More significantly, BOEMRE's reasoning ignores the nature of the decision to be made at each stage of oil and gas development under OCSLA. It is at the lease sale stage that the agency makes the decision about whether, where and how oil and gas activities will occur within a particular portion of the outer continental shelf. Once the leases are issued, the agency's ability to alter course is constrained. OCSLA authorizes the Secretary to suspend or cancel a lease or permit only if oil and gas activities threaten to cause serious harm or damage to life, property, the environment, or national security or defense. At the exploration plan stage, the decision is whether to approve a plan that outlines the exact location, timing and equipment to be used to explore for productive deposits of oil and gas. The decision at the development and production stage is similar. In other words, while OCSLA establishes stages for development of oil and gas resources in the outer continental shelf, the decision about whether to allow that activity to go forward occurs at the lease sale stage; the decisions at later stages are simply refinements of the lease decision and BOEMRE cannot change the decision about whether to authorize oil and gas activity absent unusual circumstances. Thus, BOEMRE must have complete information about the environmental effects at the lease sale stage *before* it decides whether to authorize oil and gas activities. This thorough understanding of the existing environment and the environmental consequences of development within that environment is essential not only to determining whether to authorize oil and gas activities but also to identify any mitigation measures to minimize potential environmental impacts.

BOEMRE also asserts that it can defer gathering missing information at the lease sale stage because tiering of NEPA analyses is allowed within OCSLA. However, BOEMRE's approach is a misapplication of "tiering" within NEPA. Tiering is a means to allow an agency to avoid repetitive analysis in subsequent, more site-specific phases of a project. Thus, if a complete EIS is prepared at the first stage in which potential significant effects are identified, subsequent decisions can often be accompanied by a shorter EA/FONSI or an EIS that incorporates and follows from the analysis in the prior EIS. The key is that tiering allows for *subsequent* NEPA analysis to build on a thorough EIS prepared at an earlier stage. By assuming that it can defer gathering information until a later stage, BOEMRE is in essence committing itself to undertaking an EIS later, turning tiering on its head. In light of the fact that BOEMRE's decisions regarding approvals for oil and gas activity continue to be challenged, it makes no sense to pursue a status quo approach that satisfies no one. In its August 16, 2010 report and recommendations to BOEMRE regarding NEPA implementation, the Council on Environmental Quality (CEQ) clarified the purpose and implementation of tiering.³ The practical reality is that in order to fully comply with NEPA within the structure of OCSLA, the agency must prepare a full assessment of potential impacts and the site-specific details and impacts can then easily be addressed within the compressed approval time period for an exploration plan.

It bears mentioning that the task of gathering the vast amount of incomplete and missing information necessary to conduct a thorough analysis of the environmental impacts of oil and gas activity within Lease Sale 193 is a consequence of BOEMRE's decision to offer for lease an area approximately the size of Colorado.⁴ It would be daunting in the best of circumstances to gather and analyze the necessary information for an area of this huge scope. Nonetheless, BOEMRE cannot use its decision to offer for lease such a huge area to then treat the lease sale decision as a programmatic rather than site specific decision or as an excuse to not fully analyze the environmental impacts of oil and gas activity within that area on the grounds that it is too big with too many unknowns.

Information Identified as Missing or Incomplete in the FEIS and draft SEIS is Essential to Making Decisions Regarding the Lease Sale

BOEMRE also concludes that missing information is not relevant or essential to a choice among alternatives because the impacts under all of its alternatives are essentially the same. This rationale does nothing to support its position but instead suggests that its range of alternatives is inadequate, further compounding the flaws in the FEIS. Much of the missing information identified by BOEMRE in the original Lease Sale 193 EIS is essential to a reasoned choice about whether, where, and under what conditions to offer oil and gas leases in the Chukchi Sea. Gaps in data about the Chukchi Sea include missing basic information about species that inhabit the region and their habitat needs over both time and space. These types of gaps are widespread

³ CEQ NEPA Guidance at 22-24, available at http://ceq.hss.doe.gov/current_developments/docs/CEQ_Report_Reviewing_MMS_OCS_NEPAImplementation.pdf
⁴ Under OCSLA, leases are to be for tracts "consisting of a compact area not exceeding five thousand seven hundred and sixty acres, as the Secretary may determine, unless the Secretary finds that a larger area is necessary to comprise a reasonable economic production unit." 43 U.S.C. Sec. 1337(6)(b).

across the Chukchi Sea, and this lack of information has been widely acknowledged (e.g., CRRC 2010, MBC 2007). Table 1 depicts by category the types of essential missing basic data about the Chukchi Sea ecosystem.

Type of Essential Need (or gap in knowledge)	Explanation	Example of Essential Need or gap in knowledge
Topic	Some resources have not been studied in the Arctic or have very little information.	Zooplankton, benthic organisms, fish
Abundance	For many species or species groups, there is little or no information on population size and/or relative abundance.	Zooplankton, Opilio crab, fish, ice seals, Chukchi polar bear population, Kittlitz's Murrelet
Spatial coverage	Many resources studied in depth still lack complete coverage over the Beaufort and Chukchi seas within the U.S. EEZ.	Benthic biomass, fish, Steller's Eider, Arctic fox
Type of Essential Need (or gap in knowledge)	Explanation	Example of Essential Need or gap in knowledge
Temporal coverage	Outside of remotely sensed satellite information (temperature, chlorophyll-a, etc.), no resource in the Arctic has adequate data to detect temporal change over annual or decadal time periods for the Beaufort and Chukchi seas.	Invertebrates, fish, birds (surveyed in nearshore areas only), and marine mammals (surveyed in Beaufort only)
Seasonal coverage	Most surveys occur in July and August when weather, sea ice, and snow are in optimal condition; direct observation is difficult to impossible at other times of the year. Most species are lacking adequate seasonal distribution data.	Invertebrates, benthic organisms, fish, polar bear, ribbon seal
Spatial scale	Very broad-scale information covering the Beaufort and Chukchi seas is available for many species. Similarly, fine scale survey data in disjunct development areas also exist. Mid-scale data with full spatial coverage are needed to make reasoned landscape-scale management decisions.	The Outer Continental Shelf Environmental Assessment Program (OCSEAP) which occurred in the 1970-1980s is a good mid-scale survey that has not occurred in recent years.

Another type of missing information is data about the effects of oil and gas exploration and development on species and habitats in the Chukchi Sea. One of the lessons we have learned from the *Deepwater Horizon* Gulf of Mexico oil spill is that BOEMRE must conduct meaningful environmental review, including a full analysis of impacts, before offshore oil and gas activities occur (Nuka 2010). For example, to prevent and prepare for oil spills in the Arctic Ocean, BOEMRE needs information on the physical environment and the unique challenges it poses to offshore oil and gas drilling. It also needs to understand the effect of drilling and oil spills on marine ecosystems. A prediction of the impacts of spilled oil in Arctic waters must take into account the behavior of oil in an environment with sea ice, the varying characteristics of sea ice throughout the year, Arctic weather conditions, the long-term fate of oil in cold water and the specific vulnerabilities of Arctic marine species and ecosystems. BOEMRE has not endeavored to obtain this information for the draft SEIS.

BOEMRE Failed to Include in the FEIS and draft SEIS Available Analyses and Studies

BOEMRE completed this draft SEIS without obtaining and incorporating information from relevant Department of Interior Arctic Ocean science initiatives. Those efforts, though not currently complete, would contribute to a more thorough analysis of environmental impacts in the draft SEIS. Specifically, BOEMRE failed to take advantage of - or even acknowledge - the ongoing analysis by the U.S. Geological Survey (USGS) to identify information gaps in the Arctic Ocean as related to decisions about OCS activity that was ordered by the Secretary of Interior on March 31, 2010. That analysis will be completed in April 2011. The draft SEIS also appears to have been developed in isolation from an assessment BOEMRE is undertaking specifically to address missing information about the Chukchi Sea (MBC 2007). This Chukchi Offshore Monitoring in Drilling Area (COMIDA) effort by BOEMRE is intended to "characterize the Chukchi Sea ecosystem in order to detect and distinguish future changes resulting from oil industry activities, natural variability, and other anthropogenic effects... prior to oil and gas exploration activities" (MBC 2007). The COMIDA effort is supposed to look at data needs and provide monitoring recommendations from an ecosystem perspective, and to obtain baseline data before oil and gas activity, including exploration begins in the Chukchi Sea. While COMIDA has a promise of providing sufficient information to assist the agency in making informed decisions, the agency is not using the information gained from this research effort to inform its decisions regarding if, when, where and how oil and gas activities might occur in the Chukchi Sea.

Moreover, BOEMRE could have - and should have - included additional information in the draft SEIS that has become available in the two years since the FEIS was completed. Attachment 1 is a list of references that include relevant and essential information that should be incorporated into a revised draft SEIS.

One example pertains to the bowhead whale - an important marine mammal for the Inupiat along the Arctic slope, and a species afforded protection under the Marine Mammal Protection Act and the Endangered Species Act. The FEIS acknowledges "data are limited on the bowhead whale fall migration through the Chukchi Sea before the whales move south into the Bering Sea." And that "recent data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available." In the draft SEIS (Appendix A) BOEMRE

responded that: "While there will always be some lag between environmental change and available data that reflects that change, BOEM (formerly MMS) has conducted or commissioned extensive study bowhead use of the Chukchi Sea, and a general understanding of the bowhead distribution, abundance, and habitat use is known." The important and very pertinent research to which the agency refers was finalized in July of this year, and made publicly available on their website during the fall of 2010 (Quakenbush et al. 2010). The draft SEIS goes on to say "Existing information is sufficient to support sound scientific judgments and reasoned managerial decisions, especially during the earlier stages of OCSLA review, which are necessarily more programmatic in nature. Furthermore, the missing information pertains to potential impacts equally applicable to each action alternatives, meaning that additional information on this subject is not likely to be useful to decision making at this stage. Overall, this incomplete information is not essential to a reasoned choice among alternatives." However, this is not necessarily the case, as Quakenbush et al. (2010) identified important corridors for migration and important feeding areas that should be excluded from the lease sale or at least considered essential information.

The alternatives considered by BOEMRE in the draft SEIS all have the same impacts, with the exception of no action – indicating that the range of alternatives is too narrow. Ecologically sensitive areas must be identified and protected. Areas within an ecosystem are not equal in biological and ecological terms; some areas are more important than others to the ecosystem or human populations. Identification of important ecological areas based on essential habitats and functions in the Arctic ecosystem along with traditional cultural activities, can be an important step toward ensuring ecosystem functionality. The ecologically and culturally sensitive areas in the Arctic Ocean should be removed from the leasing process.

The draft SEIS also fails to include all of the relevant and related information collected from the BOEMRE Environmental Studies Program in Alaska. For example, Attachment 2 documents peer reviewed literature produced by the Environmental Studies Program since 1990⁵ that was not considered, but relevant to the FEIS and subsequent draft SEIS. The Alaska Annual Studies Plan Final FY 2011 notes that since the conception of the Environmental Studies Program in 1973 more than \$350 million has funded studies in Alaska across 15 planning areas (BOEMRE 2010). Since much time and effort was put into these studies, it is for BOEMRE' responsibility to consider the results and implications of these study results, particularly as they may contribute to some of the essential unknown information about species and habitats as well as the effects of oil and gas exploration and development on these species and habitats.

