.2.2.1 for details. As a result, adverse impacts on offshore water quality under the Proposed Action would be short to long term but **minor** adverse.

<u>Presence of structures:</u> O&M would not result in additional structures that would lead to impacts on water quality. During decommissioning, structures would be removed to a depth of 15 feet below the seafloor (VHB 2023), which would reduce in-water structures that have disrupted bottom current patterns and led to scouring (as described for construction and installation). Water quality during O&M would remain the same, whereas water quality during decommissioning could result in short-term changes to water quality; however, these changes would be limited in terms of duration and extent (similar to those described for construction and installation of structures). See offshore activities and facilities analysis in Section 3.21.2.2.1 for details. As a result, adverse impacts on offshore water quality under the Proposed Action would be short term **minor** adverse.

### Onshore Activities and Facilities

<u>Accidental releases and discharges:</u> O&M activities would require vehicles and equipment that require the use of fuels, oils, and lubricants. The volumes of fuels and oils and number of vehicles required during O&M and decommissioning would be less than that required during construction and operations (VHB 2023). Although unlikely due to distance to closest surface waterbody of 200 feet, any inadvertent spills in onshore waters during O&M or decommissioning would be classified as routine and **minor** adverse (BOEM 2015). See onshore activities and facilities analysis in Section 3.21.2.2.1 for details. As a result, adverse impacts on onshore surface water quality under the Proposed Action would be short term **minor** adverse. Similar to onshore construction and installation, O&M and decommissioning activities would be distanced far enough from groundwater recharge areas (at least 1.2 miles) that the risk of a spill or release reaching groundwater resources would be **negligible** adverse.

<u>New cable emplacement/maintenance:</u> O&M would require limited land disturbance should maintenance be required for underground infrastructure (i.e., transmission cable). Decommissioning of the onshore portion of the Project would lead to the same types of impacts on surface water quality from erosion,

sedimentation as described under construction and installation. See onshore activities and facilities analysis in Section 3.21.2.2.1 for details. As a result, adverse impacts on offshore water quality under the Proposed Action would be temporary and **negligible** to **minor** adverse.

The distance between Project-related land-disturbing activities and the nearest groundwater recharge area (1.2 miles) would result in limited risks of a spill or release reaching groundwater resources; **negligible** adverse impacts on groundwater are anticipated from land disturbance during onshore O&M and decommissioning.

<u>Port utilization:</u> The Project would use nearby ports to support O&M and decommissioning of the Project. As described for onshore construction and installation, increased use and related activities at ports could increase the risk of accidental spills or discharge to nearby surface waterbodies. See onshore activities and facilities analysis in Section 3.21.2.2.1 for details. As a result, adverse impacts on onshore surface water quality under the Proposed Action would be temporary and **minor** adverse. **Negligible** adverse impacts on groundwater are anticipated from port use during onshore construction and installation because there would be no required surface disturbance that could encounter groundwater or result in water quality degradations through runoff into groundwater recharge areas.

<u>Presence of structures:</u> O&M would not result in additional structures that would lead to impacts on water quality. During decommissioning, structures would be removed in compliance with applicable laws and regulations at that time (VHB 2023). Water quality during O&M and decommissioning would remain the same, whereas water quality during decommissioning could result in short-term changes to water quality; however, these changes would be limited in terms of duration and extent (similar to those described for construction and installation of structures). See onshore activities and facilities analysis in Section 3.21.2.2.1 for details. As a result, adverse impacts on offshore water quality under the Proposed Action would be short term **negligible** to **minor** adverse.

#### 3.21.2.3.3 Cumulative Impacts

#### Offshore Activities and Facilities

<u>Accidental releases and discharges:</u> The Proposed Action could noticeably add accidental releases of fuels, oils, or hazardous material; sediment; and/or trash and debris to conditions under the No Action Alternative. BOEM estimates that the Project would result in an up-to-56% increase in total chemical usage over the No Action Alternative within the offshore water quality GAA. This risk would be increased primarily during construction and installation, O&M, and decommissioning. When the Project is combined with other offshore wind projects, up to approximately 3.5 million gallons of coolants, fuels, oils, and lubricants could cumulatively be stored within WTG foundations and the OSS within the offshore water quality GAA. All vessels associated with the Proposed Action and other offshore wind projects would comply with the USCG requirements for the prevention and control of oil and fuel spills. Additionally, training and awareness of EPMs (see Table F-1 in Appendix F) proposed for waste management and mitigation of marine debris would be required of Revolution Wind Project personnel. These releases, if any, would occur infrequently at discrete locations and vary widely in space and time. For this reason, the Proposed Action when combined with other past, present, and reasonably foreseeable projects would result in short-term to long-term **minor** to **moderate** adverse impacts.

<u>Anchoring and new cable emplacement/maintenance:</u> The Proposed Action would result in localized, temporary, and minor impacts to water quality through an estimated 3,204 acres of anchoring and

mooring-related disturbance. The Proposed Action would add to the estimated 1,862 acres of seafloor that could be impacted by anchoring from other reasonably foreseeable offshore wind activities. This would result in a cumulative total of 5,066 acres of anchoring-related disturbance for the Proposed Action, plus all other future offshore wind projects. Therefore, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **minor** adverse cumulative impacts to water quality.

The Proposed Action would result in localized, short-term, and minor adverse impacts to water quality through an estimated 4,009 acres of seafloor disturbance from cable installation, which would temporarily increase suspended sediment and turbidity levels in and immediately adjacent to anchorage areas. This would result in additional turbidity effects, increasing seafloor disturbance due to cable installation, when compared to the No Action Alternative. BOEM estimates a cumulative total of 10,158 acres of cabling-related disturbance for the Proposed Action plus all other future offshore wind projects. Sediment modeling for the Proposed Action indicates that sediment suspension and deposition would occur within an area of up to 328 feet and would settle shortly (hours to days) after the release of sediment (Vinhateiro et al. 2018). Suspended sediment concentrations during activities other than dredging would be within the range of natural variability typical for the affected area. As a result, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **minor** adverse cumulative impacts to water quality.

<u>Port utilization:</u> BOEM expects impacts to water quality due to the increase in port use resulting from the Proposed Action to be negligible to minor adverse. Other offshore wind development would use nearby ports and could also require port expansion or modification. However, Revolution Wind and all other developers would comply with all permit requirements to avoid or minimize water quality impacts. Therefore, cumulative impacts associated with the Proposed Action and past, present, and reasonably foreseeable future activities would be **negligible** to **minor** adverse.

<u>Presence of structures:</u> The Proposed Action would result in long-term and minor adverse impacts to water quality through the installation of 102 structures (100 WTGs and two OSSs). This represents a 56% increase over total estimated WTG and OSS foundations under the No Action Alternative within the offshore water quality GAA. BOEM estimates a cumulative total of 283 structures for the Proposed Action plus all other future offshore wind projects within the offshore water quality GAA. These additional structures could cumulatively add to other offshore impacts to water quality from turbidity due to scour and water current alteration. However, because of the limited extent of impacts and BOEM's expectation that Revolution Wind and other developers would comply with all applicable permit requirements to minimize, reduce, or avoid impacts on water quality, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **minor** adverse and long-term impacts to water quality.

### Onshore Activities and Facilities

<u>Accidental releases and discharges:</u> The Proposed Action would result in negligible to minor adverse onshore water quality impacts on surface water due to discharges and due to dispersal of contaminants during routine spills or inadvertent releases. State and local agencies would be responsible for minimizing and avoiding water quality and other impacts during construction and installation. The Project and other reasonably foreseeable projects would be expected to comply with any applicable permit requirements to implement erosion, stormwater, and spill controls to minimize, reduce, or avoid impacts on water quality.

As a result, the Proposed Action when combined with past, present, and other reasonably foreseeable projects would result in short-term impacts and **negligible** to **minor** adverse cumulative impacts on onshore water quality.

New cable emplacement/maintenance: The Proposed Action would result in negligible to minor adverse impacts to onshore water quality impacts on surface water and groundwater due to erosion and sedimentation. State and local agencies would be responsible for minimizing and avoiding water quality and other impacts during construction and installation. The Project and other reasonably foreseeable projects would be expected to comply with any applicable permit requirements to implement erosion, stormwater, and spill controls to minimize, reduce, or avoid impacts on water quality. As a result, the Proposed Action when combined with past, present, and other reasonably foreseeable projects would result in short-term impacts and **negligible** to **minor** adverse cumulative impacts on onshore water quality.

Port utilization: The Proposed Action would result in minor adverse impacts to onshore water quality due to changes in surface water quality from increased port-related traffic. The Proposed Action would also add to the increased the risk of accidental spills or discharges. Other offshore wind development would also use nearby ports. Revolution Wind and all other developers would comply with all permit requirements to avoid or minimize water quality impacts. As a result, the Proposed Action when combined with past, present, and other reasonably foreseeable projects would result in short-term impacts and **negligible** to **minor** adverse cumulative impacts on onshore surface water quality. The Proposed Action would not contribute to impacts on groundwater quality.

Presence of structures: The Proposed Action would result in temporary and minor adverse impacts to water quality related to the presence of structures, which would also result in an increase in impervious surfaces (19 acres) through the development of 20 acres for the OnSS and ICF. Other offshore wind development would also include the construction and installation of structures and associated impacts to onshore water quality. These additional structures could cumulatively add to other onshore impacts to water quality from turbidity due to scour and water current alteration. However, because of the limited extent of impacts and BOEM's expectation that Revolution Wind and other developers would comply with all applicable permit requirements to minimize, reduce, or avoid impacts on water quality, the Proposed Action when combined with past, present, and reasonably foreseeable projects would result in **negligible** to **minor** adverse short-term impacts to water quality.

#### 3.21.2.3.4 Conclusions

Although Project construction and installation, O&M, and decommissioning would expose and disturb soils and sediments, onshore facilities would not cross surface waterbodies. Therefore, impacts to water quality from potential erosion, sedimentation, or inadvertent release of contamination or hazardous materials or debris into onshore surface waters are not anticipated and would be short term **negligible** to **minor** adverse. Offshore, Project construction and installation and decommissioning would contribute to increased movement, suspension, and deposition of sediments; changes to water column stratification; and mixing patterns that would affect water quality parameters. Impacts from Project O&M would be much lower than those produced during construction and installation and decommissioning but could also result in erosion, sediment resuspension, deposition, and inadvertent spills. BOEM anticipates that the impacts resulting from the Proposed Action alone would range from **negligible** to **moderate** adverse. Therefore, BOEM expects the overall impact on water quality from the Proposed Action alone to be

**minor** adverse because the effect would be small and the resource would be expected to recover completely without remedial or mitigating action. The Proposed Action would not result in any net beneficial change to water quality.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from **negligible** to **moderate** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with the Proposed Action when combined with past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to water quality because the effect would be small and the resource would be expected to recover completely. The Proposed Action would not result in benefits to water quality.

### 3.21.2.4 Alternatives C, D, E, and F

Table 3.21.1 discloses IPF findings for each alternative.

#### 3.21.2.4.1 Conclusions

Although Alternatives C through F would reduce the number of WTGs and their associated IACs offshore, which would have an associated reduction in potential changes to movement, suspension, and deposition of sediments; water column stratification; and mixing patterns, BOEM expects that the impacts resulting from each alternative alone would be similar to the Proposed Action and range from **negligible** to **moderate** adverse. Alternatives C through F would not result in any change to onshore water quality as compared to the Proposed Action (**minor** adverse) and would not result in any net beneficial change to water quality.

In the context of other reasonably foreseeable environmental trends and planned actions, BOEM also expects that Alternatives C through F's impacts would be similar to the Proposed Action (with individual IPFs leading to impacts ranging from **negligible** to **moderate** adverse). The overall impacts of each alternative when combined with past, present, and reasonably foreseeable activities would be the same level as under the Proposed Action: **minor** adverse. Alternatives C through F would not result in benefits to water quality.

### 3.21.2.5 Alternative G: Impacts of the Preferred Alternative on Water Quality

Table 3.21.1 discloses IPF findings for each alternative.

#### 3.21.2.5.1 Conclusions

Although Alternative G would reduce the number of WTGs and their associated IACs offshore as compared to the maximum-case scenario for the Proposed Action, which would have an associated reduction in potential changes to movement, suspension, and deposition of sediments; water column stratification; and mixing patterns, BOEM expects that the impacts resulting from Alternative G alone would be similar to the Proposed Action and range from **negligible** to **moderate** adverse. Alternative G would not result in any change to onshore water quality as compared to the Proposed Action (**minor** adverse) and would not result in any net beneficial change to water quality.

In the context of other reasonably foreseeable environmental trends and planned actions, BOEM also expects that Alternative G's impacts would be similar to the Proposed Action (with individual IPFs leading to impacts ranging from **negligible** to **moderate** adverse). The overall impacts of the alternative when combined with past, present, and reasonably foreseeable activities would be the same level as under the Proposed Action: **minor** adverse. Alternative G would not result in benefits to water quality.

#### 3.21.2.6 Mitigation

No potential additional mitigation measures for water quality are identified in Table F-2 or Table F-3 in Appendix F.

*This page intentionally left blank.*

# 3.22 Wetlands and Non-tidal Waters

## 3.22.1 Description of the Affected Environment and Environmental Consequences of the No Action Alternative for Wetlands and Non-tidal Waters

Geographic analysis area: The GAA for wetlands and non-tidal waters is the Lower West Passage subwatershed (Hydrologic Unit Code 010900040908), which overlaps the onshore Project and is the same as the GAA for onshore water quality (see Figure 3.21-2). This area encompasses the drainage basin and network of surface waterbodies that could be affected by Project activities.

Affected environment: Freshwater and tidal wetlands, lakes and ponds, streams, and other waters are found throughout the GAA (see Figure 3.21-2). Wetlands resources and their functions and values are described in Sections 1.3.2 and 3.1.2 of COP Appendix K (VHB 2023). As mapped by the USFWS National Wetlands Inventory, approximately 1,268.1 acres of freshwater forest/shrub wetlands and 99.3 acres of freshwater emergent wetlands are found near streams, lakes, and ponds throughout the GAA. In addition, estuarine and marine wetland habitat is found in tidal areas near the shore of Narragansett Bay.

Wetlands and other waters are subject to USACE jurisdiction under Section 404 of the federal Clean Water Act (CWA). Under Section 404 of the CWA, the USACE regulates the discharge of dredged or fill material into waters of the United States. The landward limit of jurisdiction in tidal waters (33 CFR 328.4) extends to the high tide line, whereas the seaward limit is 3 nm as measured from the baseline of the territorial seas. The USACE limits of jurisdiction in non-tidal waters is as follows:

- In the absence of adjacent wetlands, the jurisdiction extends to the ordinary high-water mark.
- When adjacent wetlands are present, the jurisdiction extends beyond the ordinary high-water mark to the limit of the adjacent wetlands.
- When the water of the United States consists only of wetlands, the jurisdiction extends to the limit of the wetland.

As described in COP Appendix K, wetland resources also fall under the jurisdiction of the State of Rhode Island following pre-determined physical boundaries mapped on the RIDEM's Environmental Resource Map. Based on this map, the onshore Project components are to be located almost entirely within the jurisdiction of the RI CRMC with the exception of a potential segment of an onshore transmission cable route along Roger Williams Way between Mainsail Drive and Circuit Drive, where the jurisdictional boundary follows Roger Williams Way (VHB 2023). Under the RI CRMC Coastal Resources Management Program-Rules and Regulations Governing the Protection and Management of Freshwater Wetlands in the Vicinity of the Coast (Freshwater Wetland Rules; 650-RICR-20-00-2), wetlands receive a buffer of 50 feet from the delineated edge of the wetland. The area of land within 50 feet is regulated as a separate wetland resource (RI CRMC 2011).

Freshwater and tidal wetlands (e.g., tidal salt marsh, ruderal [i.e., disturbed] forested wetland, ruderal shrub marsh, and vernal pools) were observed in the GAA during the field surveys (VHB 2023). Wetlands and streams delineated within the footprint of onshore Project components and the adjacent areas are shown on Figures 4.3.1-3 and 4.3.1-13 in COP Appendix K. All wetlands, buffers, and ditches within the footprint are summarized in Table 3.22-1. Impacts to these resources require coordination with regulating agencies, including USACE and RI CRMC, prior to any construction activities to determine jurisdiction.

**Table 3.22-1. Delineated Wetlands by Project Component**

| Project Component | Freshwater Wetlands (acres)* | Wetland Buffer (acres)† | Regulated Ditch (feet)‡ |
|---|---|---|---|
| Landfall work area | 0 | 0 | 0 |

* Freshwater wetlands subject to RI CRMC and the USACE jurisdiction. Although USACE jurisdictional wetlands are present, the proposed activity consists of hand-cutting trees and does not involve a discharge of fill; therefore, a USACE permit is not required. This was confirmed in a letter from the USACE to Revolution Wind on February 11, 2022 (USACE 2022).

† Area of land within 50 feet of the wetland boundary regulated by RI CRMC.

‡ Human-made ditch that is regulated by RI CRMC as an Area Subject to Stormwater Flowage.

The landfall work area was shifted east to avoid a delineated ruderal forested wetland (Freshwater Wetland 1) that is regulated by the RI CRMC and USACE as a freshwater wetland near the coast. Tidal salt marshes west of the landfall work area have also been avoided. There are no wetlands or waters within the onshore transmission cable corridor or easement. However, the cable corridor crosses the 50-foot wetland buffer of Freshwater Wetland 1.

Regulated wetlands within and adjacent to the OnSS and ICF parcels include four freshwater wetlands (Freshwater Wetlands 2–5), tributaries to Mill Creek, and a human-made ditch. Freshwater Wetland 2 (i.e., a small isolated forested wetland) is outside of but adjacent to the OnSS footprint. Freshwater Wetland 3 (i.e., a ruderal forested swamp) occurs along the western boundary of the OnSS parcel and continues off-site around Mill Creek. Freshwater Wetland 4 (i.e., a ruderal shrub marsh with a forested perimeter) occurs along the northern boundary of the OnSS and ICF parcel. Wetland 5 is a small, isolated scrub-shrub wetland within the ICF footprint that is hydrologically connected to Freshwater Wetland 4 by a human-made ditch that is regulated as an Area Subject to Stormwater Flowage. Tributaries to Mill Creek flow north and west through Freshwater Wetland 3, outside the OnSS footprint (see Figures 4.3.1-3 and 4.3.1-13 in COP Appendix K). Vernal pools were identified within Freshwater Wetlands 4 and 5. The OnSS and ICF footprints are designed to avoid most of the 3.92 acres of wetlands delineated within these parcels.

Warming temperatures, increasing storm severity and frequency, and ongoing rising sea levels impact wetland habitats. Large, severe storms can increase sedimentation and erosion, which can lead to habitat alteration. Offshore wind projects aim to combat climate change and associated effects by reducing GHG emissions.

## 3.22.2 Environmental Consequences

### 3.22.2.1 Relevant Design Parameters, Impact-Producing Factors, and Potential Variances in Impacts

The Project design parameters that would influence the magnitude of the impacts on wetland resources include the location of and construction of or within the OnSS, ICF, and landfall work area. The following have occurred or would occur to minimize potential impacts to wetland resources:

- Revolution Wind evaluated siting alternatives for the OnSS using the criteria that included avoidance or minimization of disturbance to wetlands and other ecologically sensitive areas.
- In accordance with Section 2.9(B)(1)(d) of the Freshwater Wetland Rules, the Onshore Facilities would be designed to avoid and minimize impacts to freshwater wetlands to the maximum extent practicable. Any wetlands that would be impacted as a result of the Project would be mitigated via the federal and state permitting process in accordance with Section 404 of the CWA and the Freshwater Wetland Rules.
- Onshore Facilities would be sited within previously disturbed and developed areas to the extent practicable.
    - The OnSS and ICF would be located on parcels that are already highly altered and include buried demolition waste.
- Accidental spill or release of oils or other hazardous materials offshore would be managed through the OSRP. Compliance with the RIPDES General Permit for Stormwater Discharges associated with construction activity which requires the implementation of a SESC Plan and spill prevention and control measures.
- Revolution Wind would follow state and federal regulations for alteration of wetlands as applicable.

Erosion control measures implemented during both construction and decommissioning, as well as a facility-specific spill plan implemented during O&M, would decrease the potential for impacts to wetland resources. These Project design parameters would be implemented across all alternatives; therefore, BOEM would not expect potential variances in impacts across the alternatives.

See Appendix E1 for a summary of IPFs analyzed for wetland and non-tidal water resources across all action alternatives. IPFs that are either not applicable to the resource or determined by BOEM to have a negligible adverse effect are excluded from Chapter 3 and provided in Table E2-2 in Appendix E1. Offshore and onshore IPFs are addressed separately in the analysis if appropriate for the resource; not all IPFs have both an offshore and onshore component. Where feasible, calculations for specific alternative impacts are provided in Appendix E4, to facilitate reader comparison across alternatives.

Table 3.22-2 provides a summary of IPF findings carried forward for analysis in this section. Each alternative analysis discussion consists of the construction and installation phase, the O&M phase, the decommissioning phase, and the cumulative analysis. If these analyses are not substantially different, then they are presented as one discussion.

A detailed analysis of the Proposed Action is provided following the table. Detailed analysis of other considered action alternatives is also provided below the table if analysis indicates that the alternative(s) would result in substantially different impacts than the Proposed Action.

The Conclusion section within each alternative analysis discussion includes rationale for the overall effect call determination for that alternative. The overall impact of any alternative would be **minor** adverse because the effects on wetland resources would be small and localized, and with implementation of EPMs, wetland resources are expected to recover completely.

*This page intentionally left blank.*

**Table 3.22-2. Alternative Comparison Summary for Wetlands and Non-tidal Waters Impact-Producing Factor**

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative G (Preferred Alternative) | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| Accidental releases and discharges | **Onshore**: Spills that reach surface water would be expected to disperse rapidly (BOEM 2015). Any discharges from future offshore wind projects are not expected to affect wetland resources within the GAA. Adverse impacts from accidental releases and discharges would be **negligible** adverse, localized, and temporary to short term due to the likely limited extent and duration of a release. | **Onshore**: Revolution Wind would prepare a construction-specific plan in accordance with applicable requirements and would outline spill prevention plans and steps to contain and clean up spills that may occur. All onshore activities would be conducted in compliance with the RI Pollutant Discharge Elimination System General Permit for the Discharge of Stormwater Associated with Construction Activities and an approved soil erosion and sedimentation control plan. Therefore, with the implementation of these measures, accidental releases and discharges during onshore construction and installation are expected to result in short-term **minor** adverse impacts within adjacent wetland resources.<br>The potential for accidental releases and discharges during O&M and decommissioning would be less than during construction and installation due to reduced use of drilling fluids, fuels, oils, and lubricants. Stormwater runoff during O&M of onshore facilities could result in turbidity and sediment deposition that could cause short-term **minor** adverse impacts to wetlands or non-tidal waters Therefore, impacts to wetland resources from accidental releases and discharges would be short term **minor** adverse.<br>The contribution from the Proposed Action would be a low percentage of the overall spill risk from ongoing and future activities in the GAA. Any ballast water discharges from the Proposed Action and future offshore wind projects are not expected to affect wetland resources within the GAA. As a result, the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in short-term **negligible** to **minor** adverse impacts to wetland resources. | **Onshore**: Alternatives C through F would have the same onshore activities and facilities as the Proposed Action; therefore, impacts from accidental releases and discharges on wetland resources would be the same as the Proposed Action: **negligible** to **minor** adverse. | | | | **Onshore**: Alternative G would have the same onshore activities and facilities as the Proposed Action; therefore, impacts from accidental releases and discharges on wetland resources would be the same as the Proposed Action: **negligible** to **minor** adverse. |
| New cable emplacement/ maintenance | **Onshore**: Future offshore wind projects do not include cable emplacement and maintenance within the GAA that would affect wetland resources. | **Onshore**: No direct impacts to wetlands or other waters would occur as a result of onshore cable emplacement or maintenance activities. Temporary soil disturbance during cable installation could disturb and alter nearby wetland habitat, as well as potentially spread invasive species, which could lead to a small, | **Onshore**: Alternatives C through F would have the same onshore activities and facilities as the Proposed Action; therefore impacts on wetland resources would be the same as the Proposed Action: **negligible** to **minor** adverse. | | | | **Onshore**: Alternative G would have the same onshore activities and facilities as the Proposed Action; therefore impacts on wetland resources would be the same as the Proposed Action: **negligible** to **minor** adverse. |

| Impact-Producing Factor | No Action Alternative | Alternative B (Proposed Action) up to 100 WTG | Alternative C (Habitat Alternative) 64–65 WTGs | Alternative G (Preferred Alternative) | Alternative E (Viewshed Alternative) 64–81 WTGs | Alternative F (Higher Capacity Turbine Alternative) 56 WTGs | Alternative G (Preferred Alternative) |
|---|---|---|---|---|---|---|---|
| | | localized reduction in habitat quality. With erosion control and weed management measures in place, any impacts to adjacent wetlands during construction and installation would be short term **negligible** adverse.<br>Land disturbance during O&M would be limited to regular maintenance of underground infrastructure, if needed, and EPMs would limit potential impacts from sedimentation. See Table F-1 in Appendix F for a list of EPMs for wetland resources. Adverse impacts on wetlands and non-tidal waters under the Proposed Action would be temporary **minor** adverse.<br>The contribution to cumulative impacts to wetland resources from anchoring and cable emplacement is expected to be the same as the Proposed Action because no other past, present, and reasonably foreseeable projects requiring cable placement/maintenance would occur within the GAA. As a result, the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in **minor** adverse short-term impacts to wetlands and non-tidal waters due to surface disturbance in wetland buffers. | | | | | |
| Presence of structures | **Onshore**: There are no known future offshore wind activities that have facilities planned within the GAA. Therefore, impacts to wetland resources would be **negligible** adverse. | **Onshore:** Land disturbances from the presence of structures associated with Project construction and installation would include the 19.53-acre landfall work area, 7.04-acre OnSS, 3.76-acre ICF, and 16.58-acre onshore transmission cable envelope. The OnSS and ICF structures would disturb 0.11 acre of freshwater forested wetland (less than 0.1% of wetlands within the GAA). Soil disturbance during construction and installation could also alter nearby wetland habitat due to sedimentation and spread invasive species, leading to a small, localized reduction in habitat quality. Revolution Wind would also comply with all permit and regulatory requirements related to wetland and non-tidal waters impacts, and the resources are expected to recover with mitigation. As a result, adverse impacts on wetland resources under the Proposed Action would be localized, short term **minor** adverse.<br>O&M of the ICF and OnSS would not impact wetlands or other waters. Project components | **Onshore**: Alternatives C through F would have the same onshore activities and facilities as the Proposed Action; therefore, impacts would be the same as the Proposed Action: **minor** adverse. | | | | **Onshore**: Alternative G would have the same onshore activities and facilities as the Proposed Action; therefore, impacts would be the same as the Proposed Action: **minor** adverse. |

|---|---|---|---|---|---|---|---|
| | | would be demolished or decommissioned in place, limiting the potential for soils and materials to wash into adjacent wetland resources. Temporary **minor** adverse impacts to wetlands or non-tidal waters adjacent to the structures could occur if debris from demolition washed into the adjacent wetland resources.<br>Additional structures could cumulatively add to other onshore impacts due to an increase in impervious surface from reasonably foreseeable structures within the GAA. The Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in long-term **minor** adverse impacts to wetland resources. | | | | | |

*This page intentionally left blank.*

### 3.22.2.2 Alternative A: Impacts of the No Action Alternative on Wetlands and Non-Tidal Waters

#### 3.22.2.2.1 Impacts of the No Action Alternative

Under the No Action Alternative, baseline conditions for wetlands and non-tidal waters (see Section 3.22.1) would continue to follow current regional trends and respond to IPFs introduced by other ongoing activities and by permitted and constructed offshore wind COP projects within the GAA. These IPFs are described and analyzed in Appendix E1.

#### 3.22.2.2.2 Cumulative Impacts

This section discloses potential wetlands and non-tidal waters impacts associated with future offshore wind development (without the Proposed Action). In this and the following sections, these resources are collectively referred to as *wetland resources*. The cumulative impact analysis for the No Action Alternative for planned non-offshore wind activities, as well as activities associated with constructed or approved offshore wind projects (without the Proposed Action), is provided in Appendix E1.

Accidental releases and discharges: However, should offshore wind facilities be located within the GAA, there is a possibility of accidental releases of fuels, oils, and lubricants that could affect wetland resources. Any activity would require a facility-specific spill plan outlining spill prevention training, plans, and steps to contain and clean up spills if they occur. Spills that reach surface water would be expected to disperse rapidly (BOEM 2015). Adverse impacts from accidental releases and discharges would be **negligible** adverse, localized, and temporary to short term due to the likely limited extent and duration of a release.

Permitted routine operational effluent discharges to receiving waters (e.g., such as ballast water) are regulated by the NPDES. Any discharges from future offshore wind projects are not expected to affect wetland resources within the GAA.

New cable emplacement/maintenance: Future offshore wind projects do not include cable emplacement and maintenance within the GAA that would affect wetland resources.

Presence of structures: There are no known future offshore wind activities that have facilities planned within the GAA. Therefore, impacts to wetland resources would be **negligible** adverse.

#### 3.22.2.2.3 Conclusions

Under the No Action Alternative, there are no known future offshore wind activities that could impact wetland resources in the GAA. Adverse impacts from future activities on onshore wetland resources under the No Action Alternative would be temporary to short term and **negligible** adverse. Impacts associated with future offshore wind activities in the GAA for onshore wetland resources combined with ongoing activities, reasonably foreseeable environmental trends, and reasonably foreseeable activities other than offshore wind would result in **minor** adverse impacts because the effects would be small, and the resource would recover completely.

### 3.22.2.3 Alternative B: Impacts of the Proposed Action on Wetlands and Non-tidal Waters

#### 3.22.2.3.1 Construction and Installation

**Onshore Activities and Facilities**

Accidental releases and discharges: Onshore construction and HDD activities would require heavy equipment use, and an inadvertent release from the machinery or spill during refueling activities could occur. Onshore cables would not contain fluids and would not be susceptible to leaks that could affect water quality. The drilling rig used for HDD would be located within the landfall envelope where there are no wetlands or other waters. Drilling fluids and mud would be transported off-site for treatment, disposal, and/or reuse. Revolution Wind would prepare a construction-specific plan in accordance with applicable requirements and would outline spill prevention plans and steps to contain and clean up spills that may occur.

To protect water quality, all onshore activities would be conducted in compliance with the RI Pollutant Discharge Elimination System General Permit for the Discharge of Stormwater Associated with Construction Activities and an approved soil erosion and sedimentation control plan. The measures employed in the soil erosion and sedimentation control plan would minimize the opportunity for turbid discharges leaving a construction work area. The plan would also include specific measures for handling dewatering discharges and measures for refueling equipment to minimize the opportunities for uncontrolled spills. Therefore, with the implementation of these measures, accidental releases and discharges during onshore construction and installation are expected to result in short-term **minor** adverse impacts within adjacent wetland resources.

New cable emplacement/maintenance: No direct impacts to wetlands or other waters would occur as a result of onshore cable emplacement or maintenance activities. The landfall work area, which would be used during cable emplacement, avoids the nearby freshwater forested wetland (Freshwater Wetland 1) and wetland buffer (see Table 3.22-1). The onshore cable route would follow Circuit Drive to the OnSS, and no wetlands or other waters are within the cable route. However, approximately 94 feet (28.65 m) of the onshore cable route crosses the 50-foot buffer of Freshwater Wetland 1, resulting in 0.07 acre of temporary disturbance in the state-regulated buffer. Temporary soil disturbance during cable installation could disturb and alter nearby wetland habitat, as well as potentially spread invasive species, which could lead to a small, localized reduction in habitat quality. With erosion control and weed management measures in place, any impacts to adjacent wetlands during construction and installation would be short term **negligible** adverse. The cable corridor would be fully restored once construction and installation is complete.

Presence of structures: Land disturbances from the presence of structures associated with Project construction and installation would include the 19.53-acre landfall work area, 7.04-acre OnSS, 3.76-acre ICF, and 16.58-acre onshore transmission cable envelope. The new OnSS and ICF would be constructed adjacent to the existing Davisville Substation to support interconnection of the Project to the existing electrical grid. These structures would require cutting of 0.11 acre of freshwater forested wetland. This amounts to 2.6% of the 3.92 acres of delineated wetlands within the OnSS and ICF parcels, and less than 0.1% of mapped wetlands in the GAA (Lower West Passage subwatershed). There are no streams or other waterbodies within the footprint of the onshore facilities; however, Mill Creek is adjacent to the OnSS.

Freshwater wetlands and wetland buffers within onshore components are detailed in Table 3.22-1 and in Figures 4.3.1-3 and 4.3.1-13 in COP Appendix K. Approximately 0.11 acre of freshwater wetlands and 143.38 feet of an Area Subject to Stormwater Flowage—state-regulated ditch—would be directly impacted by construction and installation of the onshore facilities. Clearing, grading, and hardening in these areas could directly and indirectly impact wetland resources. Soil disturbance during construction and installation could also alter nearby wetland habitat due to sedimentation (see Section 3.21) and spread invasive species, leading to a small, localized reduction in habitat quality. Impacts to wetlands would be permitted and mitigated as described in Appendix F, resulting in recovery of the resource. Implementing EPMs such as erosion and sedimentation BMPs (see Table F-1 in Appendix F) would avoid or minimize impacts on water quality, wetlands, and other waters. Before Project construction, anticipated wetland impacts would require coordination with the regulating agencies, including USACE, RI CRMC, Rhode Island Department of Environmental Management (RIDEM), and Quonset Development Corporation. Revolution Wind would comply with all permit and regulatory requirements related to wetland and other water impacts, and the resources are expected to recover with mitigation. As a result, adverse impacts on wetland resources under the Proposed Action would be localized, short term **minor** adverse.

#### 3.22.2.3.2 Operations and Maintenance and Decommissioning

### Onshore Activities and Facilities

<u>Accidental releases and discharges:</u> The potential for accidental releases and discharges during O&M and decommissioning would be less than during construction and installation due to reduced use of drilling fluids, fuels, oils, and lubricants. The additional impervious surfaces at onshore Project facilities during O&M would increase the amount of runoff and stormwater pollutants delivered to nearby wetland resources. Wetlands are important habitats for supporting wildlife, and stormwater runoff filtration and stormwater runoff during O&M could have a short-term effect on turbidity and sediment deposition that could impact wetlands or other waters. Revolution Wind would prepare a construction-specific spill plan in accordance with applicable requirements and would outline spill prevention training, plans, and steps to contain and clean up spills that may occur. Therefore, impacts to wetland resources from accidental releases and discharges would be short term **minor** adverse.

<u>New cable emplacement/maintenance:</u> If O&M activities related to the onshore cable are within the segment of the ROW that crosses the 50-foot buffer of Freshwater Wetland 1, then temporary soil disturbance could alter nearby wetland habitat and spread invasive species, leading to a reduction in habitat quality. Land disturbance during O&M would be limited to regular maintenance of underground infrastructure (i.e., transmission cable discussed above under Section 3.22.2.2.1), if needed, and EPMs would limit potential impacts from sedimentation. Adverse impacts on wetlands and non-tidal waters under the Proposed Action would be temporary **minor** adverse.

<u>Presence of structures:</u> For onshore facilities, no land disturbance is anticipated during regular maintenance. O&M of the ICF and OnSS would not impact wetlands or other waters. During decommissioning of the ICF and OnSS facilities, the Project components would be demolished or decommissioned in place, limiting the potential for soils and materials to wash into adjacent wetland resources. Pre-existing habitats are not likely to be restored as part of decommissioning. Temporary **minor** adverse impacts to wetlands or other waters adjacent to the structures could occur if debris from demolition washed into the adjacent wetland resources.

### 3.22.2.3.3 Cumulative Impacts

### Onshore Activities and Facilities

Accidental releases and discharges: The Proposed Action could contribute construction-related accidental releases of fuel, fluids, or hazardous material; sediment; and/or trash and debris. The contribution from the Proposed Action would be a low percentage of the overall spill risk from ongoing and future activities in the GAA. These types of releases, if any, would occur infrequently at discrete locations in the watershed and at varied times. As a result, the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in short-term **negligible** adverse impacts to wetland resources.

Permitted routine operational effluent discharges to receiving waters are regulated by the NPDES. Any ballast water discharges from the Proposed Action and future offshore wind projects are not expected to affect wetland resources within the GAA. Stormwater runoff during O&M of onshore facilities could result in turbidity and sediment deposition that could cause short-term **minor** adverse impacts to wetlands or other waters. Overall, the contribution to cumulative impacts to wetland resources is expected to be localized, temporary **minor** adverse.

New cable emplacement/maintenance: The contribution to cumulative impacts to wetland resources from anchoring and cable emplacement is expected to be the same as the Proposed Action because no other past, present, and reasonably foreseeable projects requiring cable placement/maintenance would occur within the GAA. As a result, the Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in **minor** adverse short-term impacts to wetlands and non-tidal waters due to surface disturbance in wetland buffers.

Presence of structures: The Proposed Action includes the OnSS and ICF structures that would require cutting 0.11 acre of freshwater forested wetland which is less than 0.1% of mapped wetlands in the GAA (Lower West Passage subwatershed) and 2.6% of wetlands delineated in those parcels. Additional structures could cumulatively add to other onshore impacts due to an increase in impervious surface from reasonably foreseeable structures within the GAA; however, only a small percentage of the 1,367.4 acres of freshwater wetlands are expected to be impacted. The Proposed Action, when combined with past, present, and reasonably foreseeable projects, would result in long-term **minor** adverse impacts to wetland resources.

### 3.22.2.3.4 Conclusions

Project construction and installation, O&M, and decommissioning would expose and disturb soils and sediments, resulting in potential erosion, sedimentation, or inadvertent release of contamination, hazardous materials or debris into onshore surface waters that could affect wetland resources in the GAA. BOEM anticipates the impacts resulting from the Proposed Action alone would range from **negligible** to **minor** adverse because the effect would be small and localized. Further, the resource would be expected to recover completely with remedial or mitigating action(s). The Proposed Action would not result in any net beneficial change to wetlands or other waters.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under the Proposed Action resulting from individual IPFs would range from **negligible** to **minor** adverse. Considering all IPFs together, BOEM anticipates that the overall impacts associated with the Proposed

Action when combined with past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to wetlands and non-tidal waters because the effects are expected to be small and localized. Further, with implementation of EPMs, wetland resources are expected to recover completely.

### 3.22.2.4 Alternatives C, D, E, and F

Table 3.22-2 discloses IPF findings for each alternative.

#### 3.22.2.4.1 Conclusions

Under Alternatives C through F, Project construction and installation, O&M, and decommissioning would expose and disturb soils and sediments, resulting in potential erosion, sedimentation, or inadvertent release of contamination, hazardous materials, or debris into onshore surface waters that could affect wetland resources in the GAA. BOEM anticipates that impacts resulting from each alternative alone would range from **negligible** to **minor** adverse because the effect would be small and localized. Further, the resource would be expected to recover completely with remedial or mitigating action(s). Alternatives C through F would not result in any net beneficial change to wetlands or other waters.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under Alternatives C through F resulting from individual IPFs would range from **negligible** to **minor** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with each alternative when combined with past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to wetlands and non-tidal waters because the effects are expected to be small and localized. Further, with implementation of EPMs, wetland resources are expected to recover completely.

### 3.22.2.5 Alternative G: Impacts of the Preferred Alternative on Wetlands and Non-tidal Waters

Table 3.22-2 discloses IPF findings for each alternative.

#### 3.22.2.5.1 Conclusions

Under Alternative G, Project construction and installation, O&M, and decommissioning would expose and disturb soils and sediments, resulting in potential erosion, sedimentation, or inadvertent release of contamination, hazardous materials, or debris into onshore surface waters that could affect wetland resources in the GAA. BOEM anticipates that impacts resulting from each alternative alone would range from **negligible** to **minor** adverse because the effect would be small and localized. Further, the resource would be expected to recover completely with remedial or mitigating action(s). Alternative G would not result in any net beneficial change to wetlands or other waters.

In the context of other reasonably foreseeable environmental trends and planned actions, the impacts under Alternative G resulting from individual IPFs would range from **negligible** to **minor** adverse. Considering all the IPFs together, BOEM anticipates that the overall impacts associated with each alternative when combined with past, present, and reasonably foreseeable activities would result in **minor** adverse impacts to wetlands and non-tidal waters because the effects are expected to be small and localized. Further, with implementation of EPMs, wetland resources are expected to recover completely.

#### 3.22.2.6 Mitigation

No potential additional mitigation measures for wetland resources are identified in Table F-2 or Table F-3 in Appendix F.

# APPENDIX E3

## Maximum-Case Scenario Estimates for Offshore Wind Projects

# Contents

# Tables

*This page intentionally left blank.*

# INTRODUCTION

Table E3-1 (parts 1–10) provides maximum-case scenario estimates of potential offshore wind project impacts assuming maximum buildout, using the geographic analysis areas in the Revolution Wind Farm (RWF) and Revolution Wind Export Cable (RWEC) project environmental impact statement (EIS) and construction and operations plan–designated numbers for the RWF and RWEC. The Bureau of Ocean Energy Management (BOEM) developed these estimates based on offshore wind demand, as discussed in its 2019 study *National Environmental Policy Act Documentation for Impact-Producing Factors in the Offshore Wind Cumulative Impacts Scenario on the North Atlantic Outer Continental Shelf* (BOEM 2019). Estimates disclosed in the EIS's Chapter 3, No Action analyses were developed by summing acreage or number calculations across all lease areas noted as occurring within, or overlapping, a given geographic analysis area. This likely overestimates some impacts in cases where lease areas only partially overlap analysis areas. However, this approach was used to provide the most conservative estimate of future offshore wind development.

BOEM recognizes that the estimates presented within this cumulative analysis are likely high, conservative estimates; however, BOEM believes that this analysis is appropriately capturing the potential cumulative impacts and errs on the side of maximum impacts. Totals by lease area and by OCS may not fully sum due to rounding errors.

Unless otherwise noted, assumptions below are based on what has been most commonly submitted via previous and current COPs. These may require updates.

[1] Categorizes each project by its geographic area and separates United States offshore wind projects into the following regions to allow for a holistic look at projects in close proximity to others:

i. NE: Northeast State Waters leases that do not align to state projects (include a single strand of WTGs and no OSSs)
ii. MA/RI: Leases from Massachusetts and Rhode Island (a 1x1–nm grid spacing is assumed if not included in COP)
iii. NY/NJ: Leases from New York and New Jersey (a 1x1–nm grid spacing is assumed if not included in COP)
iv. DE/MD: Leases from Delaware and Maryland (a 1x1–nm grid spacing is assumed if not included in COP)
v. South Atlantic: Leases from Virginia and North Carolina (a 1x1–nm grid spacing is assumed if not included in COP)

[2] Provides the name and, if applicable, part of a project, including the project's OCS number.

[3] Provides the status of the project, and should be classified as a State Project, COP, Record of Decision (ROD), and/or Built; otherwise the project should be labeled as Planning.

[4] These 8 columns are used as a template for the EIS. Project NEPA Coordinators pull these headers for their project to fill in a project-specific table of resources with checkmarks in the EIS they are drafting. These columns identify lease areas that are applicable to each resource based on the geographic analysis areas shown in the EIS.

[5] This column estimates the construction time period as a range for each project as provided in the COP. This estimate is for offshore components only.
If there is no COP, the estimated dates are based on information as of February 1, 2022, and are subject to change when an applicant submits a COP or as project COPs progress through the approval process. Furthermore, BOEM assumes that construction of all the foundations would be installed during year 1 of a given project's construction schedule with the remaining work completed in year 2. If there is no other information, assume the estimated offshore construction time period is "By 2030".

[6] Compare the dimensions of the turbine provided in the COP (if available) with known turbine capacities to determine the estimated capacity of the turbine to be installed. If the information is provided in the COP, use that.
Otherwise, use the best available public facing information in order to estimate the expected turbine size. For those projects without announced WTG sizes, use the known dimensions of turbines of the same capacity as the prototype capacity, rounded to the nearest even number, for the current year in DOE's most recent Offshore Wind Market Report (for 2022, https://www.energy.gov/eere/wind/articles/offshore-wind-market-report-2022-edition). NOTE: A different set of assumptions may be necessary for floating offshore wind, and this should be considered once floating COPs are being received.

[7] This column showcases the top of the envelope estimate based on the COP. This information will be updated to whatever is the most up to date publicly available data at the time. Often, the final generating capacity in the EIS is much more conservative.
If not included in the COP, use the formula below:
Generating Capacity = Turbine Number (Column Z) * Expected Turbine Size (Column N MW)
*Note: If you are including a range in this cell for your project, be sure to update the subregion and overall OCS total numbers by adding in the larger value of your range.

[8] Often times, COPs provide the total export cable length. If not, ask for this data from the developer. However, the COP typically reports in nautical miles, so this must be converted into statute miles. If the COP provides the export cable length rather than the export cable corridor length, you may skip Columns Q, R, and S.
Statute miles = nautical miles * (1.1508 SM/NM)
If the value is provided to you as a range, use the higher value.

[9] Often times, COPs provide the corridor length, rather than the total export cable length. However, the COP typically reports in nautical miles, so this must be converted into statute miles.
Statute miles = nautical miles * 1.15 (1.15 Statute Mile = 1 Nautical Mile)

[10] This number should come from the COP if the corridor length is provided but may have to be interpreted as COPs typically provide a description such as "up to x number of cables". In these cases, use the max case for the number of export cables.
If this information is not available, proceed to Column S to estimate the total export cable length.

[11] When the export cable length is not provided in the COP, estimate this value by using the following formula:
ESTIMATED Total Export Cable Length = [export cable corridor length (Column Q miles)] * [number of export cables (Column R)]

If neither the export cable length nor the export cable corridor length are included in the COP, assume that each offshore wind development has its own cable (both onshore and offshore) and that future projects would not utilize a regional transmission line. The length of offshore export cable for those lease areas without a known project size has been assumed to total 200 statute miles for fixed foundation development. When using the assumed 200 mile value, Column Q and Column R will be left blank (this is denoted in the main tab by a -).

[12] This number should come from the COP. If it does, ensure the value is converted to acres. If not, use the formula below to estimate:
Cable Footprint = [[COP Export Cable Length (Column P miles) OR ESTIMATED Export Cable Length (Column S miles)] * (5,280 ft/mile) * 1 ft]/(43,560 sqft/acre)
Note: If the COP provides the export cable length (Column P), use that in the equation above, otherwise use the estimated export cable length value from Column S.
The 1 ft value is the typical cable diameter provided from previously submitted COPs. Use this value unless the COP reports a different value.

[13] This number should come from the COP. If not, ask for this data from the developer.
If not available, assume the disturbance width is 6.5 feet based on COPs submitted to date. This column represents an important number for calculating the area of benthic disturbance from construction.

[14] This number should come from the COP. If not, ask for this data from the developer. If not available, use the following estimated formula:
inter-array cable length = turbine # (Column Z) * 1.48 miles
The 1.48 miles factor is based on COPs submitted to date (2.4 kilometers).

[15] This number should come from the COP. If not, ask for this data from the developer.
Otherwise, use the best available public facing information. For those projects without announced WTG dimensions, use the known dimensions of turbines of the same capacity as the prototype capacity, rounded to the nearest even number, for the current year in DOE's most recent Offshore Wind Market Report (for 2022, https://www.energy.gov/eere/wind/articles/offshore-wind-market-report-2022-edition). The report lists values in meters, ensure these values are converted to feet. NOTE: A different set of assumptions may be necessary for floating offshore wind, and this should be considered once floating COPs are being received.

[16] This number should come from the COP.
Otherwise, use the best available public facing information. For those projects without announced WTG dimensions, use the known dimensions of turbines of the same capacity as the prototype capacity, rounded to the nearest even number, for the current year in DOE's most recent Offshore Wind Market Report (for 2022, https://www.energy.gov/eere/wind/articles/offshore-wind-market-report-2022-edition). The report lists values in meters, ensure these values are converted to feet. NOTE: A different set of assumptions may be necessary for floating offshore wind, and this should be considered once floating COPs are being received.

[17] This number should come from the COP. If not, use the following assumption:
total heigh of turbine = rotor diameter (Column X feet) + 100 feet OR 853 feet, whichever is higher
The 100 ft value is the assumption for an air gap. 853 ft comes from a turbine model already available that has been used in visual simulations but has a larger air gap (Haliade X-12).

[18] This number should come from the COP. If not, ask for this data from the developer. If not available, BOEM staff will assume this data based on best available information.
*Note: If you are including a range in this cell for your project, be sure to update the subregion and overall OCS total numbers by adding in the larger value of your range.

[19] This number should come from the COP. If not, assume that for every 50 turbines there would be one ESP/OSS installed.

[20] This number should come from the COP. If not, ask for this data from the developer. If not available, use the following estimated formula:
foundation # = turbine # (Column Z) + ESP/OSS # (Column AA)
*Note: If you are including a range in this cell for your project, be sure to update the subregion and overall OCS total numbers by adding in the larger value of your range.

[21] This number should come from the COP and is typically included as the diameter of a monopile. However, there are variances to how the developer presents this information in a COP. Additionally, COPs sometimes include a formula to derive this information. If so, use said formula. If this information is not included in a COP, use the following formula to estimate:
foundation footprint = 0.26 acres * foundation # (Column AB)
Assumption of 0.26 acres is based on monopile size used in Ocean Wind and other projects with 12-14 MW turbines, subtracting scour footprint from total location footprint.
*Note: If you are including a range in this cell for your project, be sure to update the subregion and overall OCS total numbers by adding in the larger value of your range.

[22] This number should come from the COP. If the COP provides a range, include only the highest value. If not, use the following formula to estimate:
Seabed Disturbance + Scour = [1 acre * foundation # (Column AB)] + foundation footprint (Column AC acres)
The "1" is based off of a previously submitted COPs with a scour protection of 1 acre
*Note: If you are including a range in this cell for your project, be sure to update the subregion and overall OCS total numbers by adding in the larger value of your range.

[23] This number should come from the COP. If so, ensure it is converted to acres. If not, use the following formula to estimate:
Seabed Disturbance = [[COP Export Cable Length (Column P miles) OR ESTIMATED Export Cable Length (Column S miles)] * 5,280 ft/mile * installation tool disturbance width (Column U ft)]/(43,560 sqft/acre)
Note: If the COP provides the export cable length (Column P), use that in the equation above. Otherwise, use the estimated export cable length value from Column S.
Offshore export cable seabed bottom disturbance is assumed to be due to installation of the export cable, the use of jack-up vessels, the need to perform dredging, and boulder removal.

[24] This number should come from the COP. If so, ensure it is converted to acres. If not, use the following formula to estimate:
Offshore Export Cable Hard Protection = [[COP Export Cable Length (Column P miles) OR ESTIMATED Export Cable Length (Column S miles)] * 5,280 ft/mile * 0.10 * 9.8 ft]/(43,560 sqft/acre)
Note: If the COP provides the export cable length (Column P), use that in the equation above. Otherwise, use the estimated export cable length value from Column S.
This equation uses the 9.8 ft as the width of a concrete mattress used in previously submitted COPs and multiplies by 10% based on the assumption built in to previously submitted COPs on how much of the cable route will require hard protection/mattressing/armoring.

[25] This number should come from the COP. If so, ensure it is converted to acres. If not, use the following formula to estimate:
Anchoring Disturbance = [COP Export Cable Length (Column P miles) OR ESTIMATED Export Cable Length (Column S miles)] * (the corresponding subregion total COP anchoring disturbance per export cable length total)
Note: If the COP provides the export cable length (Column P), use that in the equation above. Otherwise, use the estimated export cable length value from Column S.
To provide an assumption for non-COPs, please calculate the total anchoring disturbance values for COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total export cable length associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the anchoring disturbance value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AG white color coded cells)/(SUM Corresponding Column P white color coded cells)] * (new project Column S or P)

[26] The length of expected inter-array cables should come from the COP. If so, ensure it is converted to acres. If not, use the following formula to estimate:
Inter-array construction seabed disruption = foundation # (Column AB) * (the corresponding subregion total COP inter-array construction seabed disruption per foundation total)
To provide an assumption for non-COPs, please calculate the total inter-array construction seabed disruption values for COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the construction seabed disruption value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AH white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[27] This number should come from the COP. If so, ensure it is converted to acres. If not, use the following formula to estimate:
inter-array operating seabed disruption = foundation # (Column AB) * (the corresponding subregion total COP inter-array operating seabed disruption per foundation total)
To provide an assumption for non-COPs, please calculate the total inter-array operating seabed disruption values for COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the operating seabed disruption value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AI white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[28] This number should be come from the COP. If not, this number is assumed to be zero.

[29] This column is not applicable to State Waters projects.
From the COP: Total of Coolant Fluids in WTGs = [sum of all coolants provided in the COP (any material used as a coolant, not including water)] * [turbine # (Column Z)]
To provide an assumption for non-COPs, please calculate the total coolant fluids in WTGs for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total coolant fluids in WTGs value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AK white color coded cells)/(SUM Corresponding Column Z white color coded cells)] * (new project Column Z)

[30] This column is not applicable to State Waters projects.
From the COP: Total of Coolant Fluids in ESP/OSS = [sum of all coolants provided in the COP (any material used as a coolant, not including water)] * [ESP/OSS # (Column AA)]
To provide an assumption for non-COPs, please calculate the total coolant fluids in ESP/OSSs for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total coolant fluids in ESP/OSSs value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AL white color coded cells)/(SUM Corresponding Column AA white color coded cells)] * (new project Column AA)

[31] This column is not applicable to State Waters projects.
From the COP: Total of Oils and Lubricants in WTGs = [sum of all oils and lubricants provided in the COP] * [turbine # (Column Z)]
To provide an assumption for non-COPs, please calculate the total oils and lubricants in WTGs for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total oils and lubricants in WTGs value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AM white color coded cells)/(SUM Corresponding Column Z white color coded cells)] * (new project Column Z)

[32] This column is not applicable to State Waters projects.
From the COP: Total of Oils and Lubricants in ESPs/OSSs = [sum of all oils and lubricants provided in the COP] * [ESP/OSS # (Column AA)]
To provide an assumption for non-COPs, please calculate the total oils and lubricants in ESP/OSSs for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total oils and lubricants in ESP/OSSs value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AN white color coded cells)/(SUM Corresponding Column AA white color coded cells)] * (new project Column AA)

[33] This column is not applicable to State Waters projects.
From the COP: Total of Diesel Fuel in WTGs = [sum of all diesel fuel provided in the COP] * [turbine # (Column Z)]
To provide an assumption for non-COPs, please calculate the total diesel fuel in WTGs for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total diesel fuel in WTGs value, calculate the following formula from the values currently within the MA/RI region.
[(SUM Column AO white color coded cells)/(SUM Corresponding Column Z white color coded cells)] * (new project Column Z)

[34] This column is not applicable to State Waters projects.
From the COP: Total of Diesel Fuel in ESPs/OSSs = [sum of all diesel fuel provided in the COP] * [ESP/OSS # (Column AA)]
To provide an assumption for non-COPs, please calculate the total diesel fuels in ESP/OSSs for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total diesel fuels in ESP/OSSs value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AP white color coded cells)/(SUM Corresponding Column AA white color coded cells)] * (new project Column AA)

[35] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Construction emissions are totals for all construction activities, which take place over multiple years.
To provide an assumption for non-COPs, please calculate the total construction emissions of Nox for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of Nox value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AQ white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[36] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Construction emissions are totals for all construction activities, which take place over multiple years.
To provide an assumption for non-COPs, please calculate the total construction emissions of VOC for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of VOC value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AR white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[37] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Construction emissions are totals for all construction activities, which take place over multiple years.
To provide an assumption for non-COPs, please calculate the total construction emissions of CO for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of CO value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AS white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[38] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Construction emissions are totals for all construction activities, which take place over multiple years.
To provide an assumption for non-COPs, please calculate the total construction emissions of PM10 for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of PM10 value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AT white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[39] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Construction emissions are totals for all construction activities, which take place over multiple years.
To provide an assumption for non-COPs, please calculate the total construction emissions of PM2.5 for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of PM2.5 value, calculate the following formula from the values currently within the MA/RI region.
[(SUM Column AU white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[40] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Construction emissions are totals for all construction activities, which take place over multiple years.
To provide an assumption for non-COPs, please calculate the total construction emissions of SO2 for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of SO2 value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AV white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[41] This number should come from the COP. If not, request from the developer. For COPs that report CO2 equivalent per pollutant, total all pollutant values.
To provide an assumption for non-COPs, please calculate the total construction emissions of CO2e for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total construction emissions of CO2e value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AW white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[42] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Operations emissions are the highest annual level if all years not expected to be equal.
To provide an assumption for non-COPs, please calculate the total operation emissions of Nox for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of Nox value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AX white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[43] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Operations emissions are the highest annual level if all years not expected to be equal.
To provide an assumption for non-COPs, please calculate the total operation emissions of VOC for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of VOC value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AY white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[44] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Operations emissions are the highest annual level if all years not expected to be equal.
To provide an assumption for non-COPs, please calculate the total operation emissions of CO for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of CO value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column AZ white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[45] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Operations emissions are the highest annual level if all years not expected to be equal.
To provide an assumption for non-COPs, please calculate the total operation emissions of PM10 for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of PM10 value, calculate the following formula from the values currently within the MA/RI region.
[(SUM Column BA white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[46] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Operations emissions are the highest annual level if all years not expected to be equal.
To provide an assumption for non-COPs, please calculate the total operation emissions of PM2.5 for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of PM2.5 value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column BB white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[47] This number should come from the COP, but may require a summation of numbers provided per chemical compound. If not in the COP, ask for this data from the developer. If not available, use the following assumption:
Operations emissions are the highest annual level if all years not expected to be equal.

To provide an assumption for non-COPs, please calculate the total operation emissions of $SO_2$ for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of $SO_2$ value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column BC white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

[48] This number should come from the COP. If not, request from the developer. For COPs that report $CO_2$ equivalent per pollutant, total all pollutant values.
To provide an assumption for non-COPs, please calculate the total operation emissions of $CO_2e$ for all COPs listed in the Scenario tab for a specific subregion and divide by the corresponding COP provided total foundations associated with that specific subregion. (Note: White color coded cells are values taken directly from a COP). For example, if your new project is within the MA/RI region but does not have a COP yet, or does not provide the total operation emissions of $CO_2e$ value, calculate using the following formula from the values currently within the MA/RI region.
[(SUM Column BD white color coded cells)/(SUM Corresponding Column AB white color coded cells)] * (new project Column AB)

# APPENDIX E4

## Maximum-Case Scenario Estimates for Select Offshore Wind Project Components

# Contents

# Tables

*This page intentionally left blank.*

# Introduction

The following table provides maximum-case scenario estimates of potential No Action, Proposed Action, and other action alternative impacts for specific offshore wind project components, assuming maximum buildout, using the geographic analysis areas in the Revolution Wind Farm (RWF) and Revolution Wind Export Cable (RWEC) project environmental impact statement (EIS) and cumulative estimates developed by Bureau of Ocean Energy Management BOEM (see Table E3-1 in Appendix E3). All numbers are estimates and subject to change.

*This page intentionally left blank.*

* Totals provided in Appendix E3 and summarized here.

† Sums total IAC and OSS-Link cable length by alternative, as disclosed in Section 2.1.

‡ Sums total WTGs and OSSs by alternative, as disclosed in Section 2.1.

§ Sums OSS monopile foundation (0.043 acre/foundation) and WTG monopile foundation (0.027 acre/foundation) by alternative, as disclosed in Section 2.1.

¶ Sums OSS monopile foundation (7.2 acres/foundation) and WTG monopile foundation (7.2 acres/foundation) by alternative, as disclosed in Section 2.1.

# Sums WTG monopile scour protection (0.67 acre/foundation) and OSS monopile scour protection (0.66 acres/foundation) by alternative, as disclosed in Section 2.1.

** Sums RWEC-OCS and RWEC-RI construction and installation footprint by alternative, as disclosed in Section 2.1.

†† Sums RWEC-OCS and RWEC-RI operation footprint by alternative, as disclosed in Section 2.1.

‡‡ Sums IAC and OSS-link construction and installation footprint by alternative, as disclosed in Section 2.1.

§§ Sums IAC and OSS-link operation footprint by alternative, as disclosed in Section 2.1.

*** Totals provided in Appendix E3 and summarized here.

ŧ Project design has not occurred for Alternatives C through F; therefore, GIS calculations for the IAC, OSS-link cable, and RWEC are not available. This table uses the Proposed Action as the most conservative proxy estimate. However, best professional judgment suggests that the footprint of the IAC, OSS-link cable, and RWEC would change and be slightly reduced to match the reduced number of WTGs under Alternatives C through F.

# APPENDIX F

## Environmental Protection Measures, Mitigation, and Monitoring

# Contents

# Tables

*This page intentionally left blank.*

# Introduction

The Revolution Wind Farm (RWF) and the Revolution Wind Export Cable (RWEC) Project environmental impact statement (EIS) assesses the potential environmental, social, economic, historical, and cultural impacts that could result from the construction, operations and maintenance (O&M), and decommissioning of a wind energy project (the Project) located in the Bureau of Ocean Energy Management's (BOEM's) Renewable Energy Lease Area OCS-A 0486, approximately 15.0 miles east of Block Island, Rhode Island; approximately 12.5 miles south of the Rhode Island mainland coast; and between approximately 12.0 and 13.5 miles southeast of various points along the Massachusetts coastline in the Atlantic Ocean. The Project comprises the siting and development of the RWF and the RWEC. Revolution Wind, LLC (Revolution Wind) is proposing the Project, which is designed to contribute to Connecticut's renewable energy mandate of 2,000 megawatts (MW) of offshore wind energy by 2030 and Rhode Island's 100% renewable energy goal by 2030.

As part of the Project, Revolution Wind has committed to self-implement measures to avoid, reduce, mitigate, and/or monitor impacts on the resources discussed in Chapter 3 of the EIS. Those environmental protection measures (EPMs) are summarized in Table F-1 of this appendix. BOEM considers as part of the Proposed Action and Preferred Alternative only those measures that Revolution Wind has committed to in the construction and operations plan (COP) (VHB 2023).

Table F-1 includes EPMs derived from the COP in the following volumes, sections, and appendices:

- Volume 1 Section 3.3.3.2, Section 4.6.1.3, and Table 4.7-2
- Volume III
- Appendix Z2 - *Protected Species Mitigation and Monitoring Plan (PSMMP): Sea Turtles, and ESA-Listed Fish Species* (LGL Ecological Research Associates, Inc. 2022a)
- Appendix Z3 - *Protected Species Mitigation and Monitoring Plan (PSMMP): Marine Mammals* (Revolution Wind 2022)
- Appendix AA - *Assessment of the Potential Effects of the Revolution Offshore Wind Farm on Birds and Bats* (Biodiversity Research Institute 2023)

In addition to EPMs identified in the COP, Table F-1 also includes mitigation measures that Revolution Wind has proposed in its unanticipated discovery plan (Revolution Wind 2023:Attachments B and C). Note: the EMP descriptions in Table F-1 were taken verbatim from the COP and were not edited.

Table F-2 includes mitigation measures resulting from consultations and reviews under several environmental statutes (Clean Air Act, Endangered Species Act [ESA], Magnuson-Stevens Fisheries Conservation and Management Act, Marine Mammal Protection Act [MMPA], and National Historic Preservation Act), as discussed in Appendix A of the Final EIS. Examples include the following:

- *Petition for Incidental Take Regulations for the Construction and Operation of the Revolution Wind Offshore Wind Farm* (LGL Ecological Research Associates, Inc. 2022b)

- Federal consistency consultations under the Coastal Zone Management Act, which concluded on May 10, 2023, with the Massachusetts Office of Coastal Zone Management and on May 12, 2023, with the Rhode Island Coastal Resources Management Council

BOEM may select alternatives and/or require additional mitigation or monitoring measures to further protect and monitor these resources. Additional mitigation measures identified by BOEM are shown in Table F-3.

Please note that not all of the mitigation measures in Table F-2 and Table F-3 are within BOEM's statutory and regulatory authority but could be adopted and imposed by other governmental entities.

If BOEM decides to approve the COP, the record of decision (ROD) would state which of the mitigation and monitoring measures identified in Table F-2 and Table F-3 have been adopted, and if not, why they were not. The ROD will describe the specific terms and conditions of these measures for which compliance is required (40 Code of Federal Regulations [CFR] 1505.3). Revolution Wind would be required to certify compliance with certain terms and conditions under 30 CFR 285.633(a). Furthermore, BOEM would periodically review the activities conducted under the approved COP, with the frequency and extent of the review based on the significance of any changes in available information and on onshore or offshore conditions affecting, or affected by, the activities conducted under the COP.

Monitoring measures may be required to evaluate the effectiveness of a mitigation measure or to identify if resources are responding as predicted to impacts from the Project. This monitoring would typically be developed in coordination between BOEM and agencies with jurisdiction over the resource to be monitored. The information generated by monitoring may be used to 1) modify how a mitigation measure identified in the COP or ROD is being implemented, 2) revise or develop new mitigation or monitoring measures for which compliance would be required under the RWF COP in accordance with 30 CFR 585.634(b), 3) develop measures for future projects, or 4) contribute to regional efforts for better understanding the impacts and benefits resulting from offshore wind energy projects in the Atlantic (e.g., a potential cumulative impact assessment tool). Unless specified as an EPM, the proposed mitigation measures described below would not change the impact ratings on the affected resource, as described in Chapter 3 of the Final EIS, but would further reduce expected impacts or inform the development of additional mitigation measures if required.

In this appendix, distances in miles are in statute miles (miles used in the traditional sense) or nautical miles (miles used specifically for marine navigation). Statute miles are more commonly used and are referred to simply as *miles*, whereas nautical miles are referred to by name or by their abbreviation *nm*.

**Table F-1. Environmental Protection Measures (EPMs) Committed to by Revolution Wind, LLC (Applicant Proposed Measures)**

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| **Provided in COP Table 4.7-2** | | | | | |
| AQ-1 | Construction and installation, O&M, and decommissioning | Mitigation of air emissions | Vessels providing construction or maintenance services for the RWF will use low-sulfur fuel, where possible. | Air quality | Revolution Wind |
| AQ-2 | Construction and installation, O&M, and decommissioning | Mitigation of air emissions | Vessel engines will meet the appropriate Environmental Protection Agency (EPA) air emission standards for nitrogen oxide ($NO_X$) emissions when operating within Emission Controls Areas. | Air quality | Revolution Wind |
| AQ-3 | Construction and installation, O&M, and decommissioning | Mitigation of air emissions | Onshore Facilities equipment and fuel suppliers will provide equipment and fuels that comply with the applicable EPA or equivalent emission standards. | Air quality | Revolution Wind |
| AQ-4 | Construction and installation, O&M, and decommissioning | Mitigation of air emissions | Marine engines with a model year of 2007 or later and non-road engines complying with the Tier 3 standards (in 40 CFR 89 or 1039) or better will be used to satisfy best available control technology (BACT) or lowest achievable emission rate (LAER). | Air quality | Revolution Wind |
| WQ-1 | Construction and installation | Cable burial risk assessment | To the extent feasible, installation of the Inter-array cables (IACs), OSS-Link Cable, and RWEC will occur using equipment such as mechanical cutter, mechanical plow, or jet plow. The feasibility of cable burial equipment will be determined based on an assessment of seabed conditions and the Cable Burial Risk Assessment. | Water quality | Revolution Wind |
| WQ-2 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Water quality | Revolution Wind |
| WQ-3 | Construction and installation, O&M, and decommissioning | Oil spill response plan (OSRP) | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP (COP Appendix D [Orsted 2023]). | Water quality | Revolution Wind |
| WQ-4 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with United States Coast Guard (USCG) and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations that require adherence to Notice to Lessee (NTL) 2015-G03, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Water quality | Revolution Wind |
| WQ-5 | Construction and installation | HDD contingency plan | At the landfall location, drilling fluids will be managed within a contained system to be collected for reuse, as necessary. An HDD Contingency Plan will be prepared and implemented to minimize the potential risks associated with release of drilling fluids. | Water quality | Revolution Wind |
| WQ-6 | Construction and installation, O&M, and decommissioning | Soil erosion and sediment control (SESC) plan | A SESC plan, including erosion and sedimentation control measures, will be implemented to minimize potential water quality impacts during construction and operation of the Onshore Facilities. | Water quality | Revolution Wind |
| Coast-1 | Construction and installation | Siting of onshore facilities | Onshore Facilities will be sited within previously disturbed and developed areas to the extent practicable. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-2 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Coastal and terrestrial habitats | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| Coast-3 | Construction and installation | HDD contingency plan | At the landfall location, drilling fluids will be managed within a contained system to be collected for reuse, as necessary. An HDD Contingency Plan will be prepared and implemented to minimize the potential risks associated with release of drilling fluids. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-4 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures and SESC plan | Compliance with the RIPDES General Permit for Stormwater Discharges associated with construction activity which requires the implementation of a SESC Plan and spill prevention and control measures. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-5 | Construction and installation | SESC plan | The operator must implement the site-specific SESC Plan and maintain it during the entire construction process until the entire worksite is permanently stabilized by vegetation or other means. The measures employed in the SESC Plan use best management practices (BMPs) to minimize the opportunity for turbid discharges leaving a construction work area. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-6 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | The spill prevention and control measures mandate that the operator identifies all areas where spills can occur and their accompanying drainage points. The operator must also establish spill prevention and control measures to reduce the chance of spills, stop the source of spills, contain and clean up spills, and dispose of materials contaminated by spills. Spill prevention and control training will be provided for relevant personnel. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-7 | Construction and installation and O&M | Vegetation management | The perimeter surrounding Onshore Facilities will be managed to encourage the growth of native grasses, ferns, and low-growing shrubs. The management strategy will include the removal of invasive plants in compliance with state and federal regulations (e.g., herbicide use will not be permitted within regulated wetlands). | Coastal and terrestrial habitats | Revolution Wind |
| Coast-8 | Construction and installation | Avoidance/mitigation of wetland impacts | In accordance with Section 2.9(B)(1)(d) of the Freshwater Wetland Rules, the Onshore Facilities will be designed to avoid and minimize impacts to freshwater wetlands to the maximum extent practicable. Any wetlands that will be impacted as a result of the Project will be mitigated via the federal and state permitting process in accordance with Section 404 of the CWA and the Freshwater Wetland Rules. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-9 | Construction and installation, O&M, and decommissioning | SESC plan | An SESC Plan, including erosion and sedimentation control measures, will be implemented to minimize potential water quality impacts during construction and operation of the Onshore Facilities. | Coastal and terrestrial habitats | Revolution Wind |
| Coast-10 | Construction and installation | Vegetation management | The documented sickle-leaved golden aster population on the OnSS parcel will be protected during construction. | Coastal and terrestrial habitats | Revolution Wind |
| Ben-1 | Preconstruction | Siting of RWF and RWEC | The RWF and RWEC will be sited to avoid and minimize impacts to sensitive habitats (e.g., hard-bottom habitats) to the extent practicable. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-2 | Construction and installation | Cable burial risk assessment | The IAC, OSS-Link Cable, and RWEC will avoid identified shallow hazards to the extent practicable. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-3 | Construction and installation | Cable burial risk assessment | To the extent feasible, installation of the IAC, OSS-Link Cable, and RWEC will occur using equipment such as mechanical cutter, mechanical plow, or jet plow. The feasibility of cable burial equipment will be determined based on an assessment of seabed conditions and the Cable Burial Risk Assessment. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-4 | Construction and installation | Cable burial risk assessment | To the extent feasible, the RWEC, IAC, and OSS-Link Cable will typically target a burial depth of 4 to 6 ft (1.2 to 1.8 m) below seabed. The target burial depth will be determined based on an assessment of seabed conditions, seabed mobility, the risk of interaction with external hazards such as fishing gear and vessel anchors, and a site-specific Cable Burial Risk Assessment. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-5 | Construction and installation | Cable burial risk assessment | DP vessels will be used for installation of the IACs, OSS-Link Cable, and RWEC to the extent practicable. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-6 | Preconstruction | Anchoring plan | A plan for vessels will be developed prior to construction to identify no-anchorage areas to avoid documented sensitive resources. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-7 | Preconstruction, construction and installation, and postconstruction | Fisheries and benthic monitoring studies | Revolution Wind is committed to collaborative science with the commercial and recreational fishing industries pre-, during, and post-construction. Fisheries and benthic monitoring studies are being planned to assess the impacts associated with the Project on economically and ecologically important fisheries resources. These studies will be conducted in | Benthic habitat and invertebrates | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| | | | collaboration with the local fishing industry and will build upon monitoring efforts being conducted by affiliates of Revolution Wind at other wind farms in the region. | | |
| Ben-8 | Preconstruction | Submerged aquatic vegetation (SAV) study | A preconstruction SAV survey will be completed to identify any new or expanded SAV beds. The Project design will be refined to avoid impacts to SAV to the greatest extent practicable. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-9 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-10 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials will be managed through the OSRP. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-11 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with United States Coast Guard (USCG) and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations that require adherence to Notice to Lessee (NTL) 2015-G03, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-12 | Construction and installation | Soft start before pile driving | A ramp-up or soft start will be used at the beginning of each pile segment during impact pile driving and/or vibratory pile driving to provide additional protection to mobile species in the vicinity by allowing them to vacate the area prior to the commencement of pile-driving activities. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-13 | Construction and installation and O&M | Lighting minimization | Construction and operational lighting will be limited to the minimum necessary to ensure safety and compliance with applicable regulations. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-14 | Construction and installation | Time of year (TOY) restrictions | Revolution Wind will continue to coordinate with Rhode Island Department of Environmental Management (RIDEM) and National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) regarding TOY restrictions through the permitting process and will adhere to requirements imposed by these agencies. | Benthic habitat and invertebrates | Revolution Wind |
| Ben-15 | Preconstruction and construction and installation | Siting of RWF and RWEC | The RWF and RWEC would use HRG surveys and other site characterization methods to identify, avoid, and minimize impacts to complex bottom habitats to the extent practicable | Benthic habitat and invertebrates | Revolution Wind |
| Ben-16 | Construction and installation, O&M, and decommissioning | Fisheries and benthic monitoring plan | Revolution Wind has developed a fisheries and benthic habitat monitoring plan (dated May 2023) that has been prepared in accordance with recommendations set forth in Guidelines for Providing Benthic Habitat Survey Information for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 CFR Part 585 (BOEM 2019). | Benthic habitat and invertebrates | Revolution Wind |
| Ben-17 | Construction and installation | Boulder relocation | It is anticipated that a boulder grab and specialized working class, remotely operated vehicle boulder skid will be used for the majority of boulder relocations to reduce the magnitude and spatial extent of impacts to benthic habitats and invertebrates, such as complex and large-grained complex habitats. The boulder plow will only be used in limited segments of the RWEC. | Benthic habitat and EFH | BOEM and Bureau of Safety and Environmental Enforcement (BSEE) |
| Ben-18 | Construction and installation | HDD landfall | At the landfall location, drilling fluids will be managed within a contained system to be collected for reuse, as necessary. An HDD Contingency Plan will be prepared and implemented to minimize the potential risks associated with the release of drilling fluids. This EPM would minimize adverse effects to benthic habitats and invertebrates from impacts to water quality. | Benthic habitat and EFH | Revolution Wind, BOEM |
| Ben-19 | O&M | Bathymetry surveys | Revolution Wind intends to conduct an as-built survey/bathymetry survey along the entirety of the cable routes following installation. Bathymetry surveys will be performed post-installation one year after commissioning, two years after commissioning, and every five years thereafter or in accordance with permits and authorizations received for the Project. | Benthic habitat and EFH | Revolution Wind, BOEM |
| Fin-1 | Construction and installation | Cable burial risk assessment | To the extent feasible, installation of the IAC, OSS-Link Cable, and RWEC will occur using equipment such as mechanical cutter, mechanical plow, or jet plow. The feasibility of cable burial equipment will be determined based on an assessment of seabed conditions and the Cable Burial Risk Assessment. | Finfish and essential fish habitat | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| Fin-2 | Construction and installation | TOY restrictions | Based on the coordination with RIDEM and NOAA NMFS to date, in general, offshore site preparation for and installation of the RWEC-RI north of the Convention on the International Regulations for Preventing Collisions at Sea ("COLREGS") line of demarcation will occur between the day after Labor Day and February 1 to avoid and minimize impacts to winter flounder (Pseudopleuronectes americanus) and shellfish. Revolution Wind will continue to coordinate with RIDEM and NOAA NMFS regarding TOY restrictions through the permitting process and will adhere to requirements imposed by these agencies. | Finfish and essential fish habitat | Revolution Wind |
| Fin-3 | Construction and installation | Cable burial risk assessment | To the extent feasible, the RWEC, IAC, and OSS-Link Cable will typically target a burial depth of 4 to 6 ft (1.2 to 1.8 m) below seabed. The target burial depth will be determined based on an assessment of seabed conditions, seabed mobility, the risk of interaction with external hazards such as fishing gear and vessel anchors, and a site-specific Cable Burial Risk Assessment. | Finfish and essential fish habitat | Revolution Wind |
| Fin-4 | Construction and installation | Cable burial risk assessment | DP vessels will be used for installation of the IACs, OSS-Link Cable, and RWEC to the extent practicable. | Finfish and essential fish habitat | Revolution Wind |
| Fin-5 | Preconstruction | Anchoring plan | A plan for vessels will be developed prior to construction to identify no-anchorage areas to avoid documented sensitive resources. | Finfish and essential fish habitat | Revolution Wind |
| Fin-6 | Preconstruction, construction and installation, and postconstruction | Fisheries and benthic monitoring studies | Revolution Wind is committed to collaborative science with the commercial and recreational fishing industries pre-, during, and post-construction. Fisheries and benthic monitoring studies are being planned to assess the impacts associated with the Project on economically and ecologically important fisheries resources. These studies will be conducted in collaboration with the local fishing industry and will build upon monitoring efforts being conducted by affiliates of Revolution Wind at other wind farms in the region. | Finfish and essential fish habitat | Revolution Wind |
| Fin-7 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Finfish and essential fish habitat | Revolution Wind |
| Fin-8 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials will be managed through the OSRP. | Finfish and essential fish habitat | Revolution Wind |
| Fin-9 | Construction and installation | Soft start before pile driving | A ramp-up or soft start will be used at the beginning of each pile segment during impact pile driving and/or vibratory pile driving to provide additional protection to mobile species in the vicinity by allowing them to vacate the area prior to the commencement of pile-driving activities. | Finfish and essential fish habitat | Revolution Wind |
| Fin-10 | Construction and installation and O&M | Lighting minimization | Construction and operational lighting will be limited to the minimum necessary to ensure safety and compliance with applicable regulations. | Finfish and essential fish habitat | Revolution Wind |
| Fin-11 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with USCG and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations that require adherence to NTL 2015-G03, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Finfish and essential fish habitat | Revolution Wind |
| Fin-12 | Construction and installation | TOY restrictions | Revolution Wind will continue to coordinate with RIDEM and NOAA NMFS regarding TOY restrictions through the permitting process and will adhere to requirements imposed by these agencies. | Finfish and essential fish habitat | Revolution Wind |
| Fin-13 | Construction and installation, postconstruction and installation monitoring | Gear identification | To facilitate identification of gear on any entangled animals, all trap/pot gear used in the surveys must be uniquely marked to distinguish it from other commercial or recreational gear. | Finfish and essential fish habitat | Revolution Wind, BOEM, BSEE, and NMFS |
| Fin-14 | Construction and installation | Boulder relocation | It is anticipated that a boulder grab and specialized working class, remotely operated vehicle boulder skid will be used for the majority of boulder relocations to reduce the magnitude and spatial extent of impacts to benthic habitats and | Benthic habitat and EFH | BOEM and BSEE |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| | | | invertebrates, such as complex and large-grained complex habitats. The boulder plow will only be used in limited segments of the RWEC. | | |
| Fin-15 | Construction and installation | TOY restrictions | Timing restrictions to avoid noise impacts to North Atlantic right whale would also be protective of a portion of the Atlantic cod spawning season. This includes the restriction of pile-driving to the months of May to December; no pile driving will occur from January 1st to April 30th. | Finfish and essential fish habitat | Revolution Wind, BOEM, BSEE, and NMFS |
| Fin-16 | Construction and installation | HDD landfall | At the landfall location, drilling fluids will be managed within a contained system to be collected for reuse, as necessary. An HDD Contingency Plan will be prepared and implemented to minimize the potential risks associated with the release of drilling fluids. This EPM would minimize adverse effects to benthic and pelagic EFH, including EFH species, from impacts to water quality. | Finfish and essential fish habitat | Revolution Wind, BOEM |
| Fin-17 | O&M | Bathymetry surveys | Revolution Wind intends to conduct an as-built survey/bathymetry survey along the entirety of the cable routes following installation. Bathymetry surveys will be performed post-installation one year after commissioning, two years after commissioning, and every five years thereafter or in accordance with permits and authorizations received for the Project. | Benthic habitat and essential fish habitat | Revolution Wind, BOEM |
| MM-1 | Construction and installation | Establishment of pre-clearance and shutdown zones for impact pile driving | Exclusion and monitoring zones for marine mammals and sea turtles will be established for impact and vibratory pile-driving activities. | Marine mammals | Revolution Wind |
| MM-2 | Construction and installation | Impact and vibratory pile-driving mitigation measures | The following measures will be implemented for impact and vibratory pile-driving activities. These measures will include seasonal restrictions, soft-start measures, shutdown procedures, marine mammal and sea turtle monitoring protocols, the use of qualified and NOAA-approved Protected Species Observers (PSO), and noise attenuation systems such as bubble curtains, as appropriate. | Marine mammals | Revolution Wind |
| MM-3 | Construction and installation, O&M, and decommissioning | Vessel speed restrictions | Vessels will follow NOAA guidelines for marine mammal and sea turtle strike avoidance measures, including vessel speed restrictions. | Marine mammals | Revolution Wind |
| MM-4 | Construction and installation, O&M, and decommissioning | Marine mammal, sea turtle, and marine debris awareness training | All personnel working offshore will receive training on marine mammal and sea turtle awareness and marine debris awareness. | Marine mammals | Revolution Wind |
| MM-5 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Marine mammals | Revolution Wind |
| MM-6 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Marine mammals | Revolution Wind |
| MM-7 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with USCG and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Marine mammals | Revolution Wind |
| MM-8 | Construction and installation | Cable burial risk assessment | To the extent feasible, the RWEC, IAC, and OSS-Link Cable will typically target a burial depth of 4 to 6 ft (1.2 to 1.8 m) below seabed. The target burial depth will be determined based on an assessment of seabed conditions, seabed mobility, the risk of interaction with external hazards such as fishing gear and vessel anchors, and a site-specific Cable Burial Risk Assessment. | Marine mammals | Revolution Wind |
| MM-9 | Construction and installation, | Gear identification | All trap/pot gear used in the surveys would be uniquely marked to distinguish it from other commercial or recreational gear. Per the May 2023 Fisheries Research and Benthic Monitoring Plan, Revolution Wind will use | Marine mammals | Revolution Wind, BOEM, BSEE, and NMFS |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| | postconstruction and installation monitoring | | ropeless trap/pot gear equipped with acoustic retrieval systems (see MM-12). This EPM will effectively avoid risk of marine mammal entanglement. | | |
| MM-10 | Construction and installation and postconstruction and installation | MMPA application measures | Revolution Wind is committed to minimizing impacts to marine mammal species through a comprehensive monitoring and mitigation program. The mitigation measures identified in the MMPA Incidental Take Regulations (ITR) application to be implemented include, but are not limited to, the following:<br>1. Noise attenuation through use of a noise mitigation system;<br>2. Seasonal restrictions;<br>3. Standard PSO training and equipment requirements;<br>4. Visual monitoring; including low visibility monitoring tools;<br>5. Passive acoustic monitoring;<br>6. Establishment and monitoring of shutdown zones<br>7. Pre-start clearance;<br>8. Ramp-up (soft-start) procedures;<br>9. Operational and long-term monitoring of marine mammals and sea turtles;<br>10. Operational shutdowns and delay;<br>11. Sound source verification measurements of at least one foundation installation<br>12. Survey sighting coordination;<br>13. Entanglement reduction measures during fishery and benthic monitoring surveys;<br>14. Vessel strike avoidance procedures; and<br>15. Data recording and reporting procedures. | Marine mammals | Revolution Wind, NMFS, and BSEE |
| MM-11 | Construction and installation, postconstruction and installation monitoring | Fisheries and benthic habitat monitoring | Fisheries monitoring was designed in accordance with recommendations set forth in "Guidelines for Providing Information on Fisheries for Application for Renewable Energy Development on the Atlantic Outer Continental Shelf" (BOEM 2019) and consideration to the Responsible Offshore Science Alliance (ROSA) Offshore Wind Project Monitoring Framework and Guidelines. All survey activities will be subject to rules and regulations outlined under the MMPA and ESA. Efforts will be taken to reduce marine mammal, sea turtle, and seabird injuries and mortalities caused by incidental interactions with sampling gear. All gear restrictions, closures, and other regulations set forth by take reduction plans (e.g., Harbor Porpoise Take Reduction Plan, Atlantic Large Take Whale Reduction Plan, etc.) will be adhered to as with typical scientific fishing operations to reduce the potential for interaction or injury. | Marine mammals | Revolution Wind |
| MM-12 | Construction and installation, postconstruction and installation monitoring | Fisheries and benthic habitat monitoring | Changes to Appendix Y, Fisheries Research and Benthic Monitoring Plan, include measures to reduce potential impacts to protected species, specifically, use of ropeless technology or grappling techniques which will require no downlines in the lease area. To mitigate unmarked gear, applicant would post the gear positions in an online gear tracking application until such a point, if any, where downlines and markers are permitted. As an additional mitigation measure, the researchers for the Revolution Wind ventless lobster trap survey would remove gear from the lease area between sampling periods as to reduce the risk of it being lost or accidentally towed up by fishing or survey vessels. | Marine Mammals | Revolution Wind |
| ST-1 | Construction and installation | Establishment of clearance and/or shutdown zones for impact pile driving | Exclusion and monitoring zones for marine mammals and sea turtles will be established for impact and vibratory pile-driving activities. | Sea turtles | Revolution Wind |
| ST-2 | Construction and installation | Impact and vibratory pile-driving mitigation measures | The following measures will be implemented for impact and vibratory pile-driving activities. These measures will include seasonal restrictions, soft-start measures, shut-down procedures, marine mammal and sea turtle monitoring protocols, the use of qualified and NOAA-approved Protected Species Observers (PSOs), and noise attenuation systems such as bubble curtains, as appropriate. | Sea turtles | Revolution Wind |
| ST-3 | Construction and installation, O&M, and decommissioning | Vessel speed restriction | Vessels will follow NOAA guidelines for marine mammal and sea turtle strike avoidance measures, including vessel speed restrictions. | Sea turtles | Revolution Wind |
| ST-4 | Construction and installation, O&M, and decommissioning | Marine mammal, sea turtle, and marine debris awareness training | All personnel working offshore will receive training on marine mammal and sea turtle awareness and marine debris awareness. | Sea turtles | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| ST-5 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Sea turtles | Revolution Wind |
| ST-6 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Sea turtles | Revolution Wind |
| ST-7 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with USCG and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations that require adherence to NTL 2015-G03, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Sea turtles | Revolution Wind |
| ST-8 | Construction and installation | Cable burial risk assessment | To the extent feasible, the RWEC, IAC, and OSS-Link Cable will typically target a burial depth of 4 to 6 ft (1.2 to 1.8 m) below seabed. The target burial depth will be determined based on an assessment of seabed conditions, seabed mobility, the risk of interaction with external hazards such as fishing gear and vessel anchors, and a site-specific Cable Burial Risk Assessment. | Sea turtles | Revolution Wind |
| ST-9 | Construction and installation | Develop and implement Protected Species Monitoring and Mitigation Plan | A Protected Species Monitoring and Mitigation Plan has been developed that defines the mitigation and monitoring that will be carried out to reduce the potential impacts on federally protected species including sea turtles. | Sea turtles | Revolution Wind |
| ST-10 | Construction and installation | Develop and implement Protected Species Monitoring and Mitigation Plan | All PSOs will have completed a NMFS-approved PSO training course. | Sea turtles | Revolution Wind |
| ST-11 | Construction and installation | Develop and implement Protected Species Monitoring and Mitigation Plan | Sound field verification measurements of the installation of at least three monopile foundations will be made and results used to modify shutdown zones, as appropriate. | Sea turtles | Revolution Wind |
| ST-12 | Construction and installation | Develop and implement Protected Species Monitoring and Mitigation Plan | Prior to the initiation of pile-driving and HRG survey equipment ramp-up, PSOs will conduct a 30-minute watch of the shutdown zones to monitor for sea turtles. Prior to munitions and explosives of concern/unexploded ordnance detonation, a 60-minute watch of the shutdown zone will be conducted. | Sea turtles | Revolution Wind |
| ST-13 | Construction and installation | Develop and implement Protected Species Monitoring and Mitigation Plan | If the HRG survey acoustic source is shut down for reasons other than mitigation (e.g., mechanical difficulty) for less than 30 minutes, it will be reactivated without ramp-up if PSOs have maintained constant observation and no detections of any sea turtles have occurred within the respective shutdown zones. | Sea turtles | Revolution Wind |
| ST-14 | Construction and installation, postconstruction and installation monitoring | Fisheries and benthic habitat monitoring | Revisions to the March 2023 COP version of Appendix Y, Fisheries Research and Benthic Monitoring Plan, include additional measures to reduce potential impacts to protected species. The ventless trap and pot gear will employ ropeless technology or grappling techniques that will eliminate the need for buoy lines and surface floats. To mitigate unmarked gear, the applicant would post the gear positions in an online gear tracking application until such a point, if any, where downlines and markers are permitted. As an additional mitigation measure, the researchers for the Revolution Wind ventless lobster trap survey would remove gear from the lease area between sampling periods as to reduce risk of loss. | Sea turtles | Revolution Wind |
| Bird-1 | Construction and installation | TOY restrictions for tree and shrub removal | To the extent feasible, tree and shrub removal for Onshore Facilities will occur outside the avian nesting and bat roosting period, May 1 through August 15. If tree and shrub removal cannot be avoided during this season, Revolution Wind will coordinate with appropriate agencies to determine appropriate course of action. | Birds | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| Bird-2 | Construction and installation and O&M | WTG spacing and layout | Revolution Wind is committed to an indicative layout scenario with WTGs sited in a grid with approximately 1.15-mi (1-nm) by 1.15-mi (1-nm) spacing that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This wide spacing of WTGs will allow avian species to avoid individual WTGs and minimize risk of potential collision. | Birds | Revolution Wind |
| Bird-3 | Construction and installation and O&M | Lighting minimization | Construction and operational lighting will be limited to the minimum necessary to ensure safety and compliance with applicable regulations. | Birds | Revolution Wind |
| Bird-4 | Construction and installation and O&M | Lighting minimization with lighting technology | Revolution Wind will comply with Federal Aviation Administration (FAA) and USCG requirements for lighting while using lighting technology (e.g., low-intensity strobe lights) that minimizes impacts on avian species. | Birds | Revolution Wind |
| Bird-5 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Birds | Revolution Wind |
| Bird-6 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with USCG and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations that require adherence to NTL 2015-G03, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Birds | Revolution Wind |
| Bird-7 | Construction and installation, O&M, and decommissioning | SESC plan | An SESC Plan, including erosion and sedimentation control measures, will be implemented to minimize potential water quality impacts during construction and operation of the Onshore Facilities. | Birds | Revolution Wind |
| Bird-8 | Construction and installation | Siting of onshore facilities | Onshore Facilities will be sited within previously disturbed and developed areas to the extent practicable. | Birds | Revolution Wind |
| Bird-9 | Construction and installation | Burial of onshore transmission cables | The Onshore Transmission Cables will be buried; therefore, avoiding the risk to avian and bat species associated with overhead lines. | Birds | Revolution Wind |
| Bird-10 | O&M | Adaptive mitigation for birds and bats | Revolution Wind has developed an Avian and Bat Post-Construction Monitoring Framework (see Appendix G and COP Appendix AA [Biodiversity Research Institute 2023]) for the Project that summarizes the approach to monitoring; describes overarching monitoring goals and objectives; identifies the key avian species, priority questions, and data gaps unique to the region and Project Area that will be addressed through monitoring; and describes methods and time frames for data collection, analysis, and reporting. Post-construction monitoring will assess impacts of the Project with the purpose of filling select information gaps and supporting validation of the Project's Avian Risk Assessment. Focus may be placed on improving knowledge of ESA-listed species occurrence and movements offshore, avian collision risk, species/species-group displacement, or similar topics. Where possible, monitoring conducted by Revolution Wind will build on and align with post-construction monitoring conducted by the other Orsted/Eversource offshore wind projects in the Northeast region. Revolution Wind will engage with federal and state agencies and environmental groups (eNGOs) to identify appropriate monitoring options and technologies and to facilitate acceptance of the final plan. | Birds | Revolution Wind, BOEM, BSEE, USFWS |
| Bird-11 | Construction and installation, O&M, and decommissioning | Adaptive mitigation for birds and bats | Revolution Wind will document any dead (or injured) birds/bats found incidentally on vessels and structures during construction, O&M, and decommissioning and provide an annual report to BOEM and United States Fish and Wildlife Service (USFWS). | Birds | Revolution Wind and BSEE |
| Bird-12 | Construction and installation | TOY restrictions | Revolution Wind will continue to coordinate with RIDEM and NOAA NMFS regarding TOY restrictions through the permitting process and will adhere to requirements imposed by these agencies. | Birds | Revolution Wind |
| Bird-13 | Construction and installation and O&M | Aircraft detection lighting system (ADLS) (or a similar system) | Revolution Wind will use an aircraft detection lighting system (ADLS) (or a similar system), pursuant to approval by the FAA and commercial and technical feasibility at the time of Facility Design Report (FDR)/ Fabrication and Installation Report (FIR) approval. | Birds | Revolution Wind |
| Bat-1 | Construction and installation and O&M | Lighting minimization | Construction and operational lighting will be limited to the minimum necessary to ensure safety and to comply with applicable regulations. | Bats | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| Bat-2 | Construction and installation | TOY restrictions for tree and shrub removal | To the extent feasible, tree and shrub removal for Onshore Facilities will occur outside the avian nesting and bat roosting period; May 1 through August 15. If tree and shrub removal cannot be avoided during this season, Revolution Wind will coordinate with appropriate agencies to determine appropriate course of action. | Bats | Revolution Wind |
| Bat-3 | Construction and installation and O&M | WTG spacing and layout | Revolution Wind is committed to an indicative layout scenario with WTGs sited in a grid with approximately 1.15-mi (1-nm) by 1.15-mi (1-nm) spacing that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This wide spacing of WTGs will allow avian and bat species to avoid individual WTGs and minimize risk of potential collision. | Bats | Revolution Wind |
| Bat-4 | Construction and installation and O&M | Lighting minimization with lighting technology | Revolution Wind will comply with FAA and USCG requirements for lighting while using lighting technology (e.g., low-intensity strobe lights) that minimize impacts on avian and bat species. | Bats | Revolution Wind |
| Bat-5 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Bats | Revolution Wind |
| Bat-6 | Construction and installation, O&M, and decommissioning | SESC plan | An SESC Plan, including erosion and sedimentation control measures, will be implemented to minimize potential water quality impacts during construction and operation of the Onshore Facilities. | Bats | Revolution Wind |
| Bat-7 | Construction and installation | Siting of onshore facilities | Onshore Facilities will be sited within previously disturbed and developed areas to the extent practicable. | Bats | Revolution Wind |
| Bat-8 | Construction and installation | Burial of onshore transmission cables | The Onshore Transmission Cables will be buried; therefore, avoiding the risk to avian and bat species associated with overhead lines. | Bats | Revolution Wind |
| Bat-9 | Construction and installation, O&M, and decommissioning | Adaptive mitigation for birds and bats | Revolution Wind will document any dead (or injured) birds/bats found incidentally on vessels and structures during construction, O&M, and decommissioning and provide an annual report to BOEM and USFWS. | Bats | Revolution Wind and BSEE |
| Bat-10 | Construction and installation | TOY restrictions | Revolution Wind will continue to coordinate with RIDEM and NOAA NMFS regarding TOY restrictions through the permitting process and will adhere to requirements imposed by these agencies. | Bats | Revolution Wind |
| Bat-11 | Construction | Minimization of long=term impacts | Comply with the Northern Long-Eared Bat 4(d) rule (81 FR 1900-1922) to avoid and minimize long-term impacts on the species and sensitive upland habitats. | Bats | BOEM and USFWS |
| CR-1 | Construction and installation and O&M | Aircraft detection lighting system (ADLS) (or a similar system) | Revolution Wind will use Aircraft Detection Lighting System (ADLS) (or a similar system), pursuant to approval by the FAA and commercial and technical feasibility at the time of FDR/FIR approval. | Cultural resources | Revolution Wind |
| CR-2 | Construction and installation and O&M | WTG design | RWF WTGs will have uniform design, speed, height, and rotor diameter, thereby mitigating visual clutter. | Cultural resources | Revolution Wind |
| CR-3 | Construction and installation and O&M | WTG design | The WTGs will be painted Pure White (RAL 9010) to Light Grey (RAL 7035), as recommended by BOEM and the FAA. This color white of the turbines generally blends well with the sky at the horizon and eliminates the need for daytime warning lights or red paint marking of the blade tips. | Cultural resources | Revolution Wind |
| CR-4 | Construction and installation | Burial of onshore transmission cables and ICF interconnection | The Onshore Transmission Cable and ICF Interconnection ROW will be buried, minimizing potential impacts to adjacent properties. | Cultural resources | Revolution Wind |
| CR-5 | Construction and installation and O&M | Onshore facilities location | The Onshore Facilities will be located adjacent to an existing substation on a parcel zoned for commercial and industrial/utility use. | Cultural resources | Revolution Wind |
| CR-6 | Construction and installation and O&M | Onshore facilities screening | Screening will be implemented at the aboveground Onshore Facilities to the extent feasible, to reduce potential visibility and noise. | Cultural resources | Revolution Wind |
| CR-7 | Preconstruction | Siting of RWF and RWEC | The RWF and RWEC will be sited to avoid or minimize impacts to potential submerged cultural sites and paleolandforms, or will mitigate these impacts as specified in the memorandum of agreement (MOA) (Appendix J). | Cultural resources | Revolution Wind |
| CR-8 | Construction and installation and O&M | Marine survey design, execution, and interpretation | Native American Tribal representatives were involved, and will continue to be involved, in marine survey protocol design, execution of the surveys, and interpretation of the results. | Cultural resources | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| CR-9 | Preconstruction | Anchoring plan | A plan for vessels will be developed prior to construction to identify no-anchorage areas to avoid documented sensitive resources. | Cultural resources | Revolution Wind |
| CR-10 | Construction and installation | Unanticipated discovery plan (UDP) | An Unanticipated Discovery Plan (UDP) will be implemented that will include stop-work and notification procedures to be followed if a potentially significant archaeological resource is encountered during construction. | Cultural resources | Revolution Wind |
| CR-11 | Construction and installation | Siting of onshore facilities | Onshore Facilities will be sited within previously disturbed and developed areas to the extent practicable. | Cultural resources | Revolution Wind |
| CR-12 | Preconstruction | Siting of onshore facilities | Onshore Facilities will be sited to avoid or minimize impacts to potential terrestrial archeological resources, or will mitigate these impacts as specified in the MOA (Appendix J). | Cultural resources | Revolution Wind |
| VR-1 | Construction and installation | ADLS (or a similar system) | Revolution Wind will use ADLS (or a similar system), pursuant to approval by the FAA and commercial and technical feasibility at the time of FDR/FIR approval. | Visual resources | Revolution Wind |
| VR-2 | Construction and installation and O&M | WTG design | RWF WTGs will have uniform design, speed, height, and rotor diameter, thereby mitigating visual clutter. | Visual resources | Revolution Wind |
| VR-3 | Construction and installation and O&M | WTG design | The WTGs will be painted Pure White (RAL 9010) to Light Grey (RAL 7035), as recommended by BOEM and the FAA for aviation safety. | Visual resources | Revolution Wind |
| VR-4 | Construction and installation | Burial of onshore transmission cables and ICF interconnection | The Onshore Transmission Cable and ICF Interconnection ROW will be buried, minimizing potential impacts to adjacent properties. | Visual resources | Revolution Wind |
| VR-5 | Construction and installation and O&M | Onshore facilities screening | Screening will be implemented with vegetation and other site adaptive materials at the aboveground Onshore Facilities to the extent feasible, to reduce potential visibility and noise. | Visual resources | Revolution Wind |
| VR-6 | Construction and installation and O&M | Onshore facilities design | Adaptive color treatments (i.e. the use of colors that repeat in the surrounding environment, especially those of the natural elements) and non-reflective surface treatments and finishes will be used on Onshore Facilities to minimize contrast and reflected glare to the surrounding setting, as it aligns with local stakeholder preference and approval by local authorities. | Visual resources | Revolution Wind |
| VR-7 | Construction and installation and O&M | Lighting minimization at the ONSS and ICF | Lighting at the OnSS and ICF will be designed and installed using sustainable outdoor lighting specifications to minimize impact to natural night skies or to contribute to increased impacts https://www.nps.gov/subjects/nightskies/sustainable-outdoor-lighting.htm, (e.g., kept to a minimum and turned on only as needed by manual switch, all recessed or fully shielded light fixtures, no upward lighting, etc.). | Visual resources | Revolution Wind |
| Demo-1 | Construction and installation, O&M, and decommissioning | Employment of local workers | Where possible, local workers will be hired to meet labor needs for Project construction, O&M, and decommissioning. | Demographics, employment, and economics | Revolution Wind |
| Demo-2 | Construction and installation | TOY restrictions of onshore facility construction | The Onshore Facilities construction schedule will be designed to minimize impacts to the local community during the summer tourist season, generally between Memorial Day and Labor Day. | Demographics, employment, and economics | Revolution Wind |
| Demo-3 | Construction and installation and O&M | Onshore facilities screening | Screening will be implemented at the aboveground Onshore Facilities to the extent feasible, to reduce potential visibility and noise. | Demographics, employment, and economics | Revolution Wind |
| Demo-4 | Construction and installation | Coordination with local authorities to address environmental and community concerns | Revolution Wind will coordinate with local authorities during construction of Onshore Facilities to minimize local traffic impacts; further, these Project components will be constructed in compliance with applicable regulations related to environmental and community concerns (e.g., traffic and erosion). In addition, traffic will be temporary and will not impact long-term property values. | Demographics, employment, and economics | Revolution Wind |
| Demo-5 | Preconstruction | Community-based career development programming | Revolution Wind is committing $1,000,000 to community-based programming, including $500,000 to the Community College of Rhode Island to help build their Global Wind Organization (GWO) training center and $500,000 to Building Futures Rhode Island to enable both new entrants to union construction careers (through pre-apprenticeship). An | Demographics, employment, and economics | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| | | | additional $700,000 will be dedicated to other local programming that creates access to these careers for disadvantaged communities. | | |
| Demo-6 | Construction and Installation | Labor standards | Construction of the Revolution Wind project will be governed by the National Offshore Wind Agreement, which is a project labor agreement that will apply to domestic construction activities associated with the project. | Demographics, employment, and economics | Revolution Wind |
| Rec-1 | Construction and installation | Fisheries communication plan | A comprehensive communication plan will be implemented during offshore construction to inform all mariners, including commercial and recreational fishermen, and recreational boaters of construction activities and vessel movements. Communication will be facilitated through a Project website, public notices to mariners and vessel float plans, and a fisheries liaison. Revolution Wind will submit information to the USCG to issue Local Notice to Mariners during offshore installation activities. | Recreation and tourism | Revolution Wind |
| Rec-2 | Construction and installation | TOY restrictions on onshore facilities construction | The Onshore Facilities construction schedule will be designed to minimize impacts to the local community during the summer tourist season, generally between Memorial Day and Labor Day. | Recreation and tourism | Revolution Wind |
| Rec-3 | Construction and installation | Coordination with local authorities to address environmental and community concerns | Revolution Wind will coordinate with local authorities during construction of Onshore Facilities to minimize local traffic impacts; further, these Project components will be constructed in compliance with applicable regulations related to environmental and community concerns (e.g., traffic and erosion). In addition, traffic will be temporary and will not impact long-term property values. | Recreation and tourism | Revolution Wind |
| ComFish-1 | Construction and installation and O&M | WTG spacing and layout | Revolution Wind is committed to an indicative layout scenario with WTGs sited in a grid with approximately 1.15-mi (1-nm) by 1.15-mi (1-nm) spacing that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This layout has been confirmed through expert analysis to allow for safe navigation without the need for additional designated transit lanes. This layout will also provide a uniform, wide spacing among structures to facilitate search and rescue operations. | Commercial and recreational fishing | Revolution Wind |
| ComFish-2 | Construction and installation | Cable burial risk assessment | To the extent feasible, installation of the Inter-Array Cable, OSS Interconnector Cable, and RWEC will occur using equipment such as mechanical cutter, mechanical plow, or jet plow. The feasibility of cable burial equipment will be determined based on an assessment of seabed conditions and the Cable Burial Risk Assessment. | Commercial and recreational fishing | Revolution Wind |
| ComFish-3 | Construction and installation | Cable burial risk assessment | To the extent feasible, the RWEC, IAC, and OSS-Link Cable will typically target a burial depth of 4 to 6 ft (1.2 to 1.8 m) below seabed. The target burial depth will be determined based on an assessment of seabed conditions, seabed mobility, the risk of interaction with external hazards such as fishing gear and vessel anchors, and a site-specific Cable Burial Risk Assessment. | Commercial and recreational fishing | Revolution Wind |
| ComFish-4 | Construction and installation and O&M | Implementation of BMPS | As appropriate and feasible, BMPs will be implemented to minimize impacts on fisheries, as described in the Guidelines for Providing Information on Fisheries Social and Economic Conditions for Renewable Energy Development on the Atlantic Outer Continental Shelf Pursuant to 30 CFR Part 585 (BOEM 2020). | Commercial and recreational fishing | Revolution Wind |
| ComFish-5 | Preconstruction, construction and installation, and postconstruction | Fisheries and benthic monitoring studies | Revolution Wind is committed to collaborative science with the commercial and recreational fishing industries pre-, during, and postconstruction. Fisheries and benthic monitoring studies are being planned to assess the impacts associated with the Project on economically and ecologically important fisheries resources. These studies will be conducted in collaboration with the local fishing industry and will build upon monitoring efforts being conducted by affiliates of Revolution Wind at other wind farms in the region. | Commercial and recreational fishing | Revolution Wind |
| ComFish-6 | Construction and installation and O&M | WTG lighting and ais installation | Each WTG will be marked and lit with both USCG navigation lighting and FAA aviation lighting. Automatic Identification Systems (AISs) will be installed at the RWF marking the corners of the wind farm to assist in safe navigation. | Commercial and recreational fishing | Revolution Wind |
| ComFish-7 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Commercial and recreational fishing | Revolution Wind |
| ComFish-8 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Commercial and recreational fishing | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| ComFish-9 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | All vessels will comply with USCG and EPA regulations that require operators to develop waste management plans, post informational placards, manifest trash sent to shore, and use special precautions such as covering outside trash bins to prevent accidental loss of solid materials. Vessels will also comply with BOEM lease stipulations that require adherence to NTL 2015-G03, which instructs operators to exercise caution in the handling and disposal of small items and packaging materials, requires the posting of placards at prominent locations on offshore vessels and structures, and mandates a yearly marine trash and debris awareness training and certification process. | Commercial and recreational fishing | Revolution Wind |
| ComFish-10 | Construction and installation and O&M | Fisheries communication plan | Communications and outreach with the commercial and recreational fishing industries will be guided by the Project-specific Fisheries Communication Plan. Revolution Wind has agreed to share fisheries monitoring data with regulatory agencies and interested stakeholders upon request. Data sharing will occur on an annual cycle, which may be unique to each survey, and all data will be subject to rigorous quality assurance and quality control criterion prior to dissemination. | Commercial and recreational fishing | Revolution Wind |
| ComFish-11 | Construction and installation, O&M, and decommissioning | Coordination with appropriate federal, state, and local contacts | Project construction, O&M, and decommissioning activities will be coordinated with appropriate contacts at USCG, Naval Undersea Warfare Center (NUWC)-Newport RI, the Northeast Marine Pilots Association, and Department of Defense (DoD) command headquarters. | Commercial and recreational fishing | Revolution Wind |
| ComFish-12 | Preconstruction | Siting of RWEC | RWEC was sited to avoid conflicts with DoD use areas and navigational areas identified by the USCG, as applicable. | Commercial and recreational fishing | Revolution Wind |
| ComFish-13 | Construction and installation | Fisheries communication plan | A comprehensive communication plan will be implemented during offshore construction to inform all mariners, including commercial and recreational fishermen, and recreational boaters of construction activities and vessel movements. Communication will be facilitated through a Fisheries Liaison, Project website, and public notices to mariners and vessel float plans (in coordination with USCG). | Commercial and recreational fishing | Revolution Wind |
| ComFish-14 | Construction and installation | TOY restrictions | Revolution Wind will continue to coordinate with RIDEM and NOAA NMFS regarding TOY restrictions through the permitting process and will adhere to requirements imposed by these agencies. | Commercial and recreational fishing | Revolution Wind |
| ComFish-15 | Construction and installation, O&M, and decommissioning | Coastal Zone Management Act (CZMA) consistency reviews | **Direct Compensation Program** (will be in place 30 days after the receipt of all final federal, state and local permits, authorizations, concurrences, and approvals necessary to construct and operate Revolution Wind as described in the approved COP and will exist for the life of the project) – Revolution Wind will create a Direct Compensation Program for impacted fishermen. Similar to South Fork Wind, Revolution Wind will base the direct compensation program on findings from two separate Coastal Zone Management Act (CZMA) consistency reviews conducted by the states of Rhode Island and Massachusetts and resulting mitigation agreements. The direct compensation programs which are part of the mitigation agreements for the states of Rhode Island and Massachusetts will address impacts to commercial fishing operations and for-hire recreational fishing operations. Revolution Wind expects that the structure of the direct compensation programs agreed to via the CZMA process will substantially reflect South Fork Wind's direct compensation program. Understanding there may be impacts outside of Rhode Island and Massachusetts, Revolution Wind is committed to advancing and adhering to principles set forth by the nine-state initiative as well as ideals laid out in the BOEM guidance. Together, the nine-state initiative and BOEM guidance will ensure a fair and efficient compensatory mitigation process regardless of homeport. It is Revolution Wind's intent to contribute, to the extent necessary, an amount commensurate to impacted landings from states exclusive of Rhode Island and Massachusetts. It is Revolution Wind's understanding that the nine-state initiative will create a process that will be managed by a third party, determine eligibility, and approve claims. | Commercial and recreational fishing | Revolution Wind, Massachusetts Office of Coastal Zone Management, and Rhode Island Coastal Resources Management Council |
| ComFish-16 | Construction and installation, O&M, and decommissioning | CZMA consistency reviews | **Coastal Community Funds** – In addition to the direct compensation programs created during the CZMA process, Revolution Wind will create or contribute to Coastal Community Funds in Rhode Island and Massachusetts. The contribution amounts will be determined during the CZMA process. The Coastal Community Funds will be grant-making entities, unrelated to Revolution Wind, and open to all fishing interests, including private recreational angling and on-shore support businesses. | Commercial and recreational fishing | Revolution Wind, Massachusetts Office of Coastal Zone Management, and Rhode Island Coastal Resources Management Council |
| ComFish-17 | Construction and installation, O&M, and decommissioning | CZMA consistency reviews | **Navigational Safety Fund** (will be in place 30 days after the receipt of all final federal, state and local permits, authorizations, concurrences, and approvals necessary to construct and operate Revolution Wind as described in the approved COP and will exist until funds run out) – The Navigational Safety Fund will enable eligible commercial fishermen and for-hire vessels to acquire navigation equipment through a voucher system. The Navigational Safety Fund will be similar to and carry out the same intent as the program established for South Fork Wind[2]. It will also provide training and | Commercial and recreational fishing | Revolution Wind, Massachusetts Office of Coastal Zone Management, and Rhode Island Coastal Resources Management Council |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| | | | experiential learning opportunities to those navigating within Orsted's lease area off the coast of Rhode Island and Massachusetts. Fishermen eligible for the Direct Compensation Program and who do not already possess AIS transceivers and/or pulse compression radar systems may receive one-time grants for up to $10,000 in order to upgrade or purchase pulse compression radar or AIS. Commercial fishing vessels and inspected for-hire/party vessels will be eligible for $10,000 in upgrades and uninspected for- hire vessels will be eligible for $5,000 in upgrades. Eligible fishermen will be issued vouchers to spend at approved vendors for approved products. The process of issuing vouchers, approving vendors, and approving equipment will be managed by a third party which could be the same third party managing the Direct Compensation Program. In addition to vessel upgrades, there will be an educational component to the Navigational Safety Fund. Those eligible for direct compensation may attend a professional training of their choice with support up to $1,000 per person. Eligible trainings include but are not limited to a captain's course, license upgrade, radar course, or rules of the road refresher. Like vessel upgrades, a third party manager will issue vouchers for training and be responsible for approving trainings, trainers, educators, and/or institutions. | | |
| ComFish-18 | Construction and installation, O&M, and decommissioning | CZMA consistency reviews | **Gear Claim Procedure** (currently in use and will exist for the life of the project) – Orsted administers a portfolio-wide gear claim procedure which makes fishermen whole if Orsted activities damage or destroy commercial fishing gear. The gear claim process has been in place since 2018 and has had significant updates since then. The most significant update in January 2021 included changes to model the gear claim procedure after NOAA's Fishermen's Contingency Fund to the greatest extent possible. Currently, the gear claim process requires a fisherman to file a claim within 30 days upon discovery of lost or damaged gear. They may request reimbursement for lost/damaged gear, economic loss (lost catch and business interruption), and reasonable claim preparation costs. After they submit a complete claim, the claim is reviewed and either accepted or rejected in whole or in part. If rejected in whole or in part, the fishermen may appeal the decision to an independent third party. The independent third party's review is final. The full details of the gear claim process can be found at https://us.orsted.com/renewable-energy-solutions/offshore-wind/mariners. | Commercial and recreational fishing | Revolution Wind, Massachusetts Office of Coastal Zone Management, and Rhode Island Coastal Resources Management Council |
| Nav-1 | Construction and installation and O&M | WTG spacing and layout | Revolution Wind is committed to an indicative layout scenario with WTGs sited in a grid with approximately 1.15-mi (1-nm) by 1.15-mi (1-nm) spacing that aligns with other proposed adjacent offshore wind projects in the RI-MA WEA. This layout has been confirmed through expert analysis to allow for safe navigation without the need for additional designated transit lanes. This layout will also provide a uniform, wide spacing among structures to facilitate search and rescue operations. | Navigation and vessel traffic | Revolution Wind |
| Nav-2 | Construction and installation and O&M | WTG lighting and ais installation | Each WTG will be marked and lit with both USCG navigation lighting and FAA aviation lighting. AIS will be installed at the RWF marking the corners of the wind farm to assist in safe navigation. | Navigation and vessel traffic | Revolution Wind |
| Nav-3 | Construction and installation, O&M, and decommissioning | Spill prevention and control measures | Revolution Wind will require all construction and operations vessels to comply with regulatory requirements related to the prevention and control of spills and discharges. | Navigation and vessel traffic | Revolution Wind |
| Nav-4 | Construction and installation, O&M, and decommissioning | OSRP | Accidental spill or release of oils or other hazardous materials offshore will be managed through the OSRP. | Navigation and vessel traffic | Revolution Wind |
| Nav-5 | Construction and installation, O&M, and decommissioning | Coordination with appropriate federal, state, and local contacts | Project construction, O&M, and decommissioning activities will be coordinated with appropriate contacts at USCG, NUWC-Newport RI, the Northeast Marine Pilots Association, and DoD command headquarters. | Navigation and vessel traffic | Revolution Wind |
| Nav-6 | Preconstruction | Siting of RWEC | RWEC was sited to avoid conflicts with DoD use areas and navigational areas identified by the USCG, as applicable. | Navigation and vessel traffic | Revolution Wind |
| Nav-7 | Construction and installation | Fisheries communication plan | A comprehensive communication plan will be implemented during offshore construction to inform all mariners, including commercial and recreational fishermen, and recreational boaters of construction activities and vessel movements. Communication will be facilitated through a Fisheries Liaison, Project website, and public notices to mariners and vessel float plans (in coordination with USCG). | Navigation and vessel traffic | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| Nav-8 | Construction and installation, O&M, and decommissioning | Consultation with appropriate federal, state, and local agencies | Revolution Wind will consult with USCG, NUWC-Newport RI, the Northeast Marine Pilots Association, and regional ferry service operators to avoid or reduce use conflicts. | Navigation and vessel traffic | Revolution Wind |
| Land-1 | Construction and installation | Siting of onshore facilities | Onshore Facilities will be sited within previously disturbed and developed areas to the extent practicable. | Land use and coastal infrastructure | Revolution Wind |
| Land-2 | Construction and installation | Coordination with local authorities to address environmental and community concerns | Revolution Wind will coordinate with local authorities during construction of Onshore Facilities to minimize local traffic impacts; further, these Project components will be constructed in compliance with applicable regulations related to environmental and community concerns (e.g., traffic and erosion). In addition, traffic will be temporary and will not impact long-term property values. | Land use and coastal infrastructure | Revolution Wind |
| Land-3 | Construction and installation, O&M, and decommissioning | SESC plan | An SESC Plan, including erosion and sedimentation control measures, will be implemented to minimize potential water quality impacts during construction and operation of the Onshore Facilities. | Land use and coastal infrastructure | Revolution Wind |
| Other-1 | Construction and installation and O&M | WTG spacing and layout | Revolution Wind is committed to an indicative layout scenario with WTGs sited in a grid with approximately 1.15-mi (1-nm) by 1.15-mi (1-nm) spacing that aligns with other proposed adjacent offshore wind projects in the RI/MA WEA. This layout has been confirmed through expert analysis to allow for safe navigation without the need for additional designated transit lanes. This layout will also provide a uniform, wide spacing among structures to facilitate search and rescue operations. | Other uses | Revolution Wind |
| Other-2 | Construction and installation, O&M, and decommissioning | Consultation with appropriate federal, state, and local agencies | Revolution Wind will consult with USCG, NUWC-Newport RI, the Northeast Marine Pilots Association, and regional ferry service operators to avoid or reduce use conflicts. | Other uses | Revolution Wind |
| Other-3 | Construction and installation and O&M | WTG lighting and ais installation | Each WTG will be marked and lit with both USCG navigation lighting and FAA aviation lighting. AIS will be installed at the RWF marking the corners of the wind farm to assist in safe navigation. | Other uses | Revolution Wind |
| EJ-1 | Construction and installation, O&M, and decommissioning | Labor standards | Construction of the Revolution Wind project will be governed by the National Offshore Wind Agreement, which is a project labor agreement that will apply to domestic construction activities associated with the project. | Environmental justice | Revolution Wind |
| EJ-2 | Construction and installation | TOY restrictions on onshore facilities construction | The Onshore Facilities construction schedule will be designed to minimize impacts to the local community during the summer tourist season, generally between Memorial Day and Labor Day. | Environmental justice | Revolution Wind |
| EJ-3 | Construction and installation | Coordination with local authorities to address environmental and community concerns | Revolution Wind will coordinate with local authorities during construction of Onshore Facilities to minimize local traffic impacts; further, these Project components will be constructed in compliance with applicable regulations related to environmental and community concerns (e.g., traffic and erosion). In addition, traffic will be temporary and will not impact long-term property values. | Environmental justice | Revolution Wind |
| EJ-4 | Construction and installation, O&M, and decommissioning | Studies of contaminated soil and groundwater in environmental justice focus areas | Investigation and remediation of contaminated soil and groundwater must be carried out in accordance with RIDEM regulations and policies regarding Environmental Justice Focus Areas including enhanced stakeholder outreach. | Environmental justice | Revolution Wind |
| EJ-5 | Construction and installation | ADLS (or a similar system) | Revolution Wind will use ADLS (or a similar system), pursuant to approval by the FAA and commercial and technical feasibility at the time of FDR/FIR approval. | Environmental justice | Revolution Wind |
| EJ-6 | Construction and installation | Burial of onshore transmission cables and ICF interconnection | The Onshore Transmission Cable and ICF Interconnection ROW will be buried, minimizing potential impacts to adjacent properties. | Environmental justice | Revolution Wind |
| EJ-7 | Construction and installation and O&M | Onshore facilities screening | Screening will be implemented at the aboveground Onshore Facilities to the extent feasible, to reduce potential visibility and noise. | Environmental justice | Revolution Wind |
| EJ-8 | Construction and installation, O&M, and decommissioning | Mitigation of air emissions | Onshore facilities equipment and fuel suppliers will provide equipment and fuels that comply with the applicable EPA or equivalent emission standards. | Environmental justice | Revolution Wind |

| EPM Number | Proposed Project Phase | EPM | Description of Environmental Protection Measures Committed to by Revolution Wind, LLC (VHB 2023)* | Resource Area Affected | Anticipated Enforcing Agency/Lessee† |
|---|---|---|---|---|---|
| EJ-9 | Preconstruction | Community-based career development programming | Revolution Wind is committing $1,000,000 to community-based programming, including $500,000 to the Community College of Rhode Island to help build their Global Wind Organization (GWO) training center and $500,000 to Building Futures Rhode Island to enable both new entrants to union construction careers (through pre-apprenticeship). An additional $700,000 will be dedicated to other local programming that creates access to these careers for disadvantaged communities . | Environmental Justice | Revolution Wind |

* The COP EMP descriptions were taken verbatim from the COP and were not edited.

† At the time of preparation of this document, BOEM and BSEE are in the process of transferring enforcement authorities from BOEM to BSEE.

**Table F-2. Mitigation and Monitoring Measures Resulting from Consultations**

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **Radar Systems Mitigations Resulting from Department of Defense (DOD), Federal Aviation Administration (FAA), National Oceanic and Atmospheric Administration (NOAA) Integrated Ocean Observing System (IOOS) Reviews** | | | | | |
| 1 | O&M | Mitigation for oceanographic high-frequency radars | Operational mitigations identified for impacts on airport surveillance radar (ASR)-8/9:<br>• Passive aircraft tracking using Automatic Dependent Surveillance–Broadcast (ADS-B) or signal/transponder<br>• Increasing aircraft altitude near radar<br>• Sensitivity time control (range-dependent attenuation)<br>• Range azimuth gating (ability to isolate/ignore signals from specific range-angle gates)<br>• Track initiation inhibit, velocity editing, plot amplitude thresholding (limiting the amplitude of certain signals)<br>• Modification mitigations for Air Route Surveillance Radar (ARSR)-4 and for ASR-8/9 systems:<br>• Using the dual beams of the radar simultaneously<br>• In-fill radars | Other marine uses – land-based radar | BOEM and Bureau of Safety and Environmental Enforcement (BSEE) |
| 2 | O&M | Mitigation for oceanographic high-frequency radars | BOEM would require that Revolution Wind coordinate with the radar operators and the Surface Currents Program of NOAA IOOS Office to assess if the Project causes radar interference to the degree that radar performance is no longer within the specified radar system's operation parameters or fails to meet mission objectives. If either is the case, the lessee must notify BOEM and engage radar operators and NOAA IOOS on mitigation efforts. The following options to mitigate operational impacts on oceanographic high-frequency radars have been identified:<br>• Data sharing from turbine operators to include the following:<br>○ Sharing real-time telemetry of surface current velocity, wave height, wave period, wave direction, and other oceanographic data measured at locations in the Project with radar operators into the public domain<br>○ Sharing time-series of blade rotation rates, nacelle bearing angles, and other information about the operational state of each of the Project's turbines with radar operators to aid interference mitigation<br>• Wind farm curtailment/curtailment agreement | Other marine uses – land-based radar | BOEM and BSEE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | Additional modifications identified for oceanographic high-frequency radar systems to mitigate impacts:<br>• Signal processing enhancements<br>• Antenna modifications | | |
| 3 | O&M | Mitigation for Next Generation Weather Radar (NEXRAD) weather radar systems | Operational mitigations to NEXRAD weather radar systems include the following:<br>• Wind farm curtailment/curtailment agreement<br>Research is being conducted to determine whether impacts on weather radar can be mitigated by using phased array radars to achieve a null in the antenna radiation pattern in the direction of the wind turbine. | Other marine uses – land-based radar | BOEM and BSEE |
| 4 | Construction, O&M, decommissioning | Add conditions of COP approval | Require the following conditions of COP approval to mitigate potential impacts on ASR-8/9:<br>• Notify North American Aerospace Defense Command (NORAD) 30 to 60 days ahead of Project completion and when the Project is complete and operational for radar adverse-impact management (RAM) scheduling<br>• Contribute funds toward execution of the RAM<br>• Curtail operations for national security or defense purposes as described in the leasing agreement | Other marine uses – land-based radar | BOEM and BSEE |
| **USFWS Biological Opinion Reasonable and Prudent Measures from the USFWS Issued May 30, 2023†** | | | | | |
| 1 | Construction and O&M | Measures to minimize take of piping plovers and rufa red knots. | Periodically review current technologies and methods for minimizing collision risk of migratory birds with WTGs, including but not limited to: WTG coloration/marking, lighting, avian deterrents, remote sensing such as radar and thermal cameras, and limited WTG operational changes.[1] | Birds | BOEM and USFWS |
| 2 | Construction and O&M | Measures to minimize take of piping plovers and rufa red knots. | Implement those technologies and methods deemed reasonable and prudent to minimize collision risk.[2] | Birds | BOEM and USFWS |
| **USFWS Biological Opinion Terms and Conditions from the USFWS Issued May 30, 2023†** | | | | | |
| 1 | O&M | Collision risk minimization and monitoring | Periodically review current technologies and methods for minimizing collision risk of listed birds.<br>• Prior to the start of WTG operations at Revolution Wind, BOEM must compile, from existing project documentation (e.g., the BA, other consultation documents, the final EIS, the COP), a stand-alone summary of technologies and methods that BOEM evaluated to reduce or minimize bird collisions at the Revolution Wind WTGs.<br>• Within 5 years of the start of WTG operation, and then every 5 years for the life of the project, BOEM must prepare a Collision Minimization Report (CMR), reviewing best available scientific and commercial data on technologies and methods that have been implemented, or are being studied, to reduce or minimize bird collisions at offshore and onshore WTGs. The review must be global in scope. | Birds | BOEM and USFWS |

[1] Operational changes may include, but are not limited to, feathering, which involves adjusting the angle of the blades to slow or stop them from turning under certain conditions.

[2] Reasonable and prudent minimization measures will include only actions that occur within the action area, involve only minor changes to the project, and reduce the projected level of take. Measures are reasonable and prudent when they (and their implementing terms and conditions) are consistent with the project's basic design, location, scope, duration, and timing (50 CFR 402.14(i)(i)(2)). The reasonableness determination will consider both technical and economic factors; the test for reasonableness is whether the proposed measure would cause more than a minor change to the project. The prudency determination will consider the likelihood, based on best available information, of successfully and appreciably reducing bird collisions relative to the cost and technical difficulty of the measure. The BOEM and the Service will ensure that any reasonable and prudent measures and terms and conditions are within the legal authority and jurisdiction of the BOEM and Revolution Wind to carry out.