Traditional Knowledge Can Be Used to Fill Gaps in Information

Some of the information that was identified in the FEIS and draft SEIS as missing or incomplete could be satisfied in part by incorporating local and traditional knowledge. Local and traditional knowledge, a different but equally valid knowledge system will help expand our understanding of the Arctic and can supplement and enhance existing knowledge. Indigenous peoples who have lived in the Arctic Ocean region for millennia have developed a wealth of knowledge about

⁵ BOEMRE provides a listing of all peer-reviewed ESP studies at: http://alaska.boemre.gov/ess/2010_0604_AKPeerReview.pdf (last accessed 21 November 2010)

the region. They depend on local plants and animals for food, clothing and shelter, and have learned a great deal about the species they use and see. In recent years, a substantial amount of research has focused on traditional knowledge in the Arctic. Major projects such as the Arctic Council's Arctic Climate Impact Assessment (ACIA 2004) have incorporated traditional knowledge in efforts to understand what is taking place in the region. Nonetheless, there is much more to be done to make the knowledge of Arctic peoples more widely available, such as incorporating traditional knowledge in management processes that directly impact people, including in this EIS process. Co-management organizations and institutes of public governance are one means of incorporating not just knowledge but the holders of that knowledge in the decision-making process. Greater involvement by Arctic peoples in the governance of their regions and communities allows their knowledge to benefit modern institutions. These approaches can help in the development of long-term solutions to economic and environmental challenges in the Arctic.

Documenting knowledge in a report, however, is just one step towards fully incorporating what Arctic peoples have learned over generations. A report about traditional knowledge may put certain facts and observations before a larger audience but using that knowledge appropriately entails the wisdom than many people associate with traditional perspectives. We have attached a bibliography with selected references that should help provide guidance and provide examples of situations where traditional knowledge has been effectively utilized (Attachment 3). Traditional knowledge can help fill some of the gaps in the draft SEIS as well as guide future efforts to collect necessary information.

BOEMRE Must Employ a Holistic Ecosystem-Based Approach to Research

We recognize and acknowledge that research has been and is currently being conducted in the Chukchi Sea by various U.S. government agencies, and by industry (e.g., BOEMRE 2010, Funk et al. 2007). These studies are important and contribute to our baseline knowledge and understanding of the Chukchi Sea ecosystem. However, the existence of such research does not necessarily mean that it is relevant or complete to sufficiently inform the decisions about whether, where, when, and how oil and gas activity should occur in the Chukchi Sea. A large quantity of research cannot substitute for relevant research.

Existing scientific studies have been undertaken in an uncoordinated basis without an overarching purpose for the information or a clearly identified goal to advance knowledge of Chukchi Sea ecosystems. Specifically, many of the current scientific studies are focused on specific drilling lease sites that are of interest to industry. They provide information about physical and biological aspects (e.g., species) for a small area within a larger ecosystem for a limited time period. To be useful to leasing decisions, longer-term studies must be undertaken in order to provide an understanding of the variability of species over time. Moreover, the current piecemeal approach to science currently practiced by BOEMRE in its Environmental Studies Program Annual Study Plan, is not adequate. Narrow studies are undertaken by contractors responding to a request for proposal (RFP) with no coordinated analysis and synthesis of that information. Without an overarching purpose and scientific plan to guide and tie the research together, the individual studies do little to advance knowledge of the Chukchi Sea.

BOEMRE has used the same flawed segregated approach that it uses in its research to its assessment of missing information in the draft SEIS. The agency has reached the conclusion that none of the missing information is essential to decision making by addressing each statement regarding missing information in isolation without looking at the entire set of research needs for particular species or other environmental parameters. However, a more holistic approach, would likely lead to a different conclusion. It is possible to conclude that each piece of missing information might not be relevant to the decision to be made, but taken together, all of the missing information for a particular species certainly is important. This type of piecemeal approach to scientific research is pervasive in all of BOEMRE research study programs and ensures that scientific research produces little useable information to advance knowledge about the Arctic Ocean.

What is needed instead is a comprehensive, integrated research and monitoring plan for the U.S. Arctic to improve our understanding of Arctic marine ecosystem structure and functioning and to avoid adverse impacts on the Arctic environment and subsistence way of life. Such a plan should (1) define existing information and research needs such as in a gap analysis (this is currently undertaken by the USGS) (2) gain a more comprehensive catalog of species, populations and habitats (including seasonal migrations) in a marine life assessment (3) track the physical factors that influence and determine biological productivity, habitat preference and migration pathways in an integrated, comprehensive environmental monitoring program (4) secure a better understanding of ecosystem interactions and trophic linkages and the effects of human activity and (5) integrate scientific data to identify processes and habitats that are sensitive and vulnerable to disruption. Such work is critical to the development of a comprehensive, collaborative program of research, monitoring, data collection, mapping, and documentation of local and traditional knowledge in the Arctic Ocean. This science plan would provide the framework for all development activity in the Arctic, and approval of oil and gas development activity would have to be consistent with the plan's ecological science, monitoring, and assessments.

BOEMRE Must Prepare a Revised SEIS

BOEMRE's draft SEIS fails to adequately address the district court's order and fails to satisfy NEPA's requirements. The draft SEIS also fails to incorporate the offshore oil and gas program reforms initiated by Department of Interior in the face of the worst environmental disaster in our nation's history. BOEMRE should prepare a revised draft SEIS only after it has gathered missing information and drawn on the work of other agencies.

Sincerely,

Marilyn Heiman

Re: **Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)**

Dear Regional Director:

The undersigned groups hereby submit the following comments to the draft Supplemental Environmental Impact Statement for Chukchi Sea Lease Sale 193 (draft SEIS) prepared by the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) pursuant to the National Environmental Policy Act (NEPA).

The draft SEIS purports to address the issues identified by the Alaska Federal District Court's remand order in *Native Village of Point Hope v. Salazar*, No. 1:08-cv-00004-RRB (D. Alaska). Rather than furthering the Obama administration's commitment to sound science, however, the draft appears to be a paper exercise designed to justify the earlier decision to hold Lease Sale 193. For the reasons explained below, the draft should be rescinded, a thorough assessment of missing information undertaken, and a re-assessment of natural gas development conducted. Once it has prepared an adequate and informative draft SEIS based on that information, BOEMRE should reengage in a public comment period. Thereafter, the agency should consider anew in light of these new analyses whether to cancel, modify, or affirm its decision to hold Lease Sale 193.

In *Native Village of Point Hope*, the Court determined that Lease Sale 193 was held in violation of NEPA because BOEMRE prepared a flawed environmental impact statement (EIS). BOEMRE failed to conduct a full analysis of missing information about the Chukchi Sea and the effects of oil and gas activities pursuant to Council on Environmental Quality regulation 40

Appendix 2

C.F.R. § 1502.22, and it failed to analyze the potential impacts of natural gas development. Accordingly, the Court remanded the decision to the agency with direction to redo its environmental analysis in these respects. In the draft SEIS, BOEMRE falls far short of satisfying the Court's order to meet the requirements of NEPA.

With respect to the Section 1502.22 missing information analysis, BOEMRE acknowledges it cannot make basic assessments of the lease sale's impacts in light of data gaps, but it concludes in the draft SEIS that *not one piece of information* identified as missing in the original EIS is essential to the lease sale decision. The conclusion is not supported or credible, demonstrates a desire to proceed quickly rather than deliberately, does not comply with the law, does not reflect a thoughtful assessment of the nature of the information that should be available at the critical lease sale stage of the process, and is a significant step in the wrong direction. With respect to analyzing natural gas development, the draft SEIS contains little more than a justification of the analyses contained in the original EIS. BOEMRE's conclusion that natural gas development would have only minimal additive impacts suffers from significant flaws.

BOEMRE should take actions in the Arctic Ocean that are consistent with the Administration's commitment to science-based decision-making. It should ensure that the information required for informed decision-making is available, the systemic failures in regulatory oversight made evident by the *Deepwater Horizon* accident are addressed, and new decisions, including the decision whether to cancel, amend, or affirm Chukchi Sea Lease Sale 193, are made taking into account what we have learned. Accordingly, it must not finalize the draft SEIS as currently written, but should undertake a meaningful reanalysis of Lease Sale 193 that is consistent with NEPA, and the Administration's commitment to sound science in decision-making.

I. MISSING INFORMATION ANALYSIS

It is undisputed that there are significant gaps in basic information about the Arctic Ocean and that, absent this information, it is not possible, in many instances, to understand the scope of potential impacts from oil and gas activities on the region's wildlife and people. The need for more information has been acknowledged repeatedly by the Administration: in President Obama's National Ocean Policy process, the National Marine Fisheries Service's closure of the Arctic Ocean to commercial fishing, and in Secretary Salazar's initiation of a scientific gap analysis by the United States Geological Survey. The current draft SEIS clashes badly with the Administration's commitment to sound science in decision-making.

In the original Chukchi Sea Lease Sale 193 EIS, BOEMRE identified literally hundreds of instances in which it lacked information about the Chukchi Sea, ranging from basic science about the presence and behavior of species in the region to information about the effects of oil and gas activities on wildlife. However, it failed to analyze which of the missing information was relevant to reasonably foreseeable adverse impacts and essential to a reasoned choice among alternatives and to obtain that information absent a finding that the costs of obtaining the information are exorbitant. In *Native Village of Point Hope*, the Alaska Federal District Court ruled that this failure constituted a violation of 40 C.F.R. § 1502.22. The Court remanded the EIS to the agency and directed it to conduct this analysis as required by NEPA.

Section 1502.22 sets out an "ordered process" for an agency preparing an EIS in the face of missing information. *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1244 (9th Cir. 1984). When there is incomplete information relevant to reasonably foreseeable significant adverse impacts that is essential to a reasoned choice among alternatives, an agency must obtain and include the missing information in the EIS if the overall costs of obtaining it are not exorbitant. 40 C.F.R. § 1502.22. The regulation furthers NEPA's purpose of ensuring that agencies make "fully informed and well-considered decision[s] . . ." *Vt. Yankee Nuclear Power Corp. v. Natural Resources Def. Council*, 435 U.S. 519, 558 (1978), its mandate of "widespread discussion and consideration of the environmental risks and remedies associated with [a] pending project", and its "require[ment] that this evaluation take place *before* a project is approved." *LaFlamme v. FERC*, 852 F.2d 389, 398 (9th Cir. 1988) (internal quotation marks omitted).

The draft SEIS purports to respond to the Court's order to satisfy the requirements of Section 1502.22. However, BOEMRE's determination that none of the missing information is essential to a reasoned choice among alternatives is arbitrary and improper. Rather than engage in a good-faith effort to analyze the missing information and identify which of it is essential to a reasoned choice among alternatives, the agency appears instead to have spent its energy developing justifications for avoiding its obligation to obtain essential information. Appendix A of the draft SEIS contains a 140-page exposition of the instances in the original EIS in which the agency said "we don't know" about the Chukchi Sea and the effects of oil and gas activities there. For each instance of missing information, BOEMRE offers an arbitrary justification—usually one of the same five recurring excuses discussed below—for why it does not need to obtain the particular information before leasing in the Chukchi Sea. This approach is inconsistent with Section 1502.22 and the agency's obligation to reconsider the lease sale in light of a new analysis of missing information. Much of the missing information identified in the original Lease Sale 193 EIS is essential to the decision at issue—whether, when, where, and under what conditions to issue leases in the Chukchi Sea. The appendix demonstrates the agency's misdirection of resources into justifying an already-made decision, rather than engaging in a meaningful inquiry, real science, or research to inform a reexamination of the lease sale decision.

A. Because the decision to sell leases is a critical decision in the offshore development process, information relevant to the resources in the area and to the effects of oil and gas activity on those resources is essential to making that decision.

Because the lease sale stage involves concrete and consequential decisions about committing portions of planning areas to oil and gas activities, information about the biological function of different parts of the planning area and the importance of those parts to the regional ecosystem is essential to this choice. *See, e.g., Kettle Range Conservation Group v. U.S. Forest Serv.*, 148 F. Supp. 2d 1107, 1125-26 (E.D. Wash. 2001) (information is essential if without the data the agency cannot know if its conclusions regarding impacts are reliable). Similarly, understanding the effects of industrial oil and gas activities on different components of the ecosystem is essential to deciding where, if anywhere, those activities should be permitted and how they should be constrained.

A lease sale is a meaningful decision about the commitment of an area to oil and gas activity. It is the second of the "four distinct statutory stages [under the Outer Continental Shelf Lands Act

(OCSLA) to developing an offshore oil well: (1) formulation of a five-year leasing plan by the Department of the Interior; (2) lease sales; (3) exploration by the lessees; (4) development and production.” *Sec’y of the Interior v. California*, 464 U.S. 312, 337 (1984). Each of the four stages presents the decision-maker with a different and distinct choice about offshore development. The five-year leasing plan is a programmatic evaluation of the nation’s outer continental shelf areas to determine whether any of those areas should be open to potential future oil and gas lease sales in the coming five years. 43 U.S.C. § 1344(a). At the lease sale stage, BOEMRE decides whether to hold the scheduled sales and, if so, under what conditions. In the third stage, the agency reviews exploration plans submitted by an oil company and determines whether to allow the company to drill wells on the lease tracts purchased during the second phase. If it finds recoverable reserves, the company would submit a development plan, which is reviewed and approved or denied during the fourth and final phase.

Before a lease sale, the government has complete discretion over whether to permit oil and gas activity in an area included in a five-year plan and, if so, under what conditions to permit the activity. Once valid leases are issued, the government’s options are much more constrained. Once they have obtained leases, companies may conduct ancillary activities on their leases, such as certain seismic surveying, without further approval from BOEMRE, and they may submit for approval exploration drilling plans and development plans. Further, by selling leases, the government sells a promise to the lessee that it will comply with the procedures and standards set forth in OCSLA in permitting the exploration and development of the leases. *Mobil Oil Exploration & Producing Se. v. United States*, 530 U.S. 604, 620-621 (2000) (explaining that “lease contracts g[i]ve the companies more than rights to obtain approvals. They also g[i]ve the companies rights to explore for, and to develop, oil.”). Accordingly, once the government has lawfully issued valid leases, it can suspend activities on leases only for reasons and pursuant to the procedures set forth in OCSLA and its implementing regulations. These include a “threat of serious, irreparable, or immediate harm or damage to life (including fish and other aquatic life), to property, to any mineral deposits (in areas leased or not leased), or to the marine, coastal, or human environment.” 43 U.S.C. § 1334(a)(1)(B), or when “necessary to carry out the requirements of NEPA or to conduct an environmental analysis,” 30 C.F.R. § 250.172(d). Similarly, it can only cancel leases for reasons and following procedures set forth in OCSLA, 43 U.S.C. § 1334(a)(2)(A) & (B); see also 30 C.F.R. § 256.77(d), and cancellation entitles lease holders to compensation, 43 U.S.C. §1334(a)(2)(C); 30 C.F.R. § 250.184.

BOEMRE must comply with NEPA at each stage of OCSLA offshore development process. Because the decision being made at each stage differs, so do the NEPA analyses. At the five-year plan stage, the analysis is relatively general in light of the programmatic nature of the decision. An analysis at the lease sale stage must examine more closely the impacts of oil and gas activities in a particular area. It must provide information to the decision-maker and the public about the consequences of oil and gas activities in a particular area and offer a reasonable range of alternatives. These alternatives must encompass the size and scope of the sale, including whether to defer certain areas from leasing, and the imposition of stipulations in the leases that limit or mitigate the effects of activities under the leases. Because of the nature of the decision at the lease sale stage—whether, where, and under what conditions to open areas to oil and gas activities—the analysis of potential impacts is different and more specific than the more general programmatic analysis at the five-year plan stage. The lease sale analysis is also relevant

to later-stage analyses, such as those conducted at the exploration stage. Typically, those analyses tier to and expand upon the lease sale analysis. In practice, moreover, BOEMRE has not obtained additional information at the post-lease exploration stage, because it has prepared only short environmental assessments, rather than full EISs, for these plans.

Thus, a lease sale decision is a meaningful commitment in OCSLA’s staged offshore development process, and a meaningful NEPA analysis must provide information to the decision-maker and the public about the potential effects of oil and gas activities on the areas under consideration for leasing. As described more fully below, missing information about the basic biology of the Chukchi Sea ecosystem and the effects of oil and gas activities to the biological resources of the areas under consideration for leasing is essential to the lease sale decision.

B. Missing information identified in the original Lease Sale 193 EIS is essential to the lease sale decision.

In the draft SEIS, BOEMRE concedes that much of the information identified as missing in the 2007 Chukchi Sea Lease Sale 193 EIS was relevant to potentially significant effects of the lease sale. See BOEMRE, Chukchi Sea Planning Area, Oil and Gas Lease Sale 193 in the Chukchi Sea, Alaska, Draft SEIS, OCS EIS/EA BOEMRE 2010-034 (Draft SEIS) at App. A (Sep. 2010). However, it concludes that none of the information was essential to reasoned choices among alternatives, and thus the agency was not obliged to obtain the information. *Id.* at 10-11. That conclusion is unwarranted.

1. Missing information is pervasive and goes to fundamental questions at issue in the lease sale decision.

The missing information that forms the basis for the Court’s remand includes the most basic parameters for every one of the largest and most conspicuous animals in the ecosystem—all fish, marine mammals, and birds—which in other regions are typically the most well-studied segment of an ecosystem. The missing information includes the abundance, distribution, and life history characteristics for many of these species. The state of information about these more charismatic animals in the ecosystem is further evidence of the lack of information about the rest of the ecosystem, including the clams, worms, sea stars, and other species that are important prey for the more conspicuous species. The information that does exist is outdated and too spotty to provide an appropriate baseline for decision-making. This lack of basic information about the ecosystem makes it difficult, if not impossible, to determine whether there will be significant impacts to animals and the ecosystem. Additionally, there are substantial data gaps about the effects of oil and gas activities, like industrial noise, on marine mammals and fish. These gaps further limit the agency’s ability to meaningfully analyze the impacts of the lease sale or chose among alternatives.

Gaps in data about the Chukchi Sea include missing basic information about species that inhabit the region and their habitat needs over both time and space. These types of gaps are widespread across the Chukchi Sea, and this lack of information has been widely acknowledged. See, e.g., NRDA – Coastal Response Research Center. 2010. Natural Resources Damage Assessment

(NRDA) in Arctic Waters: The Dialogue Begins. University of New Hampshire, Durham, NH; MBC Applied Environmental Sciences. 2007. Proceedings of a Workshop on Chukchi Sea Offshore Monitoring in Drilling Area OCS Study MMS 2007-002. Prepared by MBC Applied Environmental Sciences, Costa Mesa, CA for the U.S. Dept. of the Interior, Minerals Management Service, Alaska OCS Region (MBC, 2007). Table 1 depicts by category some of the types of missing basic data about the Chukchi Sea ecosystem.

Type of Gap	Explanation	Examples of Gap
Resource	Some resources have not been studied in the Arctic or have very little basic, life history information.	Zooplankton, benthic organisms, fish
Abundance	For most species or species groups, there is little or no information on population size, relative abundance, and/or distribution. Furthermore, little is known about the ecological roles played by most species and thus which species are crucial for ecosystem health.	Zooplankton, Opilio crab, fish, ice seals, Chukchi polar bear population, Kittlitz’s Murrelet
Spatial coverage	Many resources studied in depth still lack complete coverage across the Beaufort and Chukchi seas within the U.S. EEZ.	Benthic biomass, fish, Steller’s Eider, pelagic birds, Arctic fox
Temporal coverage	Outside of remotely sensed satellite information (ice, temperature, chlorophyll-a, etc.), no resource in the Arctic has adequate data to detect change over annual or decadal time periods for the Beaufort and Chukchi seas.	Invertebrates, fish, pelagic birds, and mammals (surveyed in Beaufort only)
Seasonal coverage	Most surveys occur in July and August when weather, sea ice, and snow are optimal for human observers; direct observation is difficult at other times of the year. Most species lack adequate seasonal distribution data.	Invertebrates, benthic organisms, fish, polar bear, ribbon seal
Ecosystem Structure and Functioning	The physical, chemical and biological processes that help drive the composition of the food web, energy flow and spatial variability are not well understood.	Quantitative food web model, currents and winds, nutrient cycling, the effects of sea ice on productivity And species distribution
Applied research including understanding how the ecosystem is changing	Arctic marine ecosystems are poorly known to begin with, and are now changing in a myriad of ways. There is need for greater understanding of organismic and ecosystem-level responses to changes due to loss of sea ice, increased water temperature and acidification.	Effects of ocean acidification on benthic invertebrates, which are key part of the larger food web. Cumulative effects of disturbance and noise on bowhead whales and other marine mammals.

In addition to missing basic information about the ecosystem, including the species and relationships, we also lack a basic understanding of the effects of oil and gas exploration and development on species and habitats in the Chukchi Sea. One of the lessons we have learned from the Gulf spill is that BOEMRE must conduct meaningful environmental review, including a full analysis of impacts, before offshore oil and gas activities occur. See, e.g., Nuka Research

and Planning Group, LLC, Pearson Consulting LLC. 2010. Oil spill prevention and response in the U.S. Arctic Ocean: Unexamined risks, unacceptable consequences. Commissioned by the Pew Environment Group, U.S. Arctic Program, November 2010. Philadelphia, PA, USA, available at <http://oceansnorth.org/arctic-oil-spill-report>. For example, to prevent and prepare for oil spills in the Arctic Ocean, BOEMRE needs information about the physical environment and the unique challenges it poses to offshore oil and gas drilling. It also needs to understand the effect of drilling and oil spills on marine ecosystems. A prediction of the impacts of spilled oil in Arctic waters must take into account the behavior of oil in an environment with sea ice, the varying characteristics of sea ice throughout the year, Arctic weather conditions, the long-term fate of oil in cold water and the specific vulnerabilities of Arctic marine species and ecosystems. BOEMRE has not endeavored to obtain this information for the lease sale draft SEIS.

These broad areas of missing data about the basic ecology of the Chukchi Sea and the effects of oil and gas activities there render BOEMRE unable to answer questions that are essential to the decision about whether, where, when, and under what conditions to lease an area for oil and gas activities. Listed below are some examples of the types of questions essential to the decision.

- Where will Pacific walrus be during summer? In 2007 and 2009, walrus hauled out on land in large numbers in northern Alaska. Prior to 2007, walrus spent summers on sea ice in the Chukchi Sea. In 2010, a number of walrus hauled out along the U.S. Chukchi coast, yet a number of walrus also used the region around Hanna Shoal, which is squarely within the Lease Sale 193 area, extensively. Without knowing where walrus will be, infrastructure and activity cannot be positioned to avoid incidental takes and other impacts. See e.g., USGS 2010. *Walrus tracking and telemetry data acquired from walrus instrumented on the Alaska shores of the Chukchi Sea in September 2009*. Radio-tagging field report. USGS Alaska Science Center, Walrus research project, available at http://alaska.usgs.gov/science/biology/walrus/pdfs/EC09_Radio_Tagging_Field_Report.pdf; Jay, C.V. and A.S. Fishbach. (2008). *Pacific walrus response to Arctic sea ice losses*. U.S. Geological Survey Fact Sheet 2008-3041, available at <http://pubs.usgs.gov/fs/2008/3041/>.
- Which areas in the Chukchi Sea are crucial for various life stages of marine mammals? Satellite telemetry has shown that the movements of bowhead whales, beluga whales, walrus, spotted seals, ringed seals, bearded seals, and polar bears are more complex and variable than previously anticipated. Without an understanding of which areas are crucial and why, it is impossible to identify critical areas that must be avoided by development and protected in the event of oil spills.
- How have distributions of marine birds changed since the pelagic surveys conducted in the mid-1970s to mid-1980s in the Outer Continental Shelf Environmental Assessment Program (OCSEAP)? For birds at sea, these data are now at least 25 years out of data and much has changed since. Previous data point to the importance of areas overlapping the lease sale area in the Chukchi Sea. Furthermore, because of a lack of baseline information, there is very little knowledge about long-term trends and variation due to climate change [(CRRRC 2010)]. In the Proceedings of the Northern Oil and Gas Research Forum held in Anchorage in October 2008, the forum acknowledged the importance of long-term studies compared to observations made at “a single point in time” and their usefulness. See http://alaska.boemre.gov/reports/2008rpts/2008_1028_proceedings.pdf.