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | • BOEM must distribute a draft CMR to the USFWS, Revolution Wind, and appropriate state agencies for a 60-day review period. BOEM must address all comments received during the review period and issue the final report within 60 days of the close of the review period.<br>• Within 60 days of issuing the final CMR, BOEM must convene a meeting with the USFWS, Revolution Wind, and appropriate state agencies to discuss the report and seek consensus on whether implementation of any technologies/methods are reasonable and prudent. If consensus cannot be reached, the USFWS will consider input from the meeting participants and make the final determination of whether any measures are reasonable and prudent and should be implemented under RPM 2. | | |
| 2 | Construction and O&M | Implementation of measures to minimize take of piping plovers and rufa red knots. | Implement those technologies and methods deemed reasonable and prudent to minimize collision risk.<br>BOEM will require Revolution Wind to adopt and deploy reasonable and prudent technologies and methods to avoid or minimize take of the piping plover and rufa red knot. Additional technology and methods would be required only if they are likely to appreciably reduce take of the piping plover and rufa red knot, in accordance with 50 CFR 402.14(i)(2). BOEM will specify the USFWS-approved timeframe in which any required minimization measure(s) must be implemented, as well as any requirements to monitor, maintain, or adapt the measure(s) over time.<br>BOEM will require Revolution Wind to provide periodic reporting on the implementation of any minimization measure(s) according to a schedule developed by BOEM and approved by the USFWS. | Birds | BOEM and USFWS |
| **USFWS Biological Opinion Monitoring and Reporting Requirements from the USFWS Issued May 30, 2023†** | | | | | |
| 1 | Construction and O&M | Monitoring and reporting for piping plovers and rufa red knots | BOEM or Revolution Wind shall monitor the action area for piping plovers and rufa red knots. As effective technology and methods become available, BOEM should include monitoring for piping plovers and rufa red knots that may have collided with a WTG during migration. The monitoring method(s) should be informed by the best available information and technology and could include boat-based monitoring, Motus stations, remote sensing, cameras, microphones, Doppler and NEXRAD radar, eDNA, etc. The monitoring should occur during the time(s) of year when collisions are most likely. Initially, monitoring will proceed according to Revolution Wind's Avian and Bat Post-Construction Monitoring Framework and be operational for the first piping plover and rufa red knot migratory seasons after the WTGs are operational. Subsequently, consideration of new methods and timing will occur on the same timeline as the CMR described in the Terms and Conditions above unless BOEM and the USFWS agree to a different schedule. | Birds | BOEM and USFWS |
| 2 | Construction and O&M | Monitoring and reporting for piping plovers and rufa red knots | BOEM shall notify the USFWS within two business days if an injured or dead piping plover or rufa red knot is identified in or within 1 mile of the Revolution Wind lease area | Birds | BOEM and USFWS |
| 3 | Construction and O&M | Monitoring and reporting for listed species | BOEM or Revolution Wind shall provide a report to the USFWS annually summarizing monitoring efforts, methods, and results; observations of injured or dead piping plovers and rufa red knots; observations of any listed species perching on Revolution Wind infrastructure (including offshore substations); implementation and effectiveness of avoidance and minimization measures; and any other relevant activity and information related to the proposed action and potential impacts to listed species. BOEM will submit the report to the USFWS by the end of each calendar year or at another time agreed to by the two agencies. This report can be part of a larger, more comprehensive offshore wind report submitted to the USFWS annually. | Birds | BOEM and USFWS |
| 4 | Construction and O&M | Reporting for listed species | Reports and notifications will be submitted to:<br>Field Supervisor<br>New England Field Office<br>U.S. Fish and Wildlife Service | Birds | BOEM and USFWS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | 70 Commercial Street, Suite 300<br>Concord, NH 03301<br>newengland@fws.gov<br>603-223-2541 | | |
| **BOEM-proposed Bird and Bat Mitigation Measures** | | | | | |
| 1 | Construction, O&M | Bird-perching deterrent devices | To minimize attracting birds to operating turbines, the Lessee must install anti-perching devices on turbines and the offshore substation (OSS). The location of anti-perching devices must be proposed by Revolution Wind based on best management practices (BMPs) applicable to the appropriate operation and safe installation of the devices. Revolution Wind must confirm the locations of anti-perching devices with a monitoring plan to track the efficacy of the anti-perching devices as part of the documentation it must submit with the facility design report (FDR). | Birds | BOEM, BSEE and USFWS |
| 2 | Construction and installation, O&M, and decommissioning | Annual bird and bat mortality reporting | Revolution Wind must submit an annual report covering each calendar year, due by January 31 of the following year, documenting any dead (or injured) birds or bats found on vessels and structures during construction, operations, and decommissioning. The report must be submitted to BOEM (at renewable_reporting@boem.gov) and BSEE (at OSWSubmittals@bsee.gov) and the U.S. Fish and Wildlife Service (USFWS). The report must contain the following information: name of species, date found, location, a picture to confirm species identity (if possible), and any other relevant information. Carcasses with federal or research bands must be reported to the U.S. Geological Survey (USGS) Bird Banding Laboratory at https://www.usgs.gov/labs/bird-banding-laboratory. | Birds and bats | BOEM, BSEE, and USFWS |
| 3 | Construction and installation, O&M, and decommissioning | Annual Bird and Bat Mortality Reporting | Any occurrence of dead ESA-listed birds or bats must be reported to BOEM, BSEE, and USFWS as soon as practicable (taking into account crew and vessel safety), but no later than 24 hours after the sighting, and if practicable, the dead specimen should be carefully collected and preserved in the best possible state. | Birds and bats | BOEM, BSEE and USFWS |
| 4 | O&M | Avian and Bat Monitoring Program | At least 45 calendar days before beginning surveys, Revolution Wind must complete, obtain concurrence from the U.S. Department of the Interior (DOI), and adopt an avian and bat monitoring plan (ABMP), as described in Revolution Wind's *Avian and Bat Post- Construction Monitoring Framework* in COP Appendix AA (Biodiversity Research Institute [BRI] 2023), including coordination with interested stakeholders. The DOI will review the ABMP and provide any comments on the plan within 30 calendar days of its submittal. Revolution Wind must resolve all comments on the ABMP to the DOI's satisfaction before implementing the plan. Revolution Wind may conclude that DOI has concurred in the ABMP if the DOI provides no comments on the plan within 30 calendar days of its submittal date.<br>a. Monitoring. Revolution Wind must 1) install acoustic monitoring devices for bats for 2 years; 2) install Motus receivers within the wind farm; 3) refurbish up to two onshore Motus receiver stations; 4) provide funding for up to 150 Motus tags per year for up to 3 consecutive years; and 5) conduct a 1- to 2-year cross-project radar study to measure migrant flux rates, flight heights, and marine bird avoidance.<br>b. Annual monitoring reports. Revolution Wind must submit to BOEM (at renewable_reporting@boem.gov), USFWS, and BSEE (at OSWSubmittals@bsee.gov) a comprehensive report after each full year of monitoring (preconstruction and postconstruction) within 6 months of completion of the last avian survey. The report must include all data, analyses, and summaries regarding ESA-listed and non-ESA-listed birds and bats. The DOI will use the annual monitoring reports to assess the need for reasonable revisions (based on subject matter expert analysis) to the ABMP. The DOI reserves the right to require reasonable revisions to the ABMP and may require new technologies as they become available for use in offshore environments.<br>c. Postconstruction quarterly progress reports. Revolution Wind must submit quarterly progress reports during the implementation of the ABMP to BOEM (at renewable_reporting@boem.gov) and the USFWS by the fifteenth day of the month following the end of each quarter during the first full year that the Project is | Birds and bats | BOEM, BSEE, and USFWS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | operational. The progress reports must include a summary of all work performed, an explanation of overall progress, and any technical problems encountered.<br>d. Monitoring plan revisions. Within 15 calendar days of submitting the annual monitoring report, the Lessee must meet with BOEM and the USFWS to discuss the following: the monitoring results; the potential need for revisions to the ABMP, including technical refinements or additional monitoring; and the potential need for any additional efforts to reduce impacts. If the DOI determines after this discussion that revisions to the ABMP are necessary, the DOI may require the Lessee to modify the ABMP. If the reported monitoring results deviate substantially from the impact analysis included in the Final EIS, the Lessee must transmit to the DOI recommendations for new mitigation measures and/or monitoring methods.<br>e. Operational reporting (operations). Revolution Wind must submit to BOEM (at renewable_reporting@boem.gov) and BSEE (at OSWSubmittals@bsee.gov) an annual report summarizing the following monthly operational data calculated from 10-minute supervisory control and data acquisition (SCADA) for all turbines together in tabular format: the proportion of time the turbines were operational (spinning at > x rpm) each month, the average rotor speed (monthly rpms) of spinning turbines plus 1 standard deviation, and the average pitch angle of blades (degrees relative to rotor plane) plus 1 standard deviation. The DOI will use this information as inputs for avian collision risk models to assess whether the results deviate substantially from the impact analysis included in the Final EIS.<br>f. Raw data. Revolution Wind must store the raw data from all avian and bat surveys and monitoring activities according to accepted archiving practices. Such data must remain accessible to the DOI and the USFWS, upon request for the duration of the lease. Revolution Wind must work with BOEM to ensure the data are publicly available. The USFWS may specify third-party data repositories that must be used, such as the Motus Wildlife Tracking System or MoveBank, and such parties and associated data standards may change over the duration of the monitoring plan. | | |
| 5 | O&M | Adaptive mitigation for birds and bats | If the reported postconstruction bird and bat monitoring results (generated as part of the *Avian and Bat Post-Construction Monitoring Framework* in COP Appendix AA [BRI 2023] indicate bird and bat impacts deviate substantially from the impact analysis included in this EIS, then Revolution Wind must make recommendations for new mitigation measures or monitoring methods. | Birds and bats | BOEM and USFWS |
| **BOEM-proposed Navigation and Vessel Traffic Mitigation Measures Developed in Conjunction with the U.S. Coast Guard (USCG)** | | | | | |
| 1 | Construction, O&M, decommissioning | Submarine cable system burial plan | A copy of the submarine cable system burial plan shall be submitted by Revolution Wind as part of its FDR and fabrication and installation report (FIR) that depicts precise planned locations and burial depths of the entire cable system. This plan shall be reviewed by the USCG and BOEM. | Navigation and vessel traffic | BOEM, BSEE, and USCG |
| 2 | Construction | Boulder relocation reporting | The locations of any boulder (which would protrude > 2 meters [m] or more on the seafloor) relocated during cable installation activities must be reported to BOEM, the USCG, NOAA, and the local harbormaster within 30 days of relocation. These locations must be reported in latitude and longitude degrees to the nearest 10 thousandth of a decimal degree (roughly the nearest meter), or as precise as practicable. | Navigation and vessel traffic | BOEM, BSEE, USCG, and NOAA |
| 3 | Construction, O&M, decommissioning | Vessel safety practices | All Project vessels involved in construction, O&M, and decommissioning activities would comply with U.S. or International Convention for the Safety of Life at Sea (SOLAS) standards, as applicable, with regard to vessel construction, vessel safety equipment, and crewing practices. | Navigation and vessel traffic | BOEM, BSEE, and USCG |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| 4 | Construction, O&M, decommissioning | WTG and OSS marking | Each WTG and OSS would be marked with private aids to navigation (PATONs), subject to the approval of the Commander (dpw-1) of the First Coast Guard District. Revolution Wind would do the following:<br>Provide BOEM and the USCG with a proposed lighting, marking, and signaling plan, which must be approved by BOEM after consultation with the USCG. The plan should conform to the International Association of Marine Aids to Navigation and Lighthouse Authorities Recommendation G1162, *The Marking of Man-Made Offshore Structures* (IALA 2021). Should any part of the recommendation conflict with federal law or regulation, or if Revolution Wind seeks an alternative to the recommendation, Revolution Wind must consult with the USCG.<br>Mark each individual WTG and OSS with clearly visible, unique, alphanumeric identification characters.<br>Light each WTG and OSS in a manner that is visible by mariners in a 360-degree arc around the WTG and OSS.<br>Apply to the First Coast Guard District to establish PATONs for the facility. Approval for all PATONs must be obtained before installation of RWF structures begins.<br>Ensure each WTG is lighted with red obstruction lighting consistent with the FAA Advisory Circular 70/7460-1L Change 2 (FAA 2018), so long as this requirement does not preclude the use of an aircraft detection lighting system (ADLS).<br>Provide signage that covers 360 degrees of the wind turbine structures warning vessels of the air draft of the turbine blades as determined at highest astronomical tide.<br>Cooperate with the USCG and NOAA to ensure that cable routes and wind turbines are depicted on appropriate government produced and commercially available nautical charts.<br>Provide mariner information sheets on Revolution Wind's website with details on the location of the turbines and specifics such as blade clearance above sea level. | Navigation and vessel traffic | BOEM, BSEE, USCG, and NOAA |
| 5 | Construction, O&M, decommissioning | WTG shutdown mechanism | Equip all WTG rotors (blade assemblies) with control mechanisms operable from the RWF control centers available 24 hours a day, 7 days a week. The control mechanisms shall enable control room operators to shut down the requested WTGs within an agreed-upon time of notification between the USCG and Revolution Wind. A formal shutdown procedure would be part of the standard operating procedures and periodically tested. Normally, USCG-ordered shutdowns would be limited to those WTGs in the immediate vicinity of an emergency and for as short a period as is safely practicable under the circumstances, as determined by the USCG. | Navigation and vessel traffic: other marine uses | BSEE and USCG |
| 6 | Construction, O&M, decommissioning | USCG training and exercises | Revolution Wind would participate in periodic USCG-coordinated training and exercises to test and refine notification and shutdown procedures and to provide SAR training opportunities for USCG vessels and aircraft. | Navigation and vessel traffic; other marine uses | BSEE and USCG |
| 7 | Construction, O&M, decommissioning | Operations and maintenance plan | Prior to operation of the Project, Revolution Wind shall submit a written plan for O&M, which includes control center(s), for review by BOEM and the USCG. The plan must demonstrate that the control center(s) would be adequately staffed to perform standard operating procedures, communications capabilities, and monitoring capabilities. The plan shall include, but not be limited to, the following topics, which may be modified through ongoing discussions with the USCG:<br>Standard operating procedures: Methods for establishing and testing WTG rotor shutdown; methods of lighting control; method(s) for notifying the USCG of mariners in distress or potential/actual SAR incidents; method(s) for notifying the USCG of any events or incidents that may impact maritime safety or security; and methods for providing the USCG with environmental data, imagery, communications, and other information pertinent to SAR or marine pollution response.<br>Staffing: Number of personnel intended to staff the control center(s) to ensure continuous monitoring of WTG operations, communications, and surveillance systems. | Navigation and vessel traffic; other marine uses | BOEM, BSEE, and USCG |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | Communications: Capabilities to be maintained by the control center(s) to communicate with the USCG and mariners within and near the Lease Area. Communications capability shall at a minimum include very high frequency (VHF) marine radio and landline and wireless for voice and data.<br>Monitoring: The control center(s) should maintain the capability to monitor RWF installation and operations in real time (including night and periods of poor visibility) for determining the status of all PATONs and detection of a survivor who has climbed to the survivor's platform, if installed, on any WTG or OSS. | | |
| 8 | Construction, O&M, decommissioning | WTG/OSS installation | No WTG/OSS installation work shall commence at the Project site (i.e., on or under the water) without prior review by BSEE and the USCG of a plan to be submitted by Revolution Wind that describes the schedule and process for erecting each WTG, including all planned mitigations to be implemented to minimize any adverse impacts on navigation while installation is ongoing. Appropriate Notice to Mariners submissions would accompany the plan. | Navigation and vessel traffic | BSEE and USCG |
| 9 | Construction, O&M, decommissioning | USCG reporting | Complaints: On a monthly basis during installation, Revolution Wind shall provide the USCG with a description of any complaints received (either written or oral) by boaters, fishermen, commercial vessel operators, or other mariners regarding impacts on navigation safety allegedly caused by construction vessels, crew transfer vessels, barges, or other equipment. Revolution Wind shall describe any remedial action taken in response to complaints received.<br>Correspondence: Revolution Wind shall provide the USCG copies of any correspondence received by Revolution Wind from other federal, state, or local agencies that mention or address navigation safety issues.<br>Maintenance schedule: Revolution Wind would provide the USCG with its planned WTG maintenance schedule, forecasted out to at least one quarter. Appropriate Notice to Mariners submissions would accompany each maintenance schedule. | Navigation and vessel traffic | BSEE and USCG |
| 10 | Construction, O&M, decommissioning | Public participation | To ensure sufficient opportunity for the public to receive information directly from the owners/operators of the wind energy facility, Revolution Wind would attend periodic meetings of the Southeastern Massachusetts and Rhode Island Port Safety and Security Forums to provide briefs on the status of construction and operations and on any problems or issues encountered with respect to navigation safety. | Navigation and vessel traffic | BOEM and BSEE |
| 11 | Construction, O&M, decommissioning | Helicopter landing platforms | If Revolution Wind's OSSs include helicopter landing platforms, those platforms would be designed and built to accommodate up to and including USCG H-60-sized rescue helicopters. | Navigation and vessel traffic; other marine uses | BOEM, BSEE, and USCG |
| **DOD Measures Resulting from Military Aviation and Installation Assurance Siting Clearinghouse Review** | | | | | |
| 1 | O&M | Fiber-optic sensing technology | Distributed fiber-optic sensing technology proposed for the Project or associated transmission cables would be reviewed by the DOD to ensure that distributed fiber-optic sensing is not used to detect sensitive data from DOD activities, to conduct any other type of surveillance of U.S. Government operations, or to otherwise pose a threat to national security. | Other marine uses – military and national security | BOEM, BSEE, and DOD |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **National Historic Preservation Act (NHPA) Section 106 Mitigation Measures from the Memorandum of Agreement** | | | | | |
| 1 | Construction and installation | Avoid or minimize and mitigate impacts on identified National Register of Historic Places (NRHP)–eligible cultural resources | Mitigation measures for cultural resources are drafted in the memorandum of agreement (MOA) and its historic property treatment plans attached in EIS Appendix J. Revolution Wind–committed measures identified in COP Appendix BB, *Cultural resources Avoidance, Minimization, and Mitigation Measures* (Revolution Wind 2023), would also be incorporated by BOEM into COP approval. This MOA and its requirements would be set by BOEM under NHPA Section 106 as a condition of BOEM's signing the ROD. Under the MOA, adverse effects from the Project to NRHP-eligible cultural resources, including national historic landmarks (NHLs) and traditional cultural places (TCPs), would be avoided, minimized, or mitigated in accordance with the NHPA Section 106 regulations (36 CFR 800) and in compliance with Section 110(f). | Cultural resources | BOEM and BSEE |
| **Draft NMFS Biological Opinion Reasonable and Prudent Measures from NMFS issued June 16, 2023†** | | | Draft NMFS Biological Opinion Reasonable and Prudent Measures were issued to BOEM for consideration on June 16, 2023.<br>Final NMFS Biological Opinion Reasonable and Prudent Measures to be issued to BOEM for consideration on July 21, 2023. | | |
| 1 | Construction and installation | Pile-driving | Effects to ESA-listed whales and sea turtles must be minimized during pile driving. This includes adherence to the mitigation measures specified in the final MMPA ITA. | ESA-listed marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 2 | Construction and installation | UXO detonation | Effects to ESA-listed whales and sea turtles must be minimized during UXO detonation. This includes adherence to the mitigation measures specified in the final MMPA ITA. | ESA-listed marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 3 | Construction and installation, O&M, decommissioning | Vessel operations | Vessels operated by Revolution Wind or under contract to Revolution Wind or its contractors must comply with the RPMs and Terms and Conditions relevant to vessel operations within the Delaware River and Delaware Bay included in the Incidental Take Statements provided with NMFS GARFO's July 19, 2022, Paulsboro Marine Terminal Biological Opinion or any subsequently issued Opinion that replace that Opinion as a result of reinitiation. | ESA-listed finfish | BOEM, BSEE, and NMFS |
| 4 | Construction and installation, O&M, decommissioning | Reporting requirements | Effects to, or interactions with, ESA-listed Atlantic sturgeon, whales, and sea turtles must be documented during all phases of the proposed action, and all incidental take must be reported to NMFS GARFO. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 5 | Construction and installation | Review of plans | All required plans must be submitted to NMFS GARFO with sufficient time for review, comment, and approval. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 6 | Construction and installation, O&M, decommissioning | On-site observation and inspection | On-site observation and inspection must be conducted to gather information on the effectiveness and implementation of measures to minimize and monitor incidental take during activities described in this Opinion, including its Incidental Take Statement. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **Draft NMFS Biological Opinion Terms and Conditions from NMFS issued June 16, 2023†** | | | Draft NMFS Biological Opinion Terms and Conditions were issued to BOEM for consideration on June 16, 2023.<br>Final NMFS Biological Opinion Terms and Conditions to be issued to BOEM for consideration on July 21, 2023. | | |
| 1 | Construction and installation | Pile-driving and UXO detonation | To implement the requirements of RPM 1 and 2, the measures required by the final MMPA ITA must be incorporated into any project authorizations/approvals, and the relevant Federal agency must monitor Revolution Wind's compliance with these measures:<br>a. BOEM must require, through an enforceable condition of their approval of Revolution Wind's Construction and Operations Plan, that Revolution Wind comply with any measures in the final MMPA ITA that are revised from, or in addition to, measures included in the proposed ITA, which already have been incorporated into the proposed action.<br>b. NMFS OPR must ensure that all mitigation measures as prescribed in the final ITA are implemented by Revolution Wind.<br>c. The USACE must require, through an enforceable condition of any permit issued to Revolution Wind, compliance with any measures in the final MMPA ITA that are revised from, or in addition to, measures included in the proposed ITA, which have been incorporated into the proposed action. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 2 | Construction and installation | Pile-driving | To implement the requirements of RPM 1, the following measures must be implemented by Revolution Wind:<br>a. If any of the sound field verification (SFV; see T&C 11e below) measurements from any pile indicate that the distance to any isopleth of concern is larger than those modeled assuming 10 dB attenuation (see Tables X (whales), Y (sea turtles), Z (Atlantic sturgeon)), before any additional piles are installed Revolution Wind must:<br>i. Identify additional noise attenuation measures (e.g., add noise attenuation device, adjust hammer operations) that are expected to reduce sound levels to the modeled distances; provide an explanation to NMFS GARFO and NMFS OPR supporting that determination; and, deploy those additional measures on any subsequent piles that are installed (e.g., if threshold distances are exceeded on pile 1 then additional measures must be deployed before installing pile 2).<br>ii. If any of the SFV measurements indicate that the distances to evel A thresholds for ESA listed whales or PTS peak or cumulative thresholds for sea turtles are larger than the modeled distances (assuming 10 dB attenuation), the clearance and shutdown zones for subsequent piles must be increased so that they are at least the size of the distances to those thresholds as indicated by SFV. For every 1,500 m that a zone is expanded, additional PSOs must be deployed to ensure adequate and complete monitoring of the expanded shutdown and/or clearance zone.<br>iii. If any SFV measurements to thresholds of concern for the pile installed following implementation of additional noise attenuation measures are still larger than those modeled assuming 10 dB attenuation, Revolution Wind must either install an additional noise attenuation device (e.g., additional bubble curtain) or modify the pile driving operations (i.e., reduced hammer energy) in a way that is expected to reduce noise and reduce the distance to thresholds of concern to no greater than the modeled distances (assuming 10 dB attenuation). Additionally, Revolution Wind must provide an explanation to NMFS GARFO and NMFS OPR supporting that determination and deploy those additional measures on any subsequent piles that are installed (e.g., if threshold distances are still exceeded on pile 2 the additional measures must be deployed for pile 3).<br>iv. Following installation of the the pile with additional noise attenuation measures required by 2.a.iii, if SFV results indicate that any isopleths of concern are still larger than those modeled assuming 10 dB attenuation, before any additional piles can be installed, Revolution Wind must determine, in cooperation with NMFS GARFO/OPR, BOEM, BSEE, and USACE, what additional noise attenuation measures can be implemented. If no additional measures are identified, then pile installation must continue with implementation of the enhanced sound attenuation measures required by 2.a.iii and any expanded zone sizes (and any required additional PSOs). Additionally, Revolution Wind must continued SFV for two additional piles with enhanced sound attenuation | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | measures., NMFS GARFO/OPR, BOEM, BSEE, and USACE will meet as soon as possible following completion of the SFV required here to discuss whether reinitiation of this consultation is necessary.<br>v. Following installation of the pile with additional noise attenuation measures required by 2.a.iii, if SFV results indicate that all isopleths of concern are within distances to isopleths of concern modeled assuming 10 dB attenuation, SFV must be conducted on three additional piles. If the SFV results from all piles are within the distances to isopleths of concern modeled assuming 10 dB attenuation, then Revolution Wind must continue to implement the additional sound attenuation measures and implement the original clearance and shutdown zones. | | |
| 3 | Construction and installation, O&M, decommissioning | UXO detonation | To implement the requirements of RPM 2, the following measures must be implemented by Revolution Wind:<br>a. Establish a clearance zone for sea turtles extending 500 m around any planned UXO detonation. Maintain the clearance zone for at least 60 minutes prior to any UXO detonation. This requirement expands the size of the clearance zone identified by BOEM as part of the proposed action. Revolution Wind must ensure that there is sufficient PSO coverage to reliably document sea turtle presence within the clearance zone. In the event that a PSO detects a sea turtle outside the 500 m clearance zone, detonation will be delayed until the sea turtle has not been observed for 30 minutes.<br>b. Provide NMFS GARFO with notification of planned UXO detonation as soon as possible but at least 48 hours prior to the planned detonation, unless this 48 hour notification would create delays to the detonation that would result in imminent risk of human life or safety. This notification must include the coordinates of the planned detonation, the estimated charge size, and any other information available on the characteristics of the UXO. NMFS GARFO will provide alerts to NMFS sea turtle and marine mammal stranding network partners consistent with best practices. Notification must be provided via email to nmfs.gar.incidental-take@noaa.gov and by phone to the NMFS GARFO Protected Resources Division (978-281-9328). | | BOEM, BSEE, and NMFS |
| 4 | Construction and installation, O&M, decommissioning | Vessel operations | To implement the requirements of RPM 3, the following conditions must be implemented by vessels transiting to/from the Paulsboro Marine Terminal, consistent with the terms and conditions of the July 19, 2022 Paulsboro Biological Opinion and any subsequent Opinion or amended ITS:<br>a. No later than March 1 of each year, report the number of vessel calls to the Paulsboro Marine Terminal in the previous year by month. This report must also include the type of vessel and its draft. Reports must be filed with the USACE Philadelphia District and NMFS GARFO (nmfs.gar.incidental-take@noaa.gov). (Reference: RPM 1, Term and Condition 1 of the 2022 Paulsboro Biological Opinion)<br>b. Report any sturgeon observed with injuries or mortalities in the Paulsboro Marine Terminal Area to NMFS within 24 hours using the form available at: https://media.fisheries.noaa.gov/2021-07/Take%20Report%20Form%2007162021.pdf?null. Submit forms to nmfs.gar.incidental-take@noaa.gov within 24 hours. (Reference: RPM 2, Term and Condition 2 of the 2022 Paulsboro Biological Opinion).<br>c. Hold any dead sturgeon in cold storage until proper disposal procedures are discussed with NMFS GARFO. (Reference: RPM 3, Term and Condition 5 of the 2022 Paulsboro Biological Opinion).<br>d. Complete procedures for genetic sampling of any dead Atlantic sturgeon that are over 75 cm. (Reference RPM 4, Term and Condition 6 of the 2022 Paulsboro Biological Opinion). More information on submitting genetic samples is included in Term and Condition 6a below; these instructions are consistent with the requirements of the 2022 Paulsboro Opinion.<br>e. In the event that the 2022 Paulsboro Opinion is replaced as a result of reinitiation, or its ITS is amended, comply with the requirements of any new Incidental Take Statement relevant to vessels transiting to/from the Paulsboro Marine Terminal. NMFS GARFO will strive to provide a copy of any new Opinions or amended ITSs to BOEM, BSEE, other action agencies, and Revolution Wind within three business days of their availability. | ESA-listed finfish | BOEM, BSEE, and NMFS |
| 5 | Construction and installation | Reporting requirements | To implement the requirements of RPM 4, Revolution Wind must file a report with NMFS GARFO (nmfs.gar.incidental-take@noaa.gov) in the event that any ESA listed species is observed within the identified shutdown zone during active pile driving. This report must be filed within 48 hours of the incident and include the | ESA-listed finfish, marine | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | following: duration of pile driving prior to the detection of the animal(s), location of PSOs and any factors that impaired visibility or detection ability, time of first and last detection of the animal(s), behavioral observations of the animal(s), time the PSO called for shutdown, hammer log (number of strikes, hammer energy), time the pile driving began and stopped, and any measures implemented (e.g., reduced hammer energy) prior to shutdown. If shutdown was determined not to be feasible, the report must include an explanation for that determination and the measures that were implemented (e.g., reduced hammer energy). | mammals, sea turtles | |
| 6 | Construction and installation | Reporting requirements | To implement the requirements of RPM 4, BOEM, BSEE, USACE, and Revolution Wind must implement the following reporting requirements necessary to document the amount or extent of take that occurs during all phases of the proposed action:<br>a. All observations or interactions with sea turtles or sturgeon that occur during the fisheries monitoring surveys must be reported within 48 hours to NMFS GARFO Protected Resources Division by email (nmfs.gar.incidental-take@noaa.gov). Take reports should reference the Revolution Wind project and include the Take Report Form available on NMFS webpage (https://media.fisheries.noaa.gov/2021-07/Take%20Report%20Form%2007162021.pdf?null). Reports of Atlantic sturgeon take must include a statement as to whether a fin clip sample for genetic sampling was taken. Fin clip samples are required in all cases with the only exception being when additional handling of the sturgeon would result in an imminent risk of injury to the fish or the PSO, we expect such incidents to be limited to capture and handling of sturgeon in extreme weather. Instructions for fin clips and associated metadata are available at: https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-take-reporting-programmatics-greater-atlantic, under the “Sturgeon Genetics Sampling” heading.<br>b. If a North Atlantic right whale is observed at any time by PSOs or project personnel, Revolution Wind must ensure the sighting is immediately reported to NMFS. If immediate reporting is not possible, the report must be made within 24 hours of the sighting.<br>i. The immediate report must be made to the appropriate geographic reporting line:<br>● If in the Northeast Region (ME to VA/NC border) call (866-755-6622).<br>● If in the Southeast Region (NC to FL) call (877-WHALE-HELP or 877-942-5343).<br>● If calling the hotline is not possible, reports can also be made to the U.S. Coast Guard via channel 16 or through the WhaleAlert app (http://www.whalealert.org/).<br>The sighting report must include the time, date, and location (latitude/longitude) of the sighting, number of whales, animal description/certainty of sighting (provide photos/video if taken), lease area/project name, PSO/personnel name, PSO provider company (if applicable), and reporter's contact information.<br>ii. A summary report must be sent within 24 hours to NMFS-GARFO (nmfs.gar.incidental-take@noaa.gov) and NMFS-OPR (PR.ITP.MonitoringReports@noaa.gov) with the above information and confirmation the sighting was reported to the respective hotline, the vessel/platform from which the sighting was made, activity the vessel/platform was engaged in at time of sighting, project construction and/or survey activity ongoing at time of sighting (e.g., pile driving, cable installation, HRG survey), distance from vessel/platform to sighting at time of detection, and any mitigation actions taken in response to the sighting.<br>c. In the event of a suspected or confirmed vessel strike of any ESA listed species, including a sea turtle or sturgeon, by any project vessel in any location, including observation of any injured sea turtle/sturgeon or sea turtle/sturgeon parts, Revolution Wind or their contractors must report the incident to NMFS GARFO (nmfs.gar.incidental-take@noaa.gov; for marine mammals to the NOAA stranding hotline: Maine-Virginia, report to 866755-6622, and from North Carolina-Florida to 877-942-5343 and for sea turtles from Maine-Virginia, report to 866-755-6622, and from North Caroline-Florida to 844-732-8785 as soon as feasible. The report must include the following information: (A) Time, date, and location (latitude/longitude) of the incident; (B) Species identification (if known) or description of the animal(s) involved; (C) Vessel's speed during and leading up to the | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | incident; (D) Vessel's course/heading and what operations were being conducted (if applicable); (E) Status of all sound sources in use (if applicable); (F) Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike; (G) Environmental conditions (e.g., wind speed and direction, Beaufort scale, cloud cover, visibility) immediately preceding the strike; (H) Estimated size and length of animal that was struck; (I) Description of the behavior of the animal immediately preceding and following the strike; (J) Estimated fate of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, status unknown, disappeared); and (K) To the extent practicable, photographs or video footage of the animal.<br>d. In the event that an injured or dead whale, sea turtle, or Atlantic sturgeon is sighted, Revolution Wind or their contractor must report the incident to NMFS GARFO (nmfs.gar.incidental-take@noaa.gov). Additionally, injured or dead whales must be reported to the NOAA stranding hotline: Maine-Virginia, report to 866755-6622, and from North Carolina-Florida to 877-942-5343 and for sea turtles from Maine-Virginia, report to 866-755-6622, and from North Caroline-Florida to 844-732-8785., and BSEE (protectedspecies@bsee.gov) as soon as feasible, but no later than 24 hours from the sighting. The report must include the following information: (A) Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable); (B) Species identification (if known) or description of the animal(s) involved; (C) Condition of the animal(s) (including carcass condition if the animal is dead); (D) Observed behaviors of the animal(s), if alive; (E) If available, photographs or video footage of the animal(s); and (F) General circumstances under which the animal was discovered. Staff responding to the hotline call will provide any instructions for handling or disposing of any injured or dead animals, which may include coordination of transport to shore, particularly for injured sea turtles.<br>e. Revolution Wind must compile and submit weekly reports during pile driving that document the pile ID, type of pile, pile diameter, start and finish time of each pile driving event, hammer log (number of strikes, max hammer energy, duration of piling) per pile, any changes to noise attenuation systems and/or hammer schedule, details on the deployment of PSOs and PAMOs, including the start and stop time of associated observation periods by the PSOs and PAMOs, and a record of all observations of marine mammals and sea turtles including time of sighting (UTC), species ID, behavior, distance from vessel to sighting at time of detection (meters), vessel/project activity, platform/vessel name, and mitigation measures taken (if any). These weekly reports must be submitted to NMFS GARFO (nmfs.gar.incidental-take@noaa.gov), BOEM, and BSEE by Revolution Wind or the PSO providers and can consist of raw data. Weekly reports are due on Wednesday for the previous week (Sunday – Saturday).<br>f. Revolution Wind must compile and submit reports following any UXO detonation that provide details on the UXO that was detonated (e.g., charge size), location of the detonation, the start and stop of associated observation periods by the PSOs and PAMOs, details on the deployment of PSOs and PAMOs, and a record of all observations of marine mammals and sea turtles including time of sighting (UTC), species ID, behavior, distance from vessel to sighting at time of detection (meters), vessel activity, platform/vessel name, and mitigation measures taken (if any).. This must include any observations of dead or injured fish or other marine life in the post detonation monitoring period. These reports must be submitted to NMFS GARFO (nmfs.gar.incidental-take@noaa.gov), BOEM, and BSEE by Revolution Wind or the PSO providers and can consist of raw data. Reports must be submitted within one week of the detonation, with reports of dead or injured ESA listed species required to be submitted immediately, but no later than 24 hours following the observation.<br>g. Starting in the first month that in-water activities occur (e.g., cofferdam installation, fisheries surveys), Revolution Wind must compile and submit monthly reports that include a summary of all project activities carried out in the previous month, including dates and location of any fisheries surveys carried out, vessel transits (name, type of vessel, number of transits, vessel activity, and route (this includes transits from all ports, foreign and domestic)), and number of piles installed and pile IDs, and all observations of ESA listed whales, sea turtles, and sturgeon, inclusive of any mitigation measures taken as a result of those observations. These reports must be submitted to NMFS GARFO (nmfs.gar.incidental-take@noaa.gov) and are due on the 15th of the month for the previous month. | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | h. Revolution Wind must submit to NMFS GARFO (nmfs.gar.incidental-take@noaa.gov) an annual report describing all activities carried out to implement their Fisheries Research and Monitoring Plan. This report must include the dates and locations of all ventless trap surveys and otter trawl surveys, inclusive of a summary table of any observations and captures of ESA listed species during these surveys. The report must also summarize all acoustic telemetry and benthic monitoring activities that occurred. Each annual report is due by February 15 (i.e., the report of 2023 activities is due by February 15, 2024). | | |
| 7 | O&M | Meeting requirements for sea turtle observations | To implement the requirements of RPM 4 and to facilitate monitoring of the incidental take exemption for sea turtles, BOEM, BSEE, USACE, and NMFS must meet twice annually to review sea turtle observation records. These meetings/conference calls will be held in September (to review observations through August of that year) and December (to review observations from September to November) and will use the best available information on sea turtle presence, distribution, and abundance, project vessel activity, and observations to estimate the total number of sea turtle vessel strikes in the action area that are attributable to project operations. | Sea turtles | BOEM, BSEE, and NMFS |
| 8 | Construction and installation | Review of plans | To implement RPM 5, within 10 business days of BSEE issuing a no objection to the complete Facility Design Report (FDR)/Fabrication and Installation Report (FIR) (but at least 30 calendar days prior to the initiation of pile driving) or the soonest time the relevant information is available, BOEM and/or BSEE must provide NMFS GARFO (nmfs.gar.incidental-take@noaa.gov) with the following information: number and size of foundations to be installed to support wind turbine generators and offshore substations, installation method for the sea to shore transition (i.e., casing pipe, cofferdam, no containment), the proposed construction schedule (i.e., months when pile driving is planned), and information that has become available on the ports identified for foundation fabrication and load out, WTG pre-assembly and load out, and cable staging. If at that time the amount or extent of incidental take is likely to exceed the maximum amount for each source and type of take considered in this ITS, consultation may need to be reinitiated. NMFS and BOEM will each endeavor to notify the other of the need to reinitiate consultation within 30 calendar days of BOEM's submission to NMFS, and NMFS' receipt of the requested information. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 9 | Construction and installation | Review of plans | To implement RPM 5, BOEM, BSEE and/or Revolution Wind must submit an Observer Training Plan for Trawl Surveys as soon as possible after issuance of this Opinion but no later than 7 calendar days prior to the start of trawl surveys. BOEM, BSEE, and Revolution Wind must obtain NMFS GARFO's concurrence with this plan prior to the start of any trawl surveys. As described in Section X.Y, at least one of the survey staff onboard the trawl survey vessels must have completed NMFS Northeast Fisheries Observer Program training within the last 5 years or other training in protected species identification and safe handling (inclusive of taking genetic samples from Atlantic sturgeon). If Revolution Wind will deploy non-NEFOP trained observers, BOEM, BSEE, and/or Revolution Wind must submit a plan to NMFS describing the training that will be provided to the survey observers. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 10 | Construction and installation | Review of plans | To implement RPM 5, the plans identified below must be submitted to NMFS GARFO by BOEM, BSEE, and/or Revolution Wind at nmfs.gar.incidental-take@noaa.gov. For each plan, within 45 calendar days of receipt of the plan, NMFS GARFO will provide comments to BOEM, BSEE, and Revolution Wind, including a determination as to whether the plan is consistent with the requirements outlined in this ITS and/or in Table 3.3.1 of this Opinion. If the plan is determined to be inconsistent with these requirements, BOEM, BSEE and/or Revolution Wind must resubmit a modified plan that addresses the identified issues within 30 days of the receipt of the comments but at least 15 calendar days before the start of the associated activity; at that time, BOEM, BSEE and NMFS will discuss a timeline for review and approval of the modified plan. At all times, NMFS, BOEM, and BSEE will be provided at least 3 business days for review of subsequent revisions. BOEM, BSEE and Revolution Wind must receive NMFS GARFO's concurrence with these plans before the identified activity is carried out:<br>a. Passive Acoustic Monitoring Plan. BOEM, BSEE and/or Revolution Wind must submit this Plan to NMFS GARFO at least 180 calendar days before impact pile driving is planned. BOEM, BSEE, and Revolution Wind must obtain NMFS GARFO's concurrence with this plan prior to the start of any pile driving. The Plan must include a description of all proposed PAM equipment, address how the proposed passive acoustic monitoring will follow | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | standardized measurement, processing methods, reporting metrics, and metadata standards for offshore wind (Van Parijs et al., 2021). The plan must describe all proposed PAM equipment, procedures, and protocols including information to support that it will be able to detect vocalizing right whales within the clearance and shutdown zones. The plan must also incorporate the following requirements: If a North Atlantic right whale (NARW) is detected via real-time PAM, data shall be submitted by BOEM, BSEE and/or Revolution Wind to nmfs.pacmdata@noaa.gov using the NMFS Passive Acoustic Reporting System Metadata and Detection data spreadsheets (https://www.fisheries.noaa.gov/resource/document/passive-acoustic-reporting-system-templates as soon as feasible but no longer than 24 hours after the detection. BOEM, BSEE, and/or Revolution Wind must submit the completed data templates to nmfs.pacmdata@noaa.gov; the full acoustic species Detection data, Metadata and GPS data records, from real-time data, must be submitted within 90 calendar days via the ISO standard metadata forms available on the NMFS Passive Acoustic Reporting System website (https://www.fisheries.noaa.gov/resource/document/passive-acoustic-reporting-system-templates). BOEM, BSEE, and/or Revolution Wind must submit the completed data templates to nmfs.pacmdata@noaa.gov; the full acoustic recordings from real-time systems must be sent to NCEI for archiving within 90 calendar days after pile-driving has ended and instruments have been pulled from the water and confirmation must be sent to NMFS GARFO. If a standardized template is available prior to the plan being submitted, NMFS will provide that template to Revolution Wind for use.<br>b. Marine Mammal and Sea Turtle Monitoring Plan – Pile Driving and UXO Detonation. BOEM, BSEE, and/or Revolution Wind must submit this Plan to NMFS GARFO at least 180 calendar days before any pile driving for foundation installation or any UXO detonation is planned. BOEM, BSEE, and/or Revolution Wind must obtain NMFS GARFO's concurrence with this plan prior to the start of any pile driving for foundation installation or carrying out any UXO detonation. The plan must include: a description of how all relevant mitigation and monitoring requirements contained in the incidental take statement will be implemented, a pile driving installation summary and sequence of events, a description of all training protocols for all project personnel (PSOs, PAMOs, trained crew lookouts, etc.), a description of all monitoring equipment and evidence that it can be used to effectively monitor and detect ESA listed listed marine mammals and sea turtles in the identified clearance and shutdown zones , communications and reporting details, PSO and PAMO schedules, and PSO monitoring and mitigation protocols (including number and location of PSOs) for observations and documentation of sea turtles and ESA listed marine mammals during all pile driving events and UXO detonations. The plan must detail all plans and procedures for sound attenuation, including procedures for adjusting the noise attenuation system(s) and available contingency noise attenuation measures/systems if distances to modeled isopleths of concern are exceeded during SFV. Revolution Wind must also submit an NAS inspection/performance report to NMFS- GARFO (nmfs.gar.incidental-take@noaa.gov) within 72 hours of the performance test which must occur prior to the first pile installation. The plan must also describe how Revolution Wind would determine the number of sea turtles exposed to noise above the 175 dB harassment threshold during impact pile driving of WTG and OSS foundations and how Revolution Wind would determine the number of ESA listed whales exposed to noise above the Level B harassment threshold during impact pile driving of WTG and OSS foundations.<br>c. Alternative Monitoring Plan/Night Time Pile Driving Monitoring Plan. BOEM, BSEE, and/or Revolution Wind must submit this Plan to NMFS GARFO at least 180 calendar days before impact pile driving is planned to begin. BOEM, BSEE, and Revolution Wind must obtain NMFS GARFO's concurrence with this plan prior to the start of pile driving. This plan must contain a thorough description of how Revolution Wind plans to monitor pile driving activities at night including proof of the efficacy of their night vision devices ( e.g., mounted thermal/IR camera systems, hand-held or wearable night vision devices (NVDs), infrared (IR) spotlights) in detecting ESA listed marine mammals and sea turtles over the full extent of the required clearance and shutdown zones, including demonstration that the full extent of the minimum visibility zones (WTG foundations: May – November, 2300 m and December, 4,400 m; OSS foundations: May – November 1,600 m and 2,700 m December) can be effectively and reliably monitored. The Plan must identify the efficacy of the technology at detecting marine mammals and | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | sea turtles in the clearance and shutdowns under all the various conditions anticipated during construction, including varying weather conditions, sea states, and in consideration of the use of artificial lighting. If the plan does not include a full description of the proposed technology, monitoring methodology, and data demonstrating to NMFS GARFO's satisfaction that marine mammals and sea turtles can reliably and effectively be detected within the clearance and shutdown zones for monopiles and pin piles before and during impact pile driving, nighttime pile driving (unless a pile was initiated 1.5 hours prior to civil sunset) may not occur. Additionally, this plan must contain a thorough description of how Revolution Wind plans to monitor pile driving activities during daytime when unexpected changes to lighting or weather occur during pile driving that prevent visual monitoring of the full extent of the clearance and shutdown zones.<br>d. Sound Field Verification Plan. BOEM, BSEE, and/or Revolution Wind must submit to NMFS GARFO at least 180 calendar days before impact pile driving or UXO detonation is planned to begin. BOEM, BSEE, and Revolution Wind must obtain NMFS GARFO's concurrence with this plan prior to the start of pile driving or UXO detonation activities. The plan must describe how Revolution Wind would ensure that the first three monopile installation sites and installation scenarios (i.e., hammer energy, number of strikes) and each UXO/MEC detonation site selected for SFV are representative of the rest of the monopile installation and UXO/MEC sites. If the monitored pile locations are different than the ones used for exposure modeling, justification must be provided for why these locations are representative of the modeling. In the case that these sites are not determined to be representative of all other monopile installation sites and UXO/MEC detonation locations, Revolution Wind must include information on how additional sites would be selected for SFV. The plan must also include the piling schedule and sequence of events, communication and reporting protocols, methodology for collecting, analyzing, and preparing SFV data for submission to NMFS GARFO including instrument deployment, locations of all hydrophones including direction and distance from the pile, hydrophone sensitivity, recorder/measurement layout, and analysis methods, and a template of the interim report to be submitted. The plan must describe how the effectiveness of the sound attenuation methodology would be evaluated based on the results. The plan must also identify additional noise attenuation measures (e.g., add noise attenuation device, adjust hammer operations) that will be deployed to reduce sound levels if measured distances are greater than those modeled.<br>i. SFV Interim Reports. Revolution Wind must provide, as soon as they are available but no later than 48 hours after the installation of each of the first three monopiles, the initial results of the SFV measurements to NMFS GARFO in an interim report. This report is required for each of the first three monopiles installed. The interim report must include data from all hydrophones deployed and include a summary of pile installation activities [pile diameter, pile weight, pile length, water depth, sediment type, hammer type, total strikes, total installation time (start time, end time)), duration of pile driving, max single strike energy, NAS deployments], pile location, recorder locations, modeled and measured distances to thresholds, received levels (rms, peak, and SEL) results from CTD casts/sound velocity profiles, signal and kurtosis rise times, pile driving plots, activity logs, weather conditions. The final results of SFV of monopile installations must be submitted as soon as possible, but no later than within 90 days following completion of pile driving of the three monopiles and UXO/MEC data to date. If there are any updates to the requirements to the contents of the interim plan, including availability of a template, this will be provided to Revolution Wind as soon as any such updates are available.<br>e. North Atlantic Right Whale Vessel Strike Avoidance Plan. BOEM, BSEE, and/or Revolution Wind must submit this plan to NMFS GARFO at least 180 calendar days prior to commencement of vessel use, with the exception of vessels deployed for the fisheries surveys. The plan must provide details on all relevant mitigation and monitoring measures for listed species, vessel transit protocols from all planned ports, vessel-based observer protocols for transiting vessels, proposed alternative monitoring equipment to maintain vessel strike avoidance zone in varying weather conditions, darkness, sea states, and in consideration of the use of artificial lighting. If Revolution Wind plans to implement PAM in any transit corridor to allow vessel transit above 10 knots, the plan must describe how PAM, in combination with visual observations, will be conducted to ensure the transit corridor is clear of North Atlantic right whales. | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| 11 | Construction and installation, O&M, decommissioning | On-site observation and inspection | To implement the requirements of RPM 6, BOEM and BSEE must exercise their authorities to assess the implementation of measures to minimize and monitor incidental take of ESA-listed species during activities described in this Opinion. If any term and condition(s) is/are not being complied with, BOEM and/or BSEE, as appropriate, must immediately take effective action to ensure prompt implementation. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 12 | Construction and installation, O&M, decommissioning | On-site observation and inspection | To implement the requirements of RPM 6, Revolution Wind must consent to on-site observation and inspections by Federal agency personnel (including NOAA personnel) during activities described in the Biological Opinion, for the purposes of evaluating the effectiveness and implementation of measures designed to minimize or monitor incidental take. | ESA-listed finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| **BOEM-proposed Mitigation and Monitoring Measures in National Marine Fisheries Service (NMFS) Biological Assessment (BA)†** | | | | | |
| 1 | Construction and installation, O&M, and decommissioning | Marine debris awareness training | The Lessee would ensure that vessel operators, employees, and contractors engaged in offshore activities pursuant to the approved COP complete marine trash and debris awareness training annually. The training consists of two parts: 1) viewing a marine trash and debris training video or slide show (described below) and 2) receiving an explanation from management personnel that emphasizes their commitment to the requirements. The marine trash and debris training videos, training slide packs, and other marine debris related educational material may be obtained at https://www.bsee.gov/debris or by contacting BSEE. The training videos, slides, and related material may be downloaded directly from the website. Operators engaged in marine survey activities must continue to develop and use a marine trash and debris awareness training and certification process that reasonably assures that their employees and contractors are in fact trained. The training process must include the following elements:<br>• Viewing of either a video or slide show by the personnel specified above<br>• An explanation from management personnel that emphasizes their commitment to the requirements<br>• Attendance measures (initial and annual)<br>• Recordkeeping and the availability of records for inspection by DOI<br>By January 31 of each year, the Lessee would submit to the DOI an annual report that describes its marine trash and debris awareness training process and certifies that the training process has been followed for the previous calendar year. The Lessee would send the reports via email to BOEM (at renewable_reporting@boem.gov) and to BSEE via TIMSWeb with a notification email (at marinedebris@bsee.gov). | Finfish and EFH, marine mammals, sea turtles | BOEM, BSEE, and USACE |
| 2 | Construction and installation and postconstruction and installation | Marine debris elimination | Materials, equipment, tools, containers, and other items used in Outer Continental Shelf (OCS) activities which could be lost or discarded overboard must be clearly marked with the vessel or facility identification. All markings must clearly identify the owner and must be durable enough to resist the effects of the environmental conditions to which they may be exposed. | Birds, Finfish and EFH, marine mammals, sea turtles | BOEM, BSEE, and USACE |
| 3 | Construction and installation and postconstruction and installation | Incorporate letter of authorization (LOA) requirements | The measures required by the final MMPA LOA for Incidental Take Regulations (ITRs) will be incorporated into COP approval, and BOEM and/or BSEE would monitor compliance with these measures. | Marine mammals | BOEM and BSEE |
| 4 | Construction and installation, postconstruction and installation monitoring | Passive acoustic monitoring (PAM) plan | BOEM, BSEE, and USACE would ensure that Revolution Wind prepares a PAM plan that describes all proposed equipment, deployment locations, detection review methodology and other procedures, and protocols related to the required use of PAM for monitoring. This plan must be submitted to NMFS, BOEM (at renewable_reporting@boem.gov), and BSEE (via TIMSWeb with a notification email at protectedspecies@bsee.gov) for review and concurrence preferably 180 days but no later than 120 days prior to the planned start of pile driving. | Finfish, marine mammals | BOEM, BSEE, USACE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| 5 | Construction, O&M, and decommissioning | Passive acoustic monitoring (PAM) | Use PAM buoys or autonomous PAM devices to record ambient noise, marine mammals, and cod vocalizations in the Lease Area before, during, and immediately after construction (at least 25 years of operation (or as may be extended) to monitor Project noise. The archival recorders must have a minimum capability of detecting and storing acoustic data on anthropogenic noise sources (such as vessel noise, pile driving, WTG operation, and whale detections), marine mammals, and cod vocalizations in the Lease Area. Monitoring would also occur during the decommissioning phase. The total number of PAM stations and array configuration will depend on the size of the zone to be monitored, the amount of noise expected in the area, and the characteristics of the signals being monitored to accomplish both monitoring during constructions, and also meet post-construction monitoring needs. Results must be provided within 90 days of construction completion and again within 90 days of the 1-year, 2-year, and 3-year anniversary of collection. The underwater acoustic monitoring must follow standardized measurement and processing methods and visualization metrics developed by the Atlantic Deepwater Ecosystem Observatory Network (ADEON) for the U.S. Mid- and South Atlantic OCS (see https://adeon.unh.edu/). At least two buoys must be independently deployed within or bordering the Lease Area or one or more buoys must be deployed in coordination with other acoustic monitoring efforts in the RI/MA and MA WEAs.<br>As an alternative to conducting PAM in its project area, the lessee may opt to meet this monitoring requirement through an annual deposit to BOEM's Environmental Studies Program in support of its Partnership for an Offshore Wind Energy Regional Observation Network (POWERON) initiative. The lessee's contribution would cover activities within its lease area, such as the purchase of instruments, annual deployments and refurbishment, data processing, and long-term data archiving. Funding from BOEM, other partners, and potentially other lessees will support long-term PAM throughout the region which will enable broader-scale analyses on cumulative effects to marine species. Under this option, the lessee will be expected to cooperate with the POWERON team to facilitate deployment and retrieval of instruments within the project area. If necessary, the lessee may request temporary withholding of the public release of acoustic data that has been collected within its project area. | Finfish, marine mammals | BOEM, BSEE, USACE, and NMFS |
| 6 | Construction and installation | Pile driving monitoring plan | BOEM, BSEE, and USACE would ensure that Revolution Wind prepares and submits to BSEE (via TIMSWeb and notification email at protectedspecies@bsee.gov) and BOEM (at renewable_reporting@boem.gov) for review and concurrence preferably 180 days but no later than 120 days before start of pile driving. Reporting to BSEE would follow JOINT NTL 2023-N01, Appendix B. The Lessee must not conduct pile driving operations at any time when lighting or weather conditions (e.g., darkness, rain, fog, sea state) prevent visual monitoring of the full extent of the clearance and shutdown zones including not initiating pile driving earlier than 1 hour after civil sunrise or later than 1.5 hours prior to civil sunset.<br>Pile driving at night may only occur with prior approval of an AMP. The Lessee must submit an AMP to BOEM and NMFS for review and approval at least 6 months prior to the planned start of pile-driving. This plan may include deploying additional observers, alternative monitoring technologies such as night vision, thermal, and infrared technologies, or use of PAM and must demonstrate the ability and effectiveness to maintain all clearance and shutdown zones during daytime as outlined below in Part 1 and nighttime as outlined in Part 2 to BOEM's and NMFS's satisfaction.<br>The AMP must include two stand-alone components as described below:<br>Part 1 – Daytime when lighting or weather (e.g., fog, rain, sea state) conditions prevent visual monitoring of the full extent of the clearance and shutdown zones. Daytime being defined as one hour after civil sunrise to 1.5 hours before civil sunset.<br>Part 2 – Nighttime inclusive of weather conditions (e.g., fog, rain, sea state). Nighttime being defined as 1.5 hours before civil sunset to one hour after civil sunrise.<br>If a protected marine mammal or sea turtle is observed entering or found within the shutdown zones after impact pile-driving has commenced, the Lessee would follow shutdown procedures outlined in the Protected Species Mitigation Monitoring Plan (PSMMP; Appendix B). The Lessee would notify BOEM and NMFS of any shutdown | Marine mammals, Sea turtles | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | occurrence during piling driving operations within 24 hours of the occurrence unless otherwise authorized by BOEM and NMFS.<br>The AMP should include, but is not limited to the following information:<br>• Identification of night vision devices (e.g., mounted thermal/IR camera systems, hand-held or wearable NVDs, IR spotlights), if proposed for use to detect protected marine mammal and sea turtle species.<br>• The AMP must demonstrate (through empirical evidence) the capability of the proposed monitoring methodology to detect marine mammals and sea turtles within the full extent of the established clearance and shutdown zones (i.e., species can be detected at the same distances and with similar confidence) with the same effectiveness as daytime visual monitoring (i.e., same detection probability). Only devices and methods demonstrated as being capable of detecting marine mammals and sea turtles to the maximum extent of the clearance and shutdown zones will be acceptable.<br>• Evidence and discussion of the efficacy (range and accuracy) of each device proposed for low visibility monitoring must include an assessment of the results of field studies (e.g., Thayer Mahan demonstration), as well as supporting documentation regarding the efficacy of all proposed alternative monitoring methods (e.g., best scientific data available).<br>• Procedures and timeframes for notifying NMFS and BOEM of Revolution Wind's intent to pursue nighttime pile-driving.<br>• Reporting procedures, contacts and timeframes.<br>BOEM may request additional information, when appropriate, to assess the efficacy of the AMP. For mammals see Appendix B MMPA rule. | | |
| 7 | Construction and installation | Protected species observers (PSO) coverage | BOEM, BSEE, and USACE would ensure that PSO coverage is sufficient to reliably detect marine mammals and sea turtles at the surface in clearance and shutdown zones to execute any pile driving delays or shutdown requirements. If, at any point prior to or during construction, the PSO coverage that is included as part of the Proposed Action is determined not to be sufficient to reliably detect ESA-listed whales and sea turtles within the clearance and shutdown zones, additional PSOs and/or platforms must be deployed. Determinations prior to construction must be based on review of the pile driving monitoring plan. Determinations during construction would be based on review of the weekly pile driving reports and other information, as appropriate. | Marine mammals, Sea turtles | BOEM, BSEE, and USACE |
| 8 | Construction and installation | Sound field verification (SVF) | NMFS, BOEM, BSEE, and USACE would ensure that if the clearance and/or shutdown zones are expanded, PSO coverage is sufficient to reliably monitor the expanded clearance and/or shutdown zones. Additional observers must be deployed on additional platforms for every 1,500 m that a clearance or shutdown zone is expanded beyond the distances modeled prior to verification.<br>To validate the estimated sound field, SVF measurements would be conducted during pile driving of the first three monopiles installed over the course of the Project, with noise attenuation activated. A SVF plan would be submitted to NMFS, BOEM, USACE, and BSEE for review and approval preferably 180 days but no later than 120 days prior to planned start of pile driving. This plan would describe how Revolution Wind would ensure that the first three monopile installation sites selected for sound field are representative of the rest of the monopile installation sites and, in the case that they are not, how additional sites would be selected for SVF. This plan would also include methodology for collecting, analyzing, and preparing SFV data for submission to NMFS. The plan would describe how the effectiveness of the sound attenuation methodology would be evaluated based on the results. In the event that Revolution Wind obtains technical information that indicates a subsequent monopile is likely to produce larger sound fields, SFV would be conducted for those subsequent monopiles. | Marine mammals, Sea turtles, Finfish, Benthic Habitat, EFH, Invertebrates | BOEM, BSEE, NMFS, and USACE |
| 9 | Construction and installation | Shutdown zones and pre-start clearance zone adjustment | BOEM, BSEE, and NMFS may consider adjustments in the pre-start clearance and/or shutdown zones based on the initial SFV measurements. Revolution Wind will provide the initial results of each SFV measurement to BOEM, | Marine mammals | BOEM, BSEE, NMFS, and USACE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | BSEE, and NMFS in an interim report after each monopile installation. Interim reports must be submitted as soon as they are available but no later than 48 hours after each installation.<br>Revolution Wind will conduct an SFV to empirically determine the distances to the isopleths corresponding to Level A harassment and Level B harassment thresholds, including at the locations corresponding to the modeled distances to the Level A harassment and Level B harassment thresholds. If initial SFV measurements indicate distances to the isopleths are less than the distances predicted by modeling assuming 10-decibel (dB) attenuation, Revolution Wind may request a modification of the clearance and shutdown zones for impact pile driving. For a modification request to be considered, Revolution Wind must have conducted SFV on at least three piles to verify that zone sizes are consistently smaller than predicted by modeling. If initial SFV measurements from any foundation indicate distances to the isopleths are greater than the distances predicted by modeling, Revolution Wind would implement additional sound attenuation measures prior to conducting additional pile driving. Additional measures may include improving the efficacy of the implemented noise attenuation technology and/or modifying the piling schedule to reduce the sound source. If modeled zones cannot be achieved by these corrective actions, Revolution Wind must install an additional noise mitigation system to achieve the modelled ranges. Each sequential modification would be evaluated empirically by SFV of three additional foundations with the new sound attenuation technology. Additionally, in the event that SFV measurements continue to indicate distances to isopleths corresponding to Level A harassment and Level B harassment thresholds are consistently greater than the distances predicted by modeling, BOEM, BSEE, or NMFS may expand the relevant clearance and shutdown zones and associated monitoring measures. | | |
| 10 | Construction and installation | Shutdown zones and pre-start clearance zone adjustment | BOEM, BSEE, and NMFS may consider adjustments in the pre-start clearance and/or shutdown zones based on the initial SFV measurements. Revolution Wind would provide the initial results of the SFV measurements to NMFS in an interim report after each monopile installation for the first three piles as soon as they are available but no later than 48 hours after each installation.<br>Revolution Wind would conduct an SFV to empirically determine the distances to the isopleths corresponding to hearing injury and behavioral effects thresholds for sea turtles, including at the locations corresponding to the modeled distances to these thresholds. If initial SFV measurements indicate distances to the isopleths are less than the distances predicted by modeling assuming 10-decibel (dB) attenuation, Revolution Wind may request a modification of the clearance and shutdown zones for impact pile driving. For a modification request to be considered by NMFS, Revolution Wind must have conducted SFV on at least three piles to verify that zone sizes are consistently smaller than predicted by modeling. If initial SFV measurements indicate distances to the isopleths are greater than the distances predicted by modeling, Revolution Wind would implement additional sound attenuation measures prior to conducting additional pile driving. Additional measures may include improving the efficacy of the implemented noise attenuation technology and/or modifying the piling schedule to reduce the sound source. If modeled zones cannot be achieved by these corrective actions, Revolution Wind would install an additional noise mitigation system to achieve the modelled ranges. Each sequential modification would be evaluated empirically by SFV. Additionally, in the event that SFV measurements continue to indicate distances to isopleths corresponding to hearing injury and behavioral effects thresholds are consistently greater than the distances predicted by modeling, NMFS may expand the relevant clearance and shutdown zones and associated monitoring measures. | Sea turtles | BOEM, BSEE, NMFS, and USACE |
| 11 | Construction and installation | Monitoring zone for sea turtles | BOEM, BSEE, and USACE would ensure that Revolution Wind would monitor a 500 m clearance and shutdown zone for sea turtles for the full duration of all pile driving activities and for 30 minutes following the cessation of pile driving activities and record all observations in order to ensure that all take that occurs is documented. | Sea turtles | BOEM, BSEE, and USACE |
| 12 | Construction and installation, O&M, and conceptual decommissioning | Reporting of all North Atlantic right whale (NARW) sightings | If a NARW is observed at any time by PSOs or personnel on any Project vessels, during any Project-related activity, or during vessel transit, Revolution Wind must report the sighting information to NMFS as soon as feasible and no later than within 24 hours after conclusion of the detection event (the time, location, number of animals, closest point of approach of animals, animal behavior, activities at time of detection, vessel speed, and any mitigation measures | Marine mammals | BOEM, BSEE, USACE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | implemented) via the WhaleAlert app (http://www.whalealert.org/), NMFS Right Whale Sighting Advisory System hotline (phone), and PR.ITP.MonitoringReports@noaa.gov. | | |
| 13 | Construction and installation, O&M, and decommissioning | Vessel strike avoidance measures for sea turtles | Between June 1 and November 30, Revolution Wind must have a trained lookout posted on all vessel transits during all phases of the Project to observe for sea turtles. The trained lookout must communicate any sightings, in real time, to the captain so that the requirements in (e) below can be implemented.<br>a. The trained lookout must monitor https://seaturtlesightings.org/ prior to each trip and report any observations of sea turtles in the vicinity of the planned transit to all vessel operators/captains and lookouts on duty that day.<br>b. The trained lookout must maintain a vigilant watch and monitor a vessel strike avoidance zone (500 m) at all times to maintain minimum separation distances from ESA-listed species. Alternative monitoring technology (e.g., night vision and thermal cameras) must be available to ensure effective watch at night and in any other low-visibility conditions. If the trained lookout is a vessel crew member, this must be their designated role and primary responsibility while the vessel is transiting. Any designated crew lookouts would receive training on protected species identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements.<br>c. If a sea turtle is sighted within 100 m or less of the operating vessel's forward path, the vessel operator must slow down to 4 knots (unless unsafe to do so) and then proceed away from the turtle at a speed of 4 knots or less until there is a separation distance of at least 100 m at which time the vessel may resume normal operations. If a sea turtle is sighted within 50 m of the forward path of the operating vessel, the vessel operator must shift to neutral when safe to do so wait for the turtle to pass beyond 50m and then engage engines and travel proceed away from the turtle at a speed of 4 knots until a separation distance of 100 m is observed The vessel may resume normal operations once it has passed the turtle.<br>d. Vessel captains/operators would avoid transiting through areas of visible jellyfish aggregations or floating sargassum lines or mats. In the event that operational safety prevents avoidance of such areas, vessels must slow to 4 knots while transiting through such areas.<br>e. All vessel crew members must be briefed in the identification of ESA-listed species of sea turtles and in regulations and best practices for avoiding vessel collisions. Reference materials must be available aboard all Project vessels for identification of sea turtles. The expectation and process for reporting of sea turtles (including live, entangled, and dead individuals) must be clearly communicated and posted in highly visible locations aboard all Project vessels, so that there is an expectation for reporting to the designated vessel contact (such as the lookout or the vessel captain), as well as a communication channel and process for crew members to do so.<br>f. The only exception is when the safety of the vessel or crew necessitates deviation from these requirements on an emergency basis. If any such incidents occur, they must be reported to NMFS and BSEE within 24 hours.<br>g. If a vessel is carrying a PSO or trained lookout for the purposes of maintaining watch for North Atlantic right whales, an additional lookout is not required and this PSO or trained lookout must maintain watch for whales, giant manta rays, and sea turtles. | Sea turtles | BOEM, BSEE, and USACE |
| 14 | Construction and installation, postconstruction and installation monitoring | Sampling gear | All sampling gear would be hauled out at least once every 30 days, and all gear must be removed from the water and all gear must be removed from the water and stored on land between survey seasons to minimize risk of entanglement. | Finfish, marine mammals, sea turtles, invertebrates | BOEM and BSEE |
| 15 | Construction and installation, postconstruction and installation monitoring | Lost survey gear | If any survey gear is lost, all reasonable efforts that do not compromise human safety must be undertaken to recover the gear. All lost gear must be reported to NMFS (nmfs.gar.incidental-take@noaa.gov) and BSEE (via TIMSWeb and notification email at marinedebris@bsee.gov) within 24 hours of the documented time of missing or | Finfish, marine mammals, sea | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | lost gear. This report must include information on any markings on the gear and any efforts undertaken or planned to recover the gear. | turtles, invertebrates | |
| 16 | Construction and installation, postconstruction and installation monitoring | Training | At least one of the survey staff onboard the trawl surveys and ventless trap surveys must have completed Northeast Fisheries Observer Program (NEFOP) observer training (within the last 5 years) or other training in protected species identification and safe handling (inclusive of taking genetic samples from Atlantic sturgeon). Reference materials for identification, disentanglement, safe handling, and genetic sampling procedures must be available on board each survey vessel. BOEM and BSEE would ensure that Revolution Wind prepares a training plan that addresses how this requirement would be met and that the plan is submitted to NMFS in advance of any trawl or trap surveys. This requirement is in place for any trips where gear is set or hauled. | Finfish | BOEM, BSEE, and NMFS |
| 17 | Construction and installation, postconstruction and installation monitoring | Sea turtle disentanglement | Vessels deploying fixed gear (e.g., pots/traps) would have adequate disentanglement equipment (i.e., knife and boathook) onboard. Any disentanglement would occur consistent with the Northeast Atlantic Coast STDN disentanglement guidelines (https://www.reginfo.gov/public/do/DownloadDocument?objectID=102486501) and the procedures described in *Careful Release Protocols for Sea Turtle Release with Minimal Injury* (NOAA Technical Memorandum 580; https://repository.library.noaa.gov/view/noaa/3773) (NOAA 2008). | Sea turtles | BOEM, BSEE, and NMFS |
| 18 | Construction and installation, postconstruction and installation monitoring | Sea turtle/Atlantic sturgeon identification and data collection | Any sea turtles or Atlantic sturgeon caught and/or retrieved in any fisheries' survey gear must first be identified to species or species group. Each ESA-listed species caught and/or retrieved must then be properly documented using appropriate equipment and data collection forms. Biological data, samples, and tagging must occur as outlined below. Live, uninjured animals should be returned to the water as quickly as possible after completing the required handling and documentation.<br>a. The *Sturgeon and Sea Turtle Take Standard Operating Procedures* must be followed (NOAA 2021a; https://media.fisheries.noaa.gov/dammigration/sturgeon_&_sea_turtle_take_sops_external.pdf).).<br>b. Survey vessels must have a passive integrated transponder (PIT) tag reader onboard capable of reading 134.2-kilohertz and 125-kilohertz encrypted tags (e.g., Biomark GPR Plus Handheld PIT Tag Reader), and this reader be used to scan any captured sea turtles and sturgeon for tags. Any recorded tags must be recorded on the take reporting form (see below).<br>c. Genetic samples must be taken from all captured Atlantic sturgeon (alive or dead) to allow for identification of the distinct population segment (DPS) of origin of captured individuals and tracking of the amount of incidental take. This must be done in accordance with the *Procedure for Obtaining Fin Clips from Sturgeon for Genetic Analysis* (NOAA 2019; https://media.fisheries.noaa.gov/dammigration/sturgeon_genetics_sampling_revised_june_2019.pdf).<br>i. Fin clips must be sent to a NMFS-approved laboratory capable of performing genetic analysis and assignment to DPS of origin. To the extent authorized by law, BOEM is responsible for the cost of the genetic analysis. Arrangements must be made for shipping and analysis in advance of submission of any samples; these arrangements must be confirmed in writing to NMFS within 60 days of the receipt of this incidental take statement (ITS). Results of genetic analysis, including assigned DPS of origin, must be submitted to NMFS within 6 months of the sample collection.<br>ii. Subsamples of all fin clips and accompanying metadata forms must be held and submitted to a tissue repository (e.g., the Atlantic Coast Sturgeon Tissue Research Repository) on a quarterly basis. The Sturgeon Genetic Sample Submission Form is available for download at https://www.fisheries.noaa.gov/new-england-mid-atlantic/consultations/section-7-take-reporting-programmatics-greater-atlantic.<br>d. All captured sea turtles and Atlantic sturgeon must be documented with required measurements and photographs. The animal's condition and any marks or injuries must be described. This information must be entered as part of the record for each incidental take. A NMFS Take Report Form would be filled out | Finfish, Sea turtles | BOEM, BSEE, NMFS, and USACE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | for each individual sturgeon and sea turtle (download at: https://media.fisheries.noaa.gov/2021-11/Sturgeon-Sea-Turtle-Take-SOPs-external-11032021.pdf). | | |
| 19 | Construction and installation, postconstruction and installation monitoring | Sea turtle/Atlantic sturgeon handling and resuscitation guidelines | Any sea turtles or Atlantic sturgeon caught and retrieved in gear used in fisheries surveys must be handled and resuscitated (if unresponsive) according to established protocols and whenever at-sea conditions are safe for those handling and resuscitating the animal(s) to do so. Specifically:<br>a. Priority must be given to the handling and resuscitation of any sea turtles or sturgeon that are captured in the gear being used, if conditions at sea are safe to do so. Handling times for these species should be minimized (i.e., kept to 15 minutes or less) to limit the amount of stress placed on the animals.<br>b. All survey vessels must have copies of the sea turtle handling and resuscitation requirements found at 50 CFR 223.206(d)(1) prior to the commencement of any on-water activity (download at: https://media.fisheries.noaa.gov/ dammigration/sea_turtle_handling_and_resuscitation_measures.pdf). These handling and resuscitation procedures must be carried out any time a sea turtle is incidentally captured and brought onboard the vessel during the proposed actions.<br>c. If any sea turtles that appear injured, sick, or distressed, are caught and retrieved in fisheries survey gear, survey staff must immediately contact the Greater Atlantic Region Marine Animal Hotline at 866-755-6622 for further instructions and guidance on handling the animal, and potential coordination of transfer to a rehabilitation facility. If unable to contact the hotline (e.g., due to distance from shore or lack of ability to communicate via phone), the USCG should be contacted via VHF marine radio on Channel 16. If required, hard-shelled sea turtles (i.e., non- leatherbacks) may be held on board for up to 24 hours following handling instructions provided by the Hotline, prior to transfer to a rehabilitation facility.<br>d. Attempts must be made to resuscitate any Atlantic sturgeon that are unresponsive or comatose by providing a running source of water over the gills as described in the sturgeon resuscitation guidelines (NOAA 2020; https://media.fisheries.noaa.gov/dammigration-miss/Resuscitation-Cards-120513.pdf).<br>e. Provided that appropriate cold storage facilities are available on the survey vessel, following the report of a dead sea turtle or sturgeon to NMFS, and if NMFS requests, any dead sea turtle or Atlantic sturgeon must be retained on board the survey vessel for transfer to an appropriately permitted partner or facility on shore as safe to do so.<br>f. Any live sea turtles or Atlantic sturgeon caught and retrieved in gear used in any fisheries survey must ultimately be released according to established protocols and whenever at-sea conditions are safe for those releasing the animal(s) to do so. | Finfish, Sea turtles | BOEM, BSEE, NMFS, and USACE |
| 20 | Construction and installation, postconstruction and installation monitoring | Take notification | GARFO Protected Resources Division (PRD) and BSEE must be notified as soon as possible of all observed takes of sea turtles and Atlantic sturgeon occurring as a result of any fisheries survey. Specifically:<br>a. GARFO PRD and DOI (BOEM and BSEE) must be notified within 24 hours of any interaction with a sea turtle or sturgeon (nmfs.gar.incidental- take@noaa.gov and DOI via TIMSWeb and notification email at protectedspecies@bsee.gov). The report must include at a minimum 1) survey name and applicable information (e.g., vessel name, station number); 2) GPS coordinates describing the location of the interaction (in decimal degrees); 3) gear type involved (e.g., bottom trawl, longline); 4) soak time, gear configuration, and any other pertinent gear information; 5) time and date of the interaction; and 6) identification of the animal to the species level. Additionally, the email must transmit a copy of the NMFS Take Report Form (download at: https://media.fisheries.noaa.gov/2021-07/Take%20Report%20Form%2007162021.pdf?null) and a link to or acknowledgement that a clear photograph or video of the animal was taken (multiple photographs are suggested, including at least one photograph of the head scutes). If reporting within 24 hours is not possible due to distance from shore or lack of ability to communicate via telephone, fax, or email, reports must be submitted as soon as possible; late reports must be submitted with an explanation for the delay. | Finfish, Sea turtles | BOEM, BSEE, NMFS, and USACE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | b. At the end of each survey season, a report must be sent to NMFS that compiles all information on any observations and interactions with ESA-listed species. This report must also contain information on all survey activities that took place during the season including location of gear set, duration of soak/trawl, and total effort. The report on survey activities must be comprehensive of all activities, regardless of whether ESA-listed species were observed. | | |
| 21 | Construction and installation, O&M, and decommissioning | Monthly/ annual reporting requirements | BOEM and BSEE would ensure that Revolution Wind submits regular reports (in consultation with NMFS) necessary to document the amount or extent of take that occurs during all phases of the proposed action. Details of reporting must be coordinated between Revolution Wind, NMFS, BOEM, and BSEE. All reports would be sent to: nmfs.gar.incidental- take@noaa.gov and BSEE via TIMSWeb and notification email at protectedspecies@bsee.gov. | Finfish, marine mammals, sea turtles | BOEM, BSEE, and NMFS |
| 22 | Construction and installation, O&M, and decommissioning | Vessel strike protected species observer requirements | Protected Species Observer Requirements (Construction)(Operations)(Decommissioning). The Lessee must ensure that vessel operators and crew members maintain a vigilant watch for marine mammals and sea turtles, and reduce vessel speed, alter the vessel's course, or stop the vessel as necessary to avoid striking marine mammals or sea turtles.<br>All vessels must have a visual observer on board who is responsible for monitoring the vessel strike avoidance zone for marine mammals and sea turtles. Visual observers may be PSO or crew members, but crew members responsible for these duties must be provided sufficient training by the Lessee to distinguish marine mammals from other phenomena and must be able to identify a marine mammal as a North Atlantic right whale, other whale (defined in this context as sperm whales or baleen whales other than North Atlantic right whales), or other marine mammal. Crew members serving as visual observers must not have duties other than observing for marine mammals while the vessel is operating over 10 kts;<br>Vessel Communication of Threatened and Endangered Species Sightings (Planning) (Construction) (Operations) (Decommissioning). The Lessee must ensure that whenever multiple Project vessels are operating, any detections of ESA-listed species (marine mammals and sea turtles) are communicated in near real time to these personnel on the other Project vessels: Protected Species Observer (PSO), vessel captains, or both.<br>Year-round, all vessel operators must monitor, the project's Situational Awareness System, WhaleAlert, US Coast Guard VHF Channel 16, and the Right Whale Sighting Advisory System (RWSAS) for the presence of North Atlantic right whales once every 4-hour shift during project-related activities. The PSO and PAM operator monitoring teams for all activities must also monitor these systems no less than every 12 hours. If a vessel operator is alerted to a North Atlantic right whale detection within the project area, they must immediately convey this information to the PSO and PAM teams. For any UXO/MEC detonation, these systems must be monitored for 24 hours prior to blasting;<br>Any observations of any large whale by any of the Lessee's staff or contractor, including vessel crew, must be communicated immediately to PSOs and all vessel captains to increase situational awareness. | Marine mammals | BOEM, BSEE, NMFS, and USACE |
| 23 | O&M and decommissioning | Vessel speed requirements | Between November 1st and April 30th, all vessels, regardless of size, must operate at 10 kts or less when traveling between the lease area and ports in New Jersey, New York, Maryland, Delaware, and Virginia;<br>All vessels, regardless of size, must immediately reduce speed to 10 kts or less when any large whale, mother/calf pairs, or large assemblages of non-delphinid cetaceans are observed (within 500 m) of an underway vessel;<br>All vessels, regardless of size, must immediately reduce speed to 10 kts or less when a North Atlantic right whale is sighted, at any distance, by anyone on the vessel;<br>If a vessel is traveling at greater than 10 knots, in addition to the required dedicated visual observer, the Lessee must monitor the transit corridor in real-time with PAM prior to and during transits. If a North Atlantic right whale is detected via visual observation or PAM within or approaching the transit corridor, all crew transfer vessels must travel at 10 kts or less for 12 hours following the detection. Each subsequent detection shall trigger a 12-hour reset. A slowdown in the transit corridor expires when there has been no further visual or acoustic detection in the transit corridor in the past 12 hours; | Marine mammals | BOEM, BSEE, NMFS, and USACE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | All underway vessels (e.g., transiting, surveying) operating at any speed must have a dedicated visual observer on duty at all times to monitor for marine mammals within a 180° direction of the forward path of the vessel (90° port to 90° starboard) located at an appropriate vantage point for ensuring vessels are maintaining appropriate separation distances. Visual observers must be equipped with alternative monitoring technology for periods of low visibility (e.g., darkness, rain, fog, etc.). The dedicated visual observer must receive prior training on protected species detection and identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements in this subpart. Visual observers may be third-party observers (i.e., NMFS-approved PSOs) or crew members. Observer training related to these vessel strike avoidance measures must be conducted for all vessel operators and crew prior to the start of in-water construction activities. Confirmation of the observers' training and understanding of the Incidental Take Authorization (ITA) requirements must be documented on a training course log sheet and reported to NMFS;<br>All vessels must maintain a minimum separation distance of 500 m from North Atlantic right whales. If underway, all vessels must steer a course away from any sighted North Atlantic right whale at 10 kts or less such that the 500-m minimum separation distance requirement is not violated. If a North Atlantic right whale is sighted within 500 m of an underway vessel, that vessel must shift the engine to neutral. Engines must not be engaged until the whale has moved outside of the vessel's path and beyond 500 m. If a whale is observed but cannot be confirmed as a species other than a North Atlantic right whale, the vessel operator must assume that it is a North Atlantic right whale and take the vessel strike avoidance measures described in this paragraph (b)(2)(xi);<br>All vessels must maintain a minimum separation distance of 100 m from sperm whales and non-North Atlantic right whale baleen whales. If one of these species is sighted within 100 m of an underway vessel, that vessel must shift the engine to neutral. Engines must not be engaged until the whale has moved outside of the vessel's path and beyond 100 m;<br>All vessels must, to the maximum extent practicable, attempt to maintain a minimum separation distance of 50 m from all delphinoid cetaceans and pinnipeds, with an exception made for those that approach the vessel (e.g., bow-riding dolphins). If a delphinid cetacean or pinniped is sighted within 50 m of an underway vessel, that vessel must shift the engine to neutral, with an exception made for those that approach the vessel (e.g., bow-riding dolphins). Engines must not be engaged until the animal(s) has moved outside of the vessel's path and beyond 50 m;<br>When a marine mammal(s) is sighted while a vessel is underway, the vessel must take action as necessary to avoid violating the relevant separation distances (e.g., attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal has left the area). If a marine mammal(s) is sighted within the relevant separation distance, the vessel must reduce speed and shift the engine to neutral, not engaging the engine(s) until the animal(s) is clear of the area. This does not apply to any vessel towing gear or any situation where respecting the relevant separation distance would be unsafe (i.e., any situation where the vessel is navigationally constrained);<br>All vessels underway must not divert or alter course to approach any marine mammal. Any vessel underway must avoid speed over 10 kts or abrupt changes in course direction until the animal is out of an on a path away from the separation distances; and<br>For in-water construction heavy machinery activities other than impact or vibratory pile driving, if a marine mammal is on a path towards or comes within 10 m of equipment, the Lessee must cease operations until the marine mammal has moved more than 10 m on a path away from the activity to avoid direct interaction with equipment. | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **BOEM-Proposed Monitoring Measures Developed in Conjunction with Cooperating Agencies** | | | | | |
| 1 | O&M | Periodic underwater surveys, reporting of monofilament and other fishing gear around WTG foundations | The Lessee must monitor potential loss of fishing gear near WTG foundations by surveying at least 10%Revolution Wind must report the results of the surveys to BOEM (at renewable_reporting@boem.gov) and BSEE (at marinedebris@bsee.gov) in an annual report, submitted by April 30 for the preceding calendar year. Annual reports must be submitted in Microsoft Word format. Photographic and videographic materials must be provided on a portable drive in a lossless format such as TIFF or Motion JPEG 2000. Annual reports must include survey reports that include the survey date; contact information of the operator; the location and pile identification number; photographic and/or video documentation of the survey and debris encountered; any animals sighted; and the disposition of any located debris (i.e., removed or left in place). Required data and reports may be archived, analyzed, published, and disseminated by BOEM. | Marine mammals, sea turtles, finfish | BOEM and BSEE |
| 2 | Preconstruction, Construction, O&M, and decommissioning | Long-term PAM | Long-term monitoring of ambient noise, marine mammal, and cod vocalizations in the Lease Area before, during, and following construction. Continuous recording must occur at least 30 days prior to pile driving, during foundation pile driving, initial operation, and for at least 3 full calendar years of operation to monitor for potential impacts. At least three devices must be independently deployed within the lease area to maximize spatial coverage of the project area based on 10-kilometer spacing between deployment locations or as otherwise agreed between BOEM and the Lessee. The locations of the three buoys must be coordinated with the Regional Wildlife Science Collaborative prior to the plan being submitted to BOEM and BSEE. Devices may be moved to new locations during the recording period, if existing PAM devices will be present in the lease area providing continuous recording. The archival recorders must have a minimum capability of continuously detecting and storing acoustic data on vessel noise, pile-driving, WTG operation, baleen whale vocalizations, and cod vocalizations in the lease area. No later than 180 days prior to buoy deployment, the Lessee must submit to BOEM and BSEE (renewable_reporting@boem.gov and OSWsubmittals@bsee.gov) the PAM plan, which describes all proposed equipment, deployment locations, detection review methodology, and other procedures and protocols related to the required use of PAM for monitoring.<br>The PAM plan must detail mooring best practices, data management, storage, measurement, and data processing best practices that are required by BOEM for long-term PAM monitoring. Refer to Regional Wildlife Science Collaborative for Offshore Wind Data Management & Storage Best Practices for Long-term and Archival Passive Acoustic Monitoring (PAM) Data. Other best practices consistent with COP approval should be detailed in the plan. The long-term PAM Plan must include the proposed equipment, sample rate, mooring design, deployment locations, methods for baleen whale and cod detections, and metrics for ambient noise analysis. The long-term PAM plan must be submitted to BOEM and BSEE (at renewable_reporting@boem.gov and OSWsubmittals@bsee.gov) for review and concurrence. BOEM and BSEE will review the long-term PAM Plan and provide comments, if any, on the plan within 45 calendar days, but no later than 90 days of its submittal. The plan must satisfy all outstanding comments to BOEM's and BSEE's satisfaction. The Lessee will receive written concurrence from DOI upon acceptance of the final long-term PAM plan. If DOI does not provide comments on the long-term PAM Plan within 90 calendar days of its submittal, the Lessee may conclusively presume DOI's concurrence with the long-term PAM Plan.<br>Long-term PAM monitoring results must be provided within 180 days of buoy collection and again within 180 days of the annual anniversaries of each the PAM device deployments. All raw data must be sent to NCEI for archiving no later than 6 months following the date of each recorder recovery.<br>As an alternative to conducting long-term PAM in its project area, the lessee may opt to meet this monitoring requirement through an annual deposit to BOEM's Environmental Studies Program in support of its Partnership for an Offshore Wind Energy Regional Observation Network (POWERON) initiative. The lessee's contribution would | Marine Mammals, Finfish, EFH | BOEM and BSEE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | cover activities within the area of potential effect of the project, such as the purchase of instruments, annual deployments and refurbishment, data processing, and long-term data archiving. Funding from BOEM, other partners, and potentially other lessees will support long-term PAM throughout the region which will enable broader-scale analyses on cumulative effects to marine species. Under this option, the Lessee will be expected to cooperate with the POWERON team to facilitate deployment and retrieval of instruments within the project area. If necessary, the Lessee may request temporary withholding of the public release of acoustic data that has been collected within its project area. Record long-term measurements of ambient noise, marine mammal, and cod vocalizations in the Lease Area before, during, and following construction. | | |
| **NMFS Essential Fish Habitat (EFH) Conservation Recommendations (CRs) issued June 16, 2023[3]†** | | | | | |
| EFH Conservation Recommendations | | | | | |
| 1-4 | Planning, construction and installation, O&M, decommissioning | Recommendations to minimize adverse impacts to Atlantic cod spawning | 1. To minimize adverse effects to Atlantic cod spawning aggregations in and adjacent to the project area, and to reduce the risk of adverse population level effects to this species:<br>a. No pile driving activities in the lease area should occur between November 1 and March 31 of each year.<br>b. No seafloor disturbing activities should occur between November 1 and March 31 of each year, within the Revolution Wind lease area and along the export cable route (RWEC-OCS) located from KP 45 to KP 56 (mile 28 to 35) which includes the locations where use of the boulder plow is currently proposed.<br>c. No removal or detonation of unexploded ordinances (UXOs) should occur between November 1 and March 31, of each year.<br>d. No HRG sub-bottom profiling (e.g. sparkers, boomers) survey activities should occur between November 1 and March 31, of each year, within the Revolution Wind lease area. This recommendation supersedes the October 2017 EFH consultation on the Site Assessment Plan (SAP) due to new information related to cod spawning activity in the project area.<br>2. To minimize impacts to Atlantic cod sensitive life stages and complex habitats on Cox Ledge:<br>a. No more than the minimum number of turbines required to meet the power purchase agreement should be permitted.<br>b. The largest size turbines considered in the COP (12MW) should be used to further reduce the number of turbines required for a viable project.<br>c. Avoid UXO detonation on and adjacent to Cox Ledge to avoid adverse impacts to complex habitats and other sensitive marine resources.<br>3. To minimize adverse impacts to Atlantic cod spawning habitats:<br>a. Remove the following nine (9) WTGs locations and associated inter array cables to minimize overlap with Atlantic cod spawning habitat: B36, B37, B38, B39, B44, B45, B46, B49, and B50. Turbines are numbered based on WTG labels identified in the Inspire habitat data pop-up viewer.<br>b. Re-route the OSS-link cable connecting the two offshore substations (OSSs) to avoid crossing directly through Atlantic cod spawning and complex habitat. Specifically, the OSS-link should be routed north and east around the area of complex habitat and extend north and west outside of the lease area (and north of the spawning location) to connect to the other OSS station at the northern end of the lease. | Finfish, EFH, Benthic Habitat, Invertebrates | BOEM, BSEE and NMFS |