- What are the distributions and life histories of species that are critical in marine food webs and how will loss of sea ice influence these species? Many marine birds and mammals rely on species like Arctic cod, yet there is a paucity of even basic knowledge about this species. Other of these species, such as Arctic cisco, are also very important for subsistence purposes. According to the environmental assessment on the recent Arctic Fishery Management Plan, sampling of fish and shellfish species is extremely limited, with only a small area of the Beaufort Sea off Barrow sampled adequately within the last 18 years. Some areas have never been sampled to determine even basic abundance estimates.
- How do the effects of climate change and industrial activity interact and are the effects cumulative?
- How will the distribution of species of concern (including ESA candidate or listed species) shift due to climate change? Species currently in the Chukchi may shift their ranges and key habitat areas. Species from the Bering Sea and farther south may move northwards, possibly requiring new areas or types of protection in the Chukchi Sea. The ability to reasonably predict such shifts is necessary to evaluate the life-cycle impacts of offshore development and infrastructure.
- How can quantitative risk and impact assessments be conducted? There is insufficient information about the distribution and productivity of plankton, benthic organisms, fishes, seabirds, the response of marine mammals to noise, ecological changes likely to be caused by sea ice loss, and other basic environmental parameters to support quantitative evaluation of potential and actual impacts from offshore activity, including oil spills. Without such information, risk and damage assessments are reduced to speculation or experts' opinions and recovery from an oil spill or other accident cannot be determined. Lack of an adequate quantitative baseline of information was the primary impediment to assessing ecological damages caused by the *Exxon Valdez* oil spill.
- What trajectories would spilled oil follow? The general atmospheric and circulation patterns of the Chukchi Sea have been mapped, but patterns and variability at the scale of an oil spill are not well known and are difficult to predict based on current understanding. In addition while general circulation patterns are known, there is relatively little understanding of the currents at the ocean's surface where the majority of oil collects in a spill. Without that knowledge, the placement of response equipment and the ability to respond promptly are hindered, reducing the ability to contain and recover spilled oil. Furthermore, there is insufficient information or monitoring capacity to project fine scale trajectories of spilled oil in real time to be projected in real time during a spill event, making it difficult or impossible to respond quickly and protect critical wildlife habitat areas, such as Kasegaluk Lagoon or Ledyard Bay.
- How can negative social and cultural impacts be avoided? Industrial development can disrupt traditional practices, interfere with cultural norms, and lead to social dislocation. Proper planning can help minimize such problems, but requires detailed understanding of local cultures and societies as well as the involvement of local communities in all phases of decision-making. The processes for such involvement have not yet been devised and tested for offshore oil and gas in U.S. Arctic waters. See Wernham, A. 2007. Inupiat health and proposed Alaskan oil development: Results of the first integrated health impact assessment/environmental impact statement for proposed oil development on Alaska's north slope. Ecohealth 4:500-513.

Because BOEMRE has not obtained any new information for this draft SEIS, it has left these and other questions unanswered, as they were in the original EIS. In light of the important decisions being made at the lease sale stage, as described above, the answer to these questions and others like them, are essential to the agency's choices at this stage.

During the remand, BOEMRE should obtain missing information to answer these and other important questions about the Chukchi Sea and the impacts of oil and gas development there. As discussed below and in the attachments, the most effective way to do this would be to engage in a comprehensive gap analysis, taking into account the ongoing United States Geological Survey effort, potentially supplemented by information from other federal agencies with expertise in the Arctic such as the National Oceanic and Atmospheric Administration, and then to undertake a comprehensive, coordinated, and integrated study plan to obtain essential missing information with which to analyze effects and make sound management decisions.

2. Missing information is essential to the choice among the alternatives identified in the original EIS.

The original EIS illustrates that the kind of information missing in the Chukchi Sea is essential to the choice among alternatives. BOEMRE "carried forward" the range of alternatives it analyzed in the original 2007 lease sale EIS in the draft SEIS. Draft SEIS at 12. It dismisses the importance of the missing information for choosing among these original alternatives. However, as several examples below illustrate, much of the missing information is essential to the reasoned choice among the original four alternatives in the 2007 analysis:

- Information about bowhead whale use of the Chukchi Sea is incomplete. The original EIS acknowledges that data on bowhead use of the Chukchi Sea are dated, provide only limited insight into areas where bowheads may be exposed to oil and gas activities should they occur, and "should not be interpreted as indicating current use of the Chukchi Sea by bowhead whales . . ." Draft SEIS, App. A at 21 of 143; see also Draft SEIS at 25 of 143 (noting that "recent data on distribution, abundance, or habitat use in the Chukchi Sea Planning Area are not available"). The original EIS acknowledges further that, even were distribution and use patterns better understood, the significance of bowhead use of areas to the overall food requirements of the population are not clear. See Draft SEIS, App. A at 24 of 143.

The original EIS's alternatives consisted of different sized coastal deferral zones. These different zones were proposed in part to provide different levels of protection for bowhead whales. See Minerals Management Service (MMS), Chukchi Sea Planning Area, Oil and Gas Lease Sale 193 and Seismic Surveying Activities in the Chukchi Sea, Alaska, Final EIS, OCS EIS/EA MMS 2007-026 (FEIS) at ES-7-8 (May 2007) (explaining reasons for each alternative). Indeed one alternative, Alternative IV, was developed specifically to afford protection to migrating bowhead whales. *Id.* at ES-8. Given the reason for posting the various alternatives—to offer, among other things, varying levels of protection for the bowhead whales—information that would allow BOEMRE to analyze the importance of the deferred areas to the species is essential to the choice among those alternatives.

- The original EIS for Lease Sale 193 acknowledged that information about marine and coastal birds is outdated or completely lacking for the Chukchi Sea. Draft SEIS, App. A at 4 of 143 (noting that several areas historically documented to be important for birds, as well as the entire lease sale area "lack site-specific data on habitat-use patterns, routes, and timing to assess impacts"); *id.* (noting that for many species, "the most recent data is between 15 and 30 years old, making accurate analysis difficult"). Yet, "several species or species-groups have a high probability of experiencing substantial negative impacts" and "[t]he risk that several regional bird populations could experience significant adverse impacts is high" in the event of an oil spill. *Id.*

BOEMRE proposed one of the alternatives, Alternative III, at least in part to reduce impacts to marine and coastal birds. See FEIS at ES-8. Given the reason for the alternative, information about areas that are important to marine and coastal bird species, and information about how and when those birds use these areas, is essential to making a choice between this and other potentially less-protective alternatives.

In the face of missing information, BOEMRE was left in the original EIS to speculate about the different effects among alternatives. For example, the original EIS states that in Alternatives III and IV, "[t]he increased distance between offshore development and coastal bird habitats would conceivably decrease the percent chance of spilled oil contact, increase weathering of spilled oil prior to contact, and increase available spill response time." FEIS at IV-269, 273 (emphasis added); *id.* at II-42, 45 ("The increased distance between offshore development and coastal bird habitats also would conceivably decrease the percent chance of spilled oil contacting bird habitat . . .") (emphasis added). The alternatives analysis is replete with this sort of conjectural differentiation among alternatives. Conjectural language is used to describe different effects from oil spills on fish, fish habitat, bowhead whales, other marine and coastal birds, and terrestrial mammals. FEIS at IV-268-69 (Alternative III); *id.* at IV-272-73 (Alternative IV); see also *id.* at II-41, 45 ("Differences in noise and oil-spill effects to bowhead whales from this deferral compared to Alternative I [] and Alternative III/IV [] are difficult to quantify, but qualitatively can be described."); *id.* at II-42, 45 ("any spill that would occur would conceivably take longer to reach and enter the spring-migratory route"); *id.* ("The increased distance between offshore development and coastal habitats also would conceivably decrease the percent chance of spilled oil contact with marine mammals . . ."); *id.* at II-44 ("The increased distance between offshore development and coastal fish habitats also would conceivably decrease the percent chance of spilled oil contacting fish resources . . ."); *id.* at II-41 (noting that "[i]n theory" Alternative III provides more protection for coastal and marine fish habitat). Because better information would enable BOEMRE to perform an actual, rather than a conjectural, analysis of the differences among potential alternatives, it is essential to a reasoned choice among alternatives.

3. Missing information is essential to determining an adequate range of alternatives.

Missing information is essential to the choice among alternatives, because it is essential to the agency's definition of an adequate range of alternatives. NEPA requires that an EIS contain a detailed statement of the "alternatives to the proposed action." 42 U.S.C. § 4332(C)(iii). The

discussion of alternatives "is the heart of the environmental impact statement." 40 C.F.R. § 1502.14. That discussion should "provid[e] a clear basis for choice among options by the decisionmaker and the public." *Id.*; see *City of Angoon v. Hodel*, 803 F.2d 1016, 1020 (9th Cir. 1986) ("[T]he touchstone for our inquiry is whether an EIS's selection and discussion of alternatives fosters informed decision-making and informed public participation.") (quoting *California v. Block*, 690 F.2d 753, 767 (9th Cir. 1982)). BOEMRE has chosen not to reexamine the range of alternatives for the lease sale in the draft SEIS process. The agency should reconsider this approach. As agencies and conservation groups explained in commenting on the original EIS, missing information about the basic biology of the region and about the effects of oil and gas activities on the species that inhabit it is essential to framing an appropriate range of alternatives that have meaningfully different effects. Without this information, neither the agency nor the public could determine whether the range of alternatives presented in the original EIS was adequate. The lack of information, in other words, thwarted the discussion of alternatives to the proposed lease sale, undermining a central component of the NEPA analysis.

The original EIS alternatives consist of three different-sized deferrals of coastal areas from leasing (the first of which, Alternative I, is inconsistent with the 25-mile coastal buffer zone mandated by the 2007-12 Five-Year Leasing Program, pursuant to which Lease Sale 193 was to be held, and is thus not a viable alternative). Because so much information about the Chukchi Sea is missing, however, it is impossible to determine whether these alternatives would have a different effect on the environment much less describe to a decision-maker why and how. The Environmental Protection Agency (EPA) identified this flaw, commenting on the draft of the original EIS:

Alternatives to the Proposed Action that are presented in the Draft EIS include two variations of exclusion areas along the coastward side of the Planning Area. However, it is unclear how the boundaries of the excluded areas in the two alternatives (Alternatives III and IV) were determined. Due to the lack of information about the Planning Area, the use of the "Opportunity Index" and other assumptions regarding the potential level of exploration, development and production activity as a result of a lease sale, it is unclear if the two alternatives, together with the Proposed Action and a No Action Alternative, represent a range of reasonable alternatives in the Draft EIS. The Final EIS should present a more thorough discussion of the decision criteria and the geophysical, biological and subsistence information that was used to develop the alternatives in order to demonstrate that a range of reasonable alternatives was considered.

FEIS at 013-002. EPA also suggested that BOEMRE "consider removal of additional areas with sensitive fish and wildlife, subsistence, and cultural resources, and at a minimum, deferring areas until further research and studies are conducted to ensure development can occur without significant impacts to critical resources." FEIS at II-4. BOEMRE rejected these suggestions, in part because EPA did not provide specifics as to areas that should be considered for removal. *Id.* at II-5. EPA, of course, could not do so, given the lack of information in the Chukchi Sea. Absent adequate information, it is not possible to frame a meaningful range of alternatives for the decision-maker. Missing information that would allow the agency to frame alternatives that provide meaningful choices—namely information sufficient to identify "areas with sensitive fish

and wildlife, subsistence, and cultural resources” and to provide at least one action alternative that “ensure[s] development can occur without significant impacts to critical resources”—is clearly essential to a choice among alternatives.

In the draft SEIS, BOEMRE concludes that the effects under all the action alternatives presented in the original EIS are basically the same. Draft SEIS at 11 (noting the “commonality of potential impacts and their severity among all action alternatives, which substantially reduced the utility of incomplete information to the decision-maker”); see also FEIS at ES-8 (noting that “[t]he EIS analysis concludes that for most resources, while the alternative [III and IV] would provide a measure of protection to the resources within the deferral area, the effects to the resources in the Chukchi Sea area under this alternative would be essentially the same as the effects under Alternative I.”). This conclusion, if true, which it is not,¹ suggests only that the range of alternatives in the original EIS was inadequate. It highlights, rather than excuses, the essential nature of missing information to the choice among alternatives.

For example, BOEMRE stated in the original EIS that information about beluga whales was both important for the lease sale decision and missing from the analysis. It stated that “[u]nderstanding the distribution and timing of movements of belugas is important for planning lease sales in the Chukchi Sea and designing possible mitigation measures.” FEIS at IV-163. But, “[l]ate-summer distribution and fall-migration patterns are poorly known, wintering areas effectively are unknown, and areas that are particularly important for feeding have not been identified” *Id.* Rather than obtaining this information acknowledged in 2007 to be important to planning lease sales, BOEMRE in the draft SEIS attempts to excuse itself from that work with general boilerplate language. See Draft SEIS, App. A at 99 of 143 (stating that “[w]hile additional information on the distribution and timing of movements of belugas would be useful, this information is not essential to a reasoned choice among alternatives in this case” because “[m]uch information is already known on the general habits of the many species of birds [sic] that use the Chukchi Sea” [and] “this level of available information is sufficient to support sound scientific judgments and reasoned managerial decisions regarding formulation and selection of lease sale alternatives” and “[t]he protections that this species receives under the MMPA will serve to preclude or reduce impacts under all action alternatives”). These generalizations are not credible attempts to comply with Section 1502.22 with respect to information the agency itself has admitted is important for the decision-maker. As described in the next section, BOEMRE’s rationales do not justify the agency’s course.

C. BOEMRE’s reasons for not to obtain any missing information are arbitrary.

BOEMRE advances five recurring excuses for its decision not to obtain a single piece of information during the remand period. A key BOEMRE excuse for this extraordinary decision, that is both explicit and implicit in several rationales, is that missing information is not essential to the lease sale decision, because that decision is not a consequential commitment of areas to oil

¹ The original EIS does acknowledge generally some differences in effects to a number of species among the alternatives. See FEIS at IV-268-69. However, as described above, the real problem is that there is not enough information about the biology of the region or effects of oil and gas activities on its wildlife to determine whether the different alternatives will in fact have different effects or to fashion different alternatives that will in fact ensure different effects if chosen.

and gas activities. Thus, information can be obtained at later stages of the OCSLA process, when the agency is evaluating exploration or production plans.

As an initial matter, this rationale ignores the agency’s practice, which has been to conduct only abbreviated environmental assessments of exploration plans and to rely heavily in that review on the analyses the agency conducts at the lease sale stage. See MMS, Shell Gulf of Mexico, Inc., 2010 Exploration Drilling Program, Chukchi Sea OCS, Alaska, Environmental Assessment at 6-7 (December 2009); MMS, Shell Offshore Inc. 2010 OCS Exploration Plan, Camden Bay, Alaska, Environmental Assessment at 2-3 (October 2009). Under this practice, the need to gather information is always either pushed into the future or deemed unnecessary in light of past NEPA documents.

More fundamentally, BOEMRE’s excuses fail to recognize the importance of the decision being made at the lease sale. As described above, at the lease sale stage, BOEMRE makes the decision about whether to permit oil and gas activities in an area, and the existence of leases, once issued, considerably constrains the agency’s discretion to alter course. BOEMRE can, of course, deny lessees’ exploration and development plans, and it can suspend and even cancel leases after they are issued. But these actions may only be taken in compliance with the substantive and procedural constraints of OCSLA and its regulations. It is precisely at the lease sale stage—where the agency finds itself now—when it has full discretion to determine if, when, where, and how oil and gas activities may occur in a planning area, that information about the biological resources of an area and the effects of oil and gas activities on those resources is essential.

BOEMRE also misapprehend its obligation under NEPA in preparing the draft SEIS. The job of the SEIS is to inform the decision-maker and the public about the effects of the decision to offer oil and gas leases in the Chukchi Sea. To satisfy this obligation, BOEMRE must “prepare a ‘detailed statement’ covering the impact of particular actions on the environment, the environmental costs which might be avoided, and alternative measures which might alter the cost-benefit equation . . . to aid in the agencies’ own decision making process and to advise other interested agencies and the public of the environmental consequences of planned federal action.” *Calvert Cliffs’ Coordinating Comm., Inc. v. U.S. Atomic Energy Comm’n*, 449 F.2d 1109, 1114 (D.C. Cir. 1971). “[T]he purpose of an [EIS] is to . . . produce an informed estimate of the environmental consequences.” *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1072 (9th Cir. 2002) (quotation and citation omitted), and give the decision-maker a “clear idea how to visualize the environmental harms” of the proposed action, *Mass. v. Watt*, 716 F.2d 946, 949 (1st Cir. 1983).

Similarly, BOEMRE states that, although large quantities of data are missing about the Chukchi Sea, there is enough information available now for informed management and decision-making. Draft SEIS at 11. This excuse is unsupported. In most instances, BOEMRE makes this statement without pointing to the information that it relies on to make its management decision notwithstanding important data gaps. For example, the original EIS states that there is not enough information to determine whether or not there will be significant effects to marine mammals from oil and gas activities under the lease sale. FEIS at V-32. Yet, in the draft SEIS, without disputing the fact that it is unable to determine whether there will or will not be significant effects to marine mammals from oil and gas activities in the Chukchi Sea and without

pointing to any specific information at all, BOEMRE concludes that there is nonetheless enough information now to make management decisions. Draft SEIS, App. A at 136 of 143. BOEMRE’s statement boils down to a conclusion that it is not essential to the lease sale decision to know whether oil and gas activities that will result from the decision will or will not significantly affect Chukchi Sea marine mammals. This conclusion is not credible. It underscores the agency’s abnegation of its NEPA duties to describe in detail the “the actual impact of proposed projects.” *Earth Island Institute v. U.S. Forest Serv.*, 442 F.3d 1147, 1172 (9th Cir. 2006), in an EIS “to obviate the need for [] speculation by insuring that available data is gathered and analyzed prior to the implementation of the proposed action.” *Found. for N. Am. Wild Sheep v. U.S. Dep’t of Agric.*, 681 F.2d 1172, 1179 (9th Cir. 1982).

Relatedly, BOEMRE states that it need not obtain additional information because other environmental laws and regulations would preclude significant adverse effects on particular resources. Again, BOEMRE misapprehends its obligations under NEPA. An agency may not rely on the imposition of future mitigation measures to avoid analyzing the impacts of an activity in an EIS. See *S. Fork Band Council of W. Shoshone of Nev. v. U.S. Dep’t of Interior*, 588 F.3d 718, 726 (9th Cir. 2009) (holding EIS violated NEPA because it failed to analyze a project’s air quality impacts in reliance on separate Clean Air Act permitting process); see also *Neighbors of Cuddy Mountain v. U.S. Forest Serv.*, 137 F.3d 1372, 1381 (9th Cir. 1998) (holding EIS discussion of mitigation inadequate in part because it was “not clear whether any mitigation measures would be adopted”); *Nat’l Parks & Conservation Ass’n v. Babbitt*, 241 F.3d 722, 734-35 (9th Cir. 2001). Furthermore, where an EIS relies on mitigation measures to avoid discussing potential effects, the mitigation measures must “be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated.” *Neighbors of Cuddy Mountain*, 137 F.3d at 1380-81 (EIS violated NEPA where it failed to discuss “how effective the mitigation measures would be”); *Nat’l Parks & Conservation Ass’n*, 241 F.3d at 735 (“the impact of the proposed mitigation measures must be studied as part of the preparation of an EIS”). Neither the original EIS nor the draft SEIS discusses the future mitigation BOEMRE claims excuses analysis in any meaningful detail.

BOEMRE also states that it need not obtain further information about adverse impacts because it has disclosed that significant adverse effects would occur under certain circumstances, such as an oil spill, and further description of those effects is not necessary. Draft SEIS at 11. This excuse, however, fails to recognize the agency’s obligation to prepare a “detailed statement” that provides the decision-maker and public with a “clear idea how to visualize the environmental harms.” For example, the original EIS said in the context of discrete populations of fish: “Given a lack of contemporary abundance and distribution information, large oil spill effects on rare or unique species (including potential extirpation) could occur, but would likely go unnoticed or undetected.” FEIS at II-34. The draft SEIS responds to this statement as follows: “[i]t is well understood that the environmental impacts associated with a large oil spill could be quite severe. Rare species could be affected by such an event wherever [sic] they may occur throughout the lease sale area . . . the decision-maker already has sufficient information regarding the relative probability and various impacts of a large oil spill to allow a reasoned choice among lease sale alternatives.” Draft SEIS, App. A at 2 of 134. Without information about what would happen in the event of an oil spill, including, for example, what species of fish might be extirpated, it is not possible for BOEMRE to create a detailed statement of the potential environmental harms that

could result from the lease sale and to provide the decision-maker and public with a clear picture of the potential impacts.

Finally, BOEMRE states that there is a “commonality” of effects among all action alternatives which “substantially reduced the utility of incomplete information to the decision-maker.” Draft SEIS at 11. As an initial matter, and as discussed above, the statement is not true—the original EIS acknowledges that there are differences among alternatives. The problem is that data gaps prevent meaningful distinction among those alternatives. Part of the problem is that the lack of information has led managers to consider the environment as being basically homogenous, which would be unprecedented for a continental shelf region with varying currents and topography (*i.e.*, shoals and canyons). Regions are likely to vary in their importance for a number of species. For example walrus appear to congregate regularly in the region around Hanna Shoal within the lease area. See, USGS 2010, *Walrus tracking and telemetry data acquired from walruses instrumented on the Alaska shores of the Chukchi Sea in September 2009*. Radio-tagging field report. USGS Alaska Science Center, Walrus research project. http://alaska.usgs.gov/science/biology/walrus/pdfs/EC09_Radio_Tagging_Field_Report.pdf. If information is lacking to allow BOEMRE to determine whether oil and gas activities will have significant effects on marine mammals, for instance, there is no way to describe in any detail the effects of any one alternative, let alone describe differences among different alternatives. Additionally, the statement ignores the comparison that the decision-maker must make between the action alternatives and the no-action alternatives. It also begs the question whether, if it is true that effects are the same for all alternatives, the original EIS presented an adequate range of alternatives.

D. Other flaws in BOEMRE’s analysis of missing information in the draft SEIS.

The draft SEIS suffers from a number of other flaws in its analysis of missing information. Exhibit 129 to the plaintiffs’ opening brief in *Native Village of Point Hope*, upon which BOEMRE purports to rely at least in part for its identification of missing information in Appendix A to the draft SEIS, identifies missing information related to threatened spectacled and Steller’s eiders. These identifications of missing data were contained in a biological evaluation that BOEMRE prepared in connection with its consultation with the Fish and Wildlife Service under Section 7 of the Endangered Species Act. BOEMRE relied on the analyses in that biological evaluation in the original EIS. Thus, these unknowns must be addressed here in the draft SEIS.

The draft SEIS fails to include essential information that has been developed about the Chukchi Sea that BOEMRE itself has developed. This information includes information collected from the BOEMRE Environmental Studies Program in Alaska. The listing is available at: http://alaska.boemre.gov/ess/2010_0604_AKPeerReview.pdf (last visited Nov. 21, 2010). For example, attachment A documents those references from peer reviewed literature produced under the auspices of the study program since 1990 that BOEMRE failed to consider. BOEMRE must consider these studies, as some of these studies may contain information relevant to unknowns about species and habitats as well as the fates and effects of oil and gas exploration and development on these species and habitats.