[3] NMFS issued conservation recommendations to BOEM and USACE for the Revolution Wind project via letter on 6.16.23. As required by section 305(b)(4)(B) of the Magnuson-Stevens Act, USACE and BOEM will provide a detailed response to these conservation recommendations to NMFS regarding which measures will be adopted, partially adopted, or not adopted along with a rationale. At the time of FEIS issuance, BOEM and USACE have yet not determined which conservation recommendations each agency intends to adopt or partially adopt. As such, the full list of conservation recommendations received from NMFS is included in this document.

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | 4. Continue the on-going telemetry and passive acoustic survey within the lease area and expand the existing study beyond the lease area boundaries to identify the full scope of the area affected by project construction and operation and to assess individual, synergistic, and cumulative effects of the project on cod spawning activity pre-, during, and post construction.<br>a. Provide continuous monitoring of Atlantic cod spawning aggregations between November 1 and April 30 prior to the construction of the project, during project construction, and post construction.<br>b. Place additional receivers in pending turbine locations. Once constructed, additional receivers should be added to the turbines to increase coverage.<br>c. Add an additional glider to the ongoing survey to increase the spatial coverage of the Revolution Wind project area. The ongoing survey should focus on increasing survey coverage (i.e. increase the number of glider tracts) within the project area to provide better resolution and detection of cod spawning activity within the project area before, during, and after construction.<br>d. Add a third glider to expand the survey coverage outside the lease area to assess synergistic and cumulative effects of the project on the distribution of cod spawning activity.<br>e. Data and results from this study should be made available to NMFS Habitat and Ecosystem Services Division (HESD). | | |
| 5-10 | Planning, construction and installation, O&M, decommissioning | Recommendations to minimize impacts to benthic habitats | 5. To minimize adverse impacts in complex habitats on Cox Ledge:<br>a. In addition to the nine (9) turbines that overlap with cod spawning habitat, remove the following five (5) WTG and associated inter array cables to minimize impacts to complex habitats: B48, B52, B53, B61, and B62. Turbines are numbered based on WTG labels identified in the Inspire habitat data pop-up viewer.<br>b. Removal of additional turbines beyond the 14 identified above should be selected based on the following criteria (1) adjacent to the areas already planned for removal to reduce habitat fragmentation, (2) located within complex habitats and impacts cannot be minimized through micrositing and (3) impacts to complex habitats from inter array cable connecting the turbines would be reduced. The following turbines and associated cables are consistent with these criteria and should be considered for removal: B42, B43, B54, B55, B69, and B70. Turbines are numbered based on WTG labels identified in the Inspire habitat data pop-up viewer.<br>6. Microsite WTGs, inter array cables and export cables (both RWEC-OCS and RWEC-RI) to avoid complex habitats.<br>a. For any WTGs located within complex habitats that are not removed, the WTGs should be microsited outside identified complex habitats, including large boulders/habitat elements (i.e., >/= 0.5 m in diameter) and into low multibeam backscatter return areas.<br>b. Inter-array, and export cables should be microsited to minimize impacts to complex areas and/or areas of high habitat heterogeneity (diversity of structural elements, including bathymetric features) and complexity. Cables should be microsited around all identified complex habitats, including large boulders/habitat elements (i.e., >/= 0.5 m in diameter) and into low multibeam backscatter return areas.<br>c. Cables should be sited to avoid unexploded ordinances (UXOs) and the relocation or detonation of any UXOs.<br>d. A WTG, inter-array and export cable (included RWEC-OCS and RWEC-RI) micrositing plan should be developed to demonstrate how long-term to permanent adverse impacts to complex habitats and benthic features will be avoided and minimized within the lease area.<br>i. At a minimum, the micrositing plan should include: 1) depictions of the microsited WTGs and cables (i.e., include a figure depicting large boulder locations, multibeam backscatter returns, and the proposed microsited cable); 2) information describing how the microsited locations were selected (i.e., what information other than multibeam backscatter and boulder locations was used to determine the cable path); and 3) for any cables that are identified to be infeasible to be fully microsited around complex habitats and within low multibeam backscatter areas, detailed information supporting the feasibility issues encountered, calculated impact areas of large boulders | Finfish, EFH, Benthic Habitat, Invertebrates | BOEM, BSEE, and NMFS (and USACE for CRs 6, 8-10) |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | and/or medium to high multibeam backscatter area, and impact minimization measures to be used should be provided.<br>ii. The final micrositing plan should be submitted to NMFS HESD prior to commencement of any in-water work. A copy of a redline-version of the draft plan that addresses any comments or questions submitted by BOEM (or other commenters) should also be provided to NMFS along with the final plan.<br>7. Re-route the current export cable alignment at the exit of the lease area to avoid impacts to complex habitats. The cable corridor should be rerouted to avoid the area of highly complex habitats where the use of a boulder plow is currently proposed (located between KP 45 to KP 56). The habitat data demonstrates that within this area of the project, complex habitats are patchy and soft bottom habitats are found in adjacent areas. The export cable should exit the lease area (referred to as Zone 4 in the EFH assessment) further north to avoid complex habitats and dense fields of large boulders >0.5 m.<br>8. To minimize impacts from boulder/cobble removal/relocation activities, relocate boulders and cobbles as close to the impact area as practicable, in areas immediately adjacent to existing similar complex bottom, placed in a manner that does not hinder navigation or impede commercial fishing, and avoids impacts to existing complex habitats. In order to minimize impacts to complex habitats, boulders that will be relocated using boulder "pick" methods should be relocated outside the area necessary to clear and placed along the edge of existing complex habitats such that the placement of the relocated boulders will result in a marginal expansion of complex habitats into soft-bottom habitats (i.e., boulders should be placed outside the relocation area and in an area of low multibeam backscatter return immediately adjacent to medium or high return areas) and reduce risk to navigation and fishing operations in the area.<br>a. A boulder relocation plan should be developed that identifies where boulders will be removed from and where they will be placed. Resource agencies and the fishing industry should be consulted in preparation of the boulder relocation plan. The plan should identify all areas where a boulder plow will be used during sitepreparation. At a minimum, the plan should include: 1) a clear depiction (i.e., figures) of the location of boulder relocation activities specified by activity type (e.g., pick or plow, removal or placement) and overlaid on multibeam acoustic backscatter data; 2) a detailed methodology for each type of boulder relocation activity and technical feasibility constraints; 3) any proposed measures to minimize impacts to attached epifaunal assemblages on boulder surfaces; 4) measures taken to avoid further adverse impacts to complex habitat and fishing operations; and 5) a summary of any consultation with resources agencies and the fishing industry in development of the plan.<br>b. The final, BOEM approved pre-construction boulder relocation plan should be submitted to NMFS HESD prior to commencement of any in-water work. A copy of a redline-version of the draft plan that addresses any comments or questions submitted by BOEM (or other commenters) should also be provided to NMFS HESD along with the final plan.<br>c. In all offshore/nearshore areas where seafloor preparation activities include the use of boulder plows, boulder picks, jets, grapnel runs or similar methods used, post-construction acoustic surveys (e.g. multibeam backscatter and side scan sonar) capable of detecting bathymetry changes of 0.5 feet (ft.) or less, should be completed to demonstrate how the benthos were modified by seabed preparation activities and project construction.<br>i. In areas where boulder plows are used and the berm height exceeds three ft. above the existing grade, the created berm should be restored to match that of the existing grade/pre-construction conditions.<br>d. Data should be provided to NMFS HESD in an online viewer with preconstruction and post-construction survey data. As-built post-construction information should also be provided, including information on how, if at all, the final boulder placement differs from the boulder relocation plan and why such changes were necessary.<br>9. Avoid anchoring in complex habitats and areas of high habitat heterogeneity and complexity during all phases of the project including any area where large boulders (>/= 0.5 m in diameter) or medium to high multibeam backscatter returns occur. | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | a. If anchoring is necessary in complex habitats and areas of high habitat heterogeneity, extend the anchor lines to the extent practicable to minimize the number of times the anchors must be raised and lowered to reduce the amount of habitat disturbance.<br>b. Jack-up barge locations should avoid complex habitats for WTG construction and maintenance. Where full avoidance is not feasible, the proposed locations for the jack-up barge should be selected to avoid, and in order of priority:<br>i. Complex habitats with high density large boulders;<br>ii. Complex habitats with medium density large boulders;<br>iii. Complex habitats with low density large boulders;<br>iv. Complex habitats with scattered large boulders;<br>v. Complex habitats with no large boulders.<br>c. For any area where large boulders or medium to high multibeam backscatter returns occur and vessels must remain stationary, dynamic positioning systems (DPS) or mid-line buoys on anchor chains should be required.<br>d. An anchoring plan should be developed to demonstrate how anchoring will be avoided and minimized in these habitats during all phases of the project and in both state and federal waters. At a minimum, the anchoring plan to be developed should include: 1) depictions of the lease and export cable areas that clearly identify areas, using GPS location coordinates, where large boulders and/or medium to high backscatter returns occur, and either: a) DPS, or b) mid-lines buoys are required for anchoring; 2) information describing the operations and number of vessels that will be necessary to maintain vessel position using DPS or mid-line buoys within complex areas (i.e., large boulder and medium to high multibeam backscatter areas); and 3) for any complex habitat area that is identified for it to be infeasible to be fully avoid anchoring within or using midline buoys, detailed information supporting the feasibility issues encountered, calculated impact areas of large boulders and/or medium to high multibeam backscatter area, and impact minimization measures to be used should be provided.<br>i. A copy of the anchoring plan, with complex habitat coordinates, should be provided to all vessel operators.<br>ii. The final anchoring plan should be submitted to NMFS HESD prior to commencement of any in-water work. A copy of a redline-version of the draft plan that addresses any comments or questions submitted by BOEM (or other commenters) should also be provided to NMFS along with the final plan.<br>iii. Data should be provided to NMFS in an online viewer with preconstruction and post-construction survey data. As-built post-construction information should also be provided, including information on how, if at all, the final anchoring differed from the anchoring plan and why such changes were necessary.<br>10. To minimize permanent adverse impacts to existing habitats from scour protection:<br>a. Avoid and minimize the use of scour protection by micrositing cables (inter-array cables, RWEC-OCS and RWEC-RI) to allow for full penetration/burial, regardless of habitat type (this can be done by siting cables in appropriate substrates)<br>i. Additional bottom surveys (e.g. sub-bottom cores) should be conducted, as necessary, to inform the micrositing of the cable and reduce the extent of soft bottom habitat conversion via placement of scour protection.<br>ii. Should scour protection be necessary, the minimum amount of scour protection should be used to accomplish the purpose/intent of the scour protection.<br>b. Use natural, rounded stone of consistent grain size in the entirety of any areas with complex habitat to match existing conditions.<br>c. Avoid the use/placement of engineered stone (e.g., riprap; cut, crushed, or graded stone; etc.) or concrete mattresses within complex habitats (i.e., areas with boulders >/= 0.5m, and/or medium to high multibeam backscatter returns). | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | i. As determined through the technical feasibility analysis, if the use of engineered stone or concrete mattresses cannot be avoided in these areas, the impact should be mitigated through the addition of a natural, rounded stone veneer. At a minimum, any exposed surface layer should be designed and selected to provide three-dimensional structural complexity that creates a diversity of crevice sizes (e.g., mixed stone sizes, natural rounded stone veneer) and rounded edges (e.g., tumbled stone, or natural round stone veneer), and be sloped such that outer edges match the natural grade of the seafloor.<br>d. Avoid the use of plastics/recycled polyesters/net material (i.e. rock-filled mesh bags, fronded mattresses)<br>e. Develop a scour and cable protection plan for all habitat areas. At a minimum, the plan should include: 1) a clear depiction of the location and extent of proposed scour or cable protection within complex habitat (i.e., figures displaying existing areas with large boulders and/or medium to high multibeam backscatter returns and the extent of scour or cable protection proposed within each area); 2) all available habitat information for each identified area (e.g., plan view imagery, video transects); and 3) detailed information on the proposed scour or cable protection materials for each area and habitat type;<br>f. The final scour and cable protection plan should be submitted to NMDS HESD prior commencement of any in-water work. A copy of a redline-version of the draft plan that addresses any comments or questions submitted by BOEM (or other commenters) should also be provided to NMFS HESD along with the final plan. | | |
| 11 | Construction and installation | Recommendations to minimize acoustic impacts from pile driving | 11. Require the use of noise mitigating measures during pile driving construction, including the use of soft start procedures and the deployment of noise dampening equipment such as bubble curtains.<br>a. A plan outlining the noise mitigation procedures for both offshore and inshore activities should be filed with BOEM and the USACE for approval before construction commences. BOEM should provide NMFS HESD with a copy of the final plan before in-water work begins. A copy of a redline-version of the draft plan that addresses any comments or questions submitted by BOEM (or other commenters) should also be provided to NMFS HESD along with the final plan.<br>b. The noise mitigation plan should include a process for notifying NMFS HESD within 24 hours if any evidence of a fish kill during construction activity is observed, and contingency plans to resolve issues.<br>c. The noise mitigation plan should include passive acoustic sound verification monitoring during pile driving activities. Additional noise dampening technology should be applied should real-time monitoring indicate noise levels exceed the modeled 10 decibel attenuation levels.<br>d. Acoustic monitoring reports that include any/all noise-related monitoring should be provided to NMFS HESD. | Finfish, Invertebrates | BOEM, BSEE, NMFS and USACE |
| 12-18 | Construction and installation | Recommendations to minimize impacts to Narragansett Bay | 12. Use a land based cable corridor for routing the RWEC-RI to shore to avoid impacts to Narragansett Bay.<br>a. Should the cable be routed through Narragansett Bay, the cable should be routed along the western side of the proposed cable corridor to minimize impacts to juvenile cod HAPC and complex bottom located along the eastern edge of the proposed cable corridor and consistent with EFH CR #6.<br>b. Habitat maps depicting the bottom type, including complex rocky habitats (boulder density), adjacent sandy areas, and SAV should be provided to vessels/captains to ensure HAPCs are avoided. Do not use the delineations of juvenile cod HAPC provided in the EFH assessment, as they are inconsistent with the HAPC definition and do not represent all HAPC in Narragansett Bay.<br>13. To minimize impacts to SAV in Narragansett Bay the following should be required:<br>a. Avoid cable installation, dredging, or other construction activities in SAV.<br>b. Barges should not be moored in SAV or SAV habitat.<br>c. Avoid unconfined dredging and maintain a minimum 100 ft. buffer between the edge of any SAV beds and any equipment staging or anchoring activities.<br>d. Maps derived from updated surveys should be provided to us as well as vessels/captains to ensure SAV is avoided. | Finfish, EFH, Benthic Habitat, Invertebrates | BOEM, BSEE, NMFS and USACE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | e. Pre- and post-construction monitoring of the SAV bed in the project area should be conducted. Updated pre-construction surveys should be conducted to ensure the SAV bed is accurately delineated prior to construction. Post construction surveys should be conducted to determine if any unanticipated impacts occurred as the result of project construction.<br>f. Should the project unintentionally impact SAV through frac-out, mooring in the SAV bed, or other direct or indirect effects from construction of the project, compensatory mitigation should be provided for all areas of SAV impacted by construction activities including cable installation and dredging at a minimum ratio of 3:1.<br>i. A compensatory mitigation plan that satisfies each element of a complete compensatory mitigation plan as identified in the published regulations 33 CFR Parts 325 and 332 "Compensatory Mitigation for Losses of Aquatic Resources," (Mitigation Rule) and NOAA's Mitigation Policy for Trust Resources should be required for any impacts to SAV. This plan should be included as a special condition of the permit.<br>14. Avoid in-water work including cable installation, seabed preparation, pile driving, HDD pit excavation, or other extractive or turbidity/sediment-generating activities from February 1 to June 30 of any given year in the nearshore waters to depths of 5 meters (m) to avoid impacts to winter flounder early life stages (eggs, larvae).<br>15. To minimize impacts to estuarine habitats associated with excavation of the HDD exit pits for the sea-to-shore transition, the following should be required:<br>a. Unconfined dredging should not be permitted<br>b. Dredged materials from HDD exit pits should be stored on a barge and used to backfill the excavated areas once construction and installation is complete.<br>c. Detailed frac-out plans should be developed for all areas where HDD is proposed to be used. A copy of the final plan should be provided to NMFS HESD prior to construction.<br>16. To minimize impacts from vessel operation in Narragansett Bay:<br>a. All vessels should float at all stages of the tide.<br>b. All vessels should be required to follow EFH CR 9 and CR 13 to avoid anchoring in rocky and vegetated habitats.<br>17. To minimize impacts to shellfish from construction activities in Narragansett Bay:<br>a. Avoid seafloor disturbance activities including cable installation, dredging, or other construction activities from May 1 to October 14 of any given year.<br>b. A shellfish survey should be conducted prior to the commencement of dredging at the HDD exit pits to identify high densities of shellfish.<br>i. Shellfish beds that are identified should be relocated in coordination with RI DEM prior to commencement of in-water work.<br>c. The cable should be microsited around areas of high density shellfish beds.<br>18. Avoid in-water work from February 15 to June 30 of any given year to avoid impacts to anadromous fish during the upstream in-migration to their spawning grounds. | | |
| 19-21 | O&M | Recommendations to address uncertainties and minimize impacts from project operation | 19. Revise the Benthic Habitat Monitoring Plan to address agency concerns related to the adequacy of the proposed methods to detect changes in the existing benthic community structure of Cox Ledge, the offshore, and inshore project areas. The plan should be required to address potential changes to macrobenthic communities across and within each habitat type in the project area, including the artificial substrates to be constructed.<br>a. The plan should include pre-construction/baseline monitoring data, which should be collected for a minimum of three years for each survey conducted.<br>b. The plan should include post-construction monitoring of the existing, natural soft and hard bottom benthic community structure within the lease area and export cable corridor, post-construction benthic community | Finfish, EFH, Benthic Habitat, Invertebrates | BOEM, BSEE, and NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | development, and invasive species (e.g., *Didemnum vexillum*) growth on: 1) constructed habitats, 2) natural habitats within the expected area of project impacts, and 3) within adjacent areas outside the area of impact.<br>c. Post-construction multibeam backscatter and side scan survey results should be conducted and included as a component of the benthic monitoring plan.<br>d. The monitoring plan should also include measures to evaluate: 1) physical changes to the benthic habitat from construction and boulder relocation, including changes in depth, rugosity, and slope through the collection of acoustic data (multibeam bathymetry and backscatter and side scan sonar), 2) biological changes to benthic community structure with distance from the area of impact, including areas impacted by boulder removal, cables, scour protection, and WTGs and 3) invasive species distribution and abundance with associated plans for removing/managing invasives.<br>i. The applicant should consult with the resource agencies in the revision and refinement of this plan and give the resource agencies a minimum of 90 days to review and comment on the plan. The applicant should submit a final plan to BOEM that addresses, and includes, all resource agency comments, as well as the applicant's response to those comments. A copy of the final monitoring plan should be provided to NMFS HESD prior commencement of any in-water work.<br>e. All data and metadata should be made available to NMFS HESD.<br>20. Require the development of an in situ project specific monitoring program to address uncertainties related to impacts of the operation of the Revolution Wind project on EFH and federally managed species. This monitoring recommendation is consistent with principles outlined in NOAA's Mitigation Policy for Trust Resources which highlights the use of the best available scientific information, such as results of surveys and other data collection efforts when existing information is not sufficient for the evaluation of proposed actions and mitigation, or when additional information would facilitate more effective or efficient mitigation recommendations. The project specific monitoring program should measure in situ the stressors created by project operation on the ecosystem from operational noise, electromagnetic fields (EMF), wind wake effects, and the presence of structures. Studies should also evaluate the biological effects of those stressors on commercially important species in the project area such as Atlantic cod, monkfish and ocean quahog. Monitoring plans should include the collection of baseline data and be provided to NMFS GARFO and NEFSC for review and comment within 90 days of ROD issuance. A response to NMFS comments should be provided. These monitoring studies should be developed in partnership with NMFS and other scientific institutions to aid in addressing the following questions:<br>a. How far do effects on sound pressure, particle motion, and substrate vibration extend from the individual WTGs and the Revolution Wind Farm collectively?<br>i. What effect do these operational noise effects have on the distribution of larvae for species with designated EFH in the project area and prey for these species (i.e. sand lance)?<br>b. What is the spatial distribution of the EMF emissions around inter-array, OSSlink and export cables (RWEC-OCS and RWEC-RI)?<br>i. What is the behavioral response to the altered EMF of fisheries resource species/life stages with known EMF-sensitivity?<br>c. How far does the marine and atmospheric wind wake extend from the Revolution Wind Farm during operation?<br>i. What are the effects on physical water column properties, primary and secondary production, and larval dispersal for species with designated EFH in the project area?<br>d. What is the distribution, abundance, survival, growth rate, and recruitment rate of cod larvae along a distance gradient from offshore wind structures?<br>21. Require the implementation of preventive measures to reduce the risk of contaminant emissions or accidental release of chemicals. Such measures may include backup systems, secondary containments, closed loop systems, and/or recovery tanks. | | |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | a. To reduce the contaminants in the water column Al anodes should be used for the turbine rather than Zn anodes. | | |
| 22 | Decommissioning | Project Decommissioning | 22. The EFH consultation should be reinitiated prior to decommissioning turbines to ensure that the impact to EFH as a result of the decommissioning activities have been fully evaluated and minimized to the extent practicable. Pre-consultation coordination related to decommissioning should occur at least five years prior to proposed decommissioning. | EFH | BOEM, BSEE, NMFS and USACE |
| Fish and Wildlife Coordination Act Recommendations – USACE jurisdiction | | | | | |
| 1 | Construction and installation, O&M, decommissioning | In-water work | No in-water work should occur between April 1 to June 30 of any calendar year to avoid and minimize potential impacts to horseshoe crabs spawning along the beaches of the Western Passage of Narragansett Bay. | Invertebrates | NMFS and USACE |
| 2 | Construction and installation | Reduction of WTG and IAC | To minimize impacts to American lobster and Jonah crab populations, the number of turbine locations and associated inter array cables should be reduced to the greatest extent possible, consistent with EFH CRs 2-3 and 5. Data and survey results from the proposed ventless trap surveys should be provided to NMFS HESD. | Invertebrates | NMFS and USACE |
| 3 | Construction and installation, O&M, decommissioning | NOAA Fisheries scientific surveys | The project should be required to mitigate the major impacts to NOAA Fisheries scientific surveys consistent with NMFS-BOEM Federal Survey Mitigation Strategy - Northeast U.S. Region. Revolution Wind's plans to mitigate these impacts at the project and regional levels should be provided to NMFS for review and approval prior to BOEM's decision on its acceptance. Mitigation is necessary to ensure that NOAA Fisheries can continue to accurately, precisely, and timely execute our responsibilities to monitor the status and health of trust resources. | Other uses | NMFS and USACE |
| 4 | Construction and installation, O&M | Locations of boulders, berms, and protection measures | Locations of relocated boulders, created berms, and scour protection, including cable protection measures (i.e., concrete mattresses) should be provided to NMFS and the public as soon as possible to help inform marine users, including, but not limited to the fishing industry and entities conducting scientific surveys of potential gear obstructions. | Commercial Fisheries, Other uses | NMFS and USACE |
| **BOEM-proposed Mitigation and Monitoring Measures in the NMFS EFH Assessment†** | | | | | |
| 1 | Construction and installation | Bottom-disturbing restrictions | BOEM would restrict bottom-disturbing activities from January through April, with the addition of December with contingencies as described in the MMPA final rule. Revolution Wind would be required to develop an adaptive acoustic monitoring plan for spawning Atlantic cod from November through March, including restrictions on Project activities if Atlantic cod aggregations indicative of spawning are detected. | EFH, finfish | BOEM, BSEE |
| 2 | Construction and installation | Micrositing | All WTG and OSS foundations would be positioned within micrositing windows to avoid impacts to large-grained complex and complex habitats to the extent practicable. | EFH , finfish, benthic habitat, invertebrates | BOEM, BSEE, NMFS |
| 3 | Construction and installation, O&M, and decommissioning | Anchoring Plan | BOEM would require Revolution Wind to develop an anchoring plan to avoid minimize adverse impacts on benthic habitat during Project construction *and* from O&M activities throughout the life of the Project. The anchoring plan would delineate sensitive large-grained complex and complex habitats, including eelgrass and kelp beds, and identify areas where anchoring activities are restricted. | EFH , finfish, benthic habitat, invertebrates | BOEM, BSEE, NMFS |
| 4 | Construction, installation, and O&M | Live and hard bottom impact monitoring | The Lessee would develop and implement a monitoring plan for live and hard-bottom features that may be impacted by proposed activities. The monitoring plan would also include assessing the recovery time for these sensitive habitats. BOEM recommends that all monitoring reports classify substrate conditions following Coastal and Marine Ecological Classification Standard (CMECS) standards, including live bottoms (e.g., submerged aquatic | EFH, benthic habitat, and invertebrates | BOEM, BSEE, NMFS |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | vegetation and corals and topographic features). The plan would also include a means of recording observations of any increased coverage of invasive species in the impacted hard-bottom areas. | | |
| 5 | Construction and installation, O&M, and decommissioning | Live and hard bottom habitat mapping and avoidance | Vessel operators would be provided with maps of sensitive hard-bottom habitat in OSW project areas, as well as a proposed anchoring plan that would avoid or minimize impacts on the hard-bottom habitat to the greatest extent practicable. These plans would be provided for all anchoring activity, including construction, maintenance, and decommissioning. | EFH, benthic habitat, and invertebrates | BOEM, BSEE, NMFS |
| 6 | Construction, installation, and O&M | Scour and cable protection | To the extent technically and economically feasible, the Lessee must ensure that all materials used for scour and cable protection consist of natural or engineered stone that does not inhibit epibenthic growth. The materials selected for protective purposes should mirror the natural environment and provide similar habitat functions. | EFH , finfish, benthic habitat, invertebrates | BOEM, BSEE, NMFS |
| 7 | O&M | Post-installation cable monitoring | Revolution Wind would be required to inspect all cables after construction is completed to document exact location, burial depth, and post-installation benthic habitat conditions. Inspections must be completed within 6 months of Project commissioning, annually for the first 3 years following construction, and as needed following major storm events. Monitoring reports would be submitted to BOEM within 45 days of survey completion. | EFH , finfish, benthic habitat, invertebrates | BOEM, BSEE, NMFS |
| 8 | Construction and installation | Atlantic cod spawning monitoring plan | At least 90 days prior to inter-array cable installation (e.g., boulder relocation, pre-cut trenching, cable crossing installation, cable lay and burial) and foundation site preparation (e.g., scour protection installation), BOEM would require the Lessee to provide DOI with a plan to monitor for Atlantic cod aggregations that are indicative of spawning behavior during the above-listed activities between November 1 and March 30 of each year (Plan). The objective of the Plan is to detect Atlantic cod aggregations and avoid or minimize the above-listed activities in any area with aggregations of Atlantic cod indicative of spawning behavior, as technically and economically feasible. The Lessee must include in the Plan details on detection thresholds (e.g., density and location) of spawning Atlantic cod aggregations that would trigger the adaptive management of activities described in this paragraph, including any restrictions on activities in any area with aggregations of Atlantic cod indicative of spawning behavior, and analysis of technical and/or economic infeasibility. | Finfish and EFH | BOEM, BSEE, NMFS |
| **BOEM-proposed Measures from the Data Collection and Site Survey Activities for Renewable Energy on the Atlantic OCS BA** | | | | | |
| 1 | Construction and installation, O&M, and decommissioning | Data collection BA BMPs | BOEM and BSEE would ensure that all Project design criteria and BMPs incorporated in the Atlantic data collection consultation for offshore wind activities (Baker and Howson 2021) shall be applied to activities associated with the construction, maintenance and operations of the Project as applicable. | Finfish, marine mammals, sea turtles | BOEM and BSEE |
| **NMFS-proposed Measures to Minimize Impacts on Benthic Habitat** | | | | | |
| 1 | Construction and installation | Scour and cable protection | Revolution Wind would be required to use natural rounded stone for cable and scour protection within large-grained complex and complex habitats and avoid use of concrete mattresses where practicable. The selected materials should be designed and placed to provide three-dimensional structural complexity. To the extent technically and economically feasible, the Lessee must ensure that all materials used for these measures consist of natural or engineered stone that does not inhibit epibenthic growth and provides three-dimensional complexity in height and in interstitial spaces. | Benthic habitat | BOEM and BSEE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Mitigation and Monitoring Measures Resulting from Consultations | Resource Area Mitigated | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **Other BOEM-proposed Mitigation Measures** | | | | | |
| 1 | Construction, O&M | Vessel speed restriction | BOEM will require Revolution Wind to comply with NMFS's vessel strike avoidance and reporting measures included in the final MMPA ITR and ESA biological opinion. | Marine mammals, Sea turtles | BOEM and BSEE |
| 2 | Construction and installation, O&M, conceptual decommissioning | Anchoring plan | BOEM requires the applicant to develop an anchoring plan to ensure anchoring is avoided and minimized in complex habitats, near identified marine cultural resources, and identified unexploded ordnance during construction and maintenance of the Project. The anchoring plan is required to be provided for review and comment prior to BOEM approval. | Benthic habitat, EFH, invertebrates, finfish, and cultural resources | BOEM and BSEE |

* At the time of preparation of this document, BOEM and BSEE are in the process of transferring enforcement authorities from BOEM to BSEE.

**Table F-3. Additional Mitigation and Monitoring Measures Under Consideration**

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Additional Mitigation and Monitoring Measures Under Consideration | Resource Area Affected | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **Additional BOEM-proposed Mitigation Measures** | | | | | |
| 1 | Construction, O&M | Environmental data sharing with federally recognized tribes | No later than 90 days after COP approval, Revolution Wind must, at a minimum, contact the federally recognized tribes currently consulting on the Project in order to solicit their interest in receiving the following: reports generated as a result of the fisheries and benthic monitoring plan; reporting of all NARW sightings; injured or dead protected species reporting (turtles and NARW); NARW PAM monitoring; PSO reports (e.g., weekly pile driving reports); and pile-driving schedule and changes thereto. At a minimum, Revolution Wind should offer access to the following federally recognized tribes: Delaware Nation, Delaware Tribe of Indians, Mashantucket (Western) Pequot Tribal Nation, Mashpee Wampanoag Tribe, Mohegan Tribe of Connecticut, Narragansett Indian Tribe, Shinnecock Indian Nation, Wampanoag Tribe of Gay Head (Aquinnah). Revolution Wind must provide access to non-proprietary/non-confidential business information to the federally recognized tribes no later than 30 days after the information becomes available. | Environmental Justice | BOEM |
| 2 | Construction, installation, and decommissioning | Environmental justice outreach planning | In areas where environmental justice communities experience direct impacts from onshore construction activities relating to onshore cable emplacement and installation of onshore substation and interconnection facility infrastructure, Revolution Wind shall outreach with local communities to provide opportunities for community residents and local authorities to engage with Revolution Wind on Project activities. This engagement may be partially fulfilled through Revolution Wind's planned coordination with local authorities during construction of onshore facilities to minimize local traffic impacts (see EPM EJ-3 in Table F-1). As applicable, this engagement may also be partially fulfilled by enhanced stakeholder outreach conducted to meet requirements identified in Rhode Island Department of Environmental Management's regulations and policies regarding environmental justice focus areas related to investigation and remediation of contaminated soil and groundwater (see EPM EJ-4 in Table F-1). Additional engagement opportunities, informed by coordination with applicable local and state authorities, shall be offered in a timely and locally | Environmental justice | BOEM and BSEE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Additional Mitigation and Monitoring Measures Under Consideration | Resource Area Affected | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | appropriate manner, including language considerations. Outreach and engagement efforts with environmental justice communities, and outcomes of engagement, shall be summarized and reported to BOEM within 60 days after completion of onshore facilities construction. | | |
| 3 | Construction, Installation and O&M | Visual impacts monitoring plan | Monitoring visual effects during construction and operations (daytime and nighttime). | Visual resources | BOEM and BSEE |
| 4 | Construction | Boulder relocation plan | To minimize the number of potential seafloor obstructions that may interact with bottom trawl fisheries, the Lessee must submit to BOEM a boulder relocation plan that will include the following:<br>1) Identification of areas of active (within last 5 years) bottom trawl fishing, areas where boulders > 2 m in diameter are anticipated to occur, and areas where boulders are expected to be relocated for Project purposes<br>2) Methods to minimize the quantity of seafloor obstructions from relocated boulders in areas of active bottom trawl fishing, as identified in #1<br>The plan must be submitted to BOEM at least 90 days prior to inter-array cable corridor preparation and cable installation (e.g., boulder relocation, pre-cut trenching, cable crossing installation, cable lay and burial) and foundation site preparation (e.g., scour protection installation). | Commercial and recreational fishing, EFH | BOEM and BSEE |
| 5 | Construction | Mobile gear–friendly cable protection measures | Cable protection measures should reflect the pre-existing conditions at the site. This mitigation measure chiefly ensures that seafloor cable protection does not introduce new hangs for mobile fishing gear. Thus, the cable protection measures should be trawl-friendly with tapered/sloped edges. If cable protection is necessary in "non-trawlable" habitat, such as rocky habitat, then the lessee should consider using materials that mirror the benthic environment. | Commercial fisheries | BOEM and BSEE |
| 6 | | Shoreside seafood business analysis | In addition to the Direct Compensation Fund proposed by the Lessee, BOEM would require the Lessee to ensure that the Direct Compensation Fund includes losses to shoreside seafood support services. The Lessee shall analyze the impacts to shoreside seafood support services within the communities nearby ports listed in Table 3.9-12. The shoreside seafood business analysis would be used to further supplement funds available for settling claims of lost (unrecovered) economic activity as a result of the Revolution Wind Farm and Export Cable project.<br>The Lessee must submit to BOEM a report that includes (1) a description of the structure of the Fund and its consistency with BOEM's draft Guidance and (2) an analysis of the impacts of the Project on shoreside businesses for review and comment. The Lessee must then submit to BOEM evidence of the implementation of the Fund, including:<br>• A description of any implementation details not covered in the report to BOEM regarding the mechanism established to compensate for losses to commercial and for-hire recreational fishermen and related shoreside businesses resulting from all phases of the project development on the Lease Area (pre-construction, construction, operation, and decommissioning);<br>• The Fund charter, including the governance structure, audit and public reporting procedures, and standards for paying compensatory mitigation for impacts to fishers and related shoreside businesses from lease area development; and<br>• Documentation regarding the funding account, including the dollar amount, establishment date, financial institution, and owner of the account. | Commercial fisheries | BOEM and BSEE |
| 7 | Construction, O&M | Post-installation cable monitoring | Revolution Wind must provide BOEM with a cable monitoring report following each inter-array and export cable inspection to determine cable location, burial depths, state of the cable, and site conditions. An inspection of the inter-array cable and export cable is expected to include high-resolution geophysical (HRG) methods, such as a multi-beam bathymetric survey equipment, and is expected to identify seabed features, natural and human-made hazards, and site conditions along federal sections of the cable routing. | Benthic habitat, EFH, invertebrates, finfish, and commercial fisheries and for-hire recreational fishing | BOEM and BSEE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Additional Mitigation and Monitoring Measures Under Consideration | Resource Area Affected | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | In federal waters, the initial inter-array and export cable inspection would be carried out within 6 months of commissioning, and subsequent inspections would be carried out at years 1, 2, and every 3 thereafter and after a major storm event. Major storm events are defined as when metocean conditions at the facility meet or exceed the 1 in 50-year return period calculated in the metocean design basis, to be submitted to BOEM with the facility design report (FDR). If conditions warrant adjustment to the frequency of inspections following the Year 2 survey, a revised monitoring plan may be provided to BOEM for review.<br>In addition to inspection, the export cable would be monitored continuously with the as-built Distributed Temperature Sensing System. If distributed temperature sensing data indicate that burial conditions have deteriorated or changed significantly and remedial actions are warranted, the distributed temperature sensing data, a seabed stability analysis, and report of remedial actions taken or scheduled must be provided to BOEM within 45 calendar days of the observations.<br>The Distributed Temperature Sensing data, cable monitoring survey data, and cable conditions analysis for each year must be provided to BOEM as part of the annual compliance reports, required by 30 CFR 285.633(b). | | |
| 8 | Construction and installation, O&M, conceptual decommissioning | Anchoring plan | BOEM requires the applicant to develop an anchoring plan to ensure anchoring is avoided and minimized in complex habitats, archaeological resources, and unexploded ordnances during construction and maintenance of the Project. The anchoring plan is required to be provided for review and comment prior to BOEM approval. | Benthic habitat, EFH, finfish, invertebrates, and cultural resources | BOEM and BSEE |
| 9 | Planning, construction and installation, O&M, decommissioning | Federal survey mitigation | There are 14 NMFS scientific surveys that overlap with wind energy development in the northeast region and eight of these surveys overlap with the Project. As per NMFS and BOEM Survey Mitigation strategy actions 1.3.1, 1.3.2, 2.1.1, and 2.1.2 (Hare et al. 2022), within 120 calendar days of COP Approval, the Lessee must submit to BOEM a draft survey mitigation agreement between NMFS and the Lessee. The survey mitigation agreement will describe how the Lessee will mitigate the Project impacts on the eight NMFS surveys. If after consultation with NMFS NEFSC, BOEM deems the survey mitigation agreement acceptable, the mitigation will be considered required as a term and condition of the Project's COP approval.<br>As soon as reasonably practicable, but no later than 30 days after the issuance of the Project's COP Approval, the Lessee will initiate coordination with NMFS NEFSC to develop the survey mitigation agreement described above. Mitigation activities specified under the agreement will be designed to mitigate the Project impacts on the following NMFS NEFSC surveys: (a) Spring Bottom Trawl survey; (b) Autumn Multi-species Bottom Trawl survey; (c) Ecosystem Monitoring survey; (d) NARW aerial survey; (e) Aerial marine mammal and sea turtle survey; (f) Shipboard marine mammal and sea turtle survey; (g) Atlantic surfclam and ocean quahog survey; and (h) Atlantic sea scallop survey. At a minimum, the survey mitigation agreement will describe actions needed and the means to address impacts on the affected surveys due to the preclusion of sampling platforms and impacts on statistical designs. In terms of statistical design, the project will be viewed as a discrete stratum in surveys that use a random stratified design. Other anticipated Project impacts on NMFS surveys such as changes in habitat and increased operational costs due to loss of sampling efficiencies may also be addressed in the agreement.<br>The survey mitigation agreement will identify activities that will result in the generation of data equivalent to data generated by NMFS's affected surveys for the duration of the Project. The survey mitigation agreement will describe the implementation procedures by which the Lessee will work with NEFSC to generate, share, and manage the data required by NEFSC for each of the surveys impacted by the Project, as mutually agreed upon between the Lessee and NMFS/NEFSC. The survey mitigation agreement must also describe the Lessee's participation in the NMFS NEFSC Northeast Survey Mitigation Program to support activities that address regional-level impacts for the surveys listed above. | Commercial and recreational fishing, marine mammals, other marine uses, sea turtles | BOEM and BSEE |

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Additional Mitigation and Monitoring Measures Under Consideration | Resource Area Affected | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| **USFWS Biological Opinion Proposed Conservation Recommendations issued May 30, 2023[4]†** | | | | | |
| 1 | Construction and O&M | Adopt compensatory mitigation ratios greater than 1:1 | Estimated levels of collision mortality are associated with high uncertainty. Future advancements in SCRAM are expected to substantially reduce, but not eliminate, uncertainty. In addition, compensatory mitigation actions will likely be associated with their own levels of uncertainty (*e.g.*, probability of success, actual number of bird mortalities offset), and may occur later in time that the project-induced mortality. Thus, the USFWS recommends a compensatory mitigation ratio greater than 1:1, particularly given the extent of full buildout of WTGs anticipated on the OCS. | Birds | USFWS |
| 2 | O&M | Establish an Offshore Wind Adaptive Monitoring and Impact Minimization Framework to guide and coordinate monitoring, research, and avian impacts assessment coastwide. | To address USFWS concerns related to potential effects of WTG operation on listed and other species of concern, at both the project and coastwide scales, the USFWS recommends that the BOEM develop and adopt an Offshore Wind Adaptive Monitoring and Impact Minimization Framework (Framework) for flying wildlife. Many details will need to be worked out, but here the USFWS provides some basic principles for establishment, adoption, and operation of the Framework.<br>• Establish a Framework Principals Group to consist of representatives from the BOEM, the BSEE, the USFWS, State natural resource agencies responsible for management of birds, bats, and insect, and offshore wind energy developers/operators.<br>• Develop and adopt a written Framework foundational document specifying:<br>  ○ the governance structure of the Principals Group;<br>  ○ the geographic coverage of the Framework;<br>  ○ the species covered by the Framework; and<br>  ○ the duration of the Framework.<br>• Establish an annual operating budget for the Framework to be funded by offshore wind energy developers/operators.<br>• Arrange for the Principals Group to meet at least annually, and for the Framework foundational document to be updated at least every 5 years.<br>• Provide for experts (both internal and external to the Principals Group) to regularly assess new and improved technologies and methods for estimating collision risk of covered species and measuring or detecting collisions. Adopt and deploy such methods deemed most promising by the Principals Group.<br>• Coordinate monitoring and research across wind energy projects. Share and pool data and research results coastwide.<br>• Provide for experts (both internal and external to the Principals Group) to regularly assess new and improved technologies and methods for minimizing collision risk of covered species. Adopt and deploy such technologies/methods deemed most promising by the Principals Group.<br>• Provide for experts (both internal and external to the Principals Group) to periodically assess new and improved technologies and methods for evaluating indirect effects to covered species from WTG avoidance behaviors (e.g., impacts to time and energy budgets).<br>• Periodically assess the level and type of compensatory mitigation necessary to offset any unavoidable direct and indirect effects of WTG operation on covered species. Adopt and require the levels and types of mitigation deemed appropriate by the Principals Group. | Birds and bats | USFWS |

[4] The USFWS acknowledges that the manner and extent to which these recommendations are implemented are at the discretion of BOEM/BSEE.

| Mitigation Number | Proposed Project Phase | Mitigation or Monitoring Measure | Description of Additional Mitigation and Monitoring Measures Under Consideration | Resource Area Affected | BOEM's Identification of the Anticipated Enforcing Agency* |
|---|---|---|---|---|---|
| | | | • Consider partnering with other stakeholders or cross-sector organizations to provide administrative, institutional, and technical support to the Principals Group. | | |
| 3 | Construction and installation, O&M, conceptual decommissioning | Conduct a coastwide buildout analysis that considers all existing, proposed, and future offshore wind energy development on the Atlantic OCS. | The definition of "cumulative effects" at 50 CFR 402.02 excludes future Federal actions because such actions will be subject to their own consultations under section 7 of the ESA. Further, the analysis of environmental baseline conditions for each subsequent consultation would be limited to the action area of that particular project. While we can use the Status of the Species section of a biological opinion to capture the anticipated effects of completed consultations, we cannot consider additive effects of concurrent, ongoing consultations. Even this creates a situation where the effects analysis for each individual offshore wind energy project cannot fully account for synergistic effects that may occur with nearby projects and especially not full build-out of offshore wind infrastructure along the coast.<br>Besides the two existing offshore wind energy facilities (Block Island Wind offshore Rhode Island and Coastal Virginia Offshore Wind), we understand there are 26 additional projects in various stages of development offshore the U.S. coast from Maine to Virginia. As the Department of the Interior continues moving toward the national goal of deploying 30 gigawatts of offshore wind by 2030, we anticipate still more projects beyond those 26 (*e.g.*, within the New York Bight, Central Atlantic, and Gulf of Maine). While the Service will complete a thorough assessment of potential direct and indirect effects for each individual offshore wind project, a coastwide analysis may indicate or suggest additive and/or synergistic effects among projects. Therefore, the Service recommends that BOEM analyze potential aggregate effects from WTG operation at a coastwide scale. A coastwide analysis will work in concert with the Offshore Wind Adaptive Monitoring and Impact Minimization Framework to comprehensively assess, monitor, and manage avian impacts from wind energy development along the U.S. Atlantic coast. A Programmatic consultation for wind energy development in the New York Bight is already underway and could set the stage for a full coastwide analysis. Ultimately, a coastwide programmatic Opinion may emerge as the most effective and efficient mechanism for assessing, monitoring, minimizing, and offsetting effects to listed birds from WTG operation on the OCS. | Birds | USFWS |

* At the time of preparation of this document, BOEM and BSEE are in the process of transferring enforcement authorities from BOEM to BSEE.

† Mitigation measures and description are taken directly from NMFS (2023), USFWS (2023) , BOEM (2023a, 2023b, 2023c, 2023d), and have not been edited.

**Table F-4. Draft NMFS Proposed Incidental Take Regulations (ITR) Pursuant to the Marine Mammal Protection Act (MMPA) issued to BOEM for consideration on June 5, 2023**

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| **Draft NMFS Proposed Incidental Take Regulations (ITR) Pursuant to the Marine Mammal Protection Act (MMPA) issued to BOEM for consideration on June 5, 2023†** | |
| General Conditions | |
| 1 | A copy of any issued LOA must be in the possession of Revolution Wind and its designees, all vessel operators, visual protected species observers (PSOs), passive acoustic monitoring (PAM) operators, pile driver operators, and any other relevant designees operating under the authority of the issued LOA; |
| 2 | Revolution Wind must conduct briefings between construction supervisors, construction crews, and the PSO and PAM team prior to the start of all construction activities, and when new personnel join the work, in order to explain responsibilities, communication procedures, marine mammal monitoring and reporting protocols, and operational procedures. An informal guide must be included with the Marine Mammal Monitoring Plan to aid personnel in identifying species if they are observed in the vicinity of the project area; |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| 3 | Revolution Wind must instruct all vessel personnel regarding the authority of the PSO(s). For example, the vessel operator(s) would be required to immediately comply with any call for a shutdown by the Lead PSO. Any disagreement between the Lead PSO and the vessel operator would only be discussed after shutdown has occurred; |
| 4 | Revolution Wind must ensure that any visual observations of an ESA-listed marine mammal are communicated to PSOs and vessel captains during the concurrent use of multiple project-associated vessels (of any size; e.g., construction surveys, crew/supply transfers, etc); |
| 5 | If an individual from a species for which authorization has not been granted, or a species for which authorization has been granted but the authorized take number has been met, is observed entering or within the relevant Level B harassment zone for each specified activity, pile driving and pneumatic hammering activities, and HRG acoustic sources must be shut down immediately, unless shutdown is not practicable, or be delayed if the activity has not commenced. Impact and vibratory pile driving, pneumatic hammering, UXO/MEC detonation, and initiation of HRG acoustic sources must not commence or resume until the animal(s) has been confirmed to have left the relevant clearance zone or the observation time has elapsed with no further sightings. UXO/MEC detonations may not occur until the animal(s) has been confirmed to have left the relevant clearance zone or the observation time has elapsed with no further sightings; |
| 6 | Prior to and when conducting any in-water construction activities and vessel operations, Revolution Wind personnel (e.g., vessel operators, PSOs) must use available sources of information on North Atlantic right whale presence in or near the project area including daily monitoring of the Right Whale Sightings Advisory System, and monitoring of Coast Guard VHF Channel 16 throughout the day to receive notification of any sightings and/or information associated with any Slow Zones (i.e., Dynamic Management Areas (DMAs) and/or acoustically-triggered slow zones) to provide situational awareness for both vessel operators and PSOs; and |
| 7 | Any marine mammals observed within a clearance or shutdown zone must be allowed to remain in the area (i.e., must leave of their own volition) prior to commencing impact and vibratory pile driving activities, pneumatic hammering, or HRG surveys. |
| 8 | Revolution Wind must treat any large whale sighted by a PSO or acoustically detected by a PAM operator as if it were a North Atlantic right whale, unless a PSO or a PAM operator confirms it is another type of whale. |
| Vessel Strike Avoidance Measures | |
| 1 | Prior to the start of construction activities, all vessel operators and crew must receive a protected species identification training that covers, at a minimum:<br>i) Sightings of marine mammals and other protected species known to occur or which have the potential to occur in the Revolution Wind project area;<br>ii) Training on making observations in both good weather conditions (i.e., clear visibility, low winds, low sea states) and bad weather conditions (i.e., fog, high winds, high sea states, with glare);<br>iii) Training on information and resources available to the project personnel regarding the applicability of Federal laws and regulations for protected species;<br>iv) Observer training related to these vessel strike avoidance measures must be conducted for all vessel operators and crew prior to the start of in-water construction activities; and<br>v) Confirmation of marine mammal observer training (including an understanding of the LOA requirements) must be documented on a training course log sheet and reported to NMFS. |
| 2 | All vessels must abide by the following:<br>i) All vessel operators and crews, regardless of their vessel's size, must maintain a vigilant watch for all marine mammals and slow down, stop their vessel, or alter course, as appropriate, to avoid striking any marine mammal;<br>ii) All vessels must have a visual observer on board who is responsible for monitoring the vessel strike avoidance zone for marine mammals. Visual observers may be PSO or crew members, but crew members responsible for these duties must be provided sufficient training by Revolution Wind to distinguish marine mammals from other phenomena and must be able to identify a marine mammal as a North Atlantic right whale, other whale (defined in this context as sperm whales or baleen whales other than North Atlantic right whales), or other marine mammal. Crew members serving as visual observers must not have duties other than observing for marine mammals while the vessel is operating over 10 knots (kns);<br>iii) Year-round and when a vessel is in transit, all vessel operators must continuously monitor US Coast Guard VHF Channel 16, over which North Atlantic right whale sightings are broadcasted. At the onset of transiting and at least once every four hours, vessel operators and/or trained crew members must monitor the project's Situational Awareness System, WhaleAlert, and the Right Whale Sighting Advisory System (RWSAS) for the presence of North Atlantic right whales Any observations of any large whale by any Revolution Wind staff or contractors, including vessel crew, must be communicated immediately to PSOs, PAM operator, and all vessel captains to increase situational awareness. Conversely, any large whale observation or detection via a sighting network (e.g., Mysticetus) by PSOs or PAM operators must be conveyed to vessel operators and crew;<br>iv) Any observations of any large whale by any Revolution Wind staff or contractor, including vessel crew, must be communicated immediately to PSOs and all vessel captains to increase situational awareness;<br>v) All vessels must comply with existing NMFS vessel speed regulations, as applicable, for North Atlantic right whales;<br>vi) In the event that any Slow Zone (designated as a DMA) is established that overlaps with an area where a project-associated vessel would operate, that vessel, regardless of size, will transit that area at 10 kns or less;<br>vii) Between November 1st and April 30th, all vessels, regardless of size, would operate port to port (specifically from ports in New Jersey, New York, Maryland, Delaware, and Virginia) at 10 kns or less, except for vessels while transiting in Narragansett Bay or Long Island Sound which have not been demonstrated by best available science to provide consistent habitat for North Atlantic right whales;<br>viii) All vessels, regardless of size, must immediately reduce speed to 10 kns or less when any large whale, mother/calf pairs, or large assemblages of non-delphinid cetaceans are observed (within 500 m) of an underway vessel;<br>ix) All vessels, regardless of size, must immediately reduce speed to 10 kns or less when a North Atlantic right whale is sighted, at any distance, by anyone on the vessel;<br>x) If a vessel is traveling at greater than 10 kns, in addition to the required dedicated visual observer, Revolution Wind must monitor the transit corridor in real-time with PAM prior to and during transits. If a North Atlantic right whale is detected via visual observation or PAM within or approaching the transit corridor, all crew transfer vessels must travel at 10 kns or less for 12 hours following the detection. Each subsequent |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | detection triggers an additional 12-hour period at 10 kns or less. A slowdown in the transit corridor expires when there has been no further visual or acoustic detection of North Atlantic right whales in the transit corridor for 12 hours;<br>xi) All underway vessels (e.g., transiting, surveying) operating at any speed must have a dedicated visual observer on duty at all times to monitor for marine mammals within a 180° direction of the forward path of the vessel (90° port to 90° starboard) located at an appropriate vantage point for ensuring vessels are maintaining appropriate separation distances. Visual observers must be equipped with alternative monitoring technology for periods of low visibility (e.g., darkness, rain, fog, etc.). The dedicated visual observer must receive prior training on protected species detection and identification, vessel strike minimization procedures, how and when to communicate with the vessel captain, and reporting requirements in this proposed action. Visual observers may be third-party observers (i.e., NMFS-approved PSOs) or crew members. Observer training related to these vessel strike avoidance measures must be conducted for all vessel operators and crew prior to the start of in-water construction activities;<br>xii) All vessels must maintain a minimum separation distance of 500 m from North Atlantic right whales. If underway, all vessels must steer a course away from any sighted North Atlantic right whale at 10 kns or less such that the 500-m minimum separation distance requirement is not violated. If a North Atlantic right whale is sighted within 500 m of an underway vessel, that vessel must shift the engine to neutral. Engines must not be engaged until the whale has moved outside of the vessel's path and beyond 500 m. If a whale is observed but cannot be confirmed as a species other than a North Atlantic right whale, the vessel operator must assume that it is a North Atlantic right whale and take the vessel strike avoidance measures described herein;<br>xiii) All vessels must maintain a minimum separation distance of 100 m from sperm whales and baleen whales other than North Atlantic right whales. If one of these species is sighted within 100 m of an underway vessel, that vessel must shift the engine to neutral. Engines must not be engaged until the whale has moved outside of the vessel's path and beyond 100 m;<br>xiv) All vessels must, to the maximum extent practicable, attempt to maintain a minimum separation distance of 50 m from all delphinoid cetaceans and pinnipeds, with an exception made for those that approach the vessel (e.g., bow-riding dolphins). If a delphinid cetacean or pinniped is sighted within 50 m of an underway vessel, that vessel must shift the engine to neutral, with an exception made for those that approach the vessel (e.g., bow-riding dolphins). Engines must not be engaged until the animal(s) has moved outside of the vessel's path and beyond 50 m;<br>xv) When a marine mammal(s) is sighted while a vessel is underway, the vessel must take action as necessary to avoid violating the relevant separation distances (e.g., attempt to remain parallel to the animal's course, avoid excessive speed or abrupt changes in direction until the animal has left the area). If a marine mammal(s) is sighted within the relevant separation distance, the vessel must reduce speed and shift the engine to neutral, not engaging the engine(s) until the animal(s) is clear of the area. This does not apply to any vessel towing gear or any situation where respecting the relevant separation distance would be unsafe (i.e., any situation where the vessel is navigationally constrained);<br>xvi) All vessels underway must not divert or alter course to approach any marine mammal. Any vessel underway must avoid speed over 10 kns or abrupt changes in course direction until the animal is out of an on a path away from the separation distances;<br>xvii) For in-water construction heavy machinery activities other than impact or vibratory pile driving, if a marine mammal is on a path towards or comes within 10 m of equipment, Revolution Wind must cease operations until the marine mammal has moved more than 10 m on a path away from the activity to avoid direct interaction with equipment; and<br>xviii) Revolution Wind must submit a North Atlantic right whale vessel strike avoidance plan 90 days prior to commencement of vessel use. The plan will, at minimum, describe how PAM, in combination with visual observations, will be conducted to ensure the transit corridor is clear of right whales. The plan will also provide details on the vessel-based observer protocols on transiting vessels. |
| Fisheries Monitoring Surveys | |
| 1 | Training<br>i) All crew undertaking the fishery survey activities must receive protected species identification training prior to activities occurring;<br>ii) [Reserved]. |
| 2 | During Vessel Use<br>i) Marine mammal monitoring must occur prior to, during, and after haul-back, and gear must not be deployed if a marine mammal is observed in the area;<br>ii) Trawl operations must only start after 15 minutes of no marine mammal sightings within 1 nautical mile (nmi) of the sampling station; and<br>iii) During daytime sampling for the research trawl surveys, Revolution Wind must maintain visual monitoring efforts during the entire period of time that trawl gear is in the water from deployment to retrieval. If a marine mammal is sighted before the gear is removed from the water, the vessel must slow its speed and steer away from the observed animal(s). |
| 3 | Gear-specific Best Management Practices (BMPs)<br>i) Research trawl bottom times must be limited to 20 minutes;<br>ii) Ventless trap surveys must utilize sinking ground lines and all lines will have breaking strength of less than 1,700 pounds and sinking groundlines. Sampling gear must be hauled at least once every 30 days, and the gear must be removed from the water at the end of each sampling season;<br>iii) The permit number must be written clearly on buoy and any lines that go missing must be reported to NOAA Fisheries' Greater Atlantic Regional Fisheries Office (GARFO) Protected Resources Division as soon as possible;<br>iv) If marine mammals are sighted near the proposed sampling location, trawl or ventless trap gear must be delayed until the marine mammal(s) has left the area;<br>v) If a marine mammal is determined to be at risk of interaction with the deployed gear, all gear must be immediately removed;<br>vi) Marine mammal monitoring must occur during daylight hours and begin prior to the deployment of any gear (e.g., trawls) and continue until all gear has been retrieved; and<br>vii) If marine mammals are sighted in the vicinity within 15 minutes prior to gear deployment and it is determined the risks of interaction are present regarding the research gear, the sampling station must either be moved to another location or activities must be suspended until there are no marine mammal sightings for 15 minutes within 1 nm. |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| Wind Turbine Generator (WTG) and Offshore Substation (OSS) Foundation Installation | |
| 1 | Seasonal and Daily Restrictions:<br>i) Foundation impact pile driving activities may not occur January 1 through April 30;<br>ii) No more than three foundation monopiles may be installed per day;<br>iii) Revolution Wind must not initiate pile driving earlier than 1 hour after civil sunrise or later than 1.5 hours prior to civil sunset, unless Revolution Wind submits and NMFS approves an Alternative Monitoring Plan as part of the Pile Driving and Marine Mammal Monitoring Plan that reliably demonstrates the efficacy of their night vision devices; and<br>iv) Monopiles must be no larger than 15 m in diameter, representing the larger end of the tapered 7/15 m monopile design. The minimum amount of hammer energy necessary to effectively and safely install and maintain the integrity of the piles must be used. Maximum hammer energies must not exceed 4,000 kilojoules (kJ). |
| 2 | Noise Abatement Systems.<br>i) Revolution Wind must deploy dual noise abatement systems that are capable of achieving, at a minimum, 10-dB of sound attenuation, during all impact pile driving of foundation piles;<br>(A) A single big bubble curtain (BBC) must not be used unless paired with another noise attenuation device;<br>(B) A double big bubble curtain (dBBC) may be used without being paired with another noise attenuation device;<br>ii) The bubble curtain(s) must distribute air bubbles using an air flow rate of at least 0.5 m3/(min*m). The bubble curtain(s) must surround 100 percent of the piling perimeter throughout the full depth of the water column. In the unforeseen event of a single compressor malfunction, the offshore personnel operating the bubble curtain(s) must make appropriate adjustments to the air supply and operating pressure such that the maximum possible sound attenuation performance of the bubble curtain(s) is achieved;<br>iii) The lowest bubble ring must be in contact with the seafloor for the full circumference of the ring, and the weights attached to the bottom ring must ensure 100-percent seafloor contact;<br>iv) No parts of the ring or other objects may prevent full seafloor contact; and<br>v) Construction contractors must train personnel in the proper balancing of airflow to the ring. Construction contractors must submit an inspection/performance report for approval by Revolution Wind within 72 hours following the performance test. Corrections to the bubble ring(s) to meet the performance standards must occur prior to impact pile driving of monopiles. If Revolution Wind uses a noise mitigation device in addition to the BBC, Revolution Wind must maintain similar quality control measures as described here. |
| 3 | Sound Field Verification.<br>i) Revolution Wind must perform sound field verification (SFV) during all impact pile driving of the first three monopiles and must empirically determine source levels (peak and cumulative sound exposure level), the ranges to the isopleths corresponding to the Level A harassment (PTS) and Level B harassment thresholds, and estimated transmission loss coefficients;<br>ii) If a subsequent monopile installation location is selected that was not represented by previous three locations (i.e., substrate composition, water depth), SFV must be conducted;<br>iii) Revolution Wind may estimate ranges to the Level A harassment and Level B harassment isopleths by extrapolating from in situ measurements conducted at several distances from the monopiles, and must measure received levels at a standard distance of 750 m from the monopiles;<br>iv) If SFV measurements on any of the first three piles indicate that the ranges to Level A harassment and Level B harassment isopleths are larger than those modeled, assuming 10-dB attenuation, Revolution Wind must modify and/or apply additional noise attenuation measures (e.g., improve efficiency of bubble curtain(s), modify the piling schedule to reduce the source sound, install an additional noise attenuation device) before the second pile is installed. Until SFV confirms the ranges to Level A harassment and Level B harassment isopleths are less than or equal to those modeled, assuming 10-dB attenuation, the shutdown and clearance zones must be expanded to match the ranges to the Level A harassment and Level B harassment isopleths based on the SFV measurements. If the application/use of additional noise attenuation measures still does not achieve ranges less than or equal to those modeled, assuming 10-dB attenuation, and no other actions can further reduce sound levels, Revolution Wind must expand the clearance and shutdown zones according to those identified through SFV, in consultation with NMFS;<br>v) If harassment zones are expanded beyond an additional 1,500 m, additional PSOs must be deployed on additional platforms, with each observer responsible for maintaining watch in no more than 180° and of an area with a radius no greater than 1,500 m;<br>vi) If acoustic measurements indicate that ranges to isopleths corresponding to the Level A harassment and Level B harassment thresholds are less than the ranges predicted by modeling (assuming 10-dB attenuation), Revolution Wind may request a modification of the clearance and shutdown zones for impact pile driving of monopiles and UXO/MEC detonations. For a modification request to be considered by NMFS, Revolution Wind must have conducted SFV on three or more monopiles and on all detonated UXOs/MECs thus far to verify that zone sizes are consistently smaller than predicted by modeling (assuming 10-dB attenuation). Regardless of SFV measurements, the clearance and shutdown zones for North Atlantic right whales must not be decreased;<br>vii) If a subsequent monopile installation location is selected that was not represented by previous locations (i.e., substrate composition, water depth), SFV must be conducted. If a subsequent UXO/MEC charge weight is encountered and/or detonation location is selected that was not representative of the previous locations (i.e., substrate composition, water depth), SFV must be conducted;<br>viii) Revolution Wind must submit a SFV Plan at least 180 days prior to the planned start of impact pile driving and any UXO/MEC detonation activities. The plan must describe how Revolution Wind would ensure that the first three monopile foundation installation sites selected and each UXO/MEC detonation scenario (i.e., charge weight, location) selected for SFV are representative of the rest of the monopile installation sites and UXO/MEC scenarios. In the case that these sites/scenarios are not determined to be representative of all other monopile installation sites and UXO/MEC detonations, Revolution Wind must include information on how additional sites/scenarios would be selected for SFV. The plan must also include methodology for collecting, analyzing, and preparing SFV data for submission to NMFS. The plan must describe how the effectiveness of the |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | sound attenuation methodology would be evaluated based on the results. Revolution Wind must also provide, as soon as they are available but no later than 48 hours after each installation, the initial results of the SFV measurements to NMFS in an interim report after each monopile for the first three piles and after each UXO/MEC detonation; and<br>ix) The SFV plan must also include how operational noise would be monitored. Revolution Wind must estimate source levels (at 10 m from the operating foundation) based on received levels measured at 50 m, 100 m, and 250 m from the pile foundation. These data must be used to identify estimated transmission loss rates. Operational parameters (e.g., direct drive/gearbox information, turbine rotation rate) as well as sea state conditions and information on nearby anthropogenic activities (e.g., vessels transiting or operating in the area) must be reported. |
| 4 | Protected Species Observer and Passive Acoustic Monitoring Use.<br>i) Revolution Wind must have a minimum of four PSOs actively observing marine mammals before, during, and after (specific times described below) the installation of monopiles. At least four PSOs must be actively observing for marine mammals. At least two PSOs must be actively observing on the pile driving vessel while at least two PSOs must be actively observing on a secondary, PSO-dedicated vessel. At least one active PSO on each platform must have a minimum of 90 days at-sea experience working in those roles in offshore environments with no more than eighteen months elapsed since the conclusion of the at-sea experience. Concurrently, at least one acoustic PSO (i.e., passive acoustic monitoring (PAM) operator) must be actively monitoring for marine mammals before, during and after impact pile driving with PAM; and<br>ii) All visual PSOs and PAM operators used for the Revolution Wind project must meet the requirements and qualifications described in § 217.275 (a) and (b), and (c), respectively and as applicable to the specified activity. |
| 5 | Clearance and Shutdown Zones.<br>i) Revolution Wind must establish and implement clearance and shutdown zones (all distances to the perimeter are the radii from the center of the pile being driven) as described in the LOA for all WTG and OSS foundation installation;<br>ii) Revolution Wind must use visual PSOs and PAM operators to monitor the area around each foundation pile before, during and after pile driving. PSOs must visually monitor clearance zones for marine mammals for a minimum of 60 minutes prior to commencing pile driving. At least one PAM operator must review data from at least 24 hours prior to pile driving and actively monitor hydrophones for 60 minutes prior to pile driving. Prior to initiating soft-start procedures, all clearance zones must be visually confirmed to be free of marine mammals for 30 minutes immediately prior to starting a soft-start of pile driving;<br>iii) PSOs must be able to visually clear (i.e., confirm no marine mammals are present) an area that extends around the pile being driven as described in the LOA. The entire minimum visibility zone must be visible (i.e., not obscured by dark, rain, fog, etc.) for a full 30 minutes immediately prior to commencing impact pile driving (minimum visibility zone size dependent on season);<br>iv) If a marine mammal is observed entering or within the relevant clearance zone prior to the initiation of impact pile driving activities, pile driving must be delayed and must not begin until either the marine mammal(s) has voluntarily left the specific clearance zones and have been visually or acoustically confirmed beyond that clearance zone, or, when specific time periods have elapsed with no further sightings or acoustic detections. The specific time periods are 15 minutes for small odontocetes and 30 minutes for all other marine mammal species;<br>v) The clearance zone may only be declared clear if no confirmed North Atlantic right whale acoustic detections (in addition to visual) have occurred within the PAM clearance zone during the 60-minute monitoring period. Any large whale sighting by a PSO or detected by a PAM operator that cannot be identified by species must be treated as if it were a North Atlantic right whale;<br>vi) If a marine mammal is observed entering or within the respective shutdown zone, as defined in the LOA, after impact pile driving has begun, the PSO must call for a temporary shutdown of impact pile driving;<br>vii) Revolution Wind must immediately cease pile driving if a PSO calls for shutdown, unless shutdown is not practicable due to imminent risk of injury or loss of life to an individual, pile refusal, or pile instability. In this situation, Revolution Wind must reduce hammer energy to the lowest level practicable;<br>viii) Pile driving must not restart until either the marine mammal(s) has voluntarily left the specific clearance zones and has been visually or acoustically confirmed beyond that clearance zone, or, when specific time periods have elapsed with no further sightings or acoustic detections have occurred. The specific time periods are 15 minutes for small odontocetes and 30 minutes for all other marine mammal species. In cases where these criteria are not met, pile driving may restart only if necessary to maintain pile stability at which time Revolution Wind must use the lowest hammer energy practicable to maintain stability;<br>ix) If impact pile driving has been shut down due to the presence of a North Atlantic right whale, pile driving may not restart until the North Atlantic right whale is no longer observed or 30 minutes has elapsed since the last detection;<br>x) Upon re-starting pile driving, soft start protocols must be followed. |
| 6 | Soft Start.<br>i) Revolution Wind must utilize a soft start protocol for impact pile driving of monopiles by performing 4-6 strikes per minute at 10 to 20 percent of the maximum hammer energy, for a minimum of 20 minutes;<br>ii) Soft start must occur at the beginning of monopile installation and at any time following a cessation of impact pile driving of 30 minutes or longer; and<br>iii) If a marine mammal is detected within or about to enter the applicable clearance zones, prior to the beginning of soft-start procedures, impact pile driving must be delayed until the animal has been visually observed exiting the clearance zone or until a specific time period has elapsed with no further sightings. The specific time periods are 15 minutes for small odontocetes and 30 minutes for all other species. |
| Cofferdam or Casing Pipe Installation | |
| 1 | Daily Restrictions<br>i) Revolution Wind must conduct vibratory pile driving or pneumatic hammering during daylight hours only;<br>ii) [Reserved]. |
| 2 | PSO Use.<br>i) All visual PSOs used for the Revolution Wind project must meet the requirements and qualifications described in § 217.275 (a) and (b), as applicable to the specified activity; and |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | ii) Revolution Wind must have a minimum of two PSOs on active duty during any installation and removal of the temporary cofferdams, or casing pipes and goal posts. These PSOs would always be located at the best vantage point(s) on the vibratory pile driving platform or secondary platform in the immediate vicinity of the vibratory pile driving platform, in order to ensure that appropriate visual coverage is available for the entire visual clearance zone and as much of the Level B harassment zone, as possible. |
| 3 | Clearance and Shutdown Zones<br>i) Revolution Wind must establish and implement clearance and shutdown zones as described in the LOA;<br>ii) Prior to the start of pneumatic hammering or vibratory pile driving activities, at least two PSOs must monitor the clearance zone for 30 minutes, continue monitoring during pile driving and for 30 minutes post pile driving;<br>iii) If a marine mammal is observed entering or is observed within the clearance zones, piling and hammering must not commence until the animal has exited the zone or a specific amount of time has elapsed since the last sighting. The specific amount of time is 30 minutes for large whales and 15 minutes for dolphins, porpoises, and pinnipeds;<br>iv) If a marine mammal is observed entering or within the respective shutdown zone, as defined in the LOA, after vibratory pile driving or hammering has begun, the PSO must call for a temporary shutdown of vibratory pile driving or hammering;<br>v) Revolution Wind must immediately cease pile driving or pneumatic hammering if a PSO calls for shutdown, unless shutdown is not practicable due to imminent risk of injury or loss of life to an individual, pile refusal, or pile instability; and<br>vi) Pile driving must not restart until either the marine mammal(s) has voluntarily left the specific clearance zones and have been visually or acoustically confirmed beyond that clearance zone, or, when specific time periods have elapsed with no further sightings or acoustic detections have occurred. The specific time periods are 15 minutes for small odontocetes and 30 minutes for all other marine mammal species. |
| UXO/MEC Detonation | |
| 1 | General.<br>i) Revolution Wind shall only detonate a maximum of 13 UXO/MECs, of varying sizes;<br>ii) Upon encountering a UXO/MEC of concern, Revolution Wind may only resort to high-order removal (i.e., detonation) if all other means of removal are impracticable;<br>iii) Revolution Wind must utilize a noise abatement system (e.g., bubble curtain or similar noise abatement device) around all UXO/MEC detonations and operate that system in a manner that achieves the maximum noise attenuation levels practicable. |
| 2 | Seasonal and Daily Restrictions.<br>i) Revolution Wind must not detonate UXOs/MECs from December 1 through April 31, annually; and<br>ii) Revolution Wind must only detonate UXO/MECs during daylight hours. |
| 3 | PSO and PAM Use.<br>i) All visual PSOs and PAM operators used for the Revolution Wind project must meet the requirements and qualifications described in § 217.265 (a) and (b), and (c), respectively and as applicable to the specified activity; and<br>ii) Revolution Wind must use at least 2 visual PSOs on each platform (i.e., vessels, plane) and one acoustic PSO to monitor for marine mammals in the clearance zones prior to detonation. If the clearance zone is larger than 2 km (based on charge weight), Revolution Wind must deploy a secondary PSO vessel. If the clearance is larger than 5 km (based on charge weight), an aerial survey must be conducted. |
| 4 | Clearance Zones.<br>i) Revolution Wind must establish and implement clearance zones using both visual and acoustic monitoring, as described in the LOA;<br>ii) Clearance zones must be fully visible for at least 60 minutes and all marine mammal(s) must be confirmed to be outside of the clearance zone for at least 30 minutes prior to detonation. PAM must also be conducted for at least 60 minutes prior to detonation and the zone must be acoustically cleared during this time; and<br>iii) If a marine mammal is observed entering or within the clearance zone prior to denotation, the activity must be delayed. Detonation may only commence if all marine mammals have been confirmed to have voluntarily left the clearance zones and been visually confirmed to be beyond the clearance zone, or when 60 minutes have elapsed without any redetections for whales (including the North Atlantic right whale) or 15 minutes have elapsed without any redetections of delphinids, harbor porpoises, or seals. |
| 5 | Sound Field Verification.<br>i) During each UXO/MEC detonation, Revolution Wind must empirically determine source levels (peak and cumulative sound exposure level), the ranges to the isopleths corresponding to the Level A harassment and Level B harassment thresholds, and estimated transmission loss coefficient(s); and<br>ii) If SFV measurements on any of the detonations indicate that the ranges to Level A harassment and Level B harassment thresholds are larger than those modeled, assuming 10-dB attenuation, Revolution Wind must modify the ranges, with approval from NMFS, and/or apply additional noise attenuation measures (e.g., improve efficiency of bubble curtain(s), install an additional noise attenuation device) before the next detonation event. |
| HRG Surveys | |
| 1 | General. |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | i) All personnel with responsibilities for marine mammal monitoring must participate in joint, onboard briefings that would be led by the vessel operator and the Lead PSO, prior to the beginning of survey activities. The briefing must be repeated whenever new relevant personnel (e.g., new PSOs, acoustic source operators, relevant crew) join the survey operation before work commences;<br>ii) Revolution Wind must deactivate acoustic sources during periods where no data is being collected, except as determined to be necessary for testing. Unnecessary use of the acoustic source(s) is prohibited; and<br>iii) Any large whale sighted by a PSO within 1 km of the boomer, sparker, or CHIRP that cannot be identified by species must be treated as if it were a North Atlantic right whale. |
| 2 | PSO Use.<br>i) Revolution Wind must use at least one PSO during daylight hours and two PSOs during nighttime operations, per vessel;<br>ii) PSOs must establish and monitor the appropriate clearance and shutdown zones (i.e., radial distances from the acoustic source in-use and not from the vessel); and<br>iii) PSOs must begin visually monitoring 30 minutes prior to the initiation of the specified acoustic source (i.e., ramp-up, if applicable), through 30 minutes after the use of the specified acoustic source has ceased. |
| 3 | Ramp-up.<br>i) Any ramp-up activities of boomers, sparkers, and CHIRPs must only commence when visual clearance zones are fully visible (e.g., not obscured by darkness, rain, fog, etc.) and clear of marine mammals, as determined by the Lead PSO, for at least 30 minutes immediately prior to the initiation of survey activities using a specified acoustic source;<br>ii) Prior to a ramp-up procedure starting, the operator must notify the Lead PSO of the planned start of the ramp-up. This notification time must not be less than 60 minutes prior to the planned ramp-up activities as all relevant PSOs must monitor the clearance zone for 30 minutes prior to the initiation of ramp-up; and<br>iii) Prior to starting the survey and after receiving confirmation from the PSOs that the clearance zone is clear of any marine mammals, Revolution Wind must ramp-up sources to half power for 5 minutes and then proceed to full power, unless the source operates on a binary on/off switch in which case ramp-up is not feasible. Ramp-up activities would be delayed if a marine mammal(s) enters its respective shutdown zone. Ramp-up would only be reinitiated if the animal(s) has been observed exiting its respective shutdown zone or until additional time has elapsed with no further sighting. The specific time periods are 15 minutes for small odontocetes and seals, and 30 minutes for all other species. |
| 4 | Clearance and Shutdown Zones.<br>i) Revolution Wind must establish and implement clearance zones as described in the LOA;<br>ii) Revolution Wind must implement a 30 minute clearance period of the clearance zones immediately prior to the commencing of the survey or when there is more than a 30 minute break in survey activities and PSOs are not actively monitoring;<br>iii) If a marine mammal is observed within a clearance zone during the clearance period, ramp-up would not be allowed to begin until the animal(s) has been observed voluntarily exiting its respective clearance zone or until a specific time period has elapsed with no further sighting. The specific time period is 15 minutes for small odontocetes and seals, and 30 minutes for all other species;<br>iv) In any case when the clearance process has begun in conditions with good visibility, including via the use of night vision equipment (IR/thermal camera), and the Lead PSO has determined that the clearance zones are clear of marine mammals, survey operations would be allowed to commence (i.e., no delay is required) despite periods of inclement weather and/or loss of daylight;<br>v) Once the survey has commenced, Revolution Wind must shut down boomers, sparkers, and CHIRPs if a marine mammal enters a respective shutdown zone;<br>vi) In cases when the shutdown zones become obscured for brief periods due to inclement weather, survey operations would be allowed to continue (i.e., no shutdown is required) so long as no marine mammals have been detected;<br>vii) The use of boomers, and sparkers, and CHIRPS would not be allowed to commence or resume until the animal(s) has been confirmed to have left the Level B harassment zone or until a full 15 minutes (for small odontocetes and seals) or 30 minutes (for all other marine mammals) have elapsed with no further sighting;<br>viii) Revolution Wind must immediately shutdown any boomer, sparker, or CHIRP acoustic source if a marine mammal is sighted entering or within its respective shutdown zones. The shutdown requirement does not apply to small delphinids of the following genera: Delphinus, Stenella, Lagenorhynchus, and Tursiops. If there is uncertainty regarding the identification of a marine mammal species (i.e., whether the observed marine mammal belongs to one of the delphinid genera for which shutdown is waived), the PSOs must use their best professional judgment in making the decision to call for a shutdown. Shutdown is required if a delphinid that belongs to a genus other than those specified here is detected in the shutdown zone;<br>ix) If a boomer, sparker, or CHIRP is shut down for reasons other than mitigation (e.g., mechanical difficulty) for less than 30 minutes, it would be allowed to be activated again without ramp-up only if: (A) PSOs have maintained constant observation and (B) no additional detections of any marine mammal occurred within the respective shutdown zones; and (C) If a boomer, sparker, or CHIRP was shut down for a period longer than 30 minutes, then all clearance and ramp-up procedures must be initiated. |
| 5 | Autonomous surface vehicle (ASV) use<br>i) The ASV must remain with 800 m (2,635 ft) of the primary vessel while conducting survey operations;<br>ii) Two PSOs must be stationed on the mother vessel at the best vantage points to monitor the clearance and shutdown zones around the ASV;<br>iii) At least one PSO must monitor the output of a thermal.high-definition camera installed on the mother vessel to monitor the field-of-view around the ASV using a hand-held tablet; and<br>iv) During periods of reduced visibility (e.g., darkness, rain, or fog), PSOs must use night-vision goggles with thermal clip-ons and a hand-held spotlight to monitor the clearance and shutdown zones around the ASV. |
| Section 217.275 Requirements for monitoring and reporting | |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| 1 | PSO Qualifications. Revolution Wind must employ qualified, trained visual and acoustic PSOs to conduct marine mammal monitoring during activities associated with construction. PSO requirements are as follows:<br>1) Revolution Wind must use independent, dedicated, qualified PSOs, meaning that the PSOs must be employed by a third-party observer provider, must have no tasks other than to conduct observational effort, collect data, and communicate with and instruct relevant vessel crew with regard to the presence of protected species and mitigation requirements;<br>2) All PSOs must be approved by NMFS. Revolution Wind must submit PSO resumes for NMFS' review and approval at least 60 days prior to commencement of in-water construction activities requiring PSOs. Resumes must include dates of training and any prior NMFS approval, as well as dates and description of last experience, and must be accompanied by information documenting successful completion of an acceptable training course. NMFS shall be allowed three weeks to approve PSOs from the time that the necessary information is received by NMFS, after which PSOs meeting the minimum requirements will automatically be considered approved;<br>3) PSOs must have visual acuity in both eyes (with correction of vision being permissible) sufficient enough to discern moving targets on the water's surface with the ability to estimate the target size and distance (binocular use is allowable);<br>4) All PSOs must be trained in marine mammal identification and behaviors and must be able to conduct field observations and collect data according to assigned protocols. Additionally, PSOs must have the ability to work with a.ll required and relevant software and equipment necessary during observations.<br>5) PSOs must have sufficient writing skills to document all observations, including but not limited to:<br>i) The number and species of marine mammals observed;<br>ii) The dates and times of when in-water construction activities were conducted;<br>iii) The dates and time when in-water construction activities were suspended to avoid potential incidental injury of marine mammals from construction noise within a defined shutdown zone; and<br>iv) Marine mammal behavior.<br>6) All PSOs must be able to communicate orally, by radio, or in-person with Revolution Wind project personnel;<br>7) PSOs must have sufficient training, orientation, or experience with construction operations to provide for their own personal safety during observations;<br>i) All PSOs must complete a Permits and Environmental Compliance Plan training and a two-day refresher session that will be held with the PSO provider and Project compliance representative(s) prior to the start of construction activities;<br>ii) [Reserved];<br>8) At least one PSO must have prior experience working as an observer. Other PSOs may substitute education (i.e., degree in biological science or related field) or training for experience;<br>9) One PSO for each activity (i.e., foundation installation, cofferdam or casing pipe installation and removal, HRG surveys, UXO/MEC detonation) must be designated as the "Lead PSO". The Lead PSO must have a minimum of 90 days of at-sea experience working in an offshore environment and would be required to have no more than eighteen months elapsed since the conclusion of their last at-sea experience;<br>10) At a minimum, at least one PSO located on each observation platform (either vessel-based or aerial-based) must have a minimum of 90 days of at-sea experience working in an offshore environment and would be required to have no more than eighteen months elapsed since the conclusion of their last at-sea experiences. Any new and/or inexperienced PSOs would be paired with an experienced PSO;<br>11) PSOs must monitor all clearance and shutdown zones prior to, during, and following impact pile driving, vibratory pile driving, pneumatic hammering, UXO/MEC detonations, and during HRG surveys that use boomers, sparkers, and CHIRPs (with specific monitoring durations described in § 217.275(b)(2)(iii), § 217.275(b)(3)(iv), § 217.275(b)(4)(ii), and § 217.275(b)(5)(iii). PSOs must also monitor the Level B harassment zones and document any marine mammals observed within these zones, to the extent practicable;<br>12) PSOs must be located on the best available vantage point(s) on the primary vessel(s) (i.e., pile driving vessel, UXO/MEC vessel, HRG survey vessel) and on other dedicated PSO vessels (e.g., additional UXO/MEC vessels) or aerial platforms, as applicable and necessary, to allow them appropriate coverage of the entire visual shutdown zone(s), clearance zone(s), and as much of the Level B harassment zone as possible. These vantage points must maintain a safe work environment; and<br>13) Acoustic PSOs must complete specialized training for operating passive acoustic monitoring (PAM) systems and must demonstrate familiarity with the PAM system on which they must be working. PSOs may act as both acoustic and visual observers (but not simultaneously), so long as they demonstrate that their training and experience are sufficient to perform each task. |
| 2 | PSO Requirements.<br>1) General.<br>i) All PSOs must be located at the best vantage point(s) on the primary vessel, dedicated PSO vessels, and aerial platform in order to ensure 360° visual coverage of the entire clearance and shutdown zones around the vessels, and as much of the Level B harassment zone as possible;<br>ii) During all observation periods, PSOs must use high magnification (25x) binoculars, standard handheld (7x) binoculars, and the naked eye to search continuously for marine mammals. During impact pile driving and UXO/MEC detonation events, at least one PSO on the primary pile driving or UXO/MEC vessels must be equipped with Big Eye binoculars (e.g., 25 x 150; 2.7 view angle; individual ocular focus; height control) of appropriate quality. These must be pedestal mounted on the deck at the most appropriate vantage point that provides for optimal sea surface observation and PSO safety; and<br>iii) PSOs must not exceed four consecutive watch hours on duty at any time, must have a two-hour (minimum) break between watches, and must not exceed a combined watch schedule of more than 12 hours in a 24-hour period.<br>2) WTG and OSS Foundation Installation. |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | i) At least four PSOs must be actively observing marine mammals before, during, and after installation of foundation piles (monopiles). At least two PSOs must be stationed and observing on the pile driving vessel and at least two PSOs must be stationed on a secondary, PSO-dedicated vessel. Concurrently, at least one acoustic PSO (i.e., passive acoustic monitoring (PAM) operator) must be actively monitoring for marine mammals with PAM before, during and after impact pile driving;<br>ii) If PSOs cannot visually monitor the minimum visibility zone at all times using the equipment described in § 217.275(b)(1)(ii), impact pile driving operations must not commence or must shutdown if they are currently active;<br>iii) All PSOs, including PAM operators, must begin monitoring 60 minutes prior to pile driving, during, and for 30 minutes after an activity. The impact pile driving of monopiles must only commence when the minimum visibility zone is fully visible (e.g., not obscured by darkness, rain, fog, etc.) and the clearance zones are clear of marine mammals for at least 30 minutes, as determined by the Lead PSO, immediately prior to the initiation of impact pile driving;<br>iv) For North Atlantic right whales, any visual or acoustic detection must trigger a delay to the commencement of pile driving. In the event that a large whale is sighted or acoustically detected that cannot be confirmed by species, it must be treated as if it were a North Atlantic right whale; and<br>v) Following a shutdown, monopile installation must not recommence until the minimum visibility zone is fully visible and clear of marine mammals for 30 minutes.<br>3) Cofferdam or Casing Pipe Installation and Removal.<br>i) At least two PSOs must be on active duty during all activities related to the installation and removal of cofferdams or casing pipes and goal post sheet piles;<br>ii) These PSOs must be located at appropriate vantage points on the vibratory pile driving or pneumatic hammering platform or secondary platform in the immediate vicinity of the vibratory pile driving or pneumatic hammering platforms;<br>iii) PSOs must ensure that there is appropriate visual coverage for the entire clearance zone and as much of the Level B harassment zone as possible; and<br>iv) PSOs must monitor the clearance zone for the presence of marine mammals for 30 minutes before, throughout the installation of the sheet piles and casing pipes, and for 30 minutes after all vibratory pile driving or pneumatic hammering activities have ceased. Sheet pile or casing pipe installation shall only commence when visual clearance zones are fully visible (e.g., not obscured by darkness, rain, fog, etc.) and clear of marine mammals, as determined by the Lead PSO, for at least 30 minutes immediately prior to initiation of vibratory pile driving or pneumatic hammering.<br>4) UXO/MEC Detonations.<br>i) At least two PSOs must be on active duty on each observing platform (i.e., vessel, plane) prior to, during, and after UXO/MEC detonations. Concurrently, at least one acoustic PSO (i.e., passive acoustic monitoring (PAM) operator) must be actively monitoring for marine mammals with PAM before, during and after UXO/MEC detonations;<br>ii) All PSOs, including PAM operators, must begin monitoring 60 minutes prior to UXO/MEC detonation, during detonation, and for 30 minutes after detonation; and<br>iii) Revolution Wind must ensure that clearance zones are fully (100 percent) monitored.<br>5) HRG Surveys.<br>i) Between 4 and 6 PSOs must be present on every 24-hour survey vessel and 2 to 3 PSOs must be present on every 12-hour survey vessel. At least one PSO must be on active duty during HRG surveys conducted during daylight and at least two PSOs must be on activity duty during HRG surveys conducted at night;<br>ii) During periods of low visibility (e.g., darkness, rain, fog, etc.), PSOs must use alternative technology (i.e., infrared/thermal camera) to monitor the clearance and shutdown zones;<br>iii) PSOs on HRG vessels must begin monitoring 30 minutes prior to activating boomers, sparkers, or CHIRPs, during use of these acoustic sources, and for 30 minutes after use of these acoustic sources has ceased;<br>iv) Any observations of marine mammals must be communicated to PSOs on all nearby survey vessels during concurrent HRG surveys; and<br>v) During daylight hours when survey equipment is not operating, Revolution Wind must ensure that visual PSOs conduct, as rotation schedules allow, observations for comparison of sighting rates and behavior with and without use of the specified acoustic sources. Off-effort PSO monitoring must be reflected in the monthly PSO monitoring reports. |
| 3 | PAM Operator Requirements.<br>1) General.<br>i) PAM operators must have completed specialized training for operating PAM systems prior to the start of monitoring activities, including identification of species-specific mysticete vocalizations (e.g., North Atlantic right whales);<br>ii) During use of any real-time PAM system, at least one PAM operator must be designated to monitor each system by viewing data or data products that would be streamed in real-time or in near real-time to a computer workstation and monitor;<br>iii) PAM operators may be located on a vessel or remotely on-shore but must have the appropriate equipment (i.e., computer station equipped with a data collection software system (i.e., Mysticetus or similar system) and acoustic data analysis software) available wherever they are stationed;<br>iv) Visual PSOs must remain in contact with the PAM operator currently on duty regarding any animal detection that would be approaching or found within the applicable zones no matter where the PAM operator is stationed (i.e., onshore or on a vessel);<br>v) The PAM operator must inform the Lead PSO on duty of animal detections approaching or within applicable ranges of interest to the pile driving activity via the data collection software system (i.e., Mysticetus or similar system) who will be responsible for requesting that the designated crewmember implement the necessary mitigation procedures (i.e., delay or shutdown);<br>vi) PAM operators must be on watch for a maximum of four consecutive hours, followed by a break of at least two hours between watches; and |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | vii) A Passive Acoustic Monitoring Plan must be submitted to NMFS for review and approval at least 180 days prior to the planned start of monopile installation. The authorization to take marine mammals would be contingent upon NMFS' approval of the PAM Plan.<br>2) WTG and OSS Foundation Installation.<br>i) Revolution Wind must use a minimum of one PAM operator before, during, and after impact pile driving activities. The PAM operator must assist visual PSOs in ensuring full coverage of the clearance and shutdown zones;<br>ii) PAM operators must assist the visual PSOs in monitoring by conducting PAM activities 60 minutes prior to any impact pile driving, during, and after for 30 minutes for the appropriate size PAM clearance zone (dependent on season). The entire minimum visibility zone must be clear for at least 30 minutes, with no marine mammal detections within the visual or PAM clearance zones prior to the start of impact pile driving;<br>iii) Any acoustic monitoring during low visibility conditions during the day would complement visual monitoring efforts and would cover an area of at least the Level B harassment zone around each monopile foundation;<br>iv) Any visual or acoustic detection within the clearance zones must trigger a delay to the commencement of pile driving. In the event that a large whale is sighted or acoustically detected that cannot be identified by species, it must be treated as if it were a North Atlantic right whale. Following a shutdown, monopile installation shall not recommence until the minimum visibility zone is fully visible and clear of marine mammals for 30 minutes and no marine mammals have been detected acoustically within the PAM clearance zone for 30 minutes; and<br>v) Revolution Wind must submit a Pile Driving and Marine Mammal Monitoring Plan to NMFS for review and approval at least 180 days before the start of any pile driving. The plan must include final project design related to pile driving (e.g., number and type of piles, hammer type, noise abatement systems, anticipated start date, etc.) and all information related to PAM PSO monitoring protocols for pile-driving and visual PSO protocols for all activities.<br>3) UXO/MEC Detonation(s).<br>i) Revolution Wind must use a minimum of one PAM operator before, during, and after UXO/MEC detonations. The PAM operator must assist visual PSOs in ensuring full coverage of the clearance and shutdown zones;<br>ii) PAM must be conducted for at least 60 minutes prior to detonation, during, and for 30 minutes after detonation;<br>iii) The PAM operator must monitor to and beyond the clearance zone for large whales; and<br>iv) Revolution Wind must prepare and submit a UXO/MEC and Marine Mammal Monitoring Plan to NMFS for review and approval at least 180 days before the start of any UXO/MEC detonations. The plan must include final project design and all information related to visual and PAM PSO monitoring protocols for UXO/MEC detonations. |
| 4 | Data Collection and Reporting.<br>1) Prior to initiation of project activities, Revolution Wind must demonstrate in a report submitted to NMFS (at itp.esch@noaa.gov and pr.itp.monitoringreports@noaa.gov) that all required training for Revolution Wind personnel (including the vessel crews, vessel captains, PSOs, and PAM operators) has been completed;<br>2) Revolution Wind must use a standardized reporting system during the effective period of the proposed regulations and LOA. All data collected related to the Revolution Wind project must be recorded using industry-standard softwares (e.g., Mysticetus or a similar software) that is installed on field laptops and/or tablets. For all monitoring efforts and marine mammal sightings, Revolution Wind must collect the following information and report it to NMFS:<br>i) Date and time that monitored activity begins or ends;<br>ii) Construction activities occurring during each observation period;<br>iii) Watch status (i.e., sighting made by PSO on/off effort, opportunistic, crew, alternate vessel/platform);<br>iv) PSO who sighted the animal;<br>v) Time of sighting;<br>vi) Weather parameters (e.g., wind speed, percent cloud cover, visibility);<br>vii) Water conditions (e.g., sea state, tide state, water depth);<br>viii) All marine mammal sightings, regardless of distance from the construction activity;<br>ix) Species (or lowest possible taxonomic level possible);<br>x) Pace of the animal(s);<br>xi) Estimated number of animals (minimum/maximum/high/low/best);<br>xii) Estimated number of animals by cohort (e.g., adults, yearlings, juveniles, calves, group composition, etc.);<br>xiii) Description (i.e., as many distinguishing features as possible of each individual seen, including length, shape, color, pattern, scars or markings, shape and size of dorsal fin, shape of head, and blow characteristics);<br>xiv) Description of any marine mammal behavioral observations (e.g., observed behaviors such as feeding or traveling) and observed changes in behavior, including an assessment of behavioral responses thought to have resulted from the specific activity;<br>xv) Animal's closest distance and bearing from the pile being driven, UXO/MEC, or specified HRG equipment and estimated time entered or spent within the Level A harassment and/or Level B harassment zones; |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | xvi) Construction activity at time of sighting (e.g., vibratory installation/removal, impact pile driving, UXO/MEC detonation, construction survey), use of any noise attenuation device(s), and specific phase of activity (e.g., ramp-up of HRG equipment, HRG acoustic source on/off, soft start for pile driving, active pile driving, post-UXO/MEC detonation, etc.);<br>xvii) Marine mammal occurrence in Level A harassment or Level B harassment zones;<br>xviii) Description of any mitigation-related action implemented, or mitigation-related actions called for but not implemented, in response to the sighting (e.g., delay, shutdown, etc.) and time and location of the action; and<br>xix) Other human activity in the area.<br>3) For all real-time acoustic detections of marine mammals, the following must be recorded and included in weekly, monthly, annual, and final reports:<br>i) Location of hydrophone (latitude & longitude; in Decimal Degrees) and site name;<br>ii) Bottom depth and depth of recording unit (in meters);<br>iii) Recorder (model & manufacturer) and platform type (i.e., bottom-mounted, electric glider, etc.), and instrument ID of the hydrophone and recording platform (if applicable);<br>iv) Time zone for sound files and recorded date/times in data and metadata (in relation to UTC. i.e., EST time zone is UTC-5);<br>v) Duration of recordings (start/end dates and times; in ISO 8601 format, yyyy-mm-ddTHH:MM:SS.sssZ);<br>vi) Deployment/retrieval dates and times (in ISO 8601 format);<br>vii) Recording schedule (must be continuous);<br>viii) Hydrophone and recorder sensitivity (in dB re. 1 µPa);<br>ix) Calibration curve for each recorder;<br>x) Bandwidth/sampling rate (in Hz);<br>xi) Sample bit-rate of recordings; and,<br>xii) Detection range of equipment for relevant frequency bands (in meters).<br>4) For each detection, the following information must be noted:<br>i) Species identification (if possible);<br>ii) Call type and number of calls (if known);<br>iii) Temporal aspects of vocalization (date, time, duration, etc.; date times in ISO 8601 format);<br>iv) Confidence of detection (detected, or possibly detected);<br>v) Comparison with any concurrent visual sightings;<br>vi) Location and/or directionality of call (if determined) relative to acoustic recorder or construction activities;<br>vii) Location of recorder and construction activities at time of call;<br>viii) Name and version of detection or sound analysis software used, with protocol reference;<br>ix) Minimum and maximum frequencies viewed/monitored/used in detection (in Hz); and<br>x) Name of PAM operator(s) on duty.<br>5) Weekly Reports.<br>i) Revolution Wind must compile and submit weekly PSO, PAM, and sound field verification (SFV) reports to NMFS (at itp.esch@noaa.gov and PR.ITP.monitoringreports@noaa.gov) that document the daily start and stop of all pile driving, HRG survey, or UXO/MEC detonation activities, the start and stop of associated observation periods by PSOs, details on the deployment of PSOs, a record of all detections of marine mammals (acoustic and visual), any mitigation actions (or if mitigation actions could not be taken, provide reasons why), and details on the noise abatement system(s) used and its performance. Weekly reports are due on Wednesday for the previous week (Sunday – Saturday) and must include the information required under this section. The weekly report will also identify which turbines become operational and when (a map must be provided). Once all foundation pile installation is completed, weekly reports are no longer required;<br>ii) [Reserved].<br>6) Monthly Reports.<br>i) Revolution Wind must compile and submit monthly reports to NMFS (at itp.esch@noaa.gov and PR.ITP.monitoringreports@noaa.gov) that include a summary of all information in the weekly reports, including project activities carried out in the previous month, vessel transits (number, type of vessel, and route), number of piles installed, number of UXO/MEC detonations, all detections of marine mammals, and any mitigative action taken. Monthly reports are due on the 15th of the month for the previous month. The monthly report must also identify which turbines become operational and when (a map must be provided). Once foundation installation is complete, monthly reports are no longer required;<br>ii) [Reserved].<br>7) Annual Reports. |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | i) Revolution Wind must submit an annual report to NMFS (at itp.esch@noaa.gov and PR.ITP.monitoringreports@noaa.gov) no later than 90 days following the end of a given calendar year. Revolution Wind must provide a final report within 30 days following resolution of comments on the draft report. The report must detail the following information and the information specified in § 217.275(d)(2)(i-xix), § 217.275(d)(3)(i-xii), and § 217.275(d)(4)(i-x):<br>(A) The total number of marine mammals of each species/stock detected and how many were within the designated Level A harassment and Level B harassment zones with comparison to authorized take of marine mammals for the associated activity type;<br>(B) Marine mammal detections and behavioral observations before, during, and after each activity;<br>(C) What mitigation measures were implemented (i.e., number of shutdowns or clearance zone delays, etc) or, if no mitigative actions was taken, why not;<br>(D) Operational details (i.e., days of impact and vibratory pile driving, days/amount of HRG survey effort, total number and charge weights related to UXO/MEC detonations, etc.);<br>(E) SFV results;<br>(F) Any PAM systems used;<br>(G) The results, effectiveness, and which noise abatement systems were used during relevant activities (i.e., impact pile driving, UXO/MEC detonation);<br>(H) Summarized information related to Situational Reporting; and<br>(I) Any other important information relevant to the Revolution Wind project, including additional information that may be identified through the adaptive management process.<br>ii) The final annual report must be prepared and submitted within 30 calendar days following the receipt of any comments from NMFS on the draft report. If no comments are received from NMFS within 60 calendar days of NMFS' receipt of the draft report, the report must be considered final.<br>8) Final Report.<br>i) Revolution Wind must submit its draft final report to NMFS (at itp.esch@noaa.gov and PR.ITP.monitoringreports@noaa.gov) on all visual and acoustic monitoring conducted under the LOA within 90 calendar days of the completion of activities occurring under the LOA. A final report must be prepared and submitted within 30 calendar days following receipt of any NMFS comments on the draft report. If no comments are received from NMFS within 30 calendar days of NMFS' receipt of the draft report, the report shall be considered final.<br>ii) [Reserved].<br>9) Sound Field Verification Reporting.<br>i) Revolution Wind must provide the initial results of the SFV measurements to NMFS in an interim report after each monopile foundation installation for the first three monopiles piles, and for each UXO/MEC detonation as soon as they are available, but no later than 48 hours after each installation or detonation. Revolution Wind must also provide interim reports on any subsequent SFV on foundation piles within 48 hours. The interim report must include hammer energies used during pile driving or UXO/MEC weight (including donor charge weight), peak sound pressure level (SPLpk) and (1) median, (2) mean, (3) maximum, and (4) minimum root-mean-square sound pressure level that contains 90 percent of the acoustic energy (SPLrms) and single strike sound exposure level (SELss);<br>ii) The final results of SFV of monopile installations must be submitted as soon as possible, but no later than within 90 days following completion of impact pile driving of monopiles and UXO/MEC detonations. The final report must include, at minimum, the following:<br>(A) Peak sound pressure level (SPLpk), root-mean-square sound pressure level that contains 90 percent of the acoustic energy (SPLrms), single strike sound exposure level (SELss), integration time for SPLrms, spectrum, and 24-hour cumulative SEL extrapolated from measurements at specified distances (e.g., 750 m). All these levels must be reported in the form of (1) median, (2) mean, (3) maximum, and (4) minimum. The SEL and SPL power spectral density and one-third octave band levels (usually calculated as decidecade band levels) at the receiver locations should be reported;<br>(B) The sound levels reported must be in median and linear average (i.e., average in linear space), and in dB;<br>(C) A description of depth and sediment type, as documented in the Construction and Operation Plan, at the recording and pile driving locations;<br>(D) Hammer energies required for pile installation and the number of strikes per pile;<br>(E) Hydrophone equipment and methods (i.e., recording device, bandwidth/sampling rate, distance from the pile where recordings were made; depth of recording device(s));<br>(F) Description of the SFV PAM hardware and software, including software version used, calibration data, bandwidth capability and sensitivity of hydrophone(s), any filters used in hardware or software, any limitations with the equipment, and other relevant information;<br>(G) Description of UXO/MEC, weight, including donor charge weight, and why detonation was necessary;<br>(H) Local environmental conditions, such as wind speed, transmission loss data collected on-site (or the sound velocity profile), baseline pre- and post-activity ambient sound levels (broadband and/or within frequencies of concern);<br>(I) Spatial configuration of the noise attenuation device(s) relative to the pile;<br>(J) The extents of the Level A harassment and Level B harassment zones; and<br>(K) A description of the noise abatement system and operational parameters (e.g., bubble flow rate, distance deployed from the pile, etc.) and any action taken to adjust the noise abatement system.<br>10) Situational Reporting. Specific situations encountered during the development of Revolution Wind shall require immediate reporting to be undertaken. These situations and the relevant procedures are described below. |

| Measure Number | Description of Measures that may be Required by Other Authorizations and Permits Issued to the Lessee |
|---|---|
| | i) If a North Atlantic right whale is observed at any time by PSOs or personnel on or in the vicinity of any project vessel, or during vessel transit, Revolution Wind must immediately report sighting information to the NMFS North Atlantic Right Whale Sighting Advisory System (866) 755-6622, through the WhaleAlert app (http://www.whalealert/org/), and to the U.S. Coast Guard via channel 16, as soon as feasible but no longer than 24 hours after the sighting. Information reported must include, at a minimum: time of sighting, location, and number of North Atlantic right whales observed.<br>ii) When an observation of a marine mammal occurs during vessel transit, the following information must be recorded:<br>(A) Time, date, and location;<br>(B) The vessel's activity, heading, and speed;<br>(C) Sea state, water depth, and visibility;<br>(D) Marine mammal identification to the best of the observer's ability (e.g., North Atlantic right whale, whale, dolphin, seal);<br>(E) Initial distance and bearing to marine mammal from vessel and closest point of approach; and<br>(F) Any avoidance measures taken in response to the marine mammal sighting.<br>iii) If a North Atlantic right whale is detected via PAM, the date, time, location (i.e., latitude and longitude of recorder) of the detection as well as the recording platform that had the detection must be reported to nmfs.pacmdata@noaa.gov as soon as feasible, but no longer than 24 hours after the detection. Full detection data and metadata must be submitted monthly on the 15th of every month for the previous month via the webform on the NMFS North Atlantic right whale Passive Acoustic Reporting System website (https://www.fisheries.noaa.gov/resource/document/passive-acoustic-reporting-system-templates);<br>iv) In the event that the personnel involved in the activities defined in § 217.270(a) discover a stranded, entangled, injured, or dead marine mammal, Revolution Wind must immediately report the observation to the NMFS Office of Protected Resources (OPR), the NMFS Greater Atlantic Stranding Coordinator for the New England/Mid-Atlantic area (866-755-6622), and the U.S. Coast Guard within 24 hours. If the injury or death was caused by a project activity, Revolution Wind must immediately cease all activities until NMFS OPR is able to review the circumstances of the incident and determine what, if any, additional measures are appropriate to ensure compliance with the terms of the LOA. NMFS may impose additional measures to minimize the likelihood of further prohibited take and ensure MMPA compliance. Revolution Wind may not resume their activities until notified by NMFS. The report must include the following information:<br>(A) Time, date, and location (latitude/longitude) of the first discovery (and updated location information if known and applicable);<br>(B) Species identification (if known) or description of the animal(s) involved;<br>(C) Condition of the animal(s) (including carcass condition if the animal is dead);<br>(D) Observed behaviors of the animal(s), if alive;<br>(E) If available, photographs or video footage of the animal(s); and<br>(F) General circumstances under which the animal was discovered.<br>v) In the event of a vessel strike of a marine mammal by any vessel associated with the Revolution Wind Offshore Wind Farm Project, Revolution Wind must immediately report the strike incident to the NMFS OPR and the GARFO within and no later than 24 hours. Revolution Wind must immediately cease all activities until NMFS OPR is able to review the circumstances of the incident and determine what, if any, additional measures are appropriate to ensure compliance with the terms of the LOA. NMFS may impose additional measures to minimize the likelihood of further prohibited take and ensure MMPA compliance. Revolution Wind may not resume their activities until notified by NMFS. The report must include the following information:<br>(A) Time, date, and location (latitude/longitude) of the incident;<br>(B) Species identification (if known) or description of the animal(s) involved;<br>(C) Vessel's speed leading up to and during the incident;<br>(D) Vessel's course/heading and what operations were being conducted (if applicable);<br>(E) Status of all sound sources in use;<br>(F) Description of avoidance measures/requirements that were in place at the time of the strike and what additional measures were taken, if any, to avoid strike;<br>(G) Environmental conditions (e.g., wind speed and direction, Beaufort sea state, cloud cover, visibility) immediately preceding the strike;<br>(H) Estimated size and length of animal that was struck;<br>(I) Description of the behavior of the marine mammal immediately preceding and following the strike;<br>(J) If available, description of the presence and behavior of any other marine mammals immediately preceding the strike;<br>(K) Estimated fate of the animal (e.g., dead, injured but alive, injured and moving, blood or tissue observed in the water, status unknown, disappeared); and<br>(L) To the extent practicable, photographs or video footage of the animal(s). |

## Environmental and Physical Settings and Supplemental Information

Section 508 of the Rehabilitation Act of 1973 requires that the information in federal documents be accessible to individuals with disabilities. The Bureau of Ocean Energy Management has made every reasonable effort to ensure that the information in this document is accessible. If you have any problems accessing the information, please contact BOEM's Office of Public Affairs at boempublicaffairs@boem.gov or (202) 208-6474.

# Contents

# Figures

## Tables

# Introduction

This appendix provides information on the environmental and physical settings of the Lease Area and information by resource or topic, as applicable, that supplements the information provided in the Revolution Wind Farm (RWF) and Revolution Wind Export Cable (RWEC) Project environmental impact statement (EIS).

# Environmental and Physical Settings

This section addresses the physical, geological, and biological settings near the RWF and RWEC Project (the Project). As directed under Section 1501.12 of the Council on Environmental Quality's (CEQ's) revised National Environmental Policy Act (NEPA) regulations, this EIS incorporates, by reference, the detailed analysis provided in the Vineyard Wind final EIS in Appendix E (Bureau of Ocean Energy Management [BOEM] 2021).

For more specific environmental and physical setting information, the reader is referred to the following COP sections in the *Construction & Operations Plan Revolution Wind Farm* (COP) (VHB 2023):

- General regional setting: See Sections 4.6.7 and 4.3.1 of the COP, which describe current land uses and land cover types near the onshore Project components.
- Climate: See Section 4.2.1 of the COP, which describes current air quality near the RWF and RWEC.
- Physical oceanography and meteorology: See Section 4.2.4 of the COP, which provides detailed information on physical oceanographic conditions, including circulation, currents, and water column stratification by temperature and salinity, as well as meteorological conditions such as wind speed and direction, occurrence of storms and cyclones, and ice and fog. Few hurricanes pass through New England, but the area is subjected to frequent Nor'easters that form offshore between Georgia and New Jersey and typically reach maximum intensity in New England. These storms are usually characterized by winds from the northeast and can bring heavy precipitation, wind, storm surges, and rough seas. They primarily occur between September and April but can form any time of year. Although hurricanes are relatively infrequent in New England, wave heights up to 30 feet (9 meters [m]) were recorded south of Block Island (Scripps Buoy 44097) during Hurricane Sandy in 2012 (National Oceanic and Atmospheric Administration, National Weather Service 2012).
- Geological resources: See Section 4.2.3 of the COP, which describes the regional geological setting as well as specific marine geophysical and geotechnical site investigations conducted for the RWF in accordance with BOEM regulations at 30 Code of Federal Regulations (CFR) 585.
- Biological resources: See Sections 4.3.2 to 4.3.7 of the COP, which describe current types and status of terrestrial and marine resources near the RWF and RWEC.

Analysis of potential impacts to these resources from all offshore wind activities is provided in the EIS as part of each resource's No Action Alternative discussion. Discussion of impacts as a result of the Proposed Action references the No Action Alternative where possible to reduce replication and focus the analysis on the differences among alternatives. EPMs and any other measures that would be implemented to monitor or minimize resource impacts are discussed in EIS Appendix F.

# Avian and Bat Postconstruction Monitoring Framework

Revolution Wind, LLC (Revolution Wind) has developed a draft avian and bat postconstruction monitoring plan for the Project that summarizes the approach to monitoring; describes overarching monitoring goals and objectives; identifies the key avian species, priority questions, and data gaps unique to the region and Lease Area that would be addressed through monitoring; and describes methods and time frames for data collection, analysis, and reporting (see COP Appendix AA [Biodiversity Research Institute 2023]). Postconstruction monitoring would assess impacts of the Project with the purpose of filling select information gaps and supporting validation of the Project's avian risk assessment. Focus may be placed on improving knowledge of Endangered Species Act (ESA)–listed species occurrence and movements offshore, avian collision risk, species/species group displacement, or similar topics. Where possible, monitoring conducted by Revolution Wind would build on and align with postconstruction monitoring conducted by the other Orsted/Eversource offshore wind projects in the Northeast region. Revolution Wind would engage with federal and state agencies and environmental groups to identify appropriate monitoring options and technologies and to facilitate acceptance of the final avian and bat postconstruction monitoring plan (see COP Appendix AA [Biodiversity Research Institute 2023]).

The content of the draft *Revolution Wind Avian and Bat Post-Construction Monitoring Framework* is provided below and is a direct excerpt from the *Assessment of the Potential Effects of the Revolution Offshore Wind Farm on Birds and Bats* (COP Appendix AA [Biodiversity Research Institute 2023:231–235]). Full references supporting this excerpt's author-year citations can be found in COP Appendix AA.

## Introduction

Revolution Wind LLC (Revolution Wind), a 50/50 joint venture between Orsted North America Inc. (Orsted NA) and Eversource Investment LLC (Eversource), proposes to construct and operate the RWF and the RWEC, collectively the Revolution Wind Farm Project (hereinafter referred to as the Project). The wind farm portion of the Project will be in Bureau of Ocean Energy Management (BOEM) Renewable Energy Lease Area OCS-A 0486 (Lease Area), southeast of Point Judith, Rhode Island, and east of Block Island, Rhode Island. The Project's generating capacity will range between 704 megawatts (MW) and 880 MW. This RWF Avian and Bat Post-Construction Monitoring Framework (hereafter the "Framework") focuses solely on the offshore footprint of the Project within the Lease Area, and does not apply to the offshore export cable, cable landfall, or onshore portions of the Project.

Revolution Wind has developed this Framework to outline an approach to post-construction monitoring that supports advancement of the understanding of bird and bat interactions with offshore wind farms, and other areas of uncertainty, such as the potential influence of weather conditions. The scope of monitoring is designed to meet federal requirements [30 CFR 585.626(b)(15) and 585.633(b)] and is scaled to the size and risk profile of the Project with a focus on species of conservation concern.

The intent of the Framework is to outline overarching monitoring objectives, monitoring questions, proposed monitoring elements, and reporting requirements. A detailed Avian and Bat Post-Construction Monitoring Plan (Monitoring Plan), based on this Framework, will be developed in coordination with BOEM, U.S. Fish and Wildlife Service (USFWS), and other relevant regulatory agencies prior to beginning monitoring. Where feasible, monitoring conducted at the RWF will be coordinated with monitoring at neighboring Orsted/Eversource offshore wind projects—South Fork Wind Farm (SFWF) and Sunrise Wind Farm (SRWF)—to facilitate integrated analyses across a broader geographic area.

Monitoring objectives, questions, and associated methods are summarized in Table G-AB1. Technical approaches were selected based on offshore logistical constraints, their ability to address monitoring objectives, and their effectiveness in the marine environment. Emerging technologies, such as multi-sensor radar/camera collision detection systems, are not proposed under this Framework because they have not yet been broadly deployed offshore or demonstrated to effectively reduce uncertainties related to potential impacts on birds and bats.

**Table G-AB1. Monitoring Objectives, Questions, General Approaches to be Used, and Duration**

| Taxa | Monitoring Objective | Primary Questions | Approach | Duration |
|---|---|---|---|---|
| Bats | Monitor occurrence of bats | What times of year and under what environmental conditions are bats detected in the wind farm? | Acoustics | 2 years |
| Birds | Monitor use by ESA listed birds | What times of year and under what conditions are ESA birds present in the wind farm? | Radio tags | up to 3 years |
| Birds | Monitor use by nocturnal migratory birds | What are the flux rates and flight heights of nocturnally migrating birds? | Radar | 1-2 years |
| Birds | Monitor movement of marine birds around the turbines | What are the avoidance rates of marine birds? | Radar | 1-2 years |
| Both | Document mortality | What dead or injured species are found incidentally? | Incidental observations | Project lifetime |

## Bat Acoustic Monitoring

The presence of bats in the marine environment has been documented in the U.S. (Hatch et al. 2013, Solick and Newman 2021). However, there remains uncertainty regarding the extent to which bats occur offshore, particularly within offshore wind farms. Acoustic detectors are commonly used to study bat movements and migration (Johnson et al. 2011). Following the approach taken at SFWF (Final Environmental Impact Statement Appendix F[1]), Orsted/Eversource would conduct bat acoustic monitoring to assess bat activity at RWF, targeting key data gaps related to species presence/composition, temporal patterns of activity, and correlation with weather and atmospheric conditions. The primary monitoring questions are: What times of year and under what environmental conditions are bats detected in the wind farm?

[1] https://www.boem.gov/renewable-energy/state-activities/south-fork

Acoustic monitoring of bat presence would be conducted for two years post-construction. A detector would first be tested onsite to determine if there is any sound interference. Contingent on a successful test, ultrasonic bat detector stations would be installed on the offshore convertor station, wind turbine platforms, and/or buoys. The specific number and location of detector stations would be selected to optimize study design goals, and would be determined in cooperation with BOEM, USFWS, and other relevant regulatory agencies. While specific timing would be dictated by logistics, detectors would likely be deployed in the early spring or late winter (March), and removed in the late fall or early winter (December) after migration, or the most appropriate period as determined in cooperation with BOEM, USFWS, and other relevant regulatory agencies. The detectors would record calls of both cave-hibernating bats, including the northern long-eared bat (Myotis septentrionalis), and migratory tree bats; the resulting information can be used to identify bats to species. All acoustic data recorded would be processed with approved software to filter out poor quality data and identify the presence of bat calls. Where information is insufficient to make a species identification, calls would be classified to one of two phonic groups: low frequency bats (LoF), or high frequency bats (HiF). The HiF group includes both migratory tree bats and cave hibernating bats. Since HiFi include the ESA-listed northern long-eared bat, they would then be manually vetted by an experienced acoustician to the highest resolution possible (e.g., species or genus).

All bat calls detected and identified would be analyzed to understand relationships with time of day, season, and weather/atmospheric conditions. The results would provide information on bat presence offshore and the conditions under which they may occur near offshore wind turbines.

### Motus Tracking Network and ESA Use Study

Tracking studies indicate that at least some individual ESA-listed Piping Plovers (*Charadrius melodus*), Red Knots (*Calidris canutus rufa*), and Roseate Terns, may pass through the Rhode Island and Massachusetts lease areas (Loring et al. 2018, 2019). However, due to limited coverage of onshore automated telemetry receiving stations and low probability of detecting tags (hereafter, Motus receivers and tags) in the offshore environment (Loring et al. 2019), there remains uncertainty related to offshore movements of ESA-listed birds in New England. Revolution Wind would install offshore Motus receiver stations and contribute funding to radio-tagging efforts to address this data gap. The exact species being studied would be determined in consultation with federal agencies and would be dependent on existing, ongoing field efforts. The Motus receivers would also provide opportunistic presence/absence data on other species carrying Motus tags, such as migratory songbirds and bats. The primary monitoring questions are: What times of year and under what environmental conditions are ESA birds present in the wind farm?

Movements of radio-tagged ESA-listed birds in the vicinity of the RWF would be monitored for up to three years post-construction, during the spring, summer, and fall. Motus receivers would be installed within the wind farm to determine the presence/absence of ESA-listed species. The specific number and location of offshore receiver stations would be selected to optimize study design goals, and would be determined using a design tool currently being developed through a New York State Energy Research and Development Authority (NYSERDA) funded project[2]. If there is a need identified by USFWS and in coordination with efforts at SFWF and RWF, existing Motus receiver stations at up to two onshore

[2] https://www.briloon.org/renewable/automatedvhfguidance

locations near the RWF would be refurbished or maintained to confirm the presence and movements of radio-tagged ESA-species in areas adjacent to RWF. Funding for up to 150 Motus tags per year would be provided to researchers working with ESA-listed birds for up to three consecutive years.

ESA-listed bird presence/absence in the wind farm would be analyzed by comparing detections within the wind farm to coastal receiver towers. All detections would be analyzed to understand relationships with time of day, season, and weather.

### Radar Monitoring: Nocturnal Migrants Flux and Flight Heights

Nocturnal migrants, including songbirds and shorebirds, are documented to fly offshore (Adams et al. 2015, Loring et al. 2020). Since nocturnal migration events are episodic and cannot be detected during daytime surveys, there is uncertainty on the timing and intensity of migration offshore. Radar, oriented vertically, has been used at offshore wind farms in Europe to study nocturnal migration events (Hill et al. 2014). Orsted/Eversource is considering conducting a one-to-two-year radar study across SRWF, SFWF, and RWF to record the passage rates (flux) of migrants and flight heights. The primary monitoring questions are: What are the flux rates and flight heights of nocturnally migrating birds?

Since radar approaches to monitoring birds are actively evolving and feasibility would need to be determined, a specific system and methods would be identified closer to when the projects begin operating. The results would be related to time of year and weather conditions, to increase the understanding on when nocturnal migrants may have higher collision risk.

### Radar Monitoring: Marine Bird Avoidance

Marine birds, particularly loons, sea ducks, auks, and the Northern Gannet (Morus bassanus), have been documented to avoid offshore wind farms, potentially leading to displacement from habitat (Goodale and Milman 2016). However, there remains uncertainty on how birds would respond to Orsted/Eversource’s large turbines that would be spaced one nautical mile apart. Based on methods used by Desholm and Kahlert (2005), Skov et al. (2018), and others, Orsted/Eversource is considering conducting a one-to-two-year cross-project (SRWF, SFWF, and RWF) radar study to collect data on macro (and potentially meso—i.e., flying between turbines) avoidance rates. These data on avoidance would support understanding of both displacement and collision vulnerability. The primary monitoring questions is: What are the avoidance rates of marine birds?

### Documentation of Dead and Injured Birds and Bats

Revolution Wind, or its designated operator, would implement a reporting system to document dead or injured birds or bats found incidentally on vessels and project structures during construction, operation, and decommissioning. The location would be marked using GPS, an Incident Reporting Form would be filled out, and digital photographs taken. Any animals detected that could be ESA-listed, would have their identity confirmed by consulting biologists, and a report would be submitted to the designated staff at Revolution Wind who would then report it to BOEM, USFWS, and other relevant regulatory agencies. Carcasses with federal or research bands or tags would be reported to the U.S. Geological Survey (USGS) Bird Band Laboratory, BOEM, and USFWS.