The draft SEIS also failed to include essential information that has been developed about the Chukchi Sea between the completion of the original EIS in 2007 and the present. This information is also included in attachment B. One example of an important study that is already available and provides information essential to the lease sale decision but that BOEMRE has ignored is Quakenbush, L.T., Small, R.J., and Citta, J.J. 2010. Satellite tracking of western Arctic bowhead whales. Final Report. OCS study BOEMRE 2010-033. Bureau of Ocean Energy Management, Regulation and Enforcement. 65 pp plus appendices. The study pertains to the bowhead whale—an important marine mammal for the Inupiat along the Arctic slope, and a species afforded protection under the Marine Mammal Protection Act and the Endangered Species Act. The original EIS acknowledges that “[d]ata are limited on the bowhead whale fall migration through the Chukchi Sea before the whales move south into the Bering Sea,” and that “[r]ecent data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available.” FEIS at III-51, III-55. The Quakenbush study identified important corridors for migration and potentially important feeding areas in the Chukchi Sea, information BOEMRE admits is missing and admits is relevant to potentially significant impacts from leasing. Draft SEIS, App. A at 25 of 143. BOEMRE should consider the information provided by these and other studies, such as recent walrus tagging data from the United States Geological Survey, that are already available but that it has neglected to incorporate into its analysis of Lease Sale 193 effects.

E. BOEMRE should reassess its approach, obtain essential missing information, and reconsider the lease sale decision in light of the new information.

BOEMRE should not finalize the draft SEIS as currently written. It should take a new approach and undertake a meaningful assessment of whether missing information is essential to a reasoned choice among alternatives, obtain the information that is, assess whether the new information merits different alternatives, and fully reconsider the Chukchi Sea lease sale in light of that new information.²

The most effective way to respond to the Court’s order and prepare for decisions about future industrial activities is to undertake comprehensive research and monitoring that would provide a fundamental understanding of the marine ecosystem. This information will allow managers to move from qualitative assertions (*i.e.*, educated guesses) to making quantitative assessments of potential impacts. Information will allow decision makers to weigh the costs and benefits of industrial activities and determine whether there are alternatives that could allow for development while protecting the ecosystem and subsistence way of life. Obtaining information

² In public meetings on the draft SEIS, BOEMRE repeatedly stated that it has been instructed by the Alaska Federal District Court to complete its remand analysis by January 21, 2011. This statement is misleading. Although the Court stated its opinion that a “reasonable goal” for completion of the remand analysis would be January 21 and directed the agency to make reasonable efforts to respond to the remand by that date, it was careful to state that it was not “impos[ing] rigid or arbitrary constraints on the Agency” and explicitly “recognize[d] the Agency’s expertise in the field.” *Native Village of Point Hope*, Docket No. 171 at I-2. Accordingly, the Court instructed the agency to file a report with the Court as to the agency’s progress by January 21, 2011, if that date proves unrealistic to complete consideration of the issues on remand. BOEMRE should not use this date as an excuse to avoid conducting the analysis that is required under NEPA and Section 1502.22

now would also ensure that, if leases were sold, there would not be an information gap later in the process, when the agency is called upon to analyze and approve exploration and development plans on those leases. We are attaching hereto, as attachment C, a draft research plan that sets forth one possible approach to obtaining missing information that would be true to the Administration’s commitment to science-based decision-making.

Once it has obtained missing information and completed a meaningful reanalysis of the potential effects of Lease Sale 193, BOEMRE should, as it recognizes, Draft SEIS at 4 (“When the EIS process is completed the Secretary per the court’s remand will affirm or change the department’s previous Sale 193 decision.”), make anew its decision whether to cancel, modify, or amend the decision to hold Lease Sale 193. To protect the integrity of the administrative process and avoid “bureaucratic rationalization and bureaucratic momentum,” BOEMRE and the Department of Interior must not lend weight to the existence of outstanding leases in the Chukchi Sea—the prior decision to hold the lease sale must “count for nothing” in the present decision regarding Lease Sale 193. *Northern Cheyenne Tribe v. Hodel*, 851 F.2d 1152, 1157 (9th Cir. 1988).

II. ANALYSIS OF NATURAL GAS DEVELOPMENT

The draft SEIS’s analysis of the effects of natural gas development also falls short in a number of respects. It fails to adequately take into account climate change, its scenario is unjustifiably limited, its dismissal of liquefied natural gas (LNG) tankering is unjustified, it fails to adequately analyze the impacts of pipelines, it fails to adequately analyze the effects of natural gas production on a number of species, and it fails to analyze the potential for activities to displace subsistence users.

A. The draft SEIS fails to adequately take into account climate change.

The draft SEIS, like the original Lease Sale 193 EIS, fails to assess adequately the lease sale’s impacts in the context of Arctic climate change. It is essential that the final SEIS analyze the effects of gas development and production in light of Arctic climate change because the draft SEIS states that “the timeframe for all activities . . . could span 50 years,” and assumes that gas-related activities will occur during the latter portion of that period. Draft SEIS at 65. The Arctic at the time natural gas will be developed according to BOEMRE’s scenario will be a very different place than the Arctic of 2010.

The Arctic is undergoing rapid change. It is warming faster than any other place in the world. Among the most profound changes are the loss of sea ice, the melting of permafrost, and coastal erosion. As temperatures continue to rise and precipitation patterns change, species distributions will shift, and many species will experience increased stress and decreased chance of reproduction and survival. The listing of the polar bear due to warming-related habitat loss exemplifies the changing Arctic environment. Polar bears are spending more and more time on land and less time on ice where they hunt for prey, including seals. As a result, scientists predict that two-thirds of the world’s polar bear population could disappear by the middle of the century. The future looks similarly grim for walrus. Walrus are benthic feeders that use the ice as a platform from which to dive for food. Without sea ice, food will become much more difficult to access, leading to malnutrition and increased energy expenditures in searching for food.

The original Lease Sale 193 EIS failed to adequately take into account climate change. The EIS analyzed the proposed action against a static baseline and ignored likely changes in the Arctic climate and environment. *See, e.g.*, FEIS at III-47-55 (establishing the baseline for bowheads without accounting for climate change). As a result, the EIS included an incomplete analysis of climate change impacts to a number of rare and declining species, including polar bears, walrus, seals, and other marine mammals. FEIS at IV-145 – IV-171.

The draft SEIS makes the same error. It acknowledges that climate change is occurring. Draft SEIS at 32-33. Also, it indicates that changes in climate are irregular, making accurate projections difficult, but adds that “[c]limate change in the Arctic is projected to be larger than in other areas of the globe . . .” *Id.* at 33. It recognizes that “[t]he arctic sea ice is undergoing changes in extent, thickness, distribution, age, and melt duration . . .” *Id.* at 34. However, the draft SEIS fails to analyze the effects of Arctic gas production and development in the context of a changed and likely stressed environment.

Scientists predict that over the 50-year time frame of the lease sale activities, the Arctic could warm by more than three degrees Celsius as compared to a 1981 – 2000 baseline. ACIA, Arctic Climate Impact Assessment 2005, Cambridge University Press at 122 (Table 4.3), available at <http://www.acia.uaf.edu/pages/scientific.html>. As described above, Arctic warming will dramatically affect the Arctic environment and Arctic species. BOEMRE cannot provide a complete analysis of the effects of gas development and production without considering these changes. Thus, the final SEIS must account for the fact that in future decades the Arctic will be much different than it is today. The final SEIS’s analyses of effects to Arctic species, including marine mammals, polar bears and walrus, terrestrial mammals, and birds, should account for factors like diminished habitat, food resources, or population levels, and increased competition from species expanding their ranges into the Arctic.

BOEMRE should also analyze the impact of natural gas development’s contribution to black carbon emissions, for example from increased vessel traffic and development infrastructure. Black carbon is generally regarded as the second most important contributor to Arctic warming after CO₂. It warms the environment by absorbing solar radiation and heating the atmosphere, and it darkens snow and ice after falling to earth, thus increasing absorption and reducing the reflection of sunlight and accelerating melting. EPA Ad Hoc Working Group, Current Policies, Emission Trends and Mitigation Options for Black Carbon in the Arctic Region at 7 (April 28, 2009), available at <http://iiasa.ac.at/rains/reports/DRAFTWhitePaper-BCArcticMitigation-280909.pdf>. Emissions of black carbon from sources in the Arctic itself are particularly troubling, as Arctic emissions are far more likely to come in contact with and accelerate melt of Arctic snow and ice. *See id.* at 20. One recent study indicates that Arctic black carbon emissions are 10 to 100 times more important with respect to contributing to Arctic black carbon radiative forcing than emissions outside of the Arctic. Hirdman et al., Source identification of short-lived air pollutants in the Arctic using statistical analysis of measurement data and particle dispersion model output, 10 Atmos. Chem. Phys. 669 (Jan. 2010), available at <http://www.atmos-chem-phys.net/10/669/2010/acp-10-669-2010.pdf>. BOEMRE should analyze these effects.

B. The Draft SEIS arbitrarily assumes no additional seismic or exploration drilling will occur in the natural gas development scenario.

In the draft SEIS, BOEMRE arbitrarily assumes that gas development and production would entail no additional seismic surveying or exploration drilling. Draft SEIS at 65. The scenario forms the basis of the agency’s analysis in the EIS. Thus, an arbitrary scenario infects the entire analysis of effects throughout the EIS. In the draft SEIS, BOEMRE has projected Chukchi Sea gas development and production in a manner that ensures effects will be essentially no different than the effects of projected oil development and production in the original EIS. Draft SEIS at 65.

BOEMRE’s limited gas scenario is arbitrary. BOEMRE assumes that gas development will result in no additional exploration activities because gas development will remain much less financially attractive than oil development. Draft SEIS at 65. However, even if gas development remains less attractive than oil development, this does not justify BOEMRE’s assumption that gas activities would not involve additional seismic surveying or drilling. Indeed, this assumption is contrary to the agency’s past statements on the attractiveness and probability of gas development. In the 2008 Multi-Sale Draft EIS, BOEMRE stated that an operational gas pipeline would “encourage new exploration, development, and production of natural gas throughout northern Alaska, including the Arctic OCS.” MMS, Beaufort Sea and Chukchi Sea Planning Areas, Oil and Gas Lease Sales 209, 212, 217, and 221, Draft EIS, App. E at E-4 (November 2008) (Multi-Sale Draft EIS) (stated in the context of discussing Beaufort Sea gas). Also, in the administrative record for Lease Sale 193 BOEMRE recognized that some companies could be even more interested in gas than oil in the Chukchi Sea and the agency noted that billions of dollars in royalties and taxes could be lost if companies did not develop marginal gas projects. Email from James Craig, BOEMRE, to John Goll, Re: Chukchi PNOS at 3 (March 19, 2007). A BOEMRE evaluation of Chukchi Sea lease sale scenarios plainly stated that “including gas development in the scenario will greatly increase potential environmental impacts *because the number of wells and platforms will be greater. . . .*” Email from James Craig, BOEMRE, to Rance Wall, Re: My response to Shell’s request to change the Chukchi scenario at 3 (Dec. 13, 2005).

A pipeline stretching from the Chukchi Sea to the main transport hub near Prudhoe Bay may also provide an incentive to gas companies to perform additional exploration. The Chukchi Sea could contain considerable natural gas reserves. Multi-Sale Draft EIS, App. E at E-5, E-3 (stating that undiscovered gas resources in the Chukchi Sea range from 10.3-209.5 Tcf, while such resources in the Beaufort Sea range from 0.6-72.2 Tcf). While the gas may presently be less valuable than oil, the presence of a pipeline to transport gas to market could make any Chukchi Sea gas field commercially viable. This could cause companies to develop more gas, as well as oil found in the ground with the gas. It is arbitrary for BOEMRE to ignore this incentive and the possibility that a gas pipeline could transform the value of developing a gas and oil field from marginally unprofitable to lucrative.