### Adaptive Monitoring

Adaptive monitoring is an important principle underlying Revolution Wind's post-construction monitoring Framework. Over the course of monitoring, Revolution Wind would work with BOEM, USFWS, and other relevant regulatory agencies, to determine the need for adjustments to monitoring approaches, consideration of new monitoring technologies, and/or additional periods of monitoring, based on an ongoing assessment of monitoring results. Potential triggers for adaptive monitoring may include, but not be limited to, equipment failure, an unexpected impact to birds or bats identified through monitoring, or new opportunities to collaborate with other projects in the region. The Monitoring Plan would include a series of potential adaptive monitoring actions, developed in coordination with BOEM, USFWS, and other relevant regulatory agencies, to be considered as appropriate.

### Reporting

Revolution Wind would submit an annual report to BOEM and USFWS summarizing post-construction monitoring activities, preliminary results as available, and any proposed changes in the monitoring program. Revolution Wind would participate in an annual meeting with BOEM and USFWS to discuss the report. Data from these monitoring studies would ultimately be submitted to relevant regional databases and archives (e.g., NABat), as feasible and appropriate (Biodiversity Research Institute 2023:231–235)

# Commercial Fisheries and For-Hire Recreational Fishing

This section provides an overview of the commercial fisheries data used in EIS Section 3.9. It also provides a description of the methodological approach used to describe the dependency of fishermen on the Lease Area.

## Overview of Commercial Fisheries Data Used in the Environmental Impact Statement Section 3.9

The primary source of data used for this resource was summarized vessel trip report (VTR) data provided by the National Marine Fisheries Service (NMFS) (2021a, 2022a, 2023). These data comprise annual VTR data (2008–2019) for specific geographic areas relevant to the Project showing commercial fishing revenue, trips, and number of unique vessels for each fishery management plan (FMP) fishery, species, gear, and port of landing.[3] These data were also used to analyze the distribution of commercial fishing revenue from the Lease Area across fishing vessels. In addition, the VTR data provided by NMFS (2021a) describe the activities of for-hire recreational fishing vessels, including landings by species and the number of angler trips by port.

A second source of data was the website at NMFS (2022b), which summarizes commercial fisheries data for each proposed WEA along the U.S. Atlantic Coast. These data were downloaded and used to summarize revenue at risk across all proposed offshore wind projects under the No Action Alternative.

In addition, polar histograms (Figure 3.9-3 through Figure 3.9-6) developed by BOEM based on NMFS vessel monitoring system (VMS) data provided by NMFS (2019) are included in Section 3.9.[4] From January 2014 through August 2019, VMS coverage levels ranged between 90% and 100% for the following FMP fisheries: Atlantic Herring, Bluefish, Mackerel/Squid/Butterfish, Monkfish, Northeast Multispecies (large-mesh), Northeast Multispecies (small-mesh), Atlantic Sea Scallop, Spiny Dogfish, Summer Flounder/Scup/Black Sea Bass, and Surfclam/Ocean Quahog. Average VMS coverage levels were lower for the following FMP fisheries: Northeast Skate Complex (75%), Highly Migratory Species (48%), Jonah Crab (14%), and American Lobster (11%) (NMFS 2019).

[3] NMFS requires all federally permitted commercial fishing vessels (with the exception of those vessels that only have a lobster permit) to submit a VTR for every fishing trip (50 CFR 648.7). The VTR data provide a broad census of fishing activity that encompasses the majority of commercial fisheries active near the RWF and offshore RWEC. VTRs include a single fishing location (reported in latitude and longitude coordinates) for each trip. VTR location information is only an approximation of fishing activity, particularly with respect to the use of mobile gear, because fishermen self-report only one set of coordinates for a fishing trip, despite the fact that one trip may include multiple gear tows that take place in many different locations across a much wider area. VTR instructions require that fishermen record the haulback position where most of the fishing occurred (Livermore 2017; NMFS 2020a).

A fisherman with a vessel with a federal lobster permit is only required to fill out a VTR if he or she has another federal permit. Approximately 63% of the lobster fleet fishing in statistical area 537, which encompasses most of the RI/MA WEAs, reports through VTRs (Atlantic States Marine Fisheries Commission 2018).

[4] VMS data are generated from automated transmissions from transponders that are required to be on board and operating whenever permitted vessels are fishing or transiting with the intent to harvest fish or shellfish. Data are transmitted once every 60 minutes for all FMPs except sea scallops, which are transmitted once every 30 minutes. Each transmission includes the current directional bearing and vessel speed as well as the average bearing and vessel speed since the last transmission. Using the average vessel speed, NMFS uses an algorithm to assign an assumed activity (either fishing or transiting) to each transmission.

## Average Annual Revenues and Non-Disclosure Issues

In general, Section 3.9 provides information on the average annual revenue over the 2008–2019 period. However, annual data were provided only for the years for which data could be disclosed. If an annual datapoint for a given FMP, gear, or port within a given geographic area could not be disclosed because there was an insufficient number of vessels or dealers, then NMFS added the datapoint to a “non-disclosed” category. By combining all the datapoints that could not be disclosed, NMFS was able to report the annual total revenue for every year. However, this methodology for reporting non-disclosed datapoints hampers accurate estimation of average annual revenue because there were often non-disclosed data for 1 or more years, particularly if the geographic area was small or if there were relatively low levels of participation. Table G-CF1 demonstrates these issues and shows the annual data for gears as provided by NMFS for the RWEC from 2008 to 2019. It is not possible to infer whether numbers shown as zero (with a “–”) denote zero revenue for the gear, or if the data were not disclosed and assigned to the “all other gear” category.

## Commercial Fisheries Revenue Intensity Figures

The revenue intensity figures for commercial fisheries shown in Figures G-CF1 through G-CF13 have been developed to provide a visual representation of harvesting locations across FMP fisheries. These figures are reproduced from the Fishing Footprints webpage (NMFS 2020b) with the addition of the Lease Area and the RWEC superimposed. The figures are generally limited to those that are available for the 2016–2018 period, although an exception is made for Figure G-CF13, which summarizes the revenue intensity of all fisheries combined and which is provided for the 2013–2015 (the most recent data available on the webpage).

**Table G-CF1. National Marine Fisheries Service-Greater Atlantic Regional Fisheries Office Commercial Fishing Annual Revenue ($1,000s) Data for the Lease Area**

| Gear | 2008 | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 | 2016 | 2017 | 2018 | 2019 | Non-Zero Years |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Dredge-clam | – | $7.8 | – | – | – | $0.9 | – | – | – | – | – | – | 2 |
| Dredge-scallop | $10.8 | $5.6 | $2.8 | $14.4 | – | $5.3 | $8.3 | $17.8 | $20.6 | $6.1 | $4.8 | $11.0 | 11 |
| Dredge-scallop | $10.8 | $5.6 | $2.8 | $14.4 | – | $5.3 | $8.3 | $17.8 | $20.6 | $6.1 | $4.8 | $11.0 | 11 |
| Gillnet-sink | $35.3 | $38.7 | $49.3 | $38.3 | $24.3 | $22.9 | $24.7 | $20.8 | $25.8 | $25.8 | $15.5 | $15.9 | 12 |

## Methodology Used to Estimate Annual Future Revenue at Risk as Reported in Table 3.9-27

This section explains the methodology used to develop EIS Table 3.9-27, which estimates the annual future revenue at risk by FMP for the 2022–2030 period for offshore wind projects that have already been completed (i.e., Coastal Virginia Offshore Wind), for offshore wind projects for which construction has started (South Fork and Vineyard Wind 1), and for offshore wind projects currently scheduled to begin construction in 2023 or later. The primary data source for each offshore wind energy project is *Landing and Revenue Data for Wind Energy Lease Areas, 2008-2021* (NMFS 2022b). Using these data, annual average revenue by FMP is estimated for each lease area after adjusting for inflation to 2019 dollars using the GDP Implicit Price Deflator embedded in the data.

Each future offshore wind project is then assigned a construction start year and a construction end year based on information in Table E-1 in Appendix E (Planned Activities Scenario and Reasonably Foreseeable Future Activities and Projects) augmented with the assumption that the six lease areas in the New York Bight (i.e. OCS-A_0537, OCS-A_0538, OCS-A_0539, OCS-A_0541, OCS-A_0542, OCS-A_0544) would begin a phased-in construction process over 4 years from 2026 to 2029 and would be operational in 2030.

If the construction start year and construction end year are the same years, then it is assumed that construction begins and ends in that year and that operation begins in the following year.

## Analysis of the Economic Dependency on Fishing Grounds in the Lease Area among Commercial Fishing Vessels

To analyze differences in the economic importance of fishing grounds in the Lease Area across the commercial fishing fleet, information was obtained from NMFS (2021b) on the number of federally permitted commercial fishing vessels that fished annually in the Lease Area over the 2008–2019 period, together with box plot figure summarizing the relative dependence of these vessels during that period.

The vessel-level annual revenue percentages were divided into quartiles, which were created by ordering the data from lowest to highest percentage value and then dividing the data into four groups of equal size. The first quartile represents the lowest 25% of ranked percentages while the fourth quartile represents the highest 25%. NMFS (2021b) reported the number of "outlier" vessels in the revenue distribution as a percentage of revenue. In the context of this analysis, an outlier is a vessel that derived an exceptionally high proportion of its annual revenue from the Lease Area in comparison to other vessels that fished in the area.[5]

As shown in Table G-CF2, from 2008 through 2019, an average of 288 vessels per year fished in the Lease Area, with a high of 331 vessels in 2008 and a low of 251 vessels in 2018. The average annual number of outliers was 40.5 (14% of all vessels), with a high of 47 outliers in 2016 (14.6% of all vessels) and a low of 31 outliers in 2019 (11.8% of all vessels).

[5] Technically, an outlier in a box plot distribution is an observation that is more than 1.5 times the length of the box away from either the first quartile (Q1) or third quartile (Q3). Specifically, if an observation is less than Q1 – (1.5 × IQR) or greater than Q3 + (1.5 × IQR), it is an outlier; where IQR = interquartile range = Q3 – Q1.

**Table G-CF2. Number of Federally Permitted Vessels in the Lease Area (2008–2019)**

| Year | Number of Vessels | Number of Outliers | Number of Outliers as a Percentage of Total Vessels |
|---|---|---|---|
| 2008 | 331 | 46 | 13.9% |
| 2009 | 308 | 43 | 14.0% |
| 2010 | 253 | 35 | 13.8% |
| 2011 | 262 | 31 | 11.8% |
| 2012 | 282 | 40 | 14.2% |
| 2013 | 308 | 41 | 13.3% |
| 2014 | 308 | 46 | 14.9% |
| 2015 | 296 | 40 | 13.5% |
| 2016 | 322 | 47 | 14.6% |
| 2017 | 284 | 40 | 14.1% |
| 2018 | 251 | 35 | 13.9% |
| 2019 | 261 | 42 | 16.1% |
| Average | 288 | 40 | 14.0% |

Source: NMFS (2021b).

More detailed information about the distribution of the vessel-level annual revenue percentages is provided in the boxplot in Figure G-CF14. The box plot begins at the first quartile, or the value beneath which 25% of all vessel-level revenue percentages fall. A thick line within the box identifies the median, the observation at which 50% of vessel-level revenue percentages are above or beneath. The box ends at the third quartile, or the vessel-level revenue percentage beneath which 75% of observations fall. Nonparametric estimates of the minimum and maximum values are also indicated by the "whiskers" (dashed line terminating in a vertical line) that jut out from each side of the box. Any points outside of these whiskers are vessel-level revenue percentages that are considered outliers.

From 2008 through 2019, the vessel ranked as the seventy-fifth percentile vessel (i.e., the vessel in the third quartile with the greatest dependence on the Lease Area over the 12-year period) derived 0.88% of its total revenue from the Lease Area (NMFS 2021b). Of the outliers, the vessel with the greatest dependence on the Lease Area derived 38% of its total revenue from the area. Looking at individual years shown in the box plot, in 2008, one vessel derived nearly 60% of its total revenue from the Lease Area. In that same year, the vessel with the greatest percentage of dependence in the third quartile generated approximately 2.2% of its revenue from the Lease Area. Figure G-CF14 shows that in any given year the revenue percentage for the majority of outliers were below 10%.

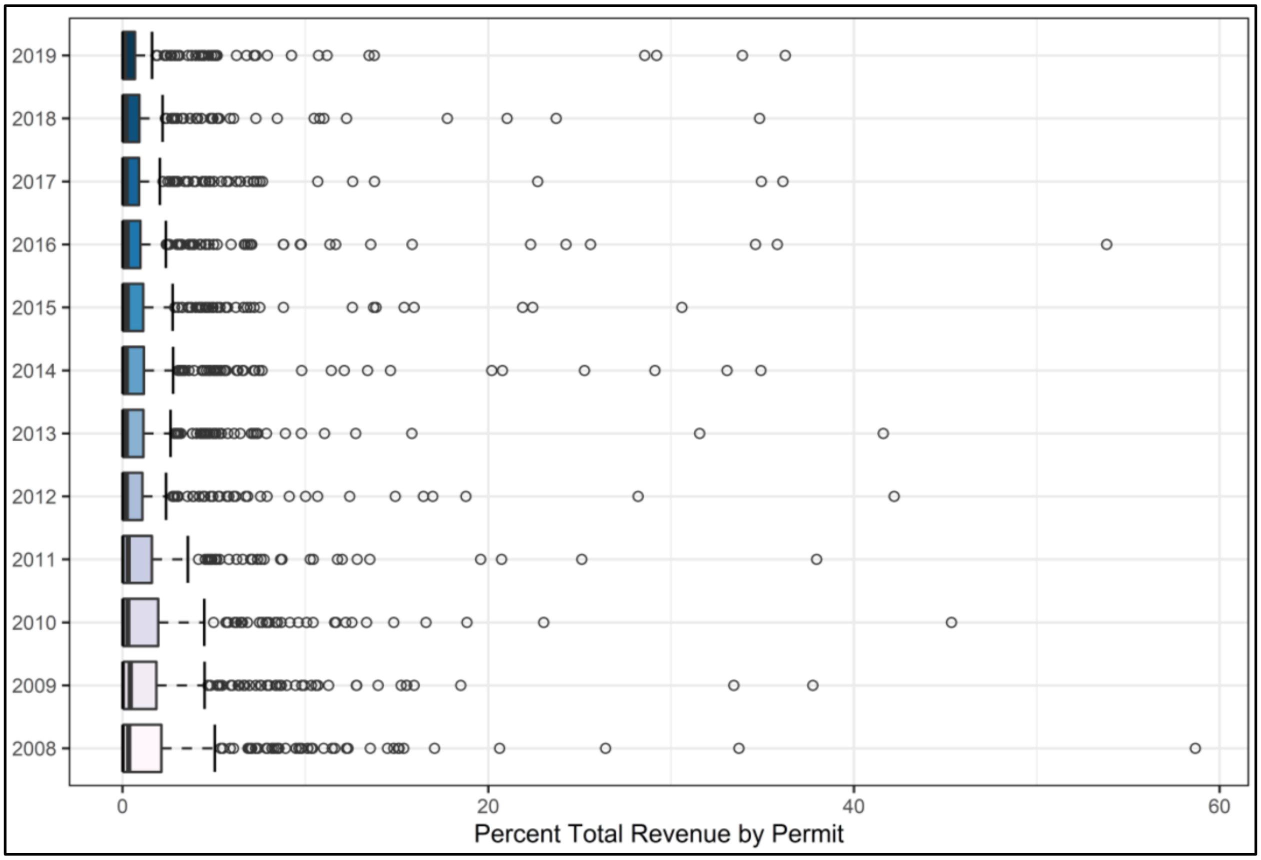

**Figure G-CF14. Percentage of Total Commercial Fishing Revenue of Federally Permitted Vessels Derived from the Lease Area by Vessel, 2008–2019 (NMFS 2021b).**

It is important to note that the box plot data do not provide any information about total revenues, or if there are correlations between the relative dependence on the Lease Area and total revenue of the individual vessel. To undertake this additional analysis, data would need to be requested from NMFS that would indicate the total revenue for each quartile/outlier group from within the Lease Area (i.e., the average numerator) as well as the total revenue from all areas fished (i.e., average denominator) for each quartile/outlier group.

### State Vessel Trip Report Data

This section reports the landings of Rhode Island state-only permitted vessels that fished in Greater Atlantic Region Statistical Area 539, which is the statistical area most relevant to the RWEC. Landings data are reported by species, gear type, and port of landing.

**Table G-CF3. Commercial Fishing Landings of Rhode Island State-only Permitted Vessels in Statistical Area 539 by Species (2009–2018)**

| Species | Average Annual Landings (pounds) |
|---|---|
| American lobster | 33,533 |
| Atlantic bonito | 5,042 |

| **Species** | **Average Annual Landings (pounds)** |
|---|---|
| Atlantic herring | 8,839 |
| Atlantic mackerel | 1,255 |
| Black sea bass | 78,100 |

## Number of Affected Vessels and Trips in the Combined Lease Area and Offshore RWEC by FMP Fishery, Species, Port, and Gear under Alternatives B, C, E2, and G

This section provides estimates of the average annual number of vessels and trips in the combined Lease Area and area along the offshore RWEC that would be affected during construction under Alternatives B, C, E2, and G. Data are reported by FMP fishery, gear type, and port of landing. The estimates are based on 2008 through 2019 data from NMFS (2021a, 2022a, 2023). Vessel and trip data for all design configurations of Alternative D and for Alternative E1 could not be provided because the data were provided separately for the Lease Area and RWEC. Combining data for the two areas could result in double counting. Vessel and trip data for Alternative F could not be provided because which WTG positions would be omitted under this alternative is unknown.

## Alternative B

### *FMP Fishery*

**Table G-CF6. Annual Number of Vessels and Trips in the Lease Area and along the RWEC by FMP Fishery under Alternative B**

| FMP Fishery | Average Annual Number of Vessels | Average Annual Number of Trips | Average Annual Number of Vessels as a Percentage of Total Vessels in the RFA | Average Annual Number of Trips as a Percentage of Total Trips in the RFA |
|---|---|---|---|---|
| American Lobster | 113 | 2,862 | 38% | 51% |
| Atlantic Herring | 24 | 172 | 40% | 36% |
| Bluefish | 132 | 1,806 | 36% | 30% |
| Highly Migratory Species | 34 | 248 | 26% | 14% |
| Jonah Crab | 52 | 996 | 52% | 51% |
| Mackerel/Squid/ Butterfish | 120 | 2,638 | 43% | 33% |
| Monkfish | 163 | 2,134 | 32% | 25% |
| Northeast Multispecies (large-mesh) | 103 | 1,177 | 38% | 38% |
| Northeast Multispecies (small-mesh) | 102 | 1,668 | 47% | 34% |
| Atlantic Sea Scallop | 58 | 407 | 16% | 14% |
| Southeast Regional Office FMPs | 184 | 3,731 | 40% | 33% |
| Northeast Skate Complex | 130 | 2,431 | 42% | 32% |
| Spiny Dogfish | 56 | 482 | 39% | 35% |
| Summer Flounder/Scup/ Black Sea Bass | 162 | 3,701 | 40% | 31% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Total over all FMP fisheries cannot be estimated with the available data.

### *Species*

**Table G-CF7. Annual Number of Vessels and Trips in the Lease Area and along the RWEC by Species under Alternative B**

| Species | Average Annual Number of Vessels | Average Annual Number of Trips | Average Annual Number of Vessels as a Percentage of Total Vessels in the RFA | Average Annual Number of Trips as a Percentage of Total Trips in the RFA |
|---|---|---|---|---|
| American lobster | 113 | 2,862 | 38% | 51% |
| Atlantic herring | 24 | 172 | 40% | 36% |
| Atlantic mackerel | 60 | 316 | 40% | 29% |

| Westport, MA | 12.6 | 255 | 77% | 63% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Rows using italicized font indicated that fewer the 12 years of data were available. State-level estimates for vessels and trips cannot be estimated with the available data.

CT = Connecticut, MA = Massachusetts, MD = Maryland, NC = North Carolina, NJ = New Jersey, NY = New York, RI = Rhode Island, VA = Virginia.

### Gear

**Table G-CF9. Annual Number of Vessels and Trips in the Lease Area and along the RWEC by Gear Type under Alternative B (2009–2018)**

| Gear | Average Annual Number of Vessels | Average Annual Number of Trips | Average Annual Number of Vessels as a Percentage of Total Vessels in the RFA | Average Annual Number of Trips as a Percentage of Total Trips in the RFA |
|---|---|---|---|---|
| *Dredge-clam (7 of 12 years)* | *6* | *112* | *20%* | *8%* |
| Dredge-scallop | 34 | 260 | 11% | 16% |
| Gillnet-sink | 45 | 1,143 | 38% | 30% |
| Handline | 41 | 333 | 21% | 10% |
| *Longline-bottom (4 of 12 years)* | *3* | *9* | *16%* | *4%* |
| Pot-lobster† | 75 | 2,600 | 53% | 54% |
| Pot-other† | 31 | 653 | 43% | 28% |
| Trawl-bottom | 133 | 3,646 | 40% | 30% |
| *Trawl-midwater (10 of 12 years)* | *11* | *57* | *68%* | *37%* |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Rows using italicized font indicated that fewer the 12 years of data were available. Totals over all gears cannot be estimated with the available data.

†Pot gear has been disaggregated to Pot-Lobster and Pot-Other.

## Alternative C

### FMP Fishery

**Table G-CF10. Annual Number of Vessels and Trips in the Lease Area and along the RWEC by FMP Fishery under Alternative C1**

| FMP Fishery | Average Annual Number of Vessels | Average Annual Number of Trips | Average Annual Number of Vessels as a Percentage of Total Vessels in the RFA | Average Annual Number of Trips as a Percentage of Total Trips in the RFA |
|---|---|---|---|---|
| American Lobster | 113 | 2,862 | 38% | 51% |
| Atlantic Herring | 24 | 172 | 40% | 36% |
| Bluefish | 132 | 1,806 | 36% | 30% |
| Highly Migratory Species | 34 | 248 | 26% | 14% |
| Jonah Crab | 52 | 996 | 52% | 51% |

| FMP Fishery | Average Annual Number of Vessels | Average Annual Number of Trips | Average Annual Number of Vessels as a Percentage of Total Vessels in the RFA | Average Annual Number of Trips as a Percentage of Total Trips in the RFA |

†Pot gear has been disaggregated to Pot-Lobster and Pot-Other.

## Estimated Annual Commercial Fishing Revenue Exposed in the Combined Lease Area and Offshore RWEC by FMP Fishery, Port, and Gear under Alternatives C, D, E, and G

This section provides estimates of the annual commercial fishing revenue at risk in the combined Lease Area and area along the offshore RWEC during construction under all design configurations of Alternatives C, D, E, and G. Data are reported by FMP fishery, gear type, and port of landing. The estimates are based on 2008 through 2019 data from NMFS (2021a, 2022a, 2023). Revenue at risk data for Alternative F could not be provided because which WTG positions would be omitted under this alternative is unknown.

## Alternative C

### *FMP Fishery*

**Table G-CF26. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative C1**

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| American Lobster | $462.9 | $261.8 | 0.28% | 3.36% |
| Atlantic Herring | $267.1 | $100.9 | 0.39% | 3.37% |
| Bluefish | $17.0 | $8.6 | 0.67% | 1.47% |
| Highly Migratory Species | $6.8 | $2.2 | 0.10% | 0.98% |
| Jonah Crab | $37.8 | $21.4 | 0.22% | 0.36% |
| Mackerel/Squid/ Butterfish | $296.6 | $136.4 | 0.26% | 0.88% |
| Monkfish | $179.0 | $97.9 | 0.48% | 1.30% |
| Northeast Multispecies (large-mesh) | $112.3 | $48.9 | 0.07% | 2.05% |
| Northeast Multispecies (small-mesh) | $189.0 | $71.1 | 0.63% | 2.52% |
| Atlantic Sea Scallop | $367.9 | $143.7 | 0.03% | 0.29% |
| Northeast Skate Complex | $160.5 | $102.1 | 1.37% | 2.85% |
| Spiny Dogfish | $35.2 | $15.2 | 0.51% | 6.22% |
| Summer Flounder/Scup/ Black Sea Bass | $126.3 | $80.5 | 0.20% | 0.73% |
| Other FMPs, non-disclosed species and non-FMP fisheries | $550.4 | $235.4 | 0.25% | 0.70% |
| All FMP and non-FMP fisheries | $1,610.9 | $1,326.0 | 0.14% | 0.92% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

The “Other FMPs, non-disclosed species, and non-FMP fisheries” category includes revenue from three FMP fisheries: Surfclam/Ocean Quahog, Red Crab, and River Herring. In addition, it includes revenue from species in FMP fisheries for which data could not be disclosed due to confidentiality restrictions, and revenue earned by federally permitted vessels operating in fisheries that are not federally managed.

**Table G-CF27. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative C2**

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| American Lobster | $428.1 | $246.0 | 0.26% | 3.15% |
| Atlantic Herring | $261.1 | $99.2 | 0.38% | 3.31% |
| Bluefish | $16.8 | $8.5 | 0.67% | 1.46% |
| Highly Migratory Species | $6.6 | $2.1 | 0.09% | 0.95% |
| Jonah Crab | $36.0 | $20.3 | 0.21% | 0.35% |
| Mackerel/Squid/ Butterfish | $279.7 | $130.7 | 0.25% | 0.85% |
| Monkfish | $166.4 | $92.6 | 0.45% | 1.23% |
| Northeast Multispecies (large-mesh) | $109.3 | $47.1 | 0.06% | 1.97% |
| Northeast Multispecies (small-mesh) | $185.3 | $69.2 | 0.61% | 2.45% |
| Atlantic Sea Scallop | $354.5 | $138.1 | 0.03% | 0.28% |
| Northeast Skate Complex | $152.3 | $97.0 | 1.30% | 2.71% |
| Spiny Dogfish | $34.6 | $14.7 | 0.49% | 6.03% |
| Summer Flounder/Scup/ Black Sea Bass | $121.9 | $77.8 | 0.20% | 0.71% |
| Other FMPs, non-disclosed species and non-FMP fisheries | $534.3 | $227.5 | 0.24% | 0.67% |
| All FMP and non-FMP fisheries | $1,546.5 | $1,270.8 | 0.13% | 0.88% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

The "Other FMPs, non-disclosed species, and non-FMP fisheries" category includes revenue from three FMP fisheries: Surfclam/Ocean Quahog, Red Crab, and River Herring. In addition, it includes revenue from species in FMP fisheries for which data could not be disclosed due to confidentiality restrictions, and revenue earned by federally permitted vessels operating in fisheries that are not federally managed.

### *Port*

**Table G-CF28. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by Port under Alternative C1**

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

† Pot gear combines pot-lobster and pot-other.

* Includes revenue from federally permitted vessels using longline gear, seine gear, other gillnet gear, and unspecified gear, as well as listed gear for years when they were not disclosed.

## Alternative D

### *FMP Fishery*

**Table G-CF32. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative D1**

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| American Lobster | $492.7 | $274.2 | 0.29% | 3.52% |
| Atlantic Herring | $270.5 | $101.8 | 0.39% | 3.40% |
| Bluefish | $17.0 | $8.6 | 0.67% | 1.47% |
| Highly Migratory Species | $6.6 | $2.1 | 0.10% | 0.97% |
| Jonah Crab | $38.4 | $22.0 | 0.23% | 0.37% |
| Mackerel/Squid/ Butterfish | $306.4 | $139.7 | 0.27% | 0.91% |
| Monkfish | $186.9 | $98.4 | 0.48% | 1.31% |
| Northeast Multispecies (large-mesh) | $113.1 | $48.8 | 0.07% | 2.04% |
| Northeast Multispecies (small-mesh) | $190.7 | $71.6 | 0.64% | 2.53% |
| Atlantic Sea Scallop | $338.6 | $136.5 | 0.03% | 0.27% |
| Northeast Skate Complex | $166.5 | $104.5 | 1.40% | 2.92% |

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| Spiny Dogfish | $35.2 | $15.3 | 0.51% | 6.27% |
| Summer Flounder/Scup/ Black Sea Bass | $127.4 | $81.5 | 0.20% | 0.74% |
| Other FMPs, non-disclosed species and non-FMP fisheries | $567.3 | $238.2 | 0.25% | 0.71% |
| All FMP and non-FMP Fisheries | $1,632.7 | $1,343.1 | 0.14% | 0.93% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

The “Other FMPs, non-disclosed species, and non-FMP fisheries” category includes revenue from three FMP fisheries: Surfclam/Ocean Quahog, Red Crab, and River Herring. In addition, it includes revenue from species in FMP fisheries for which data could not be disclosed due to confidentiality restrictions, and revenue earned by federally permitted vessels operating in fisheries that are not federally managed.

### Table G-CF33. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative D2

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| American Lobster | $496.8 | $272.5 | 0.29% | 3.49% |
| Atlantic Herring | $271.7 | $102.3 | 0.39% | 3.42% |

| Confidential port data‡‡ | *$143.4* | *$66.5* | *0.14%* | *1.19%* |
| **Total** | **$1,632.7** | **$1,348.6** | **0.14%** | **0.94%** |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

Ports shown in *italics* indicate that fewer than 12 years but more than 4 years of data were used to calculate the estimates. Otherwise, estimates are based on 12 years of data.

CT = Connecticut, MA = Massachusetts, MD = Maryland, NC = North Carolina, NJ = New Jersey, NY = New York, RI = Rhode Island, VA = Virginia.

* See Table 3.9-4 in Section 3.9 for Mid-Atlantic and New England fisheries data by port and state.

† See Table 3.9-8 in Section 3.9 for RFA fisheries data by port state.

‡ Revenues by Port State includes all of the revenues by the ports listed above, as well as revenues of other ports within the state that were reported by NMFS, but which had 4 or fewer years of data and were not included in the table.

‡‡ Includes data for all ports that were withheld by NMFS to protect the confidentiality of individual vessels and/or buyers.

## Alternative E

### *FMP Fishery*

**Table G-CF53. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative E1**

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| American Lobster | $344.9 | $189.3 | 0.20% | 2.43% |
| Atlantic Herring | $206.4 | $83.9 | 0.32% | 2.80% |
| Bluefish | $15.8 | $8.0 | 0.63% | 1.37% |
| Highly Migratory Species | $5.9 | $1.9 | 0.08% | 0.86% |
| Jonah Crab | $26.2 | $15.4 | 0.16% | 0.26% |
| Mackerel/Squid/Butterfish | $236.6 | $111.8 | 0.22% | 0.72% |

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| Monkfish | $173.3 | $89.0 | 0.43% | 1.18% |
| Northeast Multispecies (large-mesh) | $100.6 | $42.9 | 0.06% | 1.80% |
| Northeast Multispecies (small-mesh) | $124.4 | $55.2 | 0.49% | 1.95% |
| Atlantic Sea Scallop | $373.4 | $134.1 | 0.03% | 0.27% |
| Northeast Skate Complex | $131.9 | $82.9 | 1.11% | 2.32% |
| Spiny Dogfish | $26.2 | $11.5 | 0.39% | 4.70% |
| Summer Flounder/Scup/Black Sea Bass | $103.2 | $65.3 | 0.16% | 0.59% |
| Other FMPs, non-disclosed species and non-FMP fisheries | $356.0 | $169.3 | 0.18% | 0.50% |
| All FMP and non-FMP Fisheries | $1,309.5 | $1,060.5 | 0.11% | 0.74% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

The “Other FMPs, non-disclosed species, and non-FMP fisheries” category includes revenue from three FMP fisheries: Surfclam/Ocean Quahog, Red Crab, and River Herring. In addition, it includes revenue from species in FMP fisheries for which data could not be disclosed due to confidentiality restrictions, and revenue earned by federally permitted vessels operating in fisheries that are not federally managed.

**Table G-CF54. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative E2**

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |

* See Table 3.9-4 in Section 3.9 for Mid-Atlantic and New England fisheries data by port and state.

[†] See Table 3.9-8 in Section 3.9 for RFA fisheries data by port state.

[‡] Revenues by Port State includes all of the revenues by the ports listed above, as well as revenues of other ports within the state that were reported by NMFS, but which had 4 or fewer years of data and were not included in the table.

[‡‡] Includes data for all ports that were withheld by NMFS to protect the confidentiality of individual vessels and/or buyers.

### *Gear*

**Table G-CF57. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by Gear Type under Alternative E1**

| Gear Type | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue in the Lease Area as a Percentage of Total Landings in the Mid-Atlantic and New England Regions | Average Annual Revenue in the Lease Area as a Percentage of Total Landings in the RFA |
|---|---|---|---|---|
| Dredge-clam | $189.3 | $55.9 | 0.09% | 0.27% |
| Dredge-scallop | $380.8 | $134.8 | 0.03% | 0.28% |
| Gillnet-sink | $236.5 | $161.4 | 0.54% | 1.68% |
| Handline | $13.7 | $3.3 | 0.07% | 0.24% |
| Pot[†] | $357.8 | $231.0 | 0.20% | 1.44% |
| Trawl-bottom | $494.3 | $380.3 | 0.20% | 0.88% |
| Trawl-midwater | $152.4 | $75.9 | 0.40% | 3.23% |
| All other gear* | $184.1 | $53.9 | 0.11% | 2.02% |

| Gear Type | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue in the Lease Area as a Percentage of Total Landings in the Mid-Atlantic and New England Regions | Average Annual Revenue in the Lease Area as a Percentage of Total Landings in the RFA |
|---|---|---|---|---|
| All gear types | $1,309.5 | $1,096.4 | 0.11% | 0.76% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

† Pot gear combines pot-lobster and pot-other.

Gear types shown in *italics* indicate that fewer than 12 years but more than 4 years of data were used to calculate the estimates. Otherwise, estimates are based on 12 years of data.

* Includes revenue from federally permitted vessels using longline gear, seine gear, other gillnet gear, and unspecified gear, as well as listed gear for years when they were not disclosed.

**Table G-CF58. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by Gear Type under Alternative E2**

| Gear Type | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue in the Lease Area as a Percentage of Total Landings in the Mid-Atlantic and New England Regions | Average Annual Revenue in the Lease Area as a Percentage of Total Landings in the RFA |
|---|---|---|---|---|
| Dredge-clam | $207.3 | $78.1 | 0.13% | 0.37% |
| Dredge-scallop | $402.5 | $143.6 | 0.03% | 0.30% |
| Gillnet-sink | $264.0 | $178.9 | 0.60% | 1.86% |
| Handline | $15.3 | $3.6 | 0.08% | 0.26% |
| Pot† | $432.2 | $276.3 | 0.24% | 1.72% |
| Trawl-bottom | $541.9 | $398.6 | 0.21% | 0.93% |
| Trawl-midwater | $156.2 | $79.5 | 0.42% | 3.39% |
| All other gear* | $230.2 | $54.6 | 0.12% | 2.05% |
| All gear types | $1,438.2 | $1,213.1 | 0.13% | 0.84% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

† Pot gear combines pot-lobster and pot-other.

Gear types shown in *italics* indicate that fewer than 12 years but more than 4 years of data were used to calculate the estimates. Otherwise, estimates are based on 12 years of data.

* Includes revenue from federally permitted vessels using longline gear, seine gear, other gillnet gear, and unspecified gear, as well as listed gear for years when they were not disclosed.

## Alternative G

### *FMP Fishery*

**Table G-CF59. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative G**

| FMP Fishery | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue at Risk as a Percentage of Total in the Mid-Atlantic and New England Regions | Average Annual Revenue at Risk as a Percentage of Total Revenue in the RFA |
|---|---|---|---|---|
| American Lobster | $446.6 | $253.5 | 0.27% | 3.25% |
| Atlantic Herring | $269.8 | $104.3 | 0.40% | 3.48% |
| Bluefish | $17.8 | $8.9 | 0.69% | 1.52% |
| Highly Migratory Species | $5.1 | $1.8 | 0.08% | 0.83% |
| Jonah Crab | $35.5 | $20.8 | 0.22% | 0.35% |
| Mackerel/Squid/Butterfish | $289.6 | $135.5 | 0.26% | 0.88% |
| Monkfish | $155.3 | $88.1 | 0.43% | 1.17% |
| Northeast Multispecies (large-mesh) | $79.6 | $38.6 | 0.05% | 1.61% |
| Northeast Multispecies (small-mesh) | $174.4 | $62.0 | 0.55% | 2.20% |
| Atlantic Sea Scallop | $315.6 | $115.1 | 0.02% | 0.23% |
| Northeast Skate Complex | $150.7 | $96.6 | 1.30% | 2.70% |
| Spiny Dogfish | $32.2 | $14.1 | 0.48% | 5.79% |
| Summer Flounder/Scup/Black Sea Bass | $248.8 | $162.8 | 0.41% | 1.48% |
| Other FMPs, non-disclosed species and non-FMP fisheries | $188.5 | $38.9 | 0.04% | 0.12% |
| All FMP and non-FMP Fisheries | $1,503.1 | $1,141.0 | 0.12% | 0.79% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a, 2023).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

The “Other FMPs, non-disclosed species, and non-FMP fisheries” category includes revenue from three FMP fisheries: Surfclam/Ocean Quahog, Red Crab, and River Herring. In addition, it includes revenue from species in FMP fisheries for which data could not be disclosed due to confidentiality restrictions, and revenue earned by federally permitted vessels operating in fisheries that are not federally managed.

### *Port*

**Table G-CF60. Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by Port under Alternative G**

| Port and State | Peak Annual Revenue ($1,000s) | Average Annual Revenue ($1,000s) | Average Annual Revenue as a Percentage of Total Revenue in the Mid-Atlantic and New England Regions* | Average Annual Revenue as a Percentage of Total Revenue in the RFA† |
|---|---|---|---|---|
| *Beaufort, NC* | *$9.7* | *$3.1* | *0.12%* | *0.36%* |
| Chilmark/Menemsha, MA‡ | $25.3 | $15.2 | 3.22% | 3.61% |

Source: Developed using 2008 through 2019 data from NMFS (2021a, 2022a, 2023).

Notes: Revenue is adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. Peak annual revenue is calculated independently for all rows including the total row.

† Pot gear combines pot-lobster and pot-other.

Gear types shown in *italics* indicate that fewer than 12 years but more than 4 years of data were used to calculate the estimates. Otherwise, estimates are based on 12 years of data.

* Includes revenue from federally permitted vessels using longline gear, seine gear, other gillnet gear, and unspecified gear, as well as listed gear for years when they were not disclosed.

## Comparison of Estimated Annual Commercial Fishing Revenue Exposed (2008–2019 and 2008–2021)

This section compares the estimated annual revenue at risk in the 1) Lease Area and 2) Lease Area and along the RWEC under Alternative G based on the data for two different time periods: 2008–2019 and 2008–2021.

**Table G-CF62. Comparison of Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by FMP Fishery under Alternative G Based on Data for 2008–2019 and 2008–2021**

| FMP Fishery | Average Annual Revenue from 2008–2019 ($1,000's) | Average Annual Revenue from 2008–2021 ($1,000s) | Absolute Difference ($1,000s) | Percentage Difference |
|---|---|---|---|---|
| American Lobster | $253.5 | $258.2 | $4.7 | 1.8% |
| Atlantic Herring | $104.3 | $89.7 | ($14.6) | -14.0% |
| Bluefish | $8.9 | $8.7 | ($0.1) | -1.3% |
| Highly Migratory Species | $1.8 | $1.7 | ($0.1) | -4.4% |
| Jonah Crab | $20.8 | $19.9 | ($0.9) | -4.4% |
| Mackerel/Squid/Butterfish | $135.5 | $136.1 | $0.6 | 0.5% |
| Monkfish | $88.1 | $80.4 | ($7.7) | -8.8% |
| Northeast Multispecies (large-mesh) | $38.6 | $34.1 | ($4.5) | -11.7% |
| Northeast Multispecies (small-mesh) | $62.0 | $84.1 | $22.1 | 35.7% |
| Atlantic Sea Scallop | $115.1 | $110.3 | ($4.8) | -4.1% |
| Northeast Skate Complex | $96.6 | $91.2 | ($5.3) | -5.5% |
| Spiny Dogfish | $14.1 | $12.3 | ($1.9) | -13.1% |
| Summer Flounder/Scup/Black Sea Bass | $162.8 | $169.5 | $6.7 | 4.1% |

| FMP Fishery | Average Annual Revenue from 2008–2019 ($1,000's) | Average Annual Revenue from 2008–2021 ($1,000s) | Absolute Difference ($1,000s) | Percentage Difference |
|---|---|---|---|---|
| Other FMPs, non-disclosed species and non-FMP fisheries | $38.9 | $40.3 | $1.4 | 3.5% |
| **All FMP and non-FMP Fisheries** | **$1,141.0** | **$1,136.5** | **($4.5)** | **-0.4%** |

Source: Developed using data from NMFS (2023).

Notes: Revenues are adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. *Absolute Difference* is calculated by subtracting the *Annual Average for 2008–2019* from *Annual Average for 2008–2021.* The percentage difference is calculated as *Absolute Difference ÷ Annual Average for 2008–2019.*

**Table G-CF63. Comparison of Average Annual Commercial Fishing Landings in the Lease Area and along the RWEC by Species under Alternative G Based on Data for 2008–2019 and 2008–2021**

| Species | Average Annual Landings from 2008–2019 (pounds) | Average Annual Revenue from 2008–2021 (pounds) | Absolute Difference (pounds) | Percentage Difference |
|---|---|---|---|---|
| American lobster | 48,245 | 48,508 | 263 | 0.5% |
| Atlantic herring | 842,128 | 777,828 | -64,300 | -7.6% |
| Atlantic mackerel | 77,828 | 72,325 | -5,502 | -7.1% |
| Black sea bass | 5,985 | 6,719 | 734 | 12.3% |
| Bluefish | 12,851 | 12,701 | -150 | -1.2% |
| Butterfish | 22,051 | 25,852 | 3,800 | 17.2% |
| Cod | 4,271 | 3,990 | -280 | -6.6% |
| Jonah crab | 28,192 | 27,251 | -941 | -3.3% |
| *Loligo* squid | 82,281 | 80,526 | -1,755 | -2.1% |
| Monkfish | 56,696 | 56,143 | -553 | -1.0% |

Source: Developed using data from NMFS (2023).

Notes: Revenues are adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. *Absolute Difference* is calculated by subtracting the *Annual Average for 2008–2019* from *Annual Average for 2008–2021.* The percentage difference is calculated as *Absolute Difference ÷ Annual Average for 2008–2019.* Revenues are adjusted for inflation to 2019 dollars.

Ports shown in *italics* indicate that landings did not occur in the port or state in all years. Averages are calculated based on the number of years landings were reported.

CT = Connecticut, MA = Massachusetts, MD = Maryland, NC = North Carolina, NJ = New Jersey, NY = New York, RI = Rhode Island, VA = Virginia.

* Revenues by Port State includes all of the revenues by the ports listed above, as well as revenues of other ports within the state that were reported by NMFS, but which had 4 or fewer years of data and were not included in the table.

**Table G-CF65. Comparison of Estimated Annual Commercial Fishing Revenue Exposed in the Lease Area and along the RWEC by Gear Type under Alternative G Based on Data for 2008–2019 and 2008–2021**

| Gear | Average Annual Revenue from 2008–2019 ($1,000s) | Average Annual Revenue from 2008–2021 ($1,000s) | Absolute Difference | Percentage Difference |
|---|---|---|---|---|
| *Dredge-clam* | *$68.3* | *$68.3* | – | – |
| Dredge-scallop | $122.3 | $119.2 | -$3.1 | -2.6% |
| Gillnet-sink | $175.6 | $163.4 | -$12.3 | -7.0% |
| Handline | $3.6 | $3.6 | -$0.1 | -2.0% |
| Pot gear[†] | $332.3 | $352.5 | $20.2 | 6.1% |
| Trawl-bottom | $487.9 | $519.6 | $31.7 | 6.5% |
| *Trawl-midwater* | $103.2 | $103.2 | – | – |
| *All other gear** | *$111.8* | *$100.7* | *-$11.2* | *-10.0%* |
| **All gear types** | **$1,405.0** | **$1,430.2** | **$25.2** | **1.8%** |

Source: Developed using data from NMFS (2023).

Notes: Revenues are adjusted for inflation to 2019 dollars using the GDP Implicit Price Deflator. *Absolute Difference* is calculated by subtracting the *Annual Average for 2008–2019* from *Annual Average for 2008–2021.* The percentage difference is calculated as *Absolute Difference ÷ Annual Average for 2008–2019.*

† Pot gear combines pot-lobster and pot-other.

Gear types shown in *italics* indicate there were multiple years for which data were not reported, and averages were calculated by summing all years and dividing by non-zero years. Otherwise, averages are based on all year of data.

* Includes revenue from federally permitted vessels using longline gear, seine gear, other gillnet gear, and unspecified gear, as well as listed gear for years when gears were not disclosed.

## Annual Commercial Fishing Revenue in the Entire Lease Area and Lease Area under Alternative G by State of Landing

This section shows the commercial fishing revenue in the entire Lease Area (Figure 1.1-2) and the Lease Area under Alternative G (Figure 2.1-22) by state of landing for each year from 2008 to 2021. In addition, the section compares the average annual commercial fishing revenue in the separate entire Lease Area and the Lease Area under Alternative G by state of landing based on the data for two different time periods: 2008–2019 and 2008–2021.

**Table G-CF66. Comparison of Average Annual Commercial Fishing Revenue in the Entire Lease Area by State Based on Data for 2008–2019 and 2008–2021**

| State of Landing | CT ($1,000s) | MA ($1,000s) | ME ($1,000s) | NC ($1,000s) | NJ ($1,000s) | NY ($1,000s) | RI ($1,000s) | VA ($1,000s) | All Other States ($1,000s) | All States ($1,000s) |
|---|---|---|---|---|---|---|---|---|---|---|
| 2008 | $22.5 | $568.8 | – | – | – | $27.6 | $748.6 | – | $1.0 | $1,368.6 |
| 2009 | $4.2 | $628.5 | – | – | $0.9 | $10.4 | $689.6 | – | – | $1,333.7 |
| 2010 | $1.5 | $356.8 | – | – | $0.0 | $14.3 | $438.4 | – | $3.5 | $814.5 |
| 2011 | $6.6 | $511.2 | – | – | $1.2 | $13.7 | $554.9 | $0.3 | $0.1 | $1,088.0 |
| 2012 | $10.6 | $269.9 | – | $0.5 | $1.8 | $11.1 | $642.6 | $1.1 | – | $937.5 |
| 2013 | $12.9 | $397.9 | $10.9 | $1.8 | $0.9 | $12.6 | $580.9 | $24.7 | $0.1 | $1,042.6 |
| 2014 | $8.9 | $573.8 | – | $3.2 | $3.6 | $15.4 | $726.4 | $2.0 | $3.2 | $1,336.5 |
| 2015 | $23.8 | $673.7 | $1.6 | $0.9 | $8.5 | $16.1 | $603.5 | $3.7 | $0.1 | $1,331.9 |
| 2016 | $38.4 | $666.5 | $5.4 | $14.0 | $3.5 | $39.1 | $605.6 | $2.6 | – | $1,375.1 |

# Demographics, Employment, and Economics

This section provides a summary of the assumptions and methodologies used to generate estimates of the employment impacts of the Project under the alternatives assessed.

## Assumptions Regarding Local Hiring Practices and Local and U.S. Suppliers of Wind Farm Components

This section contains two subsections that describe a) the assumptions regarding the local hiring practices of Revolution Wind, and b) the ability of local and U.S. manufacturing industries to meet the demands of offshore wind projects.

### Local Hiring Practices

Revolution Wind documents many of its assumptions relating to local hiring practices in Table ES-1 of the COP and provides additional information in Section 4.6.1 of the COP (VHB 2023). These are summarized in the bulleted list below and provide guidance for the assessment of the economic impacts of the Project and alternatives:

- Where possible, local workers would be hired to meet labor needs for Project construction, operations and maintenance (O&M), and decommissioning.
- The onshore facilities construction schedule would be designed to minimize impacts to the local community during the summer tourist season, generally between Memorial Day and Labor Day.
- The Project would be constructed using multiple ports for fabrication and pre-commissioning and could use locations in different states throughout the geographic analysis area.
- Revolution Wind would hire local workers to the extent practical for RWF, RWEC, and interconnection facility management, fabrication, and construction.
- Non-local construction personnel typically include mariners, export cable manufacturing personnel, and other specialists who may temporarily relocate during the construction and decommissioning.
- Population impacts to the communities in the geographic analysis area could result mainly from the short-term influx of construction personnel. The total population change is assumed to equal the total number of non-local construction workers plus any accompanying family members. Due to the short duration of construction activities,[6] however, it is unlikely that non-local workers would relocate families to the area.

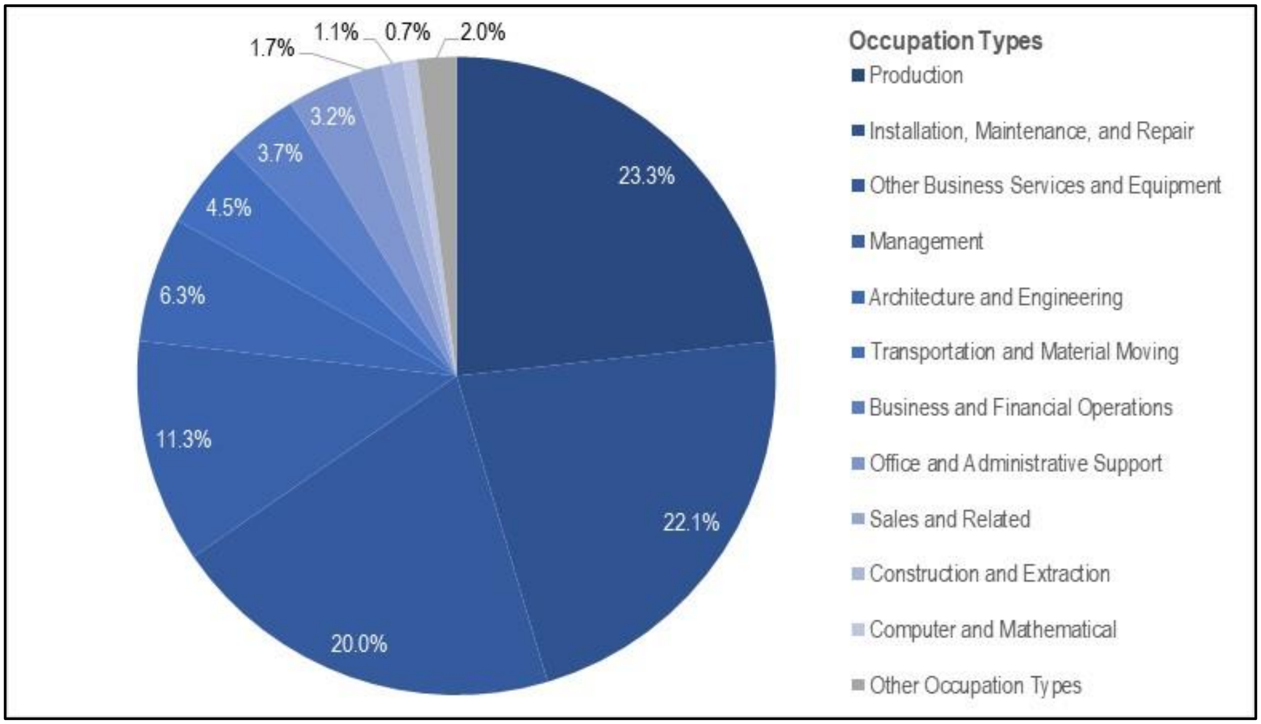
[6] Revolution Wind lists the expected duration of various components of construction, installation, and commissioning of the Project in Sections 3.3 and 3.4 of the COP (VHB 2023). It is assumed that the actual construction work on the Project would be completed within a 2-year window. Final engineering, design, and manufacturing of Project components would begin prior to actual construction and installation.

### Assumptions Regarding the Ability of "Local Suppliers" to Meet Project Demands for Specialized Project Components

Several recent studies describe the offshore wind industry in the United States as being in its early developmental stages, and that as it currently exists, a relatively large share of the capital expenditures (CapEx) of the Project and the resulting jobs and income for offshore wind projects are likely to leak out to economies outside both the geographic analysis area and the United States as a whole. In its study for the U.S. Department of Energy, Navigant Consulting, Inc. (2013:x) states that because of the lack of U.S. demand for offshore components, "no domestic manufacturing facilities are currently serving the offshore wind market." More recently, AECOM (2017:3-42) in its white paper, *Evaluating Benefits of Offshore Wind Energy Projects in NEPA*, developed for BOEM, states the following:

> At each phase of offshore wind energy development, there is the potential to generate economic benefits locally, regionally, nationally, and/or internationally, depending on the extent to which these geographic areas can deliver the materials and skills necessary to develop offshore wind energy. Imported materials and services into the particular region being assessed represent lost opportunities for local production and employment. As the offshore wind energy industry advances in the U.S., more opportunities for domestic value can be created along the value chain and for supporting services. Supporting services could include consulting services, financial services, education and training, and research and development.

From a more quantitative perspective, BVG Associates Limited (BVG) (2017) concludes that for offshore projects constructed before 2022, the United States as a whole can expect to realize a minimum of 35% of the total expected jobs needed to meet U.S. demand, including jobs in the supply chain, development, and construction. In addition, BVG concludes that there is a high probability that United States–based jobs could be between 50% and 63% of offshore wind–related jobs by 2022. The BVG report also estimates the numbers of jobs by occupational type that can be expected in the future with offshore wind development. Figure G-DEM1 summarizes the major occupational types that are expected to increase as a result of offshore wind projects as projected by BVG (2017).



Source: Developed from data provided by BVG (2017).

**Figure G-DEM1. Expected occupational categories for offshore wind development.**

A March 2020 report by the American Wind Energy Association (2020) appears somewhat more conservative and assumes in its baseline scenario that by 2025, U.S. offshore wind installations will reach 2,000 MW per year with domestic content reaching 21% of the total capital expenditure. By 2030, it expects domestic content to increase to 45% in its baseline scenario.

Based on the economic impact methodology used, which is described in the next section, it is estimated that the local share of CapEx for the RWF would range from approximately 20% to 30% of pre-tax CapEx, whereas the local share for operating expenditures (OpEx) (excluding local taxes, lease payments, and finance charges) is estimated at 40% to 50% of total OpEx (excluding local taxes, lease payments, and finance charges).

## Methodology Used to Estimate Employment and Value-Added Impacts of Alternatives Included in the Environmental Impact Statement

This section describes the methodology used to generate estimates of the economic impacts (jobs and value added) of the Project and included alternatives. The first section describes the estimates of economic impacts of the Project as estimated in the COP, and the second section describes the methodology used to assess the impacts of permutations of the Project required for the EIS that were not included in the COP.

### Economics Impacts of the Project as Estimated in the Construction and Operations Plan

In the COP and Appendix CC to the COP, Hamilton and Nubbe (2020), using the Jobs and Economic Development Impacts Offshore Wind Model (JEDI-OWM) developed by the National Renewable Energy

Laboratory (NREL 2017), provide an economic impact analysis summarizing estimates of jobs, earnings, output, and value added that are expected to result from a "Baseline Project" with a nameplate capacity of 712 megawatts (MW) that uses 89 wind turbine generators (WTGs), each with a capacity to generate 8 MW of power. In COP Appendix CC, Hamilton and Nubbe (2020) state that the "primary source for the model inputs was DWW Rev I who provided capital and operating budgets including costs, employment, and percent local data that are specific to the Project." Although the COP and Appendix CC summarize Baseline Project impacts, very few of the project-specific inputs provided to Hamilton and Nubbe (2020) for use in its modeling exercise were actually specified. Two key confidential inputs[7] were included in Appendix CC—specifically, the total expected capital expenditures (Total CapEx) for the Project and the total local expenditure for O&M (Local OpEx). Table DEM-1 summarizes the "local" jobs and investment impacts of the Baseline Project in Rhode Island and Connecticut as estimated by Hamilton and Nubbe (2020).

**Table G-DEM1. Summary of Jobs and Investment Impacts in Rhode Island and Connecticut for the Baseline Project**

| Project Phase | Impact Category | Jobs | Earnings ($ millions) | Output ($ millions) | Value Added ($ millions) |
|---|---|---|---|---|---|
| Construction | Direct | 1,440 | $124.40 | $148.80 | $130.10 |
| | Indirect | 1,623 | $123.00 | $497.40 | $205.80 |
| | Induced | 793 | $51.10 | $137.60 | $81.10 |
| | **Total** | **3,856** | **$298.50** | **$783.90** | **$417.00** |
| Operations | Direct | 58 | $4.90 | $4.90 | $4.90 |
| | Indirect | 18 | $1.50 | $51.40 | $47.50 |
| | Induced | 156 | $10.80 | $29.30 | $17.60 |
| | **Total** | **233** | **$17.20** | **$85.70** | **$70.00** |

Source: Hamilton and Nubbe (2020).

Note that the impacts of the Baseline Project (712-MW capacity using 89 8-MW WTGs) during construction aggregate impacts over the entire construction period. Construction job figures are in job years, which are full-time equivalent (FTE) jobs multiplied by the number of construction years. Operations jobs are FTEs for a period of 1 year.

Northern Economics—the contracted economic analysts for this EIS—have developed similar estimates using the same JEDI-OWM for an identically sized project using confidential inputs for Total CapEx and Total Local OpEx that were documented in Appendix CC, but without the additional inputs that were supplied to Hamilton and Nubbe (2020) from Revolution Wind. These results are provided in Table G-DEM2, and Table G-DEM3 presents a percentage-based comparison of the two set of results. An examination of the tables indicates that there are differences in the two sets of tables—the additional inputs supplied by Revolution Wind to Hamilton and Nubbe (2020) are important for directly estimating Project impacts.

[7] These key inputs are considered confidential and therefore cannot be specified in the EIS.

**Table G-DEM2. Summary of Jobs and Investment Impacts in Rhode Island and Connecticut for the Baseline Project as Developed by Northern Economics**

| Project Phase | Impact Category | Jobs | Earnings ($ millions) | Output ($ millions) | Value Added ($ millions) |
|---|---|---|---|---|---|
| Construction | Direct | 1,185 | $56.52 | $222.28 | $84.95 |
| | Indirect | 2,016 | $146.37 | $574.85 | $224.00 |
| | Induced | 1,376 | $86.84 | $237.76 | $145.13 |
| | **Total** | **4,577** | **$289.73** | **$1,034.89** | **$454.09** |
| Operations | Direct | 42 | $4.32 | $4.32 | $4.32 |
| | Indirect | 99 | $7.70 | $26.35 | $11.45 |
| | Induced | 40 | $2.74 | $7.71 | $4.04 |
| | **Total** | 181 | $14.76 | $38.38 | $19.81 |

Source: Developed by Northern Economics using information in COP Appendix CC (Hamilton and Nubbe 2020).

Note that the impacts of the Baseline Project (712-MW capacity using 89 8-MW WTGs) during construction summarize impacts over the entire construction period. Construction job figures are in job years, which are full-time equivalent (FTE) jobs multiplied by the number of construction years. Operations jobs are FTEs for a period of 1 year.

**Table G-DEM3. Percentage-Based Comparison of Jobs and Economic Development Impacts Offshore Wind Model Results**

| Project Phase | Impact Category | Jobs in Table G-DEM2 as a Percentage of Jobs in Table G-DEM1 (%) | Earnings in Table G-DEM2 as a Percentage of Earnings in Table G-DEM1 (%) | Output in Table G-DEM2 as a Percentage of Output in Table G-DEM1 (%) | Value Added in Table G-DEM2 as a Percentage of Value Added in Table G-DEM1 (%) |
|---|---|---|---|---|---|
| Construction | Direct | 82% | 45% | 149% | 65% |
| | Indirect | 124% | 119% | 116% | 109% |
| | Induced | 174% | 170% | 173% | 179% |
| | **Total** | **119%** | **97%** | **132%** | **109%** |
| Operations | Direct | 71% | 88% | 88% | 88% |
| | Indirect | 71% | 88% | 88% | 88% |
| | Induced | 541% | 513% | 51% | 24% |
| | **Total** | 25% | 25% | 26% | 23% |

Source: Developed by Northern Economics.

Notwithstanding differences in the two sets of results, the full analysis of the economic impacts of the RWF requires estimates for the Baseline Project as well as estimates of economic impacts for the Project if larger WTGs are used (i.e., 10-MW or 12-MW WTGs) and/or if the Project capacity increased to its maximum capacity of 880 MW. In addition, because there is a suite of alternatives that could constrain the number of WTG positions that can be used (i.e., Alternatives C, D, and E), it will be necessary to estimate economic impacts under a much wider range of Project configurations than the single configuration provided in the COP.

Therefore, a methodology that builds on the results developed by Hamilton and Nubbe (2020) but allows the flexibility to estimate impacts under different configurations is required. This methodology is summarized below.

### Methodology to Estimate Project Permutations while Incorporating Information from Hamilton and Nubbe (2020)

The methodology developed to estimate Project permutations relies on the fact that the JEDI-OWM is essentially a scalable model—if the number of WTGs increases relative to the baseline and all other Project inputs are held constant, then the economic impacts generally change proportionally regardless of the starting values.

Assume for example that rather than the Baseline Project of 712 MW using 89 8-MW WTGs, a larger project of 800 MW using 100 8-MW turbines is assessed. In this case, the only change is the number of WTGs used in the Project, which increase by 12.4% from 89 to 100. The WTGs used are assumed to have the same unit cost as the monopile foundations on which they are installed. Similarly, assuming the spacing of the WTGs remains constant, the total length of the inter-array cable would also be expected to increase by an amount that approaches 12.4%. Table G-DEM4 shows the percentage differences between the 800-MW project and the 712-MW project as estimated by Northern Economics. Based on the built-in scalability of the JEDI-OWM model, it assumed that if Hamilton and Nubbe (2020) were to run the same comparison, changing only the total Project capacity by changing the number of WTGs and holding all $-per-kilowatt ratios constant, the results would be remarkably similar as those shown below.

**Table G-DEM4. Percentage-Based Comparison of Northern Economics JEDI-OWM Model Results between an 800-MW Project and a 712-MW Project**

| Project Phase | Impact Category | Jobs with the 800-MW Project as a Percentage of Jobs in Table G-DEM2 (%) | Earnings with the 800-MW Project as a Percentage of Earnings in Table G-DEM2 (%) | Output with the 800-MW Project as a Percentage of Output in Table G-DEM2 (%) | Value Added with the 800-MW Project as a Percentage of Value Added in Table G-DEM2 (%) |
|---|---|---|---|---|---|
| Construction | Direct | 110.8% | 109.0% | 106.6% | 108.4% |
| | Indirect | 109.8% | 110.3% | 110.9% | 110.3% |
| | Induced | 111.0% | 111.2% | 111.1% | 111.1% |
| | **Total** | **110.4%** | **110.3%** | **110.0%** | **110.2%** |

| | | | | | |
|---|---|---|---|---|---|
| Operations | Direct | 112.4% | 112.4% | 112.4% | 112.4% |
| | Indirect | 112.4% | 112.4% | 112.4% | 112.4% |
| | Induced | 112.4% | 112.4% | 112.4% | 112.4% |
| | **Total** | **112.4%** | **112.4%** | **112.4%** | **112.4%** |

Based on the results above, economic impacts of Project permutations will be estimated using the following steps:

1. Estimate the economic impacts of the Project permutation by making appropriate changes to Northern Economics' Baseline Project inputs
2. Estimate the percentage change of the permutation against the Northern Economic Baseline Project impacts.
3. Apply this percentage change to the Baseline Project impacts estimated by Hamilton and Nubbe (2020).

## Other Assumptions Used to Estimate Impacts of Project Permutations

In addition to the scaling methodology described above, the following assumptions are also used in the estimates of economic impacts.

### *Assumptions Regarding the Minimum Project Size If Larger Capacity Wind Turbine Generators are Used*

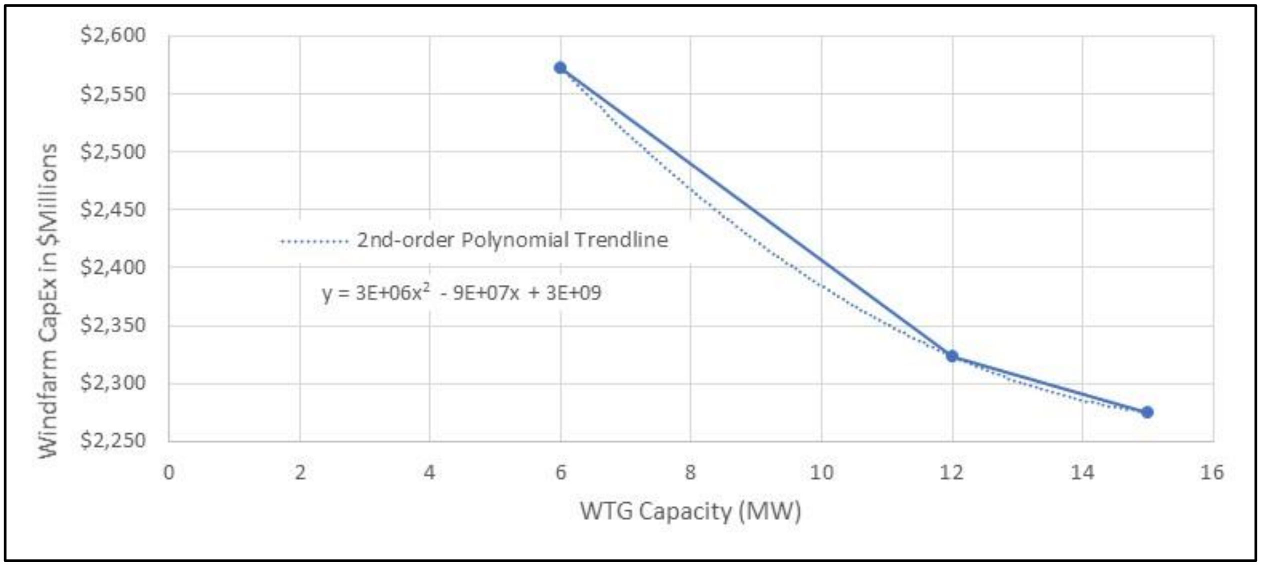
Hamilton and Nubbe (2020) do not explicitly state why they assumed a 712-MW project as opposed to a 704-MW project, which would match the Project's existing power purchase agreement (PPA) and the minimum project listed in the project design envelope (PDE), as reported in EIS Appendix D. Note that a 712-MW project with 89 8-MW WTGs exceeds the PPA by one full 8-MW WTG. Therefore, it is assumed that excess capacity would be built by an amount equal to one WTG in excess of the number of WTGs nominally needed to meet the 704-MW PPA. Thus, if 10-MW WTGs are used, 71 WTGs (with a total capacity of 710 MW) would nominally be able meet the 704-MW PPA. It is assumed, however, that one additional WTG would be installed for a total of 720 MW—the extra WTG would provide greater reliability for customers of the Project. Similarly, if 12-MW WTGs are used, 63 WTGs would nominally meet the PPA capacity with 708 MW. Adding one additional WTG (64 in total) would result in a Project capacity of 720 MW and provide greater reliability.[8]

### *Assumptions Regarding the Relative Project Capital Costs when Higher Capacity Wind Turbine Generators Are Used*

Information regarding the comparative capital costs of offshore wind projects that use smaller or larger WTGs are not readily available, although it is generally assumed and reported that use of larger WTGs generally results in lower overall capital costs and greater overall project efficiency. An updated version of the JEDI-OWM (Release 2021-2) has been made available (NREL 2021), which enables users to

[8] The Project developer has confirmed that the assumption is reasonable.

estimate project capital cost using a choice of three WTG capacities: 6 MW, 12 MW, or 15 MW.[9] Figure G-DEM2 shows hypothetical capital cost of a 720-MW project with three alternative assumptions regarding the size of the WTGs. Moving from the use of 6-MW WTGs to the use of 12-MW WTGs results in a nominal CapEx reduction of approximately $250 million or 10% of total CapEx. Using 15-MW WTGs rather than 12-MW WTGs results in a smaller (2%) CapEx reduction. The 2nd order polynomial trendline shown in the figure was used to estimate CapEx savings for similar size projects using different sizes of WTGs ranging from 6 to 16 MW.



Source: Developed by Northern Economics using JEDI-OWM Release 2021-2 (NREL 2021) and the RWF Project location.

Note: Reviewers should not assume the Project capital costs shown here reflect actual estimates of the Project capital costs for Revolution Wind.

**Figure G-DEM2. Hypothetical capital cost estimates of a 720-MW wind farm with three WTG sizes.**

### *Assumptions Regarding the Maximum Capacity Limits*

The PDE summarized in EIS Appendix D states that the maximum capacity of the Project is 880 MW. The PDE also indicates that WTGs ranging from 8 to 12 MW would be considered, but no more than 100 WTGs would be used. If 100 8-MW WTGs are used, then the largest project that could be built is 800 MW. An 880-MW project could be built using 88 10-MW WTGs, but if 12-MW WTGs are used, then 73 WTGs achieve a project capacity of 876 MW; using 71 12-MW WTGs results in a project that exceeds the maximum project capacity by 8 MW (i.e., project capacity would be 888 MW, and thus would not be developed).

Based on guidance from Revolution Wind (Roll 2021) indicating that they would not exceed the 880-MW maximum capacity of the Project established in the PDE, it is presumed that the maximum project size that would be developed if 12-MW WTGs are used would comprise 73 WTGs with a total capacity of 876 MW. Similarly, if 14-MW WTGs are authorized as in Alternative F, the largest project that would be

[9] Although JEDI-OWM Release 2021-2 includes this built-in capital cost comparison feature, the model does not yet appear to include built-in local economic impact coefficients linked to multipliers that enable the user to generate economic impacts in terms of jobs, earnings, and value added. In addition, NREL has not yet published a user guide for the newer version of the JEDI-OWM.

developed would use 62 14-MW WTGs for a total capacity of 868 MW, noting that adding an additional 14-MW turbine results in 882 MW of total capacity project, which would exceed the Project's maximum capacity of 880 MW (see EIS Appendix D).

# Environmental Justice

This section provides maps displaying the environmental justice characteristics of the counties and cities/towns in the geographical analysis area. The geographical analysis area includes counties that contain or are adjacent to ports that may be used for Project construction staging, O&M, or decommissioning; contain major ports that commercial fisheries that could be affected by the Project; that contain the Project landing site and onshore transmission cable; or for which some portion of the county lies within the visual study area. Minority and low-income percentages are based on 2015-2019 American Community Survey 5-year summary file data obtained from EPA's Environmental Justice Screening and Mapping Tool (EJScreen), an environmental justice screening and mapping tool (EPA 2021).

Figures G-EJ1 though G-EJ6 show minority population percentages by census block group, whereas Figures G-EJ7 through G-12 show low-income population percentages by census block group. Figures G-EJ13 though G-EJ18 show the locations of block groups that have been determined to be potential environmental justice areas of concern because of concentrations of minority or low-income populations (see Section 3.12.1 for additional details).

Tables G-EJ1 through G-EJ28 provide additional information about the identity of the block groups determined to be potential environmental justice areas of concern. The tables list the multi-digit identifier of each of these block groups. The block group identifiers are organized by county and sub-county name (city, town, or census designated place). Each identifier listed in the tables include the census tract (CT) code and census block group (BG) code as reported by the U.S. Census Bureau in the online mapping tool available at https://tigerweb.geo.census.gov/tigerweb/ (U.S. Census Bureau 2021). The fully specified identifiers for census block groups include the two-digit code for the state and three-digit code for the county. The captions for the tables include these codes. Each block group is categorized based on whether it is a potential environmental justice concern because of its minority population, low-income population, or both.

# Electromagnetic Fields

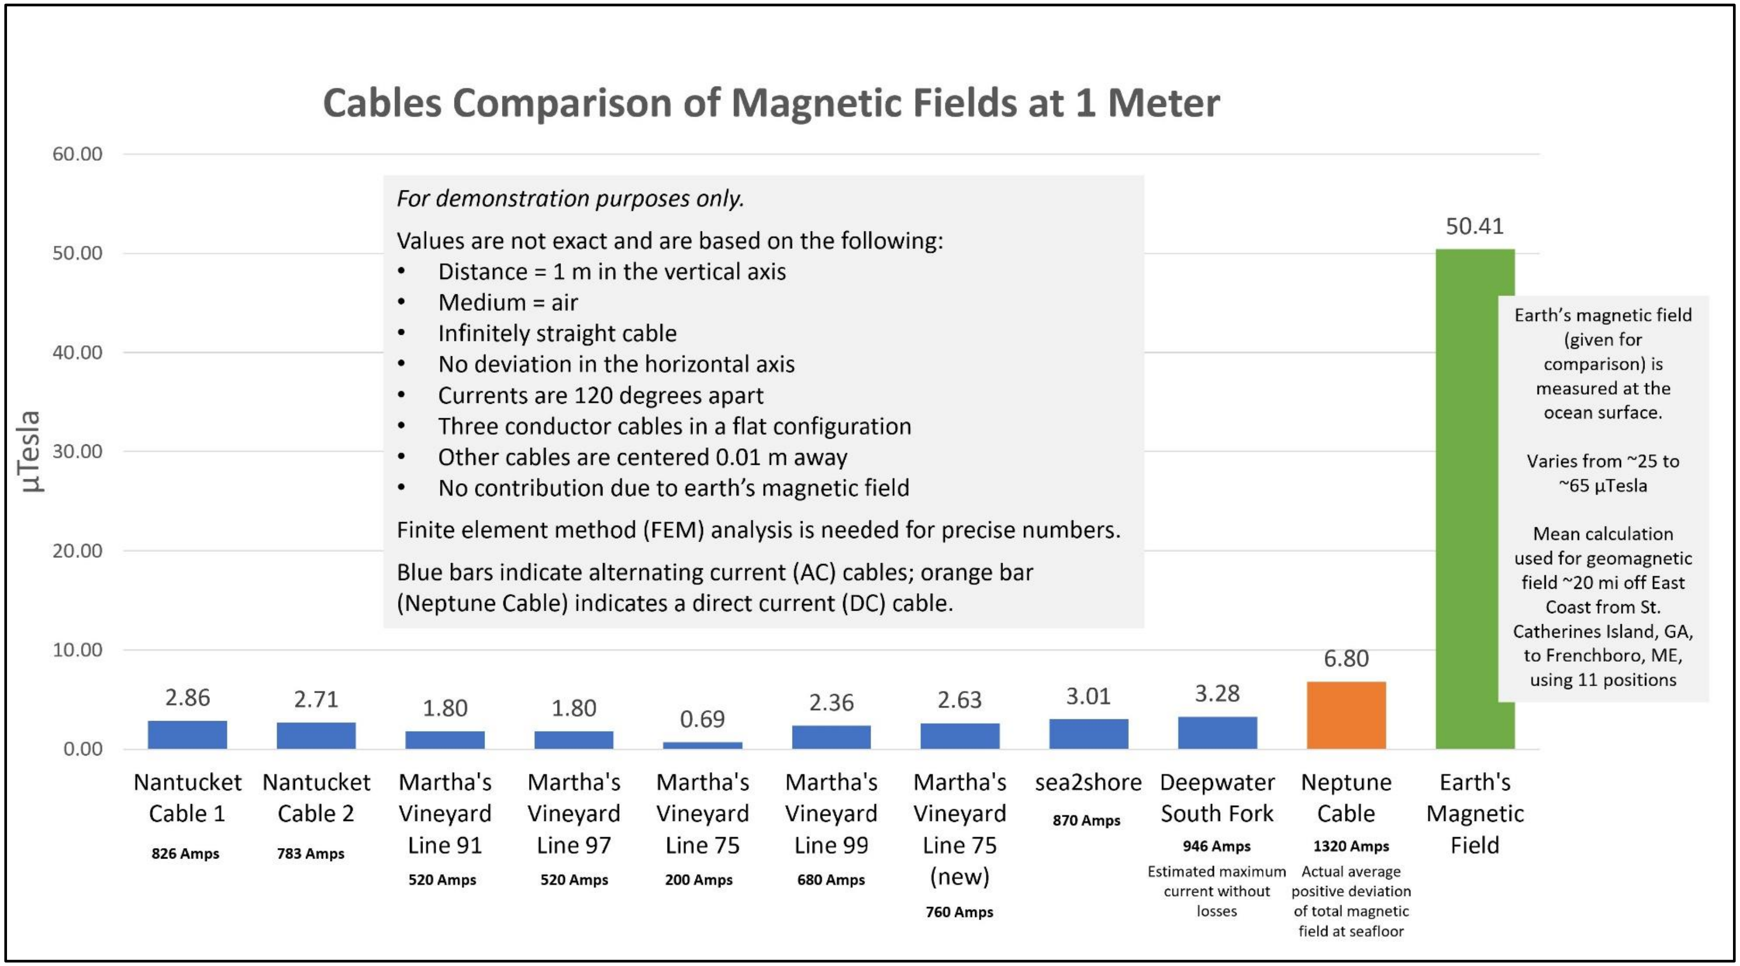

**Figure G-EMF1. Comparison of electromagnetic fields produced by offshore wind farm transmission cables to the Earth's background magnetic field.**

# Overview of Sound and Marine Mammal Hearing

Underwater noise can be described through a source-path-receiver model. An acoustic source emits sound energy that radiates outward and travels through the water and the seafloor as pressure waves, which is the most relevant component of sound to marine mammals. The sound level decreases with increasing distance from the acoustic source as the sound pressure waves spread out under the influence of the surrounding environment. The amount by which the sound levels decrease between a source and receiver is called transmission loss (Richardson et al. 1995). The amount of transmission loss that occurs depends on the source-receiver separation, frequency of the sound, properties of the water column, and properties of the seafloor layers. Underwater sound levels are expressed in decibels, which is a logarithmic ratio relative to a fixed reference pressure of 1 micropascal (equal to 10-6 pascals or 10-11 bar).

Underwater sound can be produced by biological and physical oceanographic sources, as well as anthropogenic sources. A brief overview of acoustic units and the propagation of underwater sound can be found in Appendix J (Underwater Sound and Acoustic Modeling Results) of the *Ocean Wind 1 Offshore Wind Farm Final Environmental Impact Statement* (BOEM 2023). Biological sounds include vocalizations made by marine mammals and physical oceanographic sounds, including wind and wave activity, rain, sea ice, and undersea earthquakes. Anthropogenic (human-introduced) sounds include shipping and other vessel traffic, military activities, marine construction, oil and gas exploration, and more. Some of these natural and anthropogenic sounds are present everywhere in the ocean all of the time; therefore, background sound in the ocean is commonly referred to as “ambient noise” (DOSITS 2019). The efficiency of underwater sound propagation allows marine mammals to use underwater sound as a primary method of communication, navigation, prey detection (i.e., foraging), and predator avoidance (Richardson et al. 1995; Southall et al. 2007; OSPAR Commission 2009). Anthropogenic noise has gained recognition as an important stressor for marine mammals because of their reliance on underwater hearing for maintenance of these critical biological functions (Richardson et al. 1995; Ketten 1998). Underwater noise generated by human activities can often be detected by marine mammals many kilometers from the source. With decreasing distance from a noise source, potential acoustic impacts can result in mortality, non-auditory injury, permanent or temporary hearing loss, behavioral changes, and acoustic masking. All of these effects have the potential to induce impacts on marine mammals (OSPAR Commission 2009; Erbe 2013).

Auditory masking occurs when sound signals used or produced by marine mammals overlap in time, space, and frequency with another sound source (Richardson et al. 1995). Masking can reduce communication space, limit the detection of relevant biological cues, and reduce echolocation effectiveness. A growing body of literature is focused on improving the framework for assessing the potential for masking of animal communication by anthropogenic noise and understanding the resulting effects. More research is needed to understand the process of masking, the risk of masking by anthropogenic activities, the ecological significance of masking, and what anti-masking strategies are used by marine animals and their degree of effectiveness before masking can be incorporated into regulation strategies or mitigation approaches (Erbe et al. 2016). The potential for masking can be assessed qualitatively by comparing the frequencies of anthropogenic sources with the frequencies at which marine mammal vocalizations are made and the hearing ranges of marine mammal species.

Marine mammals are acoustically diverse, with wide variations in ear anatomy, hearing frequency range, and amplitude sensitivity (Ketten 1991). An animal's sensitivity to sound likely depends on the presence and level of sound in certain frequency bands and the range of frequencies to which the animal is most sensitive (Richardson et al. 1995). In general, larger species, such as baleen whales, are believed to hear better at lower frequency ranges than smaller species, such as porpoises and dolphins. Hearing abilities are generally only well understood for smaller species for which audiograms (plots of hearing threshold at different sound frequencies) have been developed based on captive behavioral studies (reactions to sound or behavioral audiograms), and electrophysiological experiments (measuring auditory evoked potentials) on captive or stranded animals (Erbe et al. 2012). Audiograms have been obtained in some toothed whale (odontocetes) and pinniped species (Southall et al. 2007; Finneran 2015), while direct measurements of baleen whale (mysticetes) hearing are lacking (Ridgway and Carder 2001). Baleen whale hearing sensitivities have therefore been estimated based on anatomy, modeling, vocalizations, taxonomy, and behavioral response studies (Houser et al. 2001; Ketten and Mountain 2011, 2014 in Southall et al. 2019; Cranford and Krysl 2015; Richardson et al. 1995; Wartzok and Ketten 1999; Au and Hastings 2008; Dahlheim and Ljungblad 1990; Reichmuth 2007).

## Visual Resources

Visual resources impacts associated with the RWF were evaluated and determined based on information and findings associated with the RWF visual impact assessment (VIA) (EDR 2023) and the application of BOEM’s Assessment of *Seascape, Landscape, and Visual Impacts of Offshore Wind Energy Developments on the Outer Continental Shelf of the United States* methodology (Sullivan 2021), also known as seascape, landscape, and visual impacts assessment (SLVIA). At the request of BOEM, the SLVIA methodology for determination of impacts to key observation points (KOPs) (comprising the VIA component of the SLVIA) and impacts to character areas (ocean [OCA], seascapes [SCA] and landscapes [LCA]) (comprising the seascape and landscape impacts assessment [SLIA] component of the SLVIA) was applied (Sullivan 2021:29–33) to previously documented evaluation and impact methodologies associated with the RWF VIA.

The SLVIA impact methodology was cross walked with the RWF VIA to extract previously documented existing views and proposed Project visual conditions and information associated with the Proposed Action (Tables G-VIS1a through G-VIS2e). KOP information and character area information associated with the 2021 VIA was also extracted and applied to Alternatives B, C, D, E, and G (Alternative F has not been evaluated) and compiled in Tables G-VIS1a through G-VIS10c to provide a consistent baseline of information related to determination of impacts associated with KOPs and character areas in relation to the Proposed Action for comparison purposes. EIS Tables 3.20-2 through 3.20-4 provide summaries of overall impact determination by action alternative per KOP, specially designated areas (SDAs), and character area for ease in comparison between the various action alternatives.

Up to 37 viewing condition scenarios (e.g., daytime, sunset and nighttime) associated with 28 individual KOPs were evaluated for each action alternative associated with the VIA component of the SLVIA (Tables G-VIS1a through G-VIS1b, G-VIS3, G-VIS5a through G-VIS5b, and G-VIS7 and G-VIS9). Not all KOPs were evaluated for all action alternatives. The orientation of specific KOPs in relation to action alternatives were reviewed and selected for further analysis based on geographic proximity of each action alternative. Each table combines the sensitivity rating based on a location's susceptibility to change and its perceived value to society based on information from the RWF VIA as well as the magnitude rating consisting of size or scale of the change associated with the Project, the geographic extent of the change, and the duration and reversibility of the change for each KOP, for an overall impact determination finding of major, moderate, minor, or negligible (Sullivan 2021), which correspond to impacts described in the EIS. It is assumed that nighttime impacts would be reduced to Negligible as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels) when Federal Aviation Administration (FAA) warning lights are not activated though the use of aircraft detection lighting system (ADLS). Cumulative impacts associated with KOPs (VIA Table G-VIS11) have been evaluated and identify the level of impact associated with the contribution of the Proposed Action to the No Action Alternative.

Impacts associated with the SLIA component of the analysis (see Tables G-VIS2a through G-VIS2e, G-VIS4a through G-VIS4c, G-VIS6a through G-VIS6c, G-VIS8a through G-VIS8c, and G-VIS10a through G-VIS10c) crosswalk and categorize landscape similarity zones as described in the RWF VIA with SLVIA character area descriptions to provide a general understating of OCA, SCA, and LCA relationships. Visibility analyses to determine the overall character area visibility associated with each alternative in comparison to the Proposed Action to provide a basis for impact determination is included in each table. Impacts to SDAs have also been included in each SLIA table and categorized based on SDA type.

Impact findings are based on the best available information associated with the RWF VIA for the action alternatives, and some deviation between the RWF VIA impact findings and the SLVIA impacts findings as applied in the following tables may occur due to differences in methodological approaches.

**Table G-VIS1a. Visual Impact Assessment Impact Matrix for Alternative B (Proposed Action) (see Table G-VIS1b for continuation table)**

## Table G-VIS1b. Visual Impact Assessment Impact Matrix for Alternative B (Proposed Action)

| KOP Number | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Geographic Extent Rationale* | Geographic Extent Rating (large, medium, small) | Duration/Reversibility Rationale | Duration/Reversibility Rating (good, fair, poor) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| **AI01** | Visibility of the entire RWF extends inland across public open space and into the adjacent Newport Country Club before breaking up into discrete areas of visibility of less than half of the WTGs due to screening provided by vegetation, structures, and topography. | Small | Number of turbines visible: 100<br>Percent visibility: 26%–50% | Medium | Long term (30 years)/reversible | Fair | Overall size and scale along with visibility reduce contrast and perceivability. | Medium | Importance of recreation and historic resources, duration and visibility from KOP. | Moderate |

| KOP Number | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Geographic Extent Rationale* | Geographic Extent Rating (large, medium, small) | Duration/Reversibility Rationale | Duration/Reversibility Rating (good, fair, poor) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| AI01 | The addition of the flashing warning lights on the WTGs and decks will add evidence of human development and increase visual clutter at the horizon. | Medium | Number of turbines visible:<br>Percent visibility: %<br>Information not available in RWF VIA | Large | Long term (30 years)/reversible | Fair | Prominence and dominance of warning lights in non-developed setting. | Large | The addition of aviation warning lights along the horizon within the viewshed would detract from the overall nighttime environment. | Major |
| AI03 | Project will not be conspicuous to casual observers from this KOP, and the unique rock features in the foreground will remain the focal point in this view. | Medium | Majority of turbines visible: 100<br>Percent visibility: 51%–75% | Medium | Long term (30 years)/reversible | Fair | Overall size and scale along with visibility reduce contrast and perceivability. | Medium | Importance of recreation and historic resources; proximity of residential viewers, duration, and visibility from KOP. | Moderate |
| AI05 | Project will be prominent in dramatic 180-degree open views and appears wild and undisturbed with open view of the ocean framed by boulders in the foreground. | Large | Number of turbines visible: 100<br>Percent visibility: 26%–50% | Medium | Long term (30 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of natural landscape and natural recreation opportunities, scenic values in a preserved seascape; prominence of turbines. | Major |
| AI06 | Turbines, are noticeable but are not spatially dominant. | Medium | Number of turbines visible: 99<br>Percent visibility: 51%–75% | Medium | Long term (30 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Medium | Importance of recreation along intact shoreline; turbines will be visible along horizon, although will not be a dominant feature in the seascape. | Moderate |
| AI07 | Existing foreground built features attract attention initially, although turbines across the horizon become a dominant focal point of the view. | Large | Number of turbines visible: 100<br>Percent visibility: 2%–25% | Medium | Long term (30 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of natural landscape and natural recreation opportunities, scenic values associated with byway; prominence of turbines. | Major |
| BI04 | Highly visible and likely to attract the attention of lighthouse visitors based on lighting conditions, although not as prominent as the existing BIWF. | Medium | Majority of turbines visible: 97<br>Percent visibility: 26%–50% | Medium | Long term (30 years)/reversible | Fair | Visibility based on lighting conditions, existing BIWF visibility, duration. | Medium | Importance of recreation and historic resources, duration and visibility from KOP based on lighting conditions. | Moderate |
| BI04 | The addition of the flashing warning lights on the WTGs and decks will add evidence of human development and increase visual clutter at the horizon. | Large | Number of turbines visible:<br>Percent visibility: %<br>Information not available in RWF VIA | Large | Long term (30 years)/reversible | Fair | Visibility based on lighting conditions, existing BIWF visibility, duration. | Large | Importance of recreation and historic resources, duration and visibility from KOP based on lighting conditions. | Major |
| BI12 | Visible and likely to attract attention resulting from angle of view of WTGs | Medium | Number of turbines visible: 100<br>Percent visibility: 51%–75% | Medium | Long term (30 years)/reversible | Fair | Visibility of WTGs within viewshed along horizon line within viewshed. | Medium | Importance of preservation of scenic district and uses; proximity and visibility of Project. | Moderate |

| KOP Number | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Geographic Extent Rationale* | Geographic Extent Rating (large, medium, small) | Duration/Reversibility Rationale | Duration/Reversibility Rating (good, fair, poor) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| **BI13** | Turbines become the focus of views out to the water and the tight spacing and numerous turbines along the horizon draw the viewers' eye away from natural features. | Large | Number of turbines: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of recreation and historic resources; proximity of residential viewers, duration and visibility from KOP. | Moderate |
| **CI01** | Turbines and OSS facilities would begin to dominate the horizon and are uncharacteristic of existing conditions. | Large | Number of turbines visible: 99<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Prominence and dominance of turbines in non-developed setting. | Large | Importance of recreation and historic resources; size, scale, and visibility from KOP. | Major |
| **C01** | Turbines are perceivable along horizon line, although the degree of change from existing condition would be minor. | Small | Number of turbines visible: 100<br>Percent visibility: 51%–75% | Medium | Long term (35 years)/reversible | Fair | Overall size and scale along with visibility reduces contrast and perceivability | Small | Importance of recreation and historic resources; size, scale and visibility from KOP. | Minor |
| **LI04** | Due to distance and viewer position in relation to other features in the landscape, there would be minor change in the existing condition. | Small | Number of turbines visible: 91<br>Percent visibility: 51%–75% | Medium | Long term (35 years)/reversible | Fair | Project would not be perceivable along horizon due to distance and atmospheric influences. | Small | Project would not be perceivable along horizon due to distance and atmospheric influences. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | Negligible |
| **LI04** | Due to distance and viewer position in relation to other features in the landscape, there would be minor change in the existing condition. | Small | Number of turbines visible:<br>Percent visibility: %<br>Information not available in RWF VIA | Small | Long term (35 years)/reversible | Fair | Project would be perceivable along horizon if observer views were focused toward lighting. | Small | The addition of aviation warning lights along the horizon within the viewshed would be perceivable by the focused viewer, but not a dominant element as compared to other existing warning lighting sources associated with BIWF that are in closer proximity (approximately 16 miles). | Negligible |
| **MM01** | Visible and likely to attract the attention resulting from angle of view of WTGs | Medium | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Medium | Long term (35 years)/reversible | Fair | Project blades would be perceivable along horizon. | Medium | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines. | Minor |
| **MM04** | Degree of change in existing conditions would be minimal due to distance and existing modifications within the foreground. | Small | Number of turbines visible: 90<br>Percent visibility: 51%–75% | Medium | Long term (35 years)/reversible | Fair | Distance to Project, natural and human-made features in the foreground would reduce magnitude. | Small | Importance of natural landscape and recreation opportunities; distance of turbines in relation to KOP. | Minor |
| **MV02** | Turbines are very visible on the horizon line and will dominate the view from the KOP. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines. | Moderate |

| KOP Number | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Geographic Extent Rationale* | Geographic Extent Rating (large, medium, small) | Duration/Reversibility Rationale | Duration/Reversibility Rating (good, fair, poor) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| **MV03** | Visible and likely to attract the attention resulting from angle of view of WTGs | Medium | Number of turbines visible: 59<br>Percent visibility: 76%–100% | Medium | Long term (35 years)/reversible | Fair | Visibility of WTGs within viewshed along horizon line within viewshed. | Medium | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines. | Moderate |
| **MV03** | WTGs appear dark gray against the light sky and the position of the sun serves as a focal point, drawing the viewer's eye toward part of the Project. | Large | Number of turbines visible: 59<br>Percent visibility: 76%–100% | Medium | Long term (35 years)/reversible | Fair | Visibility of backlit WTGs within viewshed along horizon line within viewshed. | Large | Scenic values; prominence of turbines- sunset backlighting of turbines along with movement influences prominence. | Major |
| **MV05** | With the proposed RWF in place, the nacelles and rotors from numerous WTGs and two OSSs will be visible from this KOP in the background along the horizon. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines. | Moderate |
| **MV05** | WTGs appear dark gray against the light sky and the position of the sun serves as a focal point, drawing the viewer's eye toward part of the Project. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Visibility of backlit WTGs within viewshed along horizon line within viewshed. | Large | Scenic values; prominence of backlit turbines on the horizon. | Major |
| **MV07** | OSSs appear as static, dark objects on the horizon intermixed with WTGs, providing scale to both the OSS and WTGs, which draw the eye. The overlook is no longer just for views of the ocean but also includes the turbines on the ocean. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Prominent, dedicated viewpoint. | Major |
| **MV07** | OSSs appear as static, dark objects on the horizon intermixed with WTGs, providing scale to both the OSS and WTGs, which draw the eye. The overlook is no longer just for views of the ocean but also includes the turbines on the ocean. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Prominent, dedicated viewpoint. | Major |
| **MV07** | Vertical lines of WTG warning lighting become focal point along the wide, dark horizon. | Large | Number of turbines visible:<br>Percent visibility: N/A<br>Information not available in RWF VIA | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Prominent, dedicated viewpoint; vertical orientation of warning lighting in dark, night sky, with brighter illumination at base of WTGs and as well as OSS lighting that draws eye across horizon and field of view. | Major |
| **MV09** | OSSs appear as static, dark objects on the horizon intermixed with WTGs, providing scale to both the OSS and WTGs, which draw the eye. The overlook is no longer just for views of the ocean but also includes the turbines on the ocean. | Large | Number of turbines visible: 70<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of historic lighthouse, scenic values; prominence of turbines and OSSs. | Major |

| KOP Number | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Geographic Extent Rationale* | Geographic Extent Rating (large, medium, small) | Duration/Reversibility Rationale | Duration/Reversibility Rating (good, fair, poor) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| **MV10** | Nacelles and rotors from numerous WTGs will be visible in the background along the horizon. Turbines are visible on the horizon and provide a focal point. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Medium | Importance of natural landscape and natural recreation opportunities; massing of turbines on horizon. | Moderate |
| **MV11** | Nearest WTG is 24.6 miles (39.6 km) away; the towers are largely obscured due to curvature of the Earth, with their degree of exposure decreasing from left to right. | Medium | Number of turbines visible: 89<br>Percent visibility: 2%–25% | Moderate | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Medium | Importance of natural landscape and natural recreation opportunities; visibility of WTGs due to distance and percentage of visibility. | Minor |
| **MV12** | KOP on Peaked Hill represents a discrete view to the southwest that requires the viewer to be perfectly positioned. | Small | Number of turbines visible:<br>Percent visibility: N/A<br>Information not available in RWF VIA | Small<br><br>Based on simulation graphic all are visible/vegetation and perspective influence | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions, vegetation and viewer perspective. | Small | Importance of cultural significance and natural recreation opportunities; visibility of WTGs due to intervening vegetation and landforms. | Major |
| **MV12** | Sunset illumination and backlighting influences change | Large | Number of turbines visible:<br>Percent visibility: N/A<br>Information not available in RWF VIA | Large<br><br>Based on simulation graphic all are visible/vegetation and perspective influence | Long term (35 years)/reversible | Fair | Backlighting of WTGs, increased visibility. | Large | Importance of cultural significance and natural recreation opportunities; visibility of WTGs due to backlighting. | Major |
| **MV13** | WTGs are visible; light gray towers, nacelles, and rotors are fully visible above the horizon. | Large | Number of turbines visible: 100<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of natural landscape and natural recreation opportunities; visibility of WTGs due to distance and percentage of visibility. | Major |
| **NI10** | WTGs are barely visible along the horizon, with a small cluster of turbine blades and nacelle comprising the majority of visible features. | Small | Number of turbines visible: 26<br>Percent visibility: 76%–100% | Small (distance) | Long term (35 years)/reversible | Fair | Not perceivable at distance. | Small | Importance of natural landscape and natural recreation opportunities; visibility of WTGs due to distance influences impact determination. | Negligible |
| **NL01** | WTGs appear as gray vertical lines against the yellow backdrop of the sky that look out of character with the vast extent of open water. | Large | Number of turbines visible: 100<br>Precent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Intact seascape and prominence of WTGs in close proximity, although no viewers. | Major |
| **NL01** | Sunset illumination and backlighting influences change | Large | Number of turbines visible: 100<br>Precent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Backlighting of WTGs, increased visibility. | Large | Intact seascape and prominence of WTGs, although no viewers; backlighting of WTGs and OSS. | Major |

| KOP Number | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Geographic Extent Rationale* | Geographic Extent Rating (large, medium, small) | Duration/Reversibility Rationale | Duration/Reversibility Rating (good, fair, poor) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| **RI01** | WTGs are barely visible from this location due largely to their distance from the viewer and the screening effects of curvature of the Earth. | Small | Number of turbines visible: 89<br>Percent visibility: 26%–75% | Small (Distance) | Long term (35 years)/reversible | Fair | Not perceivable at distance. | Small | Importance of historic setting and natural recreation opportunities; visibility of WTGs due to distance. | Minor |
| **RI06** | Upper portions of the WTGs are perceptible as slender gray protrusions above the horizon line. | Medium | Number of turbines visible: 99<br>Percent visibility: 2%–25% | Medium | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Medium | Intact seascape and presence of WTGs along horizon. | Minor |
| **RI08** | Nacelles and rotors of numerous WTGs are visible along the horizon, distance | Medium | Number of turbines visible: 99<br>Percent visibility: 76%–100% | Large | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Large | Importance of recreation opportunities; visibility of WTGs due to distance and percentage of visibility. | Moderate |
| **RI09** | WTGs will be visible along the horizon; distance | Medium | Number of turbines visible: 99<br>Percent visibility: 26%–50% | Medium | Long term (35 years)/reversible | Fair | Size and scale in relation to existing conditions along with percentage of visibility. | Medium | Importance of recreation opportunities; visibility of WTGs due to distance and percentage of visibility. | Moderate |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

* Data from (EDR 2023:Appendix A).

### Table G-VIS2a. Seascape Landscape Impact Assessment for Alternative B (Proposed Action) – Seascape Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Shoreline Beach | SCA | AI06, MV02, MV10, MV11, NI10, RI08, RI09 | Unobstructed, expansive water-level view of the shoreline and across open water | High | Viewer activity in this area is primarily recreational, including swimming, sunbathing, walking, beachcombi | High | Iconic eastern shore beach setting with intermixed characteristic built features. | High | 35.3/ 2.4 | Small | Prominence of WTGs based on adjacency of open water to character area, with uninterrupted views to | Large | Long term (35 years)/ reversible | Fair | Overall visible land area in comparison with prominence of Project and duration of time. | Medium | Predominately high sensitivity along with medium degree of magnitude. | Moderate |

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | ng, fishing, and surfing. Examples include Watch Hill, Narragansett, Horseneck, and Sachuest Beaches. | | Open ocean adjacency. | | | | horizon and Project. | | | | | | | |
| Coastal Bluff | SCA | BI04, BI12, C01, MV07, MV13, NL01 | Elevated views; Because of elevation and lack of tall vegetation, these views typically include significant lengths of shoreline and a broad expanse of open ocean as well as typical inland features. Views are generally only available from discrete public access points and trails. | Medium | Discrete, elevated views along visually variable landscape. Includes the south shore of Block Island including the Clayhead Trail in New Shoreham, at Gay Head in Aquinnah on Martha's Vineyard, along portions of the Cliff Walk in Newport, and at Montauk Point on Long Island. | High | Iconic eastern shore cliff and bluff setting with open ocean adjacency. | High | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Developed Waterfront | SCA | N/A | Dominance of human-made features including docks, boats, and shoreline buildings/structures | Low | Fishing ports, harbors, marinas, and shoreline commercial and industrial areas | Medium | Activity in these areas is generally water-oriented but highly variable and includes commercial fishing, seafood | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | processing, boat repair, pleasure boating, retail shopping, and restaurants. | | | | | | | | | | | |
| Shoreline Residential | SCA | AI03, RI01 | Shoreline homes are specifically situated to take advantage of water views. | High | Year-round and seasonal homes situated along the ocean shoreline. The defining characteristic of this zone is a broad, often elevated, view of the ocean from a residential setting. | High | Home are positioned and occupied for the appeal of iconic oceanside views. | High | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Coastal Dunes | SCA | BI13, MV03, MV05 | Views from the dunes are largely restricted to these paths and typically screened by the tight, rolling landform until emerging at the top of the beach. | Medium | Coastal dunes are typically strictly regulated ecological communities, and access is limited to narrow, enclosed footpaths and boardwalks that cut through or over the dunes, providing public access to the beaches. | Medium | Viewer activity in this area is almost exclusively recreational and typically focused on sightseeing and beach access. | Medium | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS2b. Seascape Landscape Impact Assessment for Alternative B (Proposed Action) – Seascape Character Areas and Landscape Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Salt Pond/ Tidal Marsh | SCA/LCA | RI06 | Views are available across the open water but are generally interrupted by adjacent dunes, barrier spits, and/or scrub vegetation that separates the ponds and the adjacent land from the ocean. | Low | Residences often occur along the edges of these ponds, as indicated by docks and boats along their shorelines. Recreational activity in the form of boating, fishing, and clamming is common in these areas. | Medium | Multi-use setting with localized views, increased distance from the open ocean. | Medium | 35.3/ 2.4 | Small | Intermix of vegetation, topography, and viewer position in relation to Project begins to influence the degree to which Project is perceived. | Medium | Long term (35 years)/ reversible | Fair | Overall visible land area in comparison with prominence of Project and duration of time. | Medium | Combination of high, medium, and low sensitivity (combined for and overall medium) along with medium degree of magnitude. | Moderate |
| Inland Lakes and Ponds | SCA/ LCA | N/A | The dominant visual feature of this zone is an open expanse of flat water that is enclosed by a vegetated shoreline. Occasionally interrupted by human-made features, such as homes and boat launches | Low | Given their locations and surrounding screening, views to the ocean are relatively rare. Human activity on the lakes and along the shoreline includes boating, fishing, and swimming. | Low | Views are constrained within immediate area with ocean views obscured by vegetation. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Maintained Recreation Area | SCA/LCA | AI01, AI03, BI04, C01, LI04, MM04, MV09, RI01 | Views of the ocean are highly variable, depending on the proximity to the shoreline. The open, maintained landscape generally allows for expansive, unobstructed views of the surrounding seascape. | High | Recreation focused with open lawns at public parks, lighthouses, USCG stations, and golf courses. Lighthouses and state parks are often associated. | High | Iconic settings, with lighthouses, open ocean views with a recreation focus. | High | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Highway Transportation | SCA/LCA | N/A | High-volume vehicular travel corridors that | Low | Dominated by adjacent buildings/structures | Medium | Viewer focus is associated | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | traverse the landscape and are dominated by automobiles. Travel is at moderate to high speed, and outward peripheral views are fleeting. | | and trees with limited elevated long-distance views available. | | with driving activity and with limited duration views. | | | | | | | | | | | |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS2c. Seascape Landscape Impact Assessment for Alternative B (Proposed Action) – Landscape Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Coastal Scrub/ Shrub Forest | LCA | AI05, AI07, CI01, MM01, | Outward views are largely enclosed by surrounding vegetation and are limited to the orientation and width of the cleared corridor. | Low | Viewer activity is primarily local travel and recreational trail use. | Medium | Views are constrained within the immediate area with ocean views obscured by vegetation. | Low | 35.3/ 2.4 | Small | As distance from Project increases, the degree to which Project is noticeable decreases due to the influence of the built and naturally vegetated environment associated with these character areas. | Medium/ Small | Long term (35 years)/ reversible | Fair | Overall visible land area in comparison with prominence of Project and duration of time. | Medium | Overall low sensitivity with medium degree of magnitude | Minor |

| **Character Area Name** | **Character Area Association (SCA/LCA/OCA)** | **Key Observation Points with Simulations** | **Susceptibility Rationale** | **Susceptibility Rating (high, medium, low)** | **Value Rationale** | **Value Rating (high, medium, low)** | **SLIA Sensitivity Rating Rationale** | **SLIA Sensitivity Rating (high, medium, low)** | **Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action Total Land Acres within Analysis Area: 1,488.1 Square Miles** | **Geographic Extent Rating (large, medium, small)** | **Size or Scale Rating Rationale (degree of change from existing conditions)** | **Size and Scale Rating (large, medium, small)** | **Duration/ Reversibility Rationale** | **Duration/ Reversibility Rating (good, fair, poor)** | **SLIA Magnitude Rating Rationale** | **SLIA Magnitude Rating (large, medium, small)** | **SLIA Overall Impact Level Rationale** | **SLIA Overall Impact Level (major, moderate, minor, negligible)** |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Agricultural/ Open Field | LCA | N/A | Open farmland provides for long-distance views in this zone; adjacent forest, coastal scrub, and buildings/structures typically frame/enclose these views and provide significant screening. | Low | Occurs primarily inland of the coast, views to the ocean are relatively rare. | Low | Setting is not influenced by views of the ocean, and pastoral/agricultural character dominates. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Forest | LCA | MV12 | Long-distance views within the zone are generally either fully or partially screened by vegetation and, when present, are tightly enclosed by the surrounding trees. | Low | Variable vegetation characteristics in relation to typical ocean, seascape environment provides more enclosed setting for users. | Low | Views are constrained within the immediate area with ocean views obscured by vegetation. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Rural Residential | LCA | N/A | Rural residences tend to be located along narrow, tree-lined roads, with intervening vegetation. Long-distance views are largely restricted to | Low | Typical viewer activity includes residential activity, outdoor recreation, and local travel. | Low | Views are constrained within the immediate area with ocean views obscured by vegetation. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action Total Land Acres within Analysis Area: 1,488.1 Square Miles | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | small open fields. | | | | | | | | | | | | | | | |
| Suburban Residential | LCA | N/A | Medium to high-density residential neighborhoods that typically occur on the outskirts of villages and town centers and along secondary roads and cul-de-sacs spurring off the main roads. | Low | Views are generally limited by the surrounding forest vegetation, adjacent buildings/structures, and/or undulating topography that surrounds the subdivisions. | Low | Localized views and influence of built residential environment. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Village/ Town Center | LCA | N/A | Moderate to high-density residential and commercial development includes larger town center areas. Buildings (typically two- to three-stories tall) and other human-made features dominate the landscape. | Low | Outward views that are available will typically exist in areas on the outskirts of the villages and town centers and will generally be partially screened by existing buildings/structures and surrounding native vegetation. | Low | Localized views and influence of built environment. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |
| Commercial | LCA | N/A | Commercial development along a highway includes retail businesses, restaurants, convenience | Low | Views are focused along the axis of the highway and the foreground is dominated by buildings, | Low | Urbanized built environment dominates and is the primary focus. | Low | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. | Same as above. |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | stores, automobile dealers, shopping centers, and malls. | | automobiles, paved roads, and parking lots. | | | | | | | | | | | | | |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

**Table G-VIS2d. Seascape Landscape Impact Assessment for Alternative B (Proposed Action) – Ocean Character Areas**

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) *Alternative B – Proposed Action*<br><br>*Total OCA area within Analysis Area: 6,113.4 Square Miles* | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and Scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Open Ocean | OCA | N/A | Presence of open water as a dominant foreground element in all directions. Human-made features in the water are limited but may include occasional jetties, buoys, and boats. | High | Human activity on the water can be extensive, especially near major ports and navigation. | High | Presence of open ocean environment with unobstructed horizon is of high importance to users and visitors. | High | 5,882.2/96.2<br><br>Maximum ocean visibility as compared to all alternatives | Large | Predominantly intact open ocean within immediate proximity of WTGs and OSS facilities not characteristic of the OCA. | Large | Long term (35 years)/ reversible | Fair | Proximity of OCA to Project with uninterrupted ocean views surrounding Project for duration of Project. Approximately 96% of OCA total acres with visibility. | Large | Intact open ocean setting, in immediate proximity of Project components for the duration of Project. | Major |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

**Table G-VIS2e. Seascape Landscape Impact Assessment for Alternative B (Proposed Action) – Specially Designated Areas**

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Specially Designated Area with Visibility of Alternative (Acres/Percentage) *Proposed Action (Alternative B)* | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Historic Sites and National Landmarks | 12,308.0 | AI01, AI03, BI04, BI12, BI13, C01, C02, BI13, MM04, MV07, MV09, MV13, RI01 | 161 districts and individual properties listed or eligible for the NRHP and 13 properties or districts listed as National Historic Landmarks (NHL). These include historic districts, homes, lighthouses, churches, and government buildings. | High | Properties have historic, regional and national significance. | High | Historic properties and sites generally have high than average sensitivity based on the nature of the property and its relationship to the setting. | High | 1,222.08/9.9 | Medium | General proximity of Project in relation to sensitive resource and experiences associated with historic/ culturally significant locations. | Large | Long term (35 years)/ reversible | Fair | General proximity of Project in relation to sensitive resource and experiences associated with historic/ culturally significant locations. | Large | Importance of iconic sites, settings and experiences associated with locations in contrast to introduction of Project. | Major |

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Specially Designated Area with Visibility of Alternative (Acres/Percentage) *Proposed Action (Alternative B)* | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| National Natural Landmarks | 349.7 | MV07 | Sites that contain outstanding biological and geological resources and encourages the conservation of these areas. | Medium | Two locations identified within analysis area. Primary importance is related to physical resources, with lesser potential importance on experiences. | Medium | Preservation of physical resources associated with landmarks. | Medium | 255.5/73.1 | Large | Proximity of Gay Head Cliffs is approximate 14 miles from Project. Muskeget Island is approximately 31.6 miles. | Medium | Long term (35 years)/ reversible | Fair | Variable distances of resource from Project. | Large | two identified localized resources with variable proximity to Project and localized focus on physical resources. | Moderate |
| State Scenic Areas | 105,777.6 | BI12, CI01, MV07 | 93 state-designated scenic areas, including 56 in Rhode Island; 34 in Massachusetts; 3 in New York | High | Importance of iconic landscapes (ex. Martha's Vineyard) that surround the Lease Area. | High | Often associated with iconic settings and places which most often have regional and national significance related to sense of place. | High | 18,205.6/17.2 | Small | Overall percentage of visible areas and distribution of locations often in relative proximity to Project. | Large | Long term (35 years)/ reversible | Fair | Variability of visibility in relation to resource with approximately ¼ of acres having visibility of Project. | Medium | Overall higher sensitivity to change based on nature of resource and iconic landscapes. | Major |
| National Wildlife Refuges | 15,176.1 | AI05, NL01, RI06 | System of public lands and waters set aside to conserve the nation's fish, wildlife, and plants. Nine refuges occur within the analysis area. | Low | Preservation of natural resources specific to refuge. | Low | Preservation of physical resources associated with refuges. | Medium | 767.7/5.1 | Small | Percentage of visibility of Project in relation to distributed areas and refuge locations | Small | Long term (35 years)/ reversible | Fair | Minimal to no change to physical resource visually. | Small | Refuges are focused on the preservation of natural resources, with closest refuge not occupied by humans. | Minor |
| State/Non-Profit Wildlife Management Areas | 31,967.8 | AI07 | 18 State Wildlife Management Areas: nine in Rhode Island and nine in Massachusetts. Lands are managed to provide wildlife habitat and accommodate wildlife-related recreation (hunting, bird watching, etc.). | Low | Preservation of natural resources specific to management areas. | Low | Preservation of physical resources associated with management area. Variable uses and activities. | Medium | 1,31.4/.4 | Small | Small percentage of Project visibility. | Small | Long term (35 years)/ reversible | Fair | Minimal to no change to physical resource visually. | Small | Management areas are focused on the preservation of natural resources and providing recreation resources. | Minor |

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Specially Designated Area with Visibility of Alternative (Acres/Percentage) *Proposed Action (Alternative B)* | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| National Parks | 31.2 | N/A | New Bedford Whaling National Historical Park, New Bedford, Massachusetts. Approximately 26 miles from Project. | Low | Associated with historical maritime activities, localized interest. | Low | Higher sensitivity as a result of National Park designation | Medium | .2/.7 | Small | Overall distance from Project is approximately 26 miles with one WTG visible. | Small | Long term (35 years)/ reversible | Fair | No perceivable change related to Project | Small | Importance as a National Park, though physically distanced from Project to have negligible impacts or visibility. | Negligible |
| State Parks | 10,473.8 | AI01, LI04, MV10, RI08 | 17 State parks and reservations that occur within the analysis area and provide recreation and sight-seeing opportunities. | Medium | Variable recreation sites and opportunities for local and national interests. | Medium | Importance of recreation destinations and associated ocean viewing opportunities. | High | 2,731.7/26.1 | Medium | Over ¼ of area with visibility and proximity of Project. | Medium | Long term (35 years)/ reversible | Fair | Physical presence of Project 16 miles to 30+ miles; with variable visibility. | Medium | Recreation and ocean focused recreation with multiple user groups and interests. | Moderate |
| State Nature and Historic Preserves | 248.4 | N/A | John H. Chafee State Nature Preserve. Open to the public and provides agricultural, educational, and scenic values, as well as natural and historical resources | Low | Preservation of local heritage and resources. | Low | Preservation of heritage resources of the region. | Medium | 3.1/1.2 | Small | Resource is approximately 24 miles from nearest WTG with minimal visibility. | Low | Long term (35 years)/ reversible | Fair | Physical distance from Project and overall visibility. | Low | Localized interests with preservation focus, limited to no visibility of Project. | Negligible |
| State Forests | 5,301.6 | N/A | Manuel F. Correllus State Forest, located on the inland portion of Martha's Vineyard, Massachusetts, is the only state forest. Inland forest with vegetation and topography. | Low | Located in the center of Martha's Vineyard, multi-use recreation activities. | Low | Large local recreation resource with internally focused activities, surrounded by urban development. | Low | 7.8/.2 | Small | Inland recreation resource with limited visibility of Project. | Low | Long term (35 years)/ reversible | Fair | Inland location with intervening influence of vegetation, topography and built environment. | Low | Localized recreation resource, surrounded by urban development with intervening features that limit Project visibility. | Negligible |
| State Beaches | 165.1 | N/A | Nine state beaches; heavily used bathing beaches that typically include large | Medium | Recreation destination for high number of users with focus of activities | High | Iconic eastern shore beach destinations with high user interest. | High | 78.2/ 47.4 | Medium | Approximately ½ of beach areas with visibility of Project | Medium | Long term (35 years)/ reversible | Fair | Beach locations are at or beyond 20 miles from Project where scale decreases but | Medium | Popular beach destinations with viewer focus toward ocean and beach activities. | Moderate |

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Specially Designated Area with Visibility of Alternative (Acres/Percentage) *Proposed Action (Alternative B)* | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | parking areas, bathhouses, pavilions, and concession buildings. | | towards ocean environment. | | | | | | beyond 20 miles. | | | | Project is perceivable. | | Overall distance from Project is approximately 20 miles. | |
| Highways Designated or Eligible as Scenic | 411.6 | N/A | Two scenic byways are located within Rhode Island with waterfront, shoreline and coastline views. | Medium | Scenic Byway designation indicates value and importance of resources associated. | High | Protection of designation and associated iconic views. | High | 43.4/10.5 | Small | Overall low percentage of visibility in relation to linear resource. | Low | Long term (35 years)/ reversible | Fair | Low to intermittent visibility and associated intervening features. | Medium | Importance of scenic byway designation and preservation of resource with intermittent and variable viewing conditions from motorists. | Moderate |
| National Historic Trails | 990.1 | N/A | Washington-Rochambeau Revolutionary Route – national resource with period significance related to setting. | High | Congressionally designated trail resource with historic significance. | High | Changes in visual setting related to the trail. | High | .8/.1 | Small | Small percentage of visibility related to resource. | Low | Long term (35 years)/ reversible | Fair | Low visibility with intermix of urban and natural features with WTG distance ranging from 18 to 40 miles. | Low | National Trail designation significance (high sensitivity) with low visibility of Project. | Minor |
| National Recreation Trails | 88.6 | AI03 | Cliff Walk within Ochre Point Cliffs Historic District with iconic setting and views. | High | Views of the Atlantic Ocean historic mansions, wildflowers, wildlife, and shorelines. | Medium | Iconic setting with interests associated with preservation of resource and views. | High | 65.1/73.4 | Large | Large percentage of resource has visibility of Project. | High | Long term (35 years)/ reversible | Fair | Visibility of Project in relation to resource within approximately 15 miles. | High | Importance of resources in relation to setting and natural environment with a large portion of the trail having visibility of Project. | Major |
| State Fishing and Boating Access Sites | 371.4 | N/A | 45 state-owned and/or -managed fishing and boating access sites with focus on maritime or ocean related activities. | Low | Recreational focus with inter-related views of ocean and setting. | Low | Primary focus of resources is related to recreation activities in interrelated ocean setting. | Medium | 78.4/21.1 | Medium | Approximately ¼ of acres with visibility of Project and are at least 16 miles from Lease Area. | Low | Long term (35 years)/ reversible | Fair | Resources in relation to Project and visibility. | Medium | Recreation resource with interrelated interest in ocean setting and views, variable distances from Project beyond 16 miles. | Moderate |

| **Specially Designated Areas** | **Specially Designated Area Total Acres** | **Key Observation Points with Simulations** | **Susceptibility Rationale** | **Susceptibility Rating (high, medium, low)** | **Value Rationale** | **Value Rating (high, medium, low)** | **SLIA Sensitivity Rating Rationale** | **SLIA Sensitivity Rating (high, medium, low)** | **Geographic Extent of Specially Designated Area with Visibility of Alternative (Acres/Percentage) *Proposed Action (Alternative B)*** | **Geographic Extent Rating (large, medium, small)** | **Size or Scale Rating Rationale (degree of change from existing conditions)** | **Size and scale Rating (large, medium, small)** | **Duration/ Reversibility Rationale** | **Duration/ Reversibility Rating (good, fair, poor)** | **SLIA Magnitude Rating Rationale** | **SLIA Magnitude Rating (large, medium, small)** | **SLIA Overall Impact Level Rationale** | **SLIA Overall Impact Level (major, moderate, minor, negligible)** |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Lighthouses | 23.0 | BI04, C01, MM04, MV09, RI01 | 32 lighthouses; with proximity to ocean edge based on nature of resource and setting. | High | Lighthouses are characteristically associated with shoreline areas and settings with ocean focus. | High | Visitors and users of lighthouse resources as destination and iconic setting. | High | 6.6/28.7 | Medium | One lighthouse within approximately 9 miles of Project. All others are associated with ocean proximity that orients them closer to Project. | High | Long term (35 years)/ reversible | Fair | Proximity of lighthouses in relation to Project influences potential visibility and prominence. | High | Nature of lighthouses in relation to iconic ocean setting and proximity of Project. | Major |
| Public Beaches | 4,221.0 | AI06, MM01, MV02, MV03, MV05, MV11, NI10, RI09 | 178 public beaches with recreation focus and ocean facing views, iconic settings | Medium | Iconic recreation destination for high number of users with focus towards ocean and beach activities. | Medium | Typically higher interests in ocean setting with variable activities and user focus. | Medium | 11,38.8/27.0 | Medium | Approximately ¼ of acres with visibility of Project. Viewer position along beaches is often inline with Project. | Medium | Long term (35 years)/ reversible | Fair | Closest beach is approximately 13 miles; variable viewer perspectives and positioning. | Medium | Iconic beach setting with high user interest and activity though viewer position and visibility of Project can be variable. | Moderate |
| Ferry Routes | 10,641.7 | N/A | 20 different ferry routes originating from multiple locations around Project. Proximity of routes to Project. | Medium | Dedicated ocean focused uses used for either pleasure or utility purposes. | Medium | Variability in users and interests intermixed with other seagoing vessels. | Medium | 6,365.0/59.8 | Large | Over 1.2 of ferry routes with visibility due to open ocean environment. | High | Long term (35 years)/ reversible | Fair | Resource is ocean based and in closer proximity to Project, though duration of view can be short term and directional. | High | Variability in viewer interest and overall sensitivity within dedicated ferry lanes. Proximity of Project in relation to routes influences prominence based on duration and direction. | Moderate |
| Seaports | 90.1 | N/A | Five seaports associated with working waterfront activity | Low | Industrial and seagoing areas with associated infrastructure. | Low | Variable users and interests; with primary focus related to industry. | Low | 2.3/2.5 | Small | Overall low visibility and perception of Project due to intermix of other built features and distance. | Low | Long term (35 years)/ reversible | Fair | Perceivability of Project in relation to other seaport uses and activities. | Low | Primary focus of seaports related to industrial and commercial uses with surrounding infrastructure and built environment. | Negligible |

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Susceptibility Rationale | Susceptibility Rating (high, medium, low) | Value Rationale | Value Rating (high, medium, low) | SLIA Sensitivity Rating Rationale | SLIA Sensitivity Rating (high, medium, low) | Geographic Extent of Specially Designated Area with Visibility of Alternative (Acres/Percentage) *Proposed Action (Alternative B)* | Geographic Extent Rating (large, medium, small) | Size or Scale Rating Rationale (degree of change from existing conditions) | Size and scale Rating (large, medium, small) | Duration/ Reversibility Rationale | Duration/ Reversibility Rating (good, fair, poor) | SLIA Magnitude Rating Rationale | SLIA Magnitude Rating (large, medium, small) | SLIA Overall Impact Level Rationale | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Other State Land with Public Access | 9,361.8 | N/A | Variability of other resources associated with natural resources, recreation activities and locally sensitive uses. | Medium | Variability of uses and interests. | Medium | Variable users and interests | Medium | 325.3/3.5 | Small | Overall small percentage of visibility in relation to total acres. | Low | Long term (35 years)/ reversible | Fair | Variability of locations, which based on visibility can be assumed to be inland focused. | Low | High variability in use, interest and sensitivity; low overall visibility as compared to total acres. | Negligible |

## Table G-VIS3. Visual Impact Assessment Impacts Matrix for Alternative C (Habitat Alternative)

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative C1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative C1 | Distance to Nearest Turbine (miles/nautical miles) Alternative C2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative C2 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| CI01 | Cuttyhunk Island | High | 13.9/12.1 | 13.9/12.1 | 17.8/15.5 | 13.9/12.1 | 17.8/15.5 | C2 | The reduction of WTGs in close proximity of the KOP would not decrease visibility of the WTGs. WTG reduction would be localized to the center view of the KOP, where turbines are removed surrounding the eastern most OSS. The Lease Area would appear to have two separate WTG areas. | Major |
| MM01 | Gooseberry Island | Medium | 15.2/13.2 | 15.2/13.2 | 22.4/19.5 | 15.2/13.2 | 22.3/19.4 | C1 and C2 | The reduction of WTGs associated with each alternative would not decrease visibility of the WTGs within 20 miles of the KOP. WTG reduction would be localized to areas beyond 20 miles and would remove turbines that have WTG blades visible along the horizon. | Minor |
| MV02 | Philbin Beach | High | 13.6/11.8 | 13.8/12.0 | 13.6/11.8 | 13.8/12.0 | 13.6/11.8 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Moderate |
| MV05 | Moshup Beach | High | 13.8/12.0 | 13.7/11.9 | 13.7/11.9 | 13.7/11.9 | 13.7/11.9 | C1 and C2 | Alternatives C1 and C2 would have similar impacts. The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Major |
| MV05 | Moshup Beach – Sunset | High | 13.8/12.1 | 13.7/11.9 | 13.7/11.9 | 13.7/11.9 | 13.7/11.9 | C1 and C2 | Alternatives C1 and C2 would have similar impacts. The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. The backlighting resulting from sunset conditions would enhance the distinctiveness of the break in continuity of the WTG massing. | Major |
| MV07 | Aquinnah Overlook | High | 13.7/12.0 | 13.7/12.0 | 14.0/12.1 | 13.7/12.0 | 14.0/12.1 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Moderate |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative C1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative C1 | Distance to Nearest Turbine (miles/nautical miles) Alternative C2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative C2 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| MV07 | Aquinnah Overlook – Sunset | High | 13.7/12.0 | 13.7/12.0 | 14.0/12.2 | 13.7/12.1 | 14.0/12.2 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. The backlighting resulting from sunset conditions would enhance the distinctiveness of the break in continuity of the WTG massing. | Major |
| MV07 | Aquinnah Overlook – Night | High | 13.7/12.0 | 13.7/12.0 | 14.0/12.3 | 13.7/12.2 | 14.0/12.3 | C2 | Alternative C2 would have slightly fewer nighttime impacts with the reduction of 3 WTGs within the center of view. The reduction of WTGs within the center of the Lease Area would reduce the density of the Project within the viewshed at night, though would not decrease visibility of the WTGs left and right of center of the KOP. The Alternative would visually appear as two separate projects based on visible lighting, with a slight variation associated with Alternative 1 where 3 WTGs remain in the center of view from the KOP. WTG lighting would be visible right and left of center of the KOP. | Major |
| MV09 | Gay Head Lighthouse | High | 13.9/12.1 | 13.9/12.1 | 14.1/12.3 | 13.9/12.1 | 14.1/12.3 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Moderate |
| MV10 | South Beach State Park | High | 22.0/19.1 | 22.0/19.1 | 25.3/22.0 | 22.0/19.1 | 25.3/22.0 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project along the center of the horizon of the viewshed, though would not decrease predominant visibility of the WTGs left of center of the KOP. | Major |
| MV11 | Wasque Point | Low | 24.8/21.5 | 24.8/21.5 | 28.5/24.8 | 24.8/21.5 | 28.5/24.8 | C1 and C2 | he reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the visibility of WTG blades visible along the right of center of KOP along the horizon, though would not decrease visibility of the WTGs center and left of center of the KOP. | Minor |
| MV12 | Peaked Hill Reservation | High | 16.3/14.2 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | 17.3/15.1 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Major |
| MV12 | Peaked Hill Reservation – Sunset | High | 16.3/14.2 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | 17.3/15.1 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Major |
| MV13 | Edwin DeVries Vanderhoop Homestead | Medium | 13.8/12.0 | 13.8/12.0 | 14.0/12.1 | 13.8/12.0 | 14.0/12.1 | C1 and C2 | Alternatives C1 and C2 would have similar impacts. The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 15 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Moderate |
| NI10 | Madaket Beach | Medium | 34.6/30.0 | 34.6/30.0 | 39.0/34.0 | 34.6/30.0 | 39.7/34.5 | C1 and C2 | No change from Proposed Action. Views of eastern portion of the Lease Area from the KOP would be the same as the Proposed Action. A small portion of the turbine blades would be visible on the distance horizon under clear viewing conditions. | Minor |
| NL01 | Nomans Land Island NWR *(not occupied)* | Medium | 8.7/7.5 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease visibility of the WTGs left and right of center of the KOP within 8 to 12 miles. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. | Moderate |
| NL01 | Nomans Land Island NWR – | Medium | 8.7/7.5 | 8.7/7.5 | 9.0/7.9 | 8.7/7.6 | 9.0/7.9 | C1 and C2 | The reduction of WTGs associated with each alternative within the center of the Lease Area would reduce the density of the Project within the viewshed, though would not decrease | Major |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative C1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative C1 | Distance to Nearest Turbine (miles/nautical miles) Alternative C2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative C2 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| | Sunset *(not occupied)* | | | | | | | | visibility of the WTGs left and right of center of the KOP. Both alternatives would visually appear as two separate projects, with a slight variation associated with Alternative C1 where 3 WTGs remain in the center of view from the KOP. The backlighting resulting from sunset conditions would enhance the distinctiveness of the break in continuity of the WTG massing. | |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS4a. Seascape Landscape Impact Assessment for Alternative C (Habitat Alternative) – Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative C1<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative C2<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| Shoreline Beach | SCA | AI06, MV02, MV10, MV11, NI10, RI08, RI09 | 35.3/ 2.4 | 35.0/ 2.4 | 34.7/ 2.3 | Alternative C2 would have negligible reduction in visible acres across all SCAs and LCAs as compared to the Proposed Action.<br><br>The importance of SCAs for recreation and other uses along with residential areas of LCAs in close proximity of SCAs where ocean views dominate or are of high value, influence the overall impact level associated with the Project and associated alternatives. | SCA – Moderate |
| Coastal Bluff | SCA | BI04, BI12, C01, MV07, MV13, NL01 | | | | | |
| Developed Waterfront | SCA | N/A | | | | | |
| Shoreline Residential | SCA | AI03, RI01 | | | | | |
| Coastal Dunes | SCA | BI13, MV03, MV05 | | | | | |
| Salt Pond/ Tidal Marsh | SCA/LCA | RI06 | | | | | SCA/ LCA -Moderate |
| Inland Lakes and Ponds | SCA/LCA | N/A | | | | | |
| Maintained Recreation Area | SCA/LCA | AI01, AI03, BI04, C01, LI04, MM04, MV09, RI01 | | | | | |
| Highway Transportation | SCA/LCA | N/A | | | | | |
| Coastal Scrub/ Shrub Forest | LCA | AI05 , AI07, CI01, MM01, | | | | | LCA – Minor |
| Agricultural/ Open Field | LCA | N/A | | | | | |
| Forest | LCA | MV12 | | | | | |
| Rural Residential | LCA | N/A | | | | | |
| Suburban Residential | LCA | N/A | | | | | |
| Village/ Town Center | LCA | N/A | | | | | |
| Commercial | LCA | N/A | | | | | |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

**Table G-VIS4b. Seascape Landscape Impact Assessment for Alternative C (Habitat Alternative) – Ocean Character Areas**

| Character Area Name | Character Area Association<br><br>(SCA/LCA/OCA) | Key Observation Points with Simulations | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total OCA area within Analysis Area: 6,113.4 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative C1<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative C2<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| Open Ocean | OCA | N/A | 5,882.2/96.2<br><br>Maximum ocean visibility for all alternatives | See Alternative B | See Alternative B | Intact open ocean setting, in immediate proximity of Project (all alternatives) components for duration of Project. | Major |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

**Table G-VIS4c. Seascape Landscape Impact Assessment for Alternative C (Habitat Alternative) – Specially Designated Areas**

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Proposed Action (Alternative B) | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Alternative C1 | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Alternative C2 | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| Historic Sites and National Landmarks | 12,308.0 | AI01, AI03, BI04, BI12, BI13, C01, C02, BI13, MM04, MV07, MV09, MV13, RI01 | 1,222.08/9.9 | 1,218.8/9.9 | 1,218.6/ 9.9 | Alternative C2 would have negligible reduction in visible acres across all SDAs as compared to the Proposed Action and overall impacts would remain similar. | Major |
| National Natural Landmarks | 349.7 | MV07 | 255.5/73.1 | 252.3/ 72.2 | 249.5/71.4 | | Moderate |
| State Scenic Areas | 105,777.6 | BI12, CI01, MV07 | 18,205.6/17.2 | 18,069.1/17.1 | 17,986.7/17.0 | | Major |