Moreover, it is arbitrary for BOEMRE to assume that accessible gas will remain relatively unattractive well into the future. The International Energy Agency predicts that global demand for natural gas will increase 44 percent between 2008 and 2035, and that this increase in demand

will end current conditions of oversupply and low price. See <http://www.alaskadispatch.com/dispatches/alaska-beat/88-alaska-beat/7471-ia-nat-gas-demand-to-rise-14-yearly-over-long-term>. Additionally, future attempts to mitigate climate change could further boost demand for natural gas because gas is a relatively clean fossil fuel when compared to oil.

Thus, it is reasonably foreseeable that natural gas leasing in the Chukchi Sea will result in additional exploration and development activities. BOEMRE's failure to account for this in the draft SEIS is arbitrary, and the agency must remedy this omission in the final SEIS. The agency must consider the effects of additional exploration and development, such as noise disturbances to bowhead whales and walrus from increased seismic activities, drilling, and icebreaking, the increased risk of birds striking oil and gas structures, potential air and water discharges from natural gas drilling, and increased risk of a large oil spill occurring if natural gas development results in additional oil development.

C. BOEMRE's dismissal of liquefied natural gas tankering is arbitrary.

As in the original Lease Sale 193 EIS, the draft SEIS arbitrarily fails to analyze the effects of LNG tankering. In the Lease Sale 193 EIS, BOEMRE refused to analyze the effects of LNG tankering by arguing that the method of bringing natural gas to market was not feasible or economically attractive, even though record evidence indicates that LNG tankering is not only feasible, but is also drawing industry interest. In the draft SEIS BOEMRE continues to ignore the record evidence indicating the potential for LNG tankering in the Chukchi Sea. Instead of grappling with this evidence, BOEMRE simply repeats its Lease Sale 193 EIS conclusion that LNG tankering is not feasible or economically attractive. Draft SEIS at 15.

BOEMRE should analyze the effects of LNG tankering. The record shows that LNG tankering, is a feasible option that BOEMRE has promoted and industry has showed an interest in. In the 2008 draft Multi-Sale EIS, BOEMRE stated that "LNG is a plausible . . . strategy to export gas from the Chukchi OCS." Multi-Sale Draft EIS, App. E at E-6. In its presentations to the North Slope Borough on Lease Sale 193, BOEMRE indicated that LNG tankering was a possible development scenario. Chukchi Development Presentation at 5. Further, in commenting on [BOEMRE]'s Notice of Intent to prepare the EIS for Lease Sale 193, Shell recommended that in addition to effects of a gas pipeline, LNG tankering "should also be analyzed." Shell E&P Company, Comments on Notice of Intent to Prepare an EIS on Proposed Chukchi Sea Lease Sale 193 at 2 (December 9, 2005).

An analysis of LNG tankering is essential because these activities could have substantial effects on the environment. The infrastructure and activities associated with LNG transport could affect large areas of the land and ocean. Facilities—including a major LNG plant—and activities on shore could disturb local species and destroy local habitat, including threatened and endangered birds. Also, LNG transport could significantly increase vessel traffic in the Chukchi and Bering seas. Increased noise from these vessels could harm pinnipeds and migrating bowhead whales, and disturbances of sea ice could have an impact on polar bears, walrus, and other species that depend on the ice for habitat.

Vessels transporting the LNG to market through the Bering Sea could negatively affect the critically endangered North Pacific right whale, one of the most endangered whales in the world. It is essential that BOEMRE consider the possibility that boat strikes could result in mortality to right whales because the loss of any North Pacific right whale would be a significant effect.

Additionally, LNG tankering could greatly increase Arctic emissions of black carbon and contribute to Arctic warming. BOEMRE should analyze these effects.

Thus, given the feasibility of LNG tankering, MMS's own promotion of the technology during the process leading to the original Lease Sale 193, industry interest in it, and the potentially significant impacts of LNG tankering, BOEMRE must include an analysis of the effects of LNG tankering in the final SEIS.

D. BOEMRE has not sufficiently analyzed the effects of the construction and operation of pipelines resulting from natural gas development.

The effects of a gas pipeline spanning from offshore in the Chukchi Sea to near Prudhoe Bay have never been analyzed. Neither the original Lease Sale 193 EIS nor the draft SEIS adequately analyzes the potential effects of a hundreds-mile long pipeline traversing diverse habitat for caribou and other species in across the National Petroleum Reserve—Alaska (NPR-A).

As an initial matter, the original Lease Sale 193 EIS's analysis of an oil pipeline does not provide the necessary analysis of the effects of a gas pipeline. Even if the gas pipeline travels the same corridor as the oil pipeline discussed in the original EIS, the later time frame BOEMRE has identified for gas development will result in the construction of the gas pipeline at a later date. Also, a second pipeline and additional compression facilities and maintenance activities will result in other effects, both individually and cumulatively with oil-related activities.

The final SEIS for Lease Sale 193 must consider the effects that a gas pipeline and its associated facilities and activities could have, in conjunction with oil production and development activities, on the Arctic environment. However, the draft SEIS provides no more than a cursory and incomplete analysis of the effects of the construction and operation of a gas pipeline. Instead of providing a detailed analysis, the draft SEIS relies on later analyses and permitting processes to identify and prevent environmental harms. See, e.g., Draft SEIS at 81-82 (noting that the construction and operation of a pipeline is noisy and can disturb threatened and endangered whales, but relying on later analyses and permitting to identify and prevent impacts). This does not satisfy NEPA; BOEMRE must take a hard look at the environmental effects of the lease sale before moving forward. Information about the biological resources of an area and the effects of oil and gas activities on those resources is essential at the lease sale stage because it is at this stage that the agency has discretion to determine if, when, where, and how oil and gas activities may occur in a planning area. Thus, only now can BOEMRE consider the entire scope of the lease sale and how the action as a whole could affect the Arctic environment and have that analysis inform the agency's decision making. At later stages, the agency will already be invested in particular courses of action, and its discretion may be more constrained.

In particular, the draft SEIS does not sufficiently analyze the potential effect a gas pipeline over land could have on caribou. The agency provides only two sentences on this topic, concluding that an elevated pipeline will not prevent caribou movements and stating that "[p]ipelines without adjacent roads and vehicle traffic are not likely to affect caribou movements." Draft SEIS at 89. BOEMRE should provide a more detailed analysis of the potential for onshore activities to disturb caribou, including a review of the potential for a natural gas pipeline to delay caribou movements and the effect that would have on caribou herds and individuals.

A large pipeline stretching across the NPR-A could have important adverse impacts. For example, the Bureau of Land Management (BLM) has considered the effects of smaller pipelines—ones stretching across only part of the NPR-A—in its EISs analyzing potential effects of different management strategies for the NPR-A. BLM, Northwest National Petroleum Reserve-Alaska, Final Integrated Activity Plan/Environmental Impact Statement (November 2003) (*available at* http://www.blm.gov/ak/st/en/prog/planning/npra_general/nw_npra/nw_npra-a_final_iap.html) (NW NPR-A IAAP/EIS); BLM, Northeast National Petroleum Reserve-Alaska, Final Supplemental Integrated Activity Plan/Environmental Impact Statement (April 2008), *available at* http://www.blm.gov/ak/st/en/prog/planning/npra_general/ne_npra/northeast_npra-a_final.html) (NE NPR-A IAP/EIS). The BLM identified numerous potential adverse effects of even these much less extensive pipelines. The BLM indicates that onshore oil and gas activities, and especially roads, can displace caribou and reduce caribou densities for miles. NE NPR-A IAP/EIS at 4-161. Further, it states that "there could be reproductive consequences from extensive disruption of caribou [movement] during the insect-relief season." *Id.* at 4-162. This is contrary to BOEMRE's statement in the draft SEIS that caribou are tolerant of development and its conclusion that caribou are able to habituate to oil and gas activities. Draft SEIS at 90. The BLM has also identified particular problems with pipelines themselves. It states that snow drifts under a pipeline can block or interrupt caribou movements. NW NPR-A IAP/EIS at IV-193. It also indicated that parallel sets of pipelines can lengthen crossing delays, NE NPR-A IAP/EIS at 4-171, as can roads that are adjacent to a pipeline, especially when there is high traffic on the adjacent roads, NW NPR-A IAP/EIS at IV-193. In some cases, caribou "may be delayed in crossing a pipeline and road for several minutes or hours in period of heavy traffic." *Id.* "[T]he energetic costs associated with such delays are unknown." NW NPR-A IAP/EIS at IV-193.

Moreover, the final SEIS should provide a more comprehensive review of relevant research on the effects of oil and gas development on caribou. For example, in the draft SEIS, BOEMRE cites a study from 2000 indicating that onshore development and production have not resulted in population-level effects. Draft SEIS at 90. However, a later report from the National Research Council found that

[a]s a result of conflicts with industrial activity during calving and an interaction of disturbance with the stress of summer insect harassment, reproductive success of Central Arctic Herd female caribou in contact with oil development from 1988 through 2001 was lower than for undisturbed females, contributing to an overall reduction in herd productivity.

National Research Council, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope at 116 (2003).

BOEMRE also has not provided sufficient analysis of the effects the construction of a gas pipeline from offshore facility to shore would have on marine mammals. For instance, BOEMRE recognizes that noise from the construction of a gas pipeline can be quite loud, and as a result, can affect threatened and endangered whales. Draft SEIS at 81. The agency, however, states that because construction activities will be slow moving, the whales will be able to avoid the construction area and avoid harm. *Id.* The Draft SEIS also recognizes that noise from the construction of a pipeline can disturb seals, whales, and walrus, but provides only a minimal description of potential harm, and relies on later processes to prevent these harms. *Id.* at 87-88. This does not constitute the hard look NEPA requires. The agency mentions that harm may occur to these species, but fails to analyze the relevance of this harm. The agency states that whales will avoid pipeline construction, but does not discuss whether the construction will be excluding whales from important habitat and how this may affect individuals or the species. Similarly, while the agency presumes that harm to seals and walrus can be avoided, it fails completely to consider the potential for construction activities to occur near important habitat. In the final SEIS, BOEMRE should perform a complete analysis of the potential effects of the construction of a natural gas pipeline that takes into account the locations of important marine mammal habitat and the cost of excluding animals from that habitat.

E. BOEMRE fails to adequately analyze the effects of natural gas development on Arctic species.

BOEMRE has not adequately analyzed the effects gas development and production operations will have on various Arctic species. The review of the effects of these activities provides very little data or actual analysis to support the conclusions. BOEMRE in large part attempts to avoid the need to obtain data and to perform analyses by stating that analyses at later OCSLA stages can protect health, wildlife, and the Arctic environment. This is insufficient. BOEMRE must take a hard look at the impact gas operations will have on Arctic species, including birds, at the lease sale stage.

The draft SEIS fails to sufficiently consider impacts to polar bears. Significantly, the analysis fails to account for changes in the Arctic climate and ice extent and how this will affect polar bears. It states that "[d]uring the open-water season, most polar bears remain offshore on the pack ice." Draft SEIS at 83 (quoting FWS 2009 Biological Opinion). The draft SEIS also assumes that vessel-bear interactions usually result in short-term behavior disturbances. *Id.* at 83. These assumptions ignore data showing that the disappearance of Arctic sea ice is forcing polar bears to spend increasing time in open water, and to travel farther to find prey species, such as seals. Vessels may encounter bears that are hungry and weak either on ice or in the open ocean; fleeing from a vessel may constitute a very harmful energetic cost to a weak polar bear, especially one that has already spent much time swimming in the open ocean. The draft SEIS's analysis of disturbances to polar bears also fails to recognize that the melting ice is forcing bears to spend additional time on land, and that due to a lack of access to sea ice hunting habitat, many of these bears will be very hungry, and perhaps starving. Because oil and gas facilities can draw hungry bears, gas development and production could increase bear disturbances and human-bear

encounters. BOEMRE recognizes that human-bear interactions can result in harassment of the bear, but fails to sufficiently consider the cost of such disturbances to the bear. *Id.* at 83-84. Of particular concern is the potential for these interactions to endanger the life of a human or a bear. For instance, a human-bear encounter may lead to injuries or deaths to workers or an urgent need to protect a worker that results in the killing of a bear. The final SEIS should provide a comprehensive analysis of these and other relevant potential effects to polar bears, and should consider such impacts in light of the changing Arctic climate and environment.