### Table G-VIS5b. Visual Impact Assessment Impacts Matrix – Alternative D (Transit Alternative)

| KOP Number | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D2 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1, D2, & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1, D2, & D3 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| AI01 | N/A | 18.5/16.1 | 16.7/14.5 | 18.5/16.1 | 16.7/14.5 | 18.5/16.1 | 16.7/14.5 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which removes the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible, though appear small in scale. | Moderate |

| KOP Number | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D2 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1, D2, & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1, D2, & D3 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| AI01 | N/A | 18.5/16.1 | 16.7/14.5 | 18.5/16.1 | 16.7/14.5 | 18.5/16.1 | 16.7/14.5 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which removes the first row of visible WTGs along the horizon. When viewed at night, warning lights will be visible along horizon where nighttime lighting does not currently exist. | Moderate |
| AI03 | N/A | 17.2/14.9 | 15.3/13.3 | 17.2/14.9 | 15.3/13.3 | 17.2/14.9 | 15.3/13.3 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which reduces the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible, though appear small in scale. | Moderate |
| AI05 | N/A | 17.0/14.7 | 14.8/12.9 | 17.0/14.7 | 14.8/12.9 | 17.0/14.7 | 14.8/12.9 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which removes the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible, though appear small in scale. | Moderate |
| AI06 | N/A | 18.2/15.8 | 16.0/13.9 | 18.2/15.8 | 16.0/13.9 | 18.2/15.8 | 16.0/13.9 | D1, D2, and D3 | Alternative D2 would increase the distance between the KOP and nearest turbine by approximately 2 miles which reduces the overall visibility of the WTGs along the horizon. | Minor |
| AI07 | N/A | 18.4/16.0 | 16.2/14.1 | 18.4/16.0 | 16.2/14.1 | 18.4/16.0 | 16.2/14.1 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which removes the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible and prominent. | Moderate |
| BI04 | N/A | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | D1, D2, and D3 | Alternative D3 would negligibly increase the distance between the KOP and nearest WTGs as only one WTG would be removed that is nearest the KOP. Overall the combinations of Alternatives D1 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Moderate |
| BI04 | N/A | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | D1, D2, and D3 | Alternative D3 would negligibly increase the distance between the KOP and nearest WTGs as only one WTG would be removed that is nearest the KOP. Overall the combinations of Alternatives D1 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. When viewed at night, warning lights will continue be visible along horizon similar to the Proposed Action where nighttime lighting does not currently exist. | Major |
| BI12 | N/A | 16.7/14.5 | 15.9/13.8 | 16.7/14.5 | 15.9/13.8 | 16.7/14.5 | 15.9/13.8 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 1 mile removing 1 string of WTGs. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Moderate |
| BI13 | N/A | 18.0/15.7 | 17.2/15.0 | 18.0/15.7 | 17.2/15.0 | 18.0/15.7 | 17.2/15.0 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 1 mile removing 1 string of WTGs. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Moderate |
| CI01 | N/A | 13.9/12.1 | 14.2/12.4 | 13.9/12.1 | 14.2/12.4 | 13.9/12.1 | 14.2/12.4 | D1, D2, and D3 | Alternative D3 would negligibly increase the distance between the KOP and nearest WTGs as only two WTGs would be removed that is nearest the KOP. Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Major |
| C01 | N/A | 20.0/17.4 | 18.4/15.9 | 20.0/17.4 | 18.4/15.9 | 20.0/17.4 | 18.4/15.9 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 2 miles. The overall massing of the WTGs within the Lease Area would appear smaller in scale along the horizon as a result of the increased distance and influence of the curvature of the earth. | Minor |
| LI04 | 33.8/29.4 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.9/27.7 | D1, D2, and D3 | Alternative D1 would not be perceivable along horizon due to distance (over 30 miles) and atmospheric influences. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | Negligible |
| LI04 | 33.8/29.4 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.9/27.7 | D1, D2, and D3 | The addition of aviation warning lights along the horizon within the viewshed would be perceivable by the focused viewer, but not a dominant element as | Negligible |

| KOP Number | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D2 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1, D2, & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1, D2, & D3 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | compared to other existing warning lighting sources associated with BIWF that are in closer proximity (approximately 16 miles). | |
| MM01 | N/A | 16.6/14.5 | 15.1/13.2 | 16.6/14.5 | 15.1/13.2 | 16.6/14.5 | 15.1/13.2 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 1.5 miles removing two of the WTGs. The overall massing of the WTGs (blades) within the Lease Area would continue to be perceivable along the horizon. | Minor |
| MM04 | N/A | N/A | N/A | N/A | N/A | N/A | N/A | D1, D2, and D3 | Alternative D3 would negligibly increase the distance between the KOP and nearest WTGs as only one WTG would be removed that is nearest the KOP. D3 would remove outer strings of WTGs when viewed far right of center. The overall massing of the WTGs (hub and blades) within the Lease Area would continue to be perceivable along the horizon. | Minor |
| MV02 | 14.2/12.3 | N/A | N/A | 13.6/11.8 | 14.2/12.3 | 13.6/11.8 | 14.2/12.3 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Moderate |
| MV03 | 15.5/13.5 | N/A | N/A | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | D1, D2, and D3 | Alternative D2 would remove the majority of WTGs visible (8 WTGs) to the left of Nomans Land Island which are unobstructed and prominent along the horizon. The remaining WTGs visible within the Lease Area would be partially obscured (towers) with hubs and blades still visible above the landform, but not a major focus of attention by beach users. | Minor |
| MV03 | 15.5/13.5 | N/A | N/A | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | D1, D2, and D3 | Alternative D2 would remove the majority of WTGs visible (8 WTGs) to the left of Nomans Land Island which are unobstructed and prominent along the horizon. The remaining WTGs visible within the Lease Area would be partially obscured (towers) with hubs and blades still visible above the landform, which, when backlit would continue to draw the viewers eye due to movement. | Moderate |
| MV05 | 14.5/12.6 | N/A | N/A | 13.7/11.9 | 14.5/12.6 | 13.7/11.9 | 14.5/12.6 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Major |
| MV05 | 14.5/12.6 | N/A | N/A | 13.7/11.9 | 14.5/12.6 | 13.7/11.9 | 14.5/12.6 | D1, D2, and D3 | Alternative D2 would remove the majority of WTGs visible (8 WTGs) to the left of Nomans Land Island which are unobstructed and prominent along the horizon. The remaining WTGs visible within the Lease Area, when backlit would continue to draw the viewers eye due to movement. | Moderate |
| MV07 | 14.9/12.9 | N/A | N/A | 13.7/11.9 | 14.9/12.9 | 13.7/11.9 | 14.9/12.9 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon and be the center of focus from the KOP. | Major |
| MV07 | 14.9/12.9 | N/A | N/A | 13.7/11.9 | 14.9/12.9 | 13.7/11.9 | 14.9/12.9 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon and be the center of focus from the KOP. The remaining WTGs visible within the Lease Area, when backlit would continue to draw the viewers eye due to movement and dark contrast. | Major |
| MV07 | 14.9/12.9 | N/A | N/A | 13.7/11.9 | 14.9/12.9 | 13.7/11.9 | 14.9/12.9 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon and be the center of focus from the KOP. WTG hazard lighting would be visible along the horizon based on turbine distance, with platform and tower lighting more prevalent with the first four strings of WTGs. | Major |
| MV09 | 15.0/13.0 | N/A | N/A | 13.9/12.1 | 15.0/13.0 | 13.9/12.1 | 15.0/13.0 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of | Major |

| KOP Number | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D2 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1, D2, & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1, D2, & D3 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | the WTGs within the Lease Area would continue to be visually prominent along the horizon and be the center of focus from the KOP. | |
| MV10 | 22.0/19.1 | N/A | N/A | 25.3/22.0 | 22.0/19.1 | 25.3/22.0 | 22.0/19.1 | D1, D2, and D3 | Alternative D2 would remove the majority of WTGs visible (8 WTGs) to the left of Nomans Land Island which are unobstructed and prominent along the horizon. The remaining WTGs visible within the Lease Area would be partially obscured (towers) with hubs and blades still visible continue to draw the viewers eye due to movement. | Moderate |
| MV11 | N/A | N/A | N/A | N/A | N/A | N/A | N/A | D1, D2, and D3 | Alternative D2 would remove the majority of WTGs visible (8 WTGs) to the left of Nomans Land Island which are unobstructed and prominent along the horizon. The remaining WTGs visible within the Lease Area would be partially obscured (towers) with hubs and blades perceivable along the horizon based on lighting conditions. | Minor |
| MV12 | 16.3/14.2 | N/A | N/A | 17.3/15.1 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Major |
| MV12 | 16.3/14.2 | N/A | N/A | 17.3/15.1 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs and geometric form of the OSSs within the Lease Area would continue to be visually prominent along the horizon and be the center of focus from the KOP. The remaining WTGs visible within the Lease Area, when backlit would continue to draw the viewers eye due to movement and dark contrast. | Major |
| MV13 | 14.8/12.9 | N/A | N/A | 13.8/12.0 | 14.8/12.9 | 13.8/12.0 | 14.8/12.9 | D1, D2, and D3 | Alternative D2 would remove the majority of WTGs visible (8 WTGs) to the right of Nomans Land Island which are unobstructed and prominent along the horizon. A portion of the Lease Area would continue to be visible left of the OSS with the remaining predominantly obscured to the right of center of the KOP (right of the OSS) by intervening topography. | Major |
| NL01 | 8.7/7.5 | N/A | N/A | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon. | Major |
| NL01 | 8.7/7.5 | N/A | N/A | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | D1, D2, and D3 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 1 mile though a greater reduction of WTGs when viewed from center to right of center of the KOP would be reduced along the horizon. WTGs would continue to be visible center and left of center of the KOP. | Major |
| NI10 | 34.6/30.0 | N/A | N/A | 39.0/34.0 | 34.6/30.0 | 39.0/34.0 | 34.6/30.0 | D1, D2, and D3 | Overall the combinations of Alternatives D2 and D3 would remove outer strings of WTGs when viewed far left of center and far right of center. The overall massing of the WTGs within the Lease Area would continue to be visually prominent along the horizon and be the center of focus from the KOP. The remaining WTGs visible within the Lease Area, when backlit would continue to draw the viewers eye due to movement and dark contrast. | Negligible |
| RI01 | N/A | N/A | N/A | N/A | N/A | N/A | N/A | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 1 mile which removes the first row of visible WTGs along the horizon. WTGs beyond the first removed row would not be visible. | Negligible |
| RI06 | N/A | 23.5/20.4 | 22.6/19.6 | 23.5/20.4 | 22.6/19.6 | 23.5/20.4 | 22.6/19.6 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 1 miles which reduces the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible, though appear small in scale. | Minor |
| RI08 | N/A | 19.9/17.3 | 19.1/16.6 | 19.9/17.3 | 19.1/16.6 | 19.9/17.3 | 19.1/16.6 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 0.5 mile which removes the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible, though appear small in scale. | Moderate |

| KOP Number | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D2 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D2 & D3 | Distance to Nearest Turbine (miles/nautical miles) Alternatives D1, D2, & D3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternatives D1, D2, & D3 | Alternative with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| RI09 | N/A | 21.4/18.6 | 20.0/17.4 | 21.4/18.6 | 20.0/17.4 | 21.4/18.6 | 20.0/17.4 | D1, D2, and D3 | Alternative D3 would increase the distance between the KOP and nearest WTGs by approximately 1.5 miles which removes the first row of visible WTGs along the horizon. WTGs beyond the first removed row are still visible, though appear small in scale. | Moderate |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS6a. Seascape Landscape Impact Assessment for Alternative D (Transit Alternative) – Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D1<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D2<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D3<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D1 & D2<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D1 & D3<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D1 & D3<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative D1, D2, & D3<br><br>Total SCA/LCA area within Analysis Area: 1,488.1 Square Miles | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS7. Visual Impact Assessment Impacts Matrix – Alternative E (Viewshed Alternative)

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative E1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E1 | Distance to Nearest Turbine (miles/nautical miles) Alternative E2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E2 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| AI01 | Brenton Point State Park | Medium | 16.7/14.5 | 18.6/16.2 | 16.7/14.5 | 20.7/18.0 | 16.7/14.5 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Negligible |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative E1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E1 | Distance to Nearest Turbine (miles/nautical miles) Alternative E2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E2 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| AI01 | Brenton Point State Park – Night | Medium | 16.7/14.5 | 18.6/16.3 | 16.7/14.6 | 20.7/18.1 | 16.7/14.5 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles. When viewed at night, dual aviation warning lights on nacelle may be visible intermittently along horizon where nighttime lighting does not currently exist. | Moderate |
| AI03 | Newport Cliff Walk | High | 15.3/13.3 | 17.8/15.5 | 15.3/13.3 | 19.4/16.9 | 15.3/13.3 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Negligible |
| AI05 | Sachuest Point National Wildlife Refuge | High | 14.8/12.9 | 18.4/16.0 | 14.8/12.9 | 18.9/16.4 | 14.8/12.9 | E1 and E2 | Alternatives E1 and E2 would increase the distance between the KOP and nearest turbine by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Negligible |
| AI06 | Sachuest Beach (Second Beach) | Medium | 16.0/13.9 | 19.5/17.0 | 16.0/13.9 | 20.1/17.4 | 16.0/13.9 | E2 | Alternative E2 would increase the distance between the KOP and nearest turbine by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Negligible |
| AI07 | Hanging Rock (Norman Bird Sanctuary) | High | 16.2/14.1 | 19.8/17.2 | 16.2/14.1 | 20.3/17.7 | 16.2/14.1 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Negligible |
| BI04 | Southeast Lighthouse | High | 15.3/13.3 | 15.3/13.3 | 19.9/17.3 | 15.5/13.4 | 15.3/13.3 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Moderate |
| BI04 | Southeast Lighthouse – Night | High | 15.3/13.4 | 15.3/13.3 | 19.9/17.3 | 15.5/13.4 | 15.3/13.3 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Moderate |
| BI12 | Clayhead Trail | High | 15.9/13.8 | 15.9/13.8 | 19.9/17.3 | 16.7/14.5 | 15.9/13.8 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Minor |
| BI13 | North Light | High | 17.2/15.0 | 17.2/15.0 | 21.0/18.2 | 18.0/15.7 | 17.2/15.0 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Minor |
| CI01 | Cuttyhunk Island | High | 13.9/12.1 | 19.2/16.7 | 13.9/12.1 | 14.9/12.9 | 13.9/12.1 | E1 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 4 miles which reduces the overall visibility of the WTGs along the horizon. | Moderate |
| MM01 | Gooseberry Island | Medium | 15.2/13.2 | 20.7/18.0 | 15.1/13.2 | 17.8/15.5 | 15.1/13.2 | E1 | Alternative E1 would increase the distance between the KOP and nearest turbine by approximately 5.5 miles which reduces the overall visibility of the WTGs along the horizon. | Negligible |
| MM04 | Nobska Lighthouse | Medium | 28.2/24.5 | 28.2/24.5 | 28.3/24.6 | 28.2/24.5 | 28.3/24.6 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs to a distance that would not be perceivable along horizon due to distance, intervening landforms and atmospheric influences. | Negligible |
| MV02 | Philbin Beach | High | 13.6/11.8 | 14.2/12.3 | 13.6/11.8 | 13.6/11.8 | 13.8/12.0 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 0.5 mile though a greater reduction of WTGs when viewed from center to right of center of the KOP would be reduced along the horizon. WTGs would continue to be visible left of center of the KOP beyond Nomans Land Island. | Moderate |
| MV03 | Lucy Vincent Beach | High | 15.5/13.6 | 15.5/13.4 | 16.9/14.7 | 15.5/13.5 | 18.7/16.3 | E1 | Alternative E1 would increase the distance between the KOP and turbines far right of center of the KOP along the horizon of the landform removing visibility, where WTGs are visible as part of the Proposed Action. WTGs would continue to be visible left of center of the KOP, similar to the Proposed Action. | Moderate |
| MV03 | Lucy Vincent Beach – Sunset | Medium | 15.5/13.7 | 15.5/13.5 | 16.9/14.8 | 15.5/13.5 | 18.7/16.3 | E1 | Alternative E1 would increase the distance between the KOP and turbines far right of center of the KOP along the horizon of the landform removing visibility, where WTGs are visible as part of the Proposed Action. WTGs would continue to be visible left of center of the KOP, similar to the Proposed Action. | Major |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative E1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E1 | Distance to Nearest Turbine (miles/nautical miles) Alternative E2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E2 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| MV05 | Moshup Beach | High | 13.8/12.0 | 14.5/12.6 | 13.7/11.9 | 13.7/11.9 | 13.7/11.9 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 1 mile though a greater reduction of WTGs when viewed from center to right of center of the KOP would be reduced along the horizon. WTGs would continue to be visible center and left of center of the KOP. | Moderate |
| MV05 | Moshup Beach – Sunset | High | 13.8/12.1 | 14.5/12.7 | 13.7/11.9 | 13.7/11.9 | 13.7/11.9 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 1 mile though a greater reduction of WTGs when viewed from center to right of center of the KOP would be reduced along the horizon. WTGs would continue to be visible center and left of center of the KOP where backlighting creates contrast. | Moderate |
| MV07 | Aquinnah Overlook | High | 13.7/12.0 | 14.9/12.9 | 13.7/11.9 | 14.0/12.2 | 13.7/11.9 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 1 mile though a greater reduction of WTGs when viewed from center to right of center of the KOP would be reduced along the horizon, particularly with atmospheric conditions. WTGs would continue to be visible center and left of center of the KOP. | Moderate |
| MV07 | Aquinnah Overlook – Sunset | High | 13.7/12.0 | 14.9/12.9 | 13.7/11.9 | 14.0/12.2 | 13.7/11.9 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 1 mile though a greater reduction of WTGs when viewed from center to right of center of the KOP would be reduced along the horizon. WTGs would continue to be visible center and left of center of the KOP. | Moderate |
| MV07 | Aquinnah Overlook – Night | High | 13.7/12.0 | 14.9/12.9 | 13.7/11.9 | 14.0/12.2 | 13.7/11.9 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTG (lighting) by approximately 1 mile though a greater reduction of WTG lighting when viewed from center to right of center of the KOP would be reduced along the horizon. WTG lighting would continue to be visible center and left of center of the KOP. | Moderate |
| MV09 | Gay Head Lighthouse | High | 13.9/12.1 | 15.0/13.0 | 13.9/12.1 | 14.1/12.3 | 13.9/12.1 | E1 | Alternative E1 would increase the distance between the KOP and nearest WTGs by approximately 2 miles. Though a greater reduction of WTGs when viewed from left of center of the KOP would be reduced to the far horizon (approximately 16–20 miles). WTGs would continue to be visible right of center KOP to include the OSS. | Moderate |
| MV10 | South Beach State Park | High | 22.0/19.1 | 22.0/19.1 | 25.3/22.0 | 22.0/19.1 | 28.6/24.9 | E1 and E2 | WTGs along eastern portion of Lease Area would remain for both Alternatives as compared to the Proposed Action with no visible change. | Moderate |
| MV11 | Wasque Point | Low | 24.8/21.5 | 24.8/21.5 | 28.5/24.8 | 24.8/21.5 | 32.1/28.0 | E1 and E2 | WTGs along eastern portion of Lease Area would remain for both Alternatives as compared to the Proposed Action with no visible change. | Minor |
| MV12 | Peaked Hill Reservation | Medium | 16.3/14.2 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | 18.7/16.2 | E1 | Alternative E1 would increase the distance (approximately 10 miles) between the KOP and turbines at the far right of center of the KOP along the horizon. WTGs would continue to be visible center and left of center of the KOP, similar to the Proposed Action. | Moderate |
| MV12 | Peaked Hill Reservation – Sunset | High | 16.3/14.2 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | 18.7/16.2 | E1 | Alternative E1 would increase the distance (approximately 10 miles) between the KOP and turbines at the far right of center of the KOP along the horizon. WTGs would continue to be visible center and left of center of the KOP, similar to the Proposed Action where backlighting creates contrast. | Major |
| MV13 | Edwin DeVries Vanderhoop Homestead | Medium | 13.8/12.0 | 14.8/12.9 | 13.8/12.0 | 14.0/12.1 | 13.8/12.0 | E1 | Alternative E1 would increase the distance (approximately 20 miles) between the KOP and turbines at the far right of center of the KOP, though topography blocks right of KOP views. WTGs would continue to be visible center and left of center of the KOP, similar to the Proposed Action. | Major |
| NI10 | Madaket Beach | Medium | 34.6/30.0 | 34.6/30.0 | 39.7/34.5 | 34.6/30.0 | 45.0/39.0 | E1 and E2 | Alternatives E1 and E2 would have similar views of WTGs along the far horizon, with turbine blade tips visible within a narrow view, during clear viewing conditions. Due to distance, WTGs would be predominately obscured. | Minor |
| NL01 | Nomans Land Island NWR *(not occupied)* | Low | 8.7/7.5 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 12.1/10.5 | E1 | Alternative E1 would increase the distance (approximately 16 to 19 miles) between the KOP and turbines at the far right of center of the KOP. WTGs would continue to be visible center and left of center of the KOP, similar to the Proposed Action. | Moderate |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Proposed Action | Distance to Nearest Turbine miles/nautical miles) Alternative E1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E1 | Distance to Nearest Turbine (miles/nautical miles) Alternative E2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative E2 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|
| NL01 | Nomans Land Island NWR – Sunset *(not occupied)* | Medium | 8.7/7.5 | 8.7/7.6 | 9.0/7.8 | 8.7/7.5 | 12.1/10.5 | E1 | Alternative E1 would increase the distance (approximately 16 to 19 miles) between the KOP and turbines at the far right of center of the KOP. WTGs would continue to be visible center and left of center of the KOP, similar to the Proposed Action. | Major |
| RI06 | Trustom Pond NWR | Medium | 22.6/19.6 | 22.6/19.6 | 23.8/20.7 | 23.5/20.4 | 22.6/19.6 | E2 | The reduction of WTGs would remove visibility of the WTGs along the horizon within the Lease Area. an occasional blade tip may be perceivable but not an influencing factor in overall impact. | Negligible |
| RI08 | Scarborough Beach State Park | Medium | 19.1/16.6 | 19.1/16.6 | 19.3/16.7 | 20.2/17.5 | 19.1/16.6 | E2 | E2 would have slightly less impacts as compared to E1. The reduction of WTGs in close proximity of the KOP would not decrease visibility of the WTGs along the horizon. WTG reduction would be localized to the far left of center of the KOP, with the majority of the WTGs remaining within the center of view. | Moderate |
| RI09 | Narragansett Beach | Medium | 20.0/17.4 | 20.7/18.0 | 20.0/17.4 | 22.3/19.4 | 20.0/17.4 | E2 | Alternative E2 would increase the distance between the KOP and nearest WTGs by approximately 2 miles. WTG reduction would be localized to the center of the KOP, with the majority of the WTGs remaining to the right of center of the KOP. | Moderate |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS8a. Seascape Landscape Impact Assessment for Alternative E (Viewshed Alternative) – Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative E1<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative E2<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| Shoreline Beach | SCA | AI06, MV02, MV10, MV11, NI10, RI08, RI09 | 35.3/2.4 | 32.7/2.2 | 33.5/2.3 | Alternative E1 would have negligible reduction in visible acres across all SCAs and LCAs (approximately 2.6 square miles) as compared to the Proposed Action.<br>The importance of SCAs for recreation and other uses along with residential areas of LCAs in close proximity of SCAs where ocean views dominate or are of high value, influence the overall impact level associated with the Project and associated alternatives. | SCA – Moderate |
| Coastal Bluff | SCA | BI04, BI12, C01, MV07, MV13, NL01 | | | | | |
| Developed Waterfront | SCA | N/A | | | | | |
| Shoreline Residential | SCA | AI03, RI01 | | | | | |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS8b. Seascape Landscape Impact Assessment for Alternative E (Viewshed Alternative) – Ocean Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B – Proposed Action<br><br>Total Ocean area within Analysis Area: 6,113.4 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative E1<br><br>Total Ocean area within Analysis Area: 6,113.4 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative E2<br><br>Total Ocean area within Analysis Area: 6,113.4 Square Miles | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| Open Ocean | OCA | N/A | 5,882.2/96.2<br><br>Maximum ocean visibility as compared to all alternatives | See Alternative B | See Alternative B | Intact open ocean setting, in immediate proximity of Project components for duration of Project. | Major |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS8c. Seascape Landscape Impact Assessment for Alternative E (Viewshed Alternative) – Specially Designated Areas

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Proposed Action (Alternative B) | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Alternative E1 | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Alternative E2 | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| Historic Sites and National Landmarks | 12,308.0 | AI01, AI03, BI04, BI12, BI13, C01, C02, BI13, MM04, MV07, MV09, MV13, RI01 | 1,222.8/9.9 | 1,103.3/9.0 | 1,121.7/9.1 | Alternative E1 would have negligible reduction in visible acres across all SDAs as compared to the Proposed Action and overall impacts would remain similar. | Major |
| National Natural Landmarks | 349.7 | MV07 | 255.5/73.1 | 252.1/72.2 | 252.7/72.3 | | Moderate |
| State Scenic Areas | 105,777.6 | BI12, CI01, MV07 | 18,205.6/17.2 | 17,359.2/ 16.4 | 17,528.0/16.5 | | Major |
| National Wildlife Refuges | 15,176.1 | AI05, NL01, RI06 | 767.7/5.1 | 737.6/4.9 | 734.3/4.8 | | Minor |
| State/ Non-Profit Wildlife Management Areas | 31,967.8 | AI07 | 131.4/.4 | 123.7/.4 | 114.1/.4 | | Minor |
| National Parks | 31.2 | N/A | .2/.7 | 0.2/.7 | 0.2/.7 | | Negligible |
| State Parks | 10,473.8 | AI01, LI04, MV10, RI08 | 27,31.7/26.1 | 2,638/25.2 | 2,699.8/25.8 | | Moderate |
| State Nature and Historic Preserves | 248.4 | N/A | 3.1/1.2 | 2.6/1.0 | 2.4/1.0 | | Negligible |
| State Forests | 5,301.6 | N/A | 7.8/.2 | 7.7/.1 | 7.7/.1 | | Negligible |

| Specially Designated Areas | Specially Designated Area Total Acres | Key Observation Points with Simulations | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Proposed Action (Alternative B) | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Alternative E1 | Geographic Extent of Specially Designated Area with Visibility of Alternative (acres/percentage) Alternative E2 | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|
| State Beaches | 165.1 | N/A | 78.2/ 47.4 | 75.1/45.5 | 74.3/45.0 | | Moderate |
| Highways Designated or Eligible as Scenic | 411.6 | N/A | 43.4/10.5 | 39.7/9.7 | 39.3/9.6 | | Moderate |
| National Historic Trails | 990.1 | N/A | .8/.1 | .7 /.1 | .5/.04 | | Minor |
| National Recreation Trails | 88.6 | AI03 | 65.1/73.4 | 64.8/73.2 | 64.9/73.2 | | Major |
| State Fishing and Boating Access Sites | 371.4 | N/A | 78.4/21.1 | 74.5/20.1 | 74.8/20.2 | | Moderate |
| Lighthouses | 23.0 | BI04, C01, MM04, MV09, RI01 | 6.6/28.7 | 6.5/28.3 | 6.5/28.3 | | Major |
| Public Beaches | 4,221.0 | AI06, MM01, MV02, MV03, MV05, MV11, NI10, RI09 | 11,38.8/27.0 | 1,053/25.0 | 1,109.2/26.3 | | Moderate |
| Ferry Routes | 10,641.7 | N/A | 6,365.0/59.8 | 6363.8/59.8 | 6,363.0/59.8 | | Moderate |
| Seaports | 90.1 | N/A | 2.3/2.5 | 2.2/2.5 | 2.3/2.5 | | Negligible |
| Other State Land with Public Access | 9,361.8 | N/A | 325.3/3.5 | 282.1/3.0 | 309.2/3.3 | | Negligible |
| **Total Acres For Comparison** | **208,009** | | **30,208.0/14.5** | **29,084.8/14.0** | **29,384.5/14.1** | – | – |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS9. Visual Impact Assessment Impacts Matrix – Alternative G (Preferred Alternative)

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Alternative B (Proposed Action) | Distance to Nearest Turbine miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine miles/nautical miles) Alternative G1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G1 | Distance to Nearest Turbine (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine (miles/nautical miles) Alternative G3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G3 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AI01 | Brenton Point State Park | Medium | 16.7/14.5 | 17.6/15.3 | 16.7/14.5 | 18.1/15.8 | 16.7/14.5 | 18.6/16.2 | 16.7/14.5 | 18.1/15.8 | 16.7/14.5 | G2 | Alternative G2 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which removes the first three-plus rows of visible WTGs along the horizon. WTGs would be visible from center to right field of view, though appear small in scale as those in closer proximity to the KOP are removed | Moderate |
| AI01 | Brenton Point State Park – Night | High | 16.7/14.5 | 17.6/15.3 | 16.7/14.5 | 18.1/15.8 | 16.7/14.5 | 18.6/16.2 | 16.7/14.5 | 18.1/15.8 | 16.7/14.5 | G2 | Alternative G2 would increase the distance between the KOP and nearest WTGs by approximately 2 miles which removes the first three-plus rows of visible WTGs along the horizon. WTGs would be visible from center to right field of view, though appear small in scale as those in closer proximity to the KOP are removed. When viewed at night, warning lights will be visible along horizon where nighttime lighting does not currently exist. | Moderate |
| AI03 | Newport Cliff Walk | High | 15.3/13.3 | 16.2/14.1 | 15.3/13.3 | 17.1/14.9 | 15.3/13.3 | 17.8/15.5 | 15.3/13.3 | 17.1/14.9 | 15.3/13.3 | G2 | Alternative G2 would increase the distance between the KOP and nearest WTGs by approximately 2.5 miles which removes the first three-plus rows of visible WTGs along the horizon. WTGs would be visible from center to right field of view, though appear small in scale as those in closer proximity to the KOP are removed | Moderate |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Alternative B (Proposed Action) | Distance to Nearest Turbine miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine miles/nautical miles) Alternative G1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G1 | Distance to Nearest Turbine (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine (miles/nautical miles) Alternative G3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G3 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| AI05 | Sachuest Point National Wildlife Refuge | High | 14.8/12.9 | 15.9/13.8 | 14.8/12.9 | 17.5/15.2 | 14.8/12.9 | 18.1/15.7 | 14.8/12.9 | 17.5/15.2 | 14.8/12.9 | G2 | Alternative G2 would increase the distance between the KOP and nearest WTGs by approximately 3.3 miles which removes the first three-plus rows of visible WTGs along the horizon. WTGs would be visible from center to right field of view, though appear small in scale as those in closer proximity to the KOP are removed | Moderate |
| AI06 | Sachuest Beach (Second Beach) | Medium | 16.0/13.9 | 17.1/14.8 | 16.0/13.9 | 18.6/16.2 | 16.0/14.0 | 19.2/16.7 | 16.0/13.9 | 18.6/16.2 | 16.0/13.9 | G2 | Alternative G2 would increase the distance between the KOP and nearest WTGs by approximately 3.3 miles which removes the first three-plus rows of visible WTGs along the horizon. WTGs would be visible from center to right field of view, though appear small in scale. | Minor |
| AI07 | Hanging Rock (Norman Bird Sanctuary) | High | 16.2/14.1 | 17.3/15.1 | 16.2/14.1 | 18.9/16.4 | 16.2/14.1 | 19.5/16.9 | 16.2/14.1 | 18.9/16.4 | 16.2/14.1 | G2 | Alternative G2 would increase the distance between the KOP and nearest WTGs by approximately 3.3 miles which removes the first three-plus rows of visible WTGs along the horizon. WTGs would be visible from center to right field of view, though appear small in scale as those in closer proximity to the KOP are removed. | Moderate |
| BI04 | Southeast Lighthouse | High | 15.3/13.4 | 15.3/13.3 | 15.5/13.3 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | G, G1, G2, and G3 | For all alternatives the nearest WTG at 15.3 miles would remain and WTGs to the left of view would remain, similar to the Proposed Action. Turbines visible to the right of view at approximate 15.5 miles would be removed. | Moderate |
| BI04 | Southeast Lighthouse – Night | High | 15.3/13.4 | 15.3/13.3 | 15.5/13.3 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | 15.3/13.3 | 15.5/13.4 | G, G1, G2, and G3 | For all alternatives the nearest WTG at 15.3 miles would remain and WTGs to the left of view would remain, similar to the Proposed Action. Turbines visible to the right of view at approximate 15.5 miles would be removed. When viewed at night, warning lights will continue be visible along horizon similar to the Proposed Action where nighttime lighting does not currently exist. | Major |
| BI12 | Clayhead Trail | High | 15.9/13.8 | 15.9/13.8 | 16.7/14.5 | 15.9/13.8 | 16.7/14.5 | 15.9/13.8 | 16.7/14.5 | 15.9/13.8 | 16.7/14.5 | G2 | Alternative G2 would maintain nearest WTG at 15.9 miles and WTG massing would remain in the center of view, similar to the Proposed Action. WTGs to the far left and far right of view would be removed. | Moderate |
| BI13 | North Light | High | 17.2/15.0 | 17.2/15.0 | 18.0/15.7 | 17.2/15.0 | 18.0/15.7 | 17.2/15.0 | 18.0/15.7 | 17.2/15.0 | 18.0/15.7 | G2 | Alternative G2 would maintain nearest WTG at 17.2 miles and WTGs would remain to the center of view, similar to the Proposed Action. Turbines visible to the far left of view would be removed reducing the overall horizontal field of view though a massing of WTGs would remain in the center view of the KOP. | Moderate |
| CI01 | Cuttyhunk Island | High | 13.9/12.1 | 13.9/12.1 | 14.2/12.4 | 14.9/12.9 | 13.9/12.1 | 14.9/13.0 | 13.9/12.1 | 15.9/13.8 | 13.9/12.1 | G3 | Alternative G3 would increase the distance of the nearest WTG approximately 2 miles. The overall field of view would be occupied similar to the Proposed Action though the horizon to the left of view would have areas with reduced densities of WTGs. | Moderate |
| C01 | Beavertail Lighthouse | Medium | 18.4/15.9 | 19.1/16.6 | 18.4/15.9 | 19.4/16.9 | 18.4/15.9 | 19.7/17.1 | 18.4/15.9 | 19.4/16.9 | 18.4/15.9 | G2 | Alternative G2 would increase the distance of the nearest WTG approximately 1.3 miles and WTG massing would remain in the center of view, similar to the Proposed Action. WTGs to the left of center view and far right of view would be removed. | Minor |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Alternative B (Proposed Action) | Distance to Nearest Turbine miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine miles/nautical miles) Alternative G1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G1 | Distance to Nearest Turbine (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine (miles/nautical miles) Alternative G3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G3 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| LI04 | Montauk Point State Park | Medium | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.7/27.7 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | G1, G2, and G3 | Alternatives G1, G2, and G3 would not be perceivable along horizon due to distance (over 30 miles) and atmospheric influences. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | Negligible |
| LI04 | Montauk Point State Park – Night | High | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.9/27.7 | 31.5/27.4 | 31.5/27.4 | 31.5/27.4 | 31.9/27.4 | 31.5/27.4 | G1 and G3 | The addition of aviation warning lights along the horizon within the viewshed would be perceivable by the focused viewer, but not a dominant element as compared to other existing warning lighting sources associated with BIWF that are in closer proximity (approximately 16 miles). WTGs removed from the center of view further reduces the massing of aviation warning lighting in proximity of the KOP. | Negligible |
| MM01 | Gooseberry Island | Medium | 15.1/13.2 | 16.3/14.1 | 15.1/13.2 | 17.8/15.5 | 15.1/13.2 | 17.8/15.5 | 15.1/13.2 | 18.2/15.8 | 15.1/13.2 | G3 | Alternative G3 would increase the distance between the KOP and nearest WTG by approximately 3 miles though WTGs would remain visible and clustered along the horizon within the viewshed. | Moderate |
| MM04 | Nobska Lighthouse | Medium | 28.2/24.5 | 28.2/24.5 | 28.8/25.0 | 28.2/24.5 | 28.3/24.6 | 28.2/24.5 | 28.3/24.6 | 28.2/24.5 | 28.3/24.6 | G3 | Alternative G3 would increase the distance between the KOP and nearest WTGs to a distance that would not be perceivable along horizon due to distance, intervening landforms and atmospheric influences or remove WTGs that are framed by landforms. | Negligible |
| MV02 | Philbin Beach | High | 13.6/11.8 | 13.8/12.0 | 13.6/11.8 | 14.2/12.3 | 13.6/11.8 | 14.2/12.3 | 13.6/11.8 | 14.2/12.3 | 13.6/11.8 | G3 | Alternative G3 would increase the distance of the nearest WTG approximately 0.5 mile and WTG massing would remain in the center of view, similar to the Proposed Action. WTGs to the left of center view and far right of view would be removed. | Moderate |
| MV03 | Lucy Vincent Beach | High | 15.5/13.5 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | G3 | Alternative G3 would increase the distance between the KOP and WTGs within the center of view in relation to Nomans Land Island along the horizon. WTGs would continue to be visible left of center of the KOP, similar to the Proposed Action. Intervening landforms would continue to obscure views of WTGs to the right field of view. | Moderate |
| MV03 | Lucy Vincent Beach – Sunset | Medium | 15.5/13.5 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | 15.5/13.5 | 16.9/14.7 | G3 | Alternative G3 would increase the distance between the KOP within the center of view in relation of Nomans Land Island along the horizon. WTGs would continue to be visible left of center of the KOP, similar to the Proposed Action. Intervening landforms would continue to obscure views of WTGs to the right field of view. | Moderate |
| MV05 | Moshup Beach | High | 13.7/12.0 | 13.7/12.0 | 13.7/12.0 | 14.3/12.4 | 13.7/12.0 | 14.3/12.4 | 13.7/12.0 | 14.3/12.5 | 13.7/12.0 | G3 | Alternative G3 would increase the distance of the nearest WTGs within the right of center field of view. Though WTGs would continue to be visible within the full field of view similar to the Proposed Action. | Major |
| MV05 | Moshup Beach – Sunset | High | 13.7/12.0 | 13.7/12.0 | 13.7/12.0 | 14.3/12.4 | 13.7/12.0 | 14.3/12.4 | 13.7/12.0 | 14.3/12.5 | 13.7/12.0 | G3 | Alternative G3 would increase the distance of the nearest WTGs within the right of center field of view. Though WTGs would continue to be visible within the full field of view similar to the Proposed Action. | Major |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Alternative B (Proposed Action) | Distance to Nearest Turbine miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine miles/nautical miles) Alternative G1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G1 | Distance to Nearest Turbine (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine (miles/nautical miles) Alternative G3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G3 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| MV07 | Aquinnah Overlook | High | 13.7/12.0 | 13.7/12.0 | 14.0/12.2 | 14.3/12.5 | 13.7/12.0 | 14.3/12.5 | 13.7/12.0 | 14.6/12.7 | 13.7/12.0 | G3 | Alternative G3 would increase the distance of the nearest WTGs within the right of center field of view. Though WTGs would continue to be visible within the full field of view similar to the Proposed Action. | Major |
| MV07 | Aquinnah Overlook – Sunset | High | 13.7/12.0 | 13.7/12.0 | 14.0/12.2 | 14.3/12.5 | 13.7/12.0 | 14.3/12.5 | 13.7/12.0 | 14.6/12.7 | 13.7/12.0 | G3 | Alternative G3 would increase the distance of the nearest WTGs within the right of center field of view. Though WTGs would continue to be visible within the full field of view similar to the Proposed Action. | Major |
| MV09 | Gay Head Lighthouse | High | 13.9/12.1 | 13.9/12.1 | 14.2/12.3 | 14.5/12.6 | 13.9/12.1 | 14.5/12.6 | 13.9/12.1 | 14.7/12.8 | 13.9/12.1 | G3 | Alternative G3 would increase the distance of the nearest WTGs within the right of center field of view. Though WTGs would continue to be visible within the full field of view similar to the Proposed Action and the OSSs would continue to be prominent on the horizon. | Major |
| MV10 | South Beach State Park | High | 22.0/19.1 | 22.0/19.1 | 25.3/22.0 | 22.0/19.1 | 25.3/22.0 | 22.0/19.1 | 25.3/22.0 | 22.0/19.1 | 25.3/22.0 | G1, G2, and G3 | Alternatives G1, G2, and G3 would remove a portion of the WTGs visible in the center of view to the left of Nomans Land Island. The remaining WTGs visible within the Lease Area would be partially obscured (towers) with hubs and blades still visible continue to draw the viewers eye to the left of view due to movement. | Moderate |
| MV11 | Wasque Point | Low | 24.8/21.5 | 24.8/21.5 | 28.5/24.8 | 24.8/21.5 | 28.5/24.8 | 24.8/21.6 | 28.5/24.8 | 24.8/21.6 | 28.5/24.8 | G1, G2, and G3 | Alternatives G1, G2, and G3 would remove the majority of the WTGs visible in the center of view along the horizon where WTG blade movement would be noticeable. The remaining WTGs visible along the horizon would be partially obscured (towers) with hubs and blades still visible to the left field of view. | Minor |
| MV12 | Peaked Hill Reservation | High | 16.3/14.2 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | 17.3/15.1 | 16.4/14.2 | 17.3/15.1 | 16.4/14.2 | 17.3/15.1 | G3 | Alternative G3 would maintain nearest WTGs located to the left field of view at approximately 16.4 miles. WTG massing would be similar to the Proposed Action in relation to the OSSs within the center of view. Six WTGs would be removed from the far-right field of view. | Major |
| MV12 | Peaked Hill Reservation – Sunset | High | 16.3/14.2 | 16.3/14.2 | 17.3/15.1 | 16.3/14.2 | 17.3/15.1 | 16.2/21.6 | 17.3/15.1 | 16.4/14.2 | 17.3/15.1 | G3 | Alternative G3 would maintain nearest WTGs located to the left field of view at approximately 16.4 miles. WTG massing would be similar to the Proposed Action in relation to the OSSs within the center of view. Six WTGs would be removed from the far-right field of view. | Major |
| MV13 | Edwin DeVries Vanderhoop Homestead | Medium | 13.8/12.0 | 13.8/12.0 | 14.0/12.1 | 14.4/12.5 | 13.8/12.0 | 14.4/12.5 | 13.8/12.0 | 14.5/12.6 | 13.8/12.0 | G3 | Alternative G3 would maintain nearest WTGs located to the left and center fields of view, similar to the Proposed Action. Landform obstructions would continue to obscure the right field of view. | Major |
| NI10 | Madaket Beach | Medium | 34.6/30.0 | 34.6/30.1 | 39.7/34.5 | 34.6/30.1 | 39.0/33.9 | 34.6/30.1 | 39.0/33.9 | 34.6/30.1 | 39.0/33.9 | G, G1, G2, and G3 | Alternatives G, G1, G2, and G3 would maintain nearest WTGs located to the left and center fields of view, similar to the Proposed Action. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | Negligible |
| NL01 | Normans Land Island NWR *(not occupied)* | Medium | 8.7/7.6 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | G3 | Alternative G3 would maintain nearest WTGs to the far-left field of view at approximately 8.7 miles. Although WTGs are removed within the center of the Lease Area, the massing of WTGs and visibility of the OSSs on the horizon would be prominent. | Major |

| KOP Number | KOP Name | SLVIA Sensitivity Rating (high, medium, low) | Distance to Nearest Turbine (miles/nautical miles) Alternative B (Proposed Action) | Distance to Nearest Turbine miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G (Preferred Alternative) | Distance to Nearest Turbine (miles/nautical miles) Alternative G1 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G1 | Distance to Nearest Turbine (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G2 | Distance to Nearest Turbine (miles/nautical miles) Alternative G3 | Distance to Nearest Turbine Removed (miles/nautical miles) Alternative G3 | Alternative(s) with greatest reduced visual impact to KOP as compared to the Proposed Action | VIA Overall Impact Level Rationale | VIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| NL01 | Nomans Land Island NWR – Sunset *(not occupied* | Medium | 8.7/7.6 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | 8.7/7.5 | 9.0/7.8 | G3 | Alternative G3 would maintain nearest WTGs to the far-left field of view at approximately 8.7 miles. Although WTGs are removed within the center of the Lease Area, the massing of WTGs and visibility of the OSSs on the horizon would be prominent. | Major |
| RI01 | Watch Hill Lighthouse | Medium | 32.8/28.5 | 32.8/28.5 | 33.7/29.2 | 32.8/28.5 | 33.7/29.3 | 32.8/28.5 | 33.7/29.3 | 32.8/28.5 | 33.7/29.3 | G1, G2, and G3 | Alternatives G, G1, G2, and G3 would maintain nearest WTGs located in the center field of view similar to the Proposed Action. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | Negligible |
| RI06 | Trustom Pond NWR | Medium | 22.6/19.6 | 22.6/19.6 | 24.2/21.0 | 22.6/19.6 | 24.2/21.0 | 22.6/19.6 | 23.8/20.7 | 22.6/19.6 | 24.2/21.0 | G2 | Alternative G2 would maintain nearest WTGs located in the center field of view similar to the Proposed Action. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | Negligible |
| RI08 | Scarborough Beach State Park | Medium | 19.1/16.6 | 19.1/16.6 | 19.4/16.9 | 19.1/16.6 | 19.4/16.9 | 19.1/16.6 | 19.3/16.7 | 19.1/16.6 | 19.4/16.9 | G2 | Alternative G2 would maintain nearest WTGs located in the center field of view similar to the Proposed Action. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting though WTGs would appear small on the horizon. | Minor |
| RI09 | Narragansett Beach | Medium | 20.0/17.4 | 20.6/17.9 | 20.0/17.4 | 20.6/17.9 | 20.0/17.4 | 20.7/18.0 | 20.0/17.4 | 20.6/17.9 | 20.0/17.4 | G2 | Alternative G2 would maintain WTGs located in the center field of view similar to the Proposed Action. WTGs to the far-left field of view (approximately 20 miles) would be removed. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting though WTGs would appear small on the horizon. | Moderate |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS10a. Seascape Landscape Impact Assessment for Alternative G (Preferred Alternative) – Character Areas

| Character Area Name | Character Area Association (SCA/LCA/OCA) | Key Observation Points with Simulations | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative B (Proposed Action)<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative G (Preferred Alternative)<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative G1<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative G2<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | Geographic Extent of Analysis Area with Visibility of Alternative (square miles/percentage) Alternative G3<br><br>Total SCA and LCA area within Analysis Area: 1,488.1 Square Miles | SLIA Overall Impact Level Rationale for the Alternative with the reduced level of impacts as compared to the Proposed Action | SLIA Overall Impact Level (major, moderate, minor, negligible) |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

### Table G-VIS11. Visual Impact Assessment Impacts Matrix for Cumulative Impacts

| KOP Number | KOP Name | Representative Character Area (SCA, LCA, OCA) | Viewing Direction | Elevation (feet) | Cumulative Simulation | Visibility Threshold | Distance to Nearest Turbine (miles/nautical miles) | Horizontal Field of View Occupied (Degrees) | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Lease Area within Viewshed in Addition to Proposed Action | Geographic Extent Rating (large, medium, small) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| BI04 | Southeast Lighthouse | SCA | East | 161.1 | Yes | VTL2 | 15.3/13.3 | 81 | Highly visible and likely to attract the attention of lighthouse visitors based on lighting conditions, although not as prominent as the existing BIWF. | Medium | OCS-A 0517 OCS-A 0487 | Medium | Visibility based on lighting conditions, existing BIWF visibility, duration. | **Medium** | Importance of recreation and historic resources, duration and visibility from KOP based on lighting conditions. | **Moderate** |
| BI04 | Southeast Lighthouse – Night | SCA | East | 161.1 | Yes | VTL 5 | 15.3/13.4 | 81 | The addition of the flashing warning lights on the WTGs and decks will add evidence of human development and increase visual clutter at the horizon. | Large | OCS-A 0517 OCS-A 0487 | Large | Visibility based on lighting conditions, existing BIWF visibility, duration. | **Large** | Importance of recreation and historic resources, duration and visibility from KOP based on lighting conditions. | **Major** |
| BI12 | Clayhead Trail | SCA | East | 78.8 | No | VTL1 | 15.9/13.8 | 75 | Visible and likely to attract attention resulting from angle of view of WTGs . | Medium | OCS-A 0517 OCS-A 0487 | Medium | Visibility of WTGs within viewshed along horizon line within viewshed. | **Medium** | Importance of preservation of scenic district and uses; proximity and visibility of Project. | **Moderate** |
| BI13 | North Light | SCA | East | 27.5 | No | VTL4 | 17.2/15.0 | 69 | Turbines become the focus of views out to the water and the tight spacing and numerous turbines along the horizon draw the viewers' eye away from natural features. | Large | OCS-A 0517 OCS-A 0487 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Importance of recreation and historic resources; proximity of residential viewers, duration and visibility from KOP. | **Moderate** |

| KOP Number | KOP Name | Representative Character Area (SCA, LCA, OCA) | Viewing Direction | Elevation (feet) | Cumulative Simulation | Visibility Threshold | Distance to Nearest Turbine (miles/nautical miles) | Horizontal Field of View Occupied (Degrees) | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Lease Area within Viewshed in Addition to Proposed Action | Geographic Extent Rating (large, medium, small) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| LI04 | Montauk Point State Park | SCA/LCA | East | 48.0 | Yes | VTL1 | 31.5/27.4 | 59 | Due to distance and viewer position in relation to other features in the landscape, the right field of view would have some visibility of WTG blades associated with OCS-A 0487. | Small | OCS-A 0517<br>OCS-A 0487 | Large | Projects would become perceivable along horizon, though will be variable due to distance and atmospheric influences. | **Medium** | Project would not be perceivable along horizon due to distance and atmospheric influences. Occasional blade tips and movement may be noticeable by the focused viewer or backlighting. | **Minor** |
| LI04 | Montauk Point State Park – Night | SCA/LCA | East | 48.0 | Yes | VTL2 | 31.5/27.4 | 59 | Due to distance and viewer position in relation to other features in the landscape, there would be a negligible change. | Small | OCS-A 0517<br>OCS-A 0487 | Small | Additional projects would not be perceivable along horizon if observer views were focused toward lighting. Light house illumination is most prominent. | **Small** | Additional lighting is negligible on horizon right of KOP viewshed. Lighthouse illumination is the focus. | **Negligible** |
| MV02 | Philbin Beach | SCA | South-Southwest to West-Southwest | 10.5 | No | VTL5 | 13.6/11.8 | 135 | Turbines are very visible on the horizon line and will dominate the view from the KOP. | Large | OCS-A 0487<br>OCS-A 0500 | Large | Additional WTGs visible to left of KOP at approximately same distance as eastern portion of Proposed Action. | **Large** | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines within viewshed. | **Moderate** |
| MV03 | Lucy Vincent Beach | SCA | South-Southwest to Southwest | 27.7 | No | VTL 3 | 15.5/13.5 | 126 | More direct views of additional Lease Areas. Visible and likely to attract the attention resulting from angle of view of WTGs. | Medium | OCS-A 0487<br>OCS-A 0500 | Medium | Visibility of WTGs within viewshed along horizon line within viewshed, through further visibility is beyond horizon. | **Medium** | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines. | **Moderate** |
| MV03 | Lucy Vincent Beach – Sunset | SCA | South-Southwest to Southwest | 27.7 | No | VTL 4 | 15.5/13.6 | 126 | WTGs appear dark gray against the light sky and the position of the sun serves as a focal point, drawing the viewer's eye toward part of the Project. | Large | OCS-A 0487<br>OCS-A 0500 | Medium | Visibility of backlit WTGs within viewshed along horizon line within viewshed. | **Large** | Scenic values; prominence of turbines- sunset backlighting of turbines along with movement influences prominence. | **Major** |
| MV05 | Moshup Beach | SCA | South-Southwest to West-Southwest | 23.1 | No | VTL 5 | 13.7/11.9 | 134 | With the proposed RWF in place, the nacelles and rotors from numerous WTGs and two OSSs will be visible from this KOP in the background along the horizon. | Large | OCS-A 0487<br>OCS-A 0500 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Importance of natural landscape and natural recreation opportunities, scenic values; prominence of turbines. | **Moderate** |
| MV05 | Moshup Beach – Sunset | SCA | South-Southwest to West-Southwest | 23.1 | No | VTL 5 | 13.7/11.10 | 134 | WTGs appear dark gray against the light sky and the position of the sun serves as a focal point, drawing the viewer's eye toward part of the Project. | Large | OCS-A 0487<br>OCS-A 0500 | Large | Visibility of backlit WTGs within viewshed along horizon line within viewshed. | **Large** | Scenic values; prominence of backlit turbines on the horizon. | **Major** |
| MV07 | Aquinnah Overlook | SCA | South to Southwest | 145.5 | Yes | VTL 3 | 13.7/11.9 | 132 | OSSs become focal points along the wide horizon and the overlook is no longer just for views of the ocean | Large | OCS-A 0487<br>OCS-A 0500 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Prominent, dedicated viewpoint. | **Major** |

| KOP Number | KOP Name | Representative Character Area (SCA, LCA, OCA) | Viewing Direction | Elevation (feet) | Cumulative Simulation | Visibility Threshold | Distance to Nearest Turbine (miles/nautical miles) | Horizontal Field of View Occupied (Degrees) | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Lease Area within Viewshed in Addition to Proposed Action | Geographic Extent Rating (large, medium, small) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | but includes the turbines on the ocean. | | | | | | | |
| MV07 | Aquinnah Overlook – Sunset | SCA | South to Southwest | 145.5 | Yes | VTL 5 | 13.7/11.10 | 132 | OSSs become focal points along the wide horizon and the overlook is no longer just for views of the ocean but includes the turbines on the ocean. | Large | OCS-A 0487 OCS-A 0500 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Prominent, dedicated viewpoint. | **Major** |
| MV07 | Aquinnah Overlook – Night | SCA | South to Southwest | 145.5 | Yes | VTL 3 | 13.7/11.11 | 132 | OSSs become focal points along the wide horizon and the overlook is no longer just for views of the ocean but includes the turbines on the ocean. | Large | OCS-A 0487 OCS-A 0500 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Prominent, dedicated viewpoint; warning lighting appears low on the horizon. | **Major** |
| MV09 | Gay Head Lighthouse | SCA | South to West-Southwest | 162.1 | No | VTL 4 | 13.9/12.1 | 132 | The two OSSs appear as dark elements on the horizon suspended above the water surface. From this superior vantage point, the entirety of the Project is visible. | Large | OCS-A 0487 OCS-A 0500 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Importance of historic lighthouse, scenic values; prominence of turbines and OSSs. | **Major** |
| MV10 | South Beach State Park | SCA | Southwest to West-Southwest | 17.0 | No | VTL3 | 15.0/13.0 | 109 | Nacelles and rotors from numerous WTGs will be visible in the background along the horizon. Turbines are visible on the horizon and provide a focal point. | Large | OCS-A 0487 OCS-A 0500 OCS-A 501 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Importance of natural landscape and natural recreation opportunities; massing of turbines on horizon within full viewshed. | **Major** |
| MV11 | Wasque Point | SCA | West-Southwest | 13.6 | Yes | VTL 2 | 15.0/13.0 | 100 | Nearest WTG is approximately 15 miles away; the towers are largely obscured due to curvature of the Earth, with their degree of exposure decreasing from left to right. | Large | OCS-A 0487 OCS-A 0500 OCS-A 501 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Importance of natural landscape and natural recreation opportunities; massing of turbines on horizon within full viewshed. | **Major** |
| MV12 | Peaked Hill Reservation | LCA | South-Southwest to Southwest | 305.1 | No | VTL 1 | 16.3/14.2 | 123 | KOP on Peaked Hill represents a discrete view to the southwest that requires the viewer to be perfectly positioned. | Small | OCS-A 0487 OCS-A 0500 | Small<br><br>Based on simulation graphic all are visible/vegetation and perspective influence | Size and scale in relation to existing conditions, vegetation and viewer perspective. | **Small** | Importance of cultural significance and natural recreation opportunities; visibility of WTGs due to intervening vegetation and landforms. | **Major** |
| MV12 | Peaked Hill Reservation – Sunset | LCA | South-Southwest to Southwest | 305.1 | No | VTL4 | 16.3/14.2 | 123 | Sunset illumination and backlighting influences change. | Large | OCS-A 0487 OCS-A 0500 | Large<br><br>Based on simulation graphic all are visible/vegetation and perspective influence | Backlighting of WTGs, increased visibility. | **Large** | Importance of cultural significance and natural recreation opportunities; visibility of WTGs due to backlighting. | **Major** |
| MV13 | Edwin DeVries Vanderhoop Homestead | SCA | South to Southwest | 17.0 | No | VTL5 | 13.8/12.0 | 134 | WTGs are visible; light gray towers, nacelles, and | Large | OCS-A 0487 OCS-A 0500 | Large | Size and scale in relation to existing conditions | **Large** | Importance of natural landscape and natural recreation opportunities; | **Major** |

| KOP Number | KOP Name | Representative Character Area (SCA, LCA, OCA) | Viewing Direction | Elevation (feet) | Cumulative Simulation | Visibility Threshold | Distance to Nearest Turbine (miles/nautical miles) | Horizontal Field of View Occupied (Degrees) | Size or Scale Rationale | Size and Scale Rating (large, medium, small) | Lease Area within Viewshed in Addition to Proposed Action | Geographic Extent Rating (large, medium, small) | SLVIA Magnitude Rating Rationale | SLVIA Magnitude Rating (large, medium, small) | SLVIA Overall Impact Level Rationale | SLVIA Overall Impact Level (major, moderate, minor, negligible) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | rotors are fully visible above the horizon. | | | | along with percentage of visibility. | | visibility of WTGs due to distance and percentage of visibility. | |
| NI10 | Madaket Beach | SCA | West | 20.6 | Yes | VTL1 | 17.0/ 14.8 | 109 | WTGs are barely visible along the horizon, with a small cluster of turbine blades and nacelle comprising the majority of visible features. | Small | OCS-A 0500<br>OCS-A 501<br>OCS-A 520<br>OCS-A 521<br>OCS-A 522 | Small although numerous Lease Areas are within viewshed | Variable lighting and atmospheric conditions influence visibility. | **Small** | Numerous Lease Areas are within viewshed, though perceivability of WTGs from KOP is highly influenced on visibility conditions. | **Major** |
| NL01 | Nomans Land Island NWR *(not occupied)* | SCA | West-Southwest | 42.1 | Yes | VTL5 | 8.7/7.5 | 109 | WTGs appear as gray vertical lines against the yellow backdrop of the sky that look out of character with the vast extent of open water. | Large | OCS-A 0487<br>OCS-A 0500 | Large | Size and scale in relation to existing conditions along with percentage of visibility. | **Large** | Intact seascape and prominence of WTGs in close proximity, although no viewers. | **Major** |
| NL01 | Nomans Land Island NWR – Sunset *(not occupied)* | SCA | West-Southwest | 42.1 | Yes | VTL6 | 8.7/7.6 | 165 | Sunset illumination and backlighting influences change. | Large | OCS-A 0487<br>OCS-A 0500 | Large | Backlighting of WTGs, increased visibility. | **Large** | Intact seascape and prominence of WTGs, although no viewers; backlighting of WTGs and OSS. | **Major** |

Note: Nighttime impacts would be reduced to negligible, as described in EIS Table 3.3-2 (Definitions of Potential Adverse Impact Levels), when FAA warning lights are not activated though the use of ADLS.

# Unavoidable Adverse Impacts of the Proposed Action

Table I-1 summarizes unavoidable adverse impacts for each resource analyzed in the Revolution Wind Farm and Revolution Wind Export Cable Project (the Project) environmental impact statement (EIS). These impacts are subject to applicable environmental protection measures (EPMs) (see Table F-1 in Appendix F). Table I-1 does not include potential additional mitigation measures that could avoid or further minimize or mitigate Project impacts. Please see the individual resource discussions in Chapter 3 for detailed analyses.

**Table I-1. Potential Unavoidable Adverse Impacts of the Action Alternatives by Resource**

| Resource Area | Potential Unavoidable Adverse Impacts of the Action Alternatives |
|---|---|
| Air quality | • Impacts from emissions from engines associated with vessel traffic, construction activities, equipment operation, and decommissioning activities |
| Bats | • Displacement and avoidance behavior due to habitat loss and alteration, equipment noise, and vessel traffic<br>• Individual mortality due to collisions with operating wind turbine generator (WTGs) |
| Benthic habitat and invertebrates | • Increase in suspended sediments and resulting effects due to seafloor disturbance<br>• Habitat quality impacts, including reduction in habitat as a result of seafloor surface alterations<br>• Displacement, disturbance, and avoidance behavior due to habitat loss and alteration, equipment noise, vessel traffic, increased turbidity, sediment deposition, and electromagnetic fields (EMFs)<br>• Individual mortality due to construction and installation, operations and maintenance (O&M), and decommissioning<br>• Conversion of soft-bottom habitat to new hard-bottom habitat |
| Birds | • Displacement and avoidance behavior due to habitat loss and alteration, lighting, equipment noise, and vessel traffic<br>• Individual mortality due to collisions with operating WTGs |
| Coastal habitats and fauna | • Displacement and avoidance behavior from habitat loss and alteration and equipment noise<br>• Individual mortality from collisions with vehicles or construction equipment<br>• Short-term habitat alteration and increased invasive species risk |
| Commercial fisheries and for-hire recreational fishing | • Disruption to access or temporary restriction in port access or harvesting activities due to construction of offshore Project elements<br>• Disruption to harvesting activities during operations of offshore wind facility<br>• Changes in vessel transit and fishing patterns<br>• Changes in risk of gear entanglement or target species |
| Cultural resources | • Impacts to unidentified or undefined submerged marine resources from Project construction and installation, O&M, and decommissioning Impacts to terrestrial cultural resources and the viewshed from Project construction and installation and O&M<br>• Visual impacts to onshore cultural resources |

| Resource Area | Potential Unavoidable Adverse Impacts of the Action Alternatives |
|---|---|
| Demographics, employment, and economics | • Disruption of commercial fishing, for-hire recreational fishing, and marine recreational businesses during offshore construction and cable installation<br>• Hindrances to ocean economy sectors due to the presence of the offshore wind facility, including commercial fishing, recreational fishing, sailing, sightseeing, and supporting businesses |
| Environmental justice | • Changes to air quality, water quality, land use and coastal infrastructure, and commercial fisheries and for-hire recreational fishing that are disproportionately borne by minority or low-income populations from Project construction and installation, O&M, and decommissioning |
| Finfish and essential fish habitat | • Increase in suspended sediments and resulting effects due to seafloor disturbance<br>• Habitat quality impacts, including a reduction in habitat as a result of seafloor surface alterations<br>• Displacement, disturbance, and avoidance behavior due to habitat loss and alteration, equipment noise, vessel traffic, increased turbidity, sediment deposition, and EMFs<br>• Individual mortality due to construction and installation, O&M, and decommissioning<br>• Conversion of soft-bottom habitat to new hard-bottom habitat (for some species) |
| Land use and coastal infrastructure | • Land use disturbance due to construction as well as effects due to noise, vibration, and travel delays |
| Marine mammals | • Displacement, disturbance, and avoidance behavior due to habitat loss and alteration, equipment noise, vessel traffic, increased turbidity, and sediment deposition during construction and installation and O&M<br>• Temporary loss of current ambient acoustic habitat and increased potential for vessel strikes |
| Navigation and vessel traffic | • Changes in vessel transit patterns<br>• Increased navigational complexity and allision risk within the offshore wind farm area |
| Other marine uses | • Changes in access to marine mineral resource, and cable placement<br>• Disruption of scientific surveys, radar systems, military, and aviation traffic |
| Recreation and tourism | • Disruption of coastal recreation activities during onshore construction, such as beach access<br>• Viewshed effects from the WTGs altering enjoyment of marine and coastal recreation and tourism activities<br>• Disruption to access or temporary restriction of in-water recreational activities from construction of offshore Project elements<br>• Hindrances to some types of recreational fishing from the WTGs during operation |
| Sea turtles | • Disturbance, displacement, and avoidance behavior due to habitat loss and alteration, equipment noise, vessel traffic, increased turbidity, sediment deposition, and EMFs |
| Visual resources | • Change in scenic quality of landscape and seascape |
| Water quality | • Increase in erosion, turbidity and sediment resuspension, and inadvertent spills during construction and installation, O&M, and decommissioning |
| Wetlands and non-tidal waters | • Increase in soil erosion, sedimentation, and discharges and releases from land disturbance during construction and installation, O&M, and decommissioning |

# Irreversible and Irretrievable Commitment of Resources

Irreversible commitments of resources are those that cannot be regained, such as the extinction of a species or the removal of mined ore. Irretrievable commitments are those that are lost for a period of time, such as the short-term loss of timber productivity in forested areas that are kept clear for a power line or a road. Table I-2 summarizes irreversible or irretrievable impacts for each resource analyzed in the EIS, subject to applicable EPMs. Table I-2 does not include potential additional mitigation measures that could avoid or further minimize or mitigate Project impacts. Chapter 3 provides a detailed discussion of effects associated with the Project.

**Table I-2. Irreversible and Irretrievable Commitment of Resources by Resource Area for the Proposed Action**

| Resource Area | Irreversible Impacts | Irretrievable Impacts | Explanation |
|---|---|---|---|
| Air quality | No | No | The Bureau of Ocean Energy Management (BOEM) expects air emissions to be in compliance with permits regulating air quality standards, and emissions would be temporary during construction activities. If the Proposed Action displaces fossil fuel energy generation, overall improvement of air quality would be expected. |
| Bats | No | No | Irreversible impacts on bats could occur if one or more individuals were injured or killed; however, implementation of mitigation measures developed in consultation with the U.S. Fish and Wildlife Service (USFWS) would reduce or eliminate the potential for such impacts. Decommissioning of the Project would reverse the impacts of bat displacement from foraging habitat. |
| Benthic habitat and invertebrates | No | No | Although local mortality could occur, BOEM does not anticipate population-level impacts. The Project could alter habitat during construction and operations but could restore the habitat after decommissioning. |
| Birds | No | No | Irreversible impacts on birds could occur if one or more individuals were injured or killed; however, implementation of mitigation measures developed in consultation with the USFWS would reduce or eliminate the potential for such impacts. Decommissioning of the Project would reverse the impacts of bird displacement from foraging habitat. |
| Coastal habitats and fauna | No | No | Although local mortality could occur, BOEM does not anticipate population-level impacts on other coastal habitats or fauna. The Project could alter habitat during construction and operations but could restore the habitat after decommissioning. |

| Resource Area | Irreversible Impacts | Irretrievable Impacts | Explanation |
|---|---|---|---|
| Commercial fisheries and for-hire recreational fishing | No | Yes | Based on the anticipated duration of construction and installation and O&M, BOEM does not anticipate impacts on commercial fisheries to be irreversible. The Project could alter habitat during construction and operations, limit access to fishing areas during construction, or reduce vessel maneuverability during operations. However, decommissioning of the Project would reverse those impacts. Irretrievable impacts (lost revenue) could occur due to the loss of use of fishing areas at an individual level. |
| Cultural resources | Yes | Yes | Although unlikely, unanticipated removal or disturbance of previously unidentified cultural resources onshore and offshore could result in irreversible or irretrievable impacts. |
| Demographics, employment, and economics | No | No | Based on the anticipated duration of construction and installation and O&M, BOEM does not anticipate that contractor needs, housing needs, and supply requirements would lead to an irretrievable loss of workers for other projects or increase housing and supply costs. |
| Environmental justice | No | No | Potential environmental justice impacts, if any, would be short term and localized. |
| Finfish and essential fish habitat | No | No | Although local mortality could occur, BOEM does not anticipate population-level impacts. The Project could alter habitat during construction and operations but could restore the habitat after decommissioning. |
| Land use and coastal infrastructure | Yes | Yes | Land use required for construction and operations activities, such as the land proposed for the interconnection facility, could result in a minor irreversible impact. Construction activities could result in a minor irretrievable impact due to the temporary loss of use of the land for otherwise typical activities. Onshore facilities may or may not be decommissioned. |
| Marine mammals | No | Yes | Irreversible impacts on marine mammals could occur if one or more individuals of species listed under the Endangered Species Act (ESA) were injured or killed; however, NMFS consultation mitigation measures would reduce or eliminate the potential for such impacts on listed species. Irretrievable impacts could occur if individuals or populations grow more slowly as a result of displacement from the Lease Area. |
| Navigation and vessel traffic | No | Yes | Based on the anticipated duration of construction and installation and O&M, BOEM does not anticipate impacts on vessel traffic to result in irreversible impacts. Irretrievable impacts could occur due to changes in transit routes, which could be less efficient during the life of the Project. |
| Other marine uses | No | Yes | BOEM does not anticipate the potential impacts to be irreversible; however, disruption of offshore scientific research and surveys would occur during proposed Project construction, operations, and decommissioning activities. |

| Resource Area | Irreversible Impacts | Irretrievable Impacts | Explanation |
|---|---|---|---|
| Recreation and tourism | No | No | Construction activities near the shore could result in a minor temporary loss of use of the land for recreation and tourism purposes, but these impacts would not be irreversible or irretrievable. |
| Sea turtles | No | Yes | Irreversible impacts on sea turtles could occur if one or more individuals of species listed under the ESA were injured or killed; however, NMFS consultation mitigation measures would reduce or eliminate the potential for impacts on listed species. Irretrievable impacts could occur if individuals or populations grow more slowly as a result of displacement from the Lease Area. |
| Visual resources | No | Yes | Viewshed changes would persist for the life of the Project, until decommissioning is complete. |
| Water quality | No | No | BOEM does not expect activities to cause loss of or major impacts on existing inland waterbodies or wetlands. Turbidity and other water quality impacts in the marine and coastal environment would be short term, with the rare exception of a major spill. |
| Wetlands and non-tidal waters | No | No | BOEM does not expect activities to cause loss of or major impacts on existing wetlands or other non-tidal waters. |

# Relationship between the Short-Term Use of the Human Environment and the Maintenance and Enhancement of Long-Term Productivity

The Council on Environmental Quality's National Environmental Policy Act implementing regulations (40 CFR 1502.16) require that an EIS address the relationship between short-term use of the environment and the potential impacts of such use on the maintenance and enhancement of long-term productivity. Such impacts could occur as a result of a reduction in the flexibility to pursue other options in the future, or assignment of a specific area (land or marine) or resource to a certain use that would not allow other marine uses, particularly beneficial uses, to occur at a later date. An important consideration when analyzing such effects is whether the short-term environmental effects of the action would result in detrimental effects to long-term productivity of the affected areas or resources.