The final SEIS should also provide additional analyses of effects to walrus. BOEMRE acknowledges that “the potential for serious adverse impacts to individual or groups of walrus does exist.” Draft SEIS at 88, and has noted that the population of Alaskan Pacific walrus is likely to decline, FEIS at III-74; however, the draft SEIS provides only a very brief analysis of potential impacts to walrus. Draft SEIS at 88. As with the EIS’s analysis for other species, it assumes that later permitting processes and mitigation measures will prevent harm. *Id.* However, even the short analysis BOEMRE has provided shows this to be arbitrary. The agency states that aircraft overflights can result in mortality from trampling and the separation of cow-calf pairs, but argues that “BOEM’s minimum altitude requirements would preclude adverse impacts to walrus, to the extent that human safety considerations permit flying at this altitude.” *Id.* Thus, BOEMRE’s own analysis shows that human safety considerations may result in aircraft flying at an altitude that can startle walrus and cause walrus mortalities. In fact, low-ceiling clouds in the Arctic prevent compliance with the minimum altitude requirements with some frequency. However, BOEMRE essentially ignores this potential harm and refuses to analyze whether resulting injuries or mortalities could result in population-level effects. BOEMRE also states that vessels can cause walrus to abandon haulouts, but does not address further the potential for vessels to disturb walrus. BOEMRE should provide an analysis of the potential for vessel disturbances to harm walrus. The draft SEIS does not consider any other potential disturbances to walrus. However, as discussed *supra*, gas production and development will require the construction of offshore pipelines and likely will result in additional exploration and development activity. BOEMRE must remedy these deficiencies by providing a complete analysis of potential effects to walrus in the final SEIS that includes a discussion of all relevant impacts.

BOEMRE also has not sufficiently analyzed the effects of gas development and production on birds. Gas development and production will require an onshore facility and onshore and offshore pipelines. Draft SEIS at 86, and “could entail relatively large-scale activity” *Id.* at 87. BOEMRE attempts to avoid substantive analysis by stating that later analyses and permitting processes will prevent impacts to birds. The agency should analyze the effects that disturbance could have on specific species of bird, including threatened and endangered species, and should not simply rely on conclusory statements of no significant impact, as it has done in the draft SEIS. Also, the draft SEIS fails to consider how increased predation due to predator attraction to natural gas operations will affect bird species, even though it also acknowledges that development infrastructure can increase concentrations of arctic foxes, which prey on birds and bird eggs. Draft SEIS at 86-87, 91. The final SEIS should analyze potential effects of increased predation.

F. BOEMRE fails to adequately analyze the potential for gas development and production activities to displace subsistence users.

The final SEIS should consider the potential for gas development and production activities to displace subsistence activities. The draft SEIS’s analysis of effects to subsistence-harvest patterns is largely restricted to the potential for activities to restrict access to resources through reductions in the resources themselves or changes in the distribution of those resources. Draft SEIS at 95-98. As detailed elsewhere, BOEMRE’s consideration of effects to Arctic species—including subsistence species—is lacking. However, beyond those issues, BOEMRE has also failed to consider the potential for gas development to displace subsistence users. BLM detailed some relevant subsistence displacement concerns in its Northeast NPR-A Supplemental IAP/EIS. Subsistence users have identified numerous reasons why they might avoid areas in response to industrial development. These reasons include a lack of cultural privacy, belief that resource are contaminated, reduced resource productivity in an area, and physical obstacles. NE NPR-A IAP/EIS at 3-135. Natural gas development resulting from Lease Sale 193 has the potential to result in large scale and far reaching industrial activities that could displace subsistence users from vast expanses of subsistence lands as occurred during development of the Prudhoe Bay region. See Wrenham, A. 2007. Inupiat health and proposed Alaskan oil development; Impact of the first integrated Health Impact Assessment/Environmental Impact Statement for proposed oil development on Alaska’s North Slope. EcoHealth 4:500-513. In the final SEIS, BOEMRE should analyze the potential for gas development and production to have such an effect.

III. NEW INFORMATION FROM THE DEEPWATER HORIZON SPILL

BOEMRE states in the draft SEIS that it need not consider the *Deepwater Horizon* spill in the Gulf of Mexico because it is beyond the scope of the remand. Draft SEIS at 16. Alternatively, BOEMRE states that the Gulf spill need not be incorporated into the Chukchi Sea lease sale analysis because (i) it has not changed baseline conditions in the Chukchi Sea, since it occurred in the Gulf of Mexico, (ii) it occurred in deep water and the Chukchi Sea lease sale area is predominantly shallow water, and (iii) “any change in likelihood of an oil spill from a blowout during exploration drilling would not alter the potential effects of the oil spill already analyzed” in the original EIS. *Id.* These reasons are unavailing, and BOEMRE should analyze new information from the spill that is still being developed by, for example, the Presidential commission on the *Deepwater Horizon* spill.

NEPA compels supplementation of environmental impact analyses when “there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.” 40 C.F.R. § 1502.9(c)(1)(ii); see also *Idaho Sporting Cong., Inc. v. Alexander*, 222 F.3d 562, 566 n.2 (9th Cir. 2000). The events surrounding the *Deepwater Horizon* spill provide significant new information that requires BOEMRE to supplement its analysis of lease sale 193. See, e.g., Council on Environmental Quality, Report Regarding the Minerals Management Service’s National Environmental Policy Act Policies, Practices, and Procedures as They Relate to Outer Continental Shelf Oil and Gas Exploration and Development (Aug. 16, 2010) at 32, available at <http://www.whitehouse.gov/sites/default/files/microsites/ceq/20100816-ceq-mms-ocs-nepa.pdf> (stating “The BP Oil Spill constitutes significant new information and circumstances that may

require reevaluation of some conclusions reached in prior NEPA reviews and other environmental analyses and studies”). Fundamentally, the oil spill in the Gulf shows that that large spills from exploration drilling can happen and that, even in the relatively benign conditions of the Gulf, they cannot be contained. These facts alone fundamentally undermine BOEMRE’s assumptions about oil spills in the original EIS. In the original EIS, for instance, BOEMRE concludes that no oil spill would occur during exploration drilling. FEIS, App. A at A.1-1-A.1-2. Any oil spill would occur only during development and production. *Id.* The *Deepwater Horizon* spill shows that, even with the latest technology, oil spills do, in fact, occur during exploration. In addition, the spills analyzed in the original EIS—a 1,500 barrel oil spill from a production facility and a 4,600 barrel oil spill from a pipeline, FEIS at IV-19—are less than 1/1000 the size of the *Deepwater Horizon* spill—estimated by the Presidential commission investigating the *Deepwater Horizon* spill at close to 5,000,000 barrels of oil. See National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling, *The Amount and the Fate of the Oil*, Draft, Staff Working Paper No.3 at 16 (Oct. 6, 2010). The original EIS does not analyze a large blowout spill. In light of the *Deepwater Horizon*, BOEMRE cannot dismiss a blowout spill as not reasonably foreseeable. In addition, BOEMRE must supplement its analysis of oil spill prevention and containment to reflect the lessons being learned from the spill and its aftermath, including the effects of dispersants.

CONCLUSION

BOEMRE should not finalize the draft SEIS in its current. With respect to missing information, BOEMRE should reassess whether there is essential missing information, taking into consideration the ongoing United States Geological Survey analysis of Arctic data gaps. It should obtain information that is essential to a lease sale decision, most effectively by engaging in a comprehensive and integrated research program. It should then prepare a revised draft SEIS that analyzes Lease Sale 193 in light of this new information. With respect to its analysis of natural gas development, BOEMRE should revise its assumptions and improve its analysis as described above. Once it has prepared an adequate and informative draft SEIS, it should make the document available for public comment. Thereafter, the agency should consider anew in light of this new information whether to cancel, modify, or affirm its decision to hold Lease Sale 193.

A Comprehensive, Integrated Approach to Arctic Science and Local and Traditional Knowledge for Offshore Oil and Gas Planning

Introduction

The United States is at a crossroads with respect to planning and decision-making for offshore oil and gas activities in the Chukchi and Beaufort seas. President Obama and the Department of the Interior (DOI) must decide whether to continue with plans and approvals that are based on inadequate science and have generated controversy, litigation, and—as the blowout in the Gulf of Mexico demonstrates—the potential for environmental and social disaster. This document and the attachments provide a path forward that would use a comprehensive, integrated scientific research and monitoring plan to fill the gaps identified by scientists and courts and provide the necessary baseline information from which to make effective decisions.

At the heart of the controversy about offshore drilling in the Arctic is the widely acknowledged lack of scientific information about the Arctic Ocean. While we do know that the Arctic Ocean is important to life in coastal communities, has regions of high productivity that support varied ecosystems with iconic species of wildlife, helps regulate the planet's weather and climate, and is changing rapidly, scientists know very little about how the Arctic Ocean functions or the ways in which it might respond to stresses from industrial activities. The lack of baseline information about the marine ecosystem was one of the bases for court decisions invalidating the 2007-12 Five-Year Leasing Program and Lease Sale 193 in the Chukchi Sea. Without this understanding, it is not possible to comply with statutory and regulatory mandates that were established to help ensure responsible stewardship of resources, including the Outer Continental Shelf Lands Act (OCSLA), National Environmental Policy Act (NEPA), Endangered Species Act (ESA), and Marine Mammal Protection Act (MMPA)

Moreover, the lack of baseline information creates a significant impediment to both effective planning and preparation. The U.S. Commission on Ocean Policy stated as a principle tenet, "Ocean managers and policy makers need comprehensive scientific information about the ocean and its environment to make wise decisions."¹ The final recommendations of the Interagency Ocean Policy Task Force (OPTF) call for science-based decision making and a better understanding of our ocean ecosystems, including a special emphasis on the Arctic.² The Obama administration implemented the final OPTF recommendations and has both the opportunity and obligation to obtain the necessary science and use it to guide decisions about industrial activities.³ By deferring future leasing in the Chukchi and Beaufort seas, calling for the U.S. Geological Survey Arctic (USGS) gap analysis, committing to science in the NOAA Arctic Strategic Plan, and creating the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling, the Obama administration has taken important steps toward allowing for comprehensive science and planning. At the same time, the government is in the process of determining how to respond to the court-ordered re-evaluation of Lease Sale 193 and the 2007-12 Five-Year Leasing Program, and Congress is debating legislation that includes provisions for better science in the Arctic.

The most effective way to respond to the courts' orders and prepare for decisions about future industrial activities is to undertake comprehensive research and monitoring that would provide a fundamental understanding of the marine ecosystem. This research has not been done adequately before, and much of what has been done is decades out of date in a region that is changing rapidly. While it is true that DOI and industry have undertaken significant research, those efforts have been narrowly focused, applied

studies designed to answer individual questions. Similarly, the National Science Foundation has funded significant cutting edge, hypothesis-driven basic research. While these efforts bolster our understanding of some processes in limited areas, they have not been conducted at the scale necessary to provide the holistic understanding of the ecosystem needed to make wise decisions about if and how industrial activities should proceed. Nor have they been conducted year-round—almost all of the existing studies focused solely on the summer months. The needed information is best obtained through year-round monitoring (including sampling for species distributions and abundance) and interdisciplinary research to elaborate trophic relationships, ecosystem structure and functioning, and other interactions.

Moving from uncoordinated studies to planned, integrated research would provide the necessary information, affordably, in a reasonable amount of time. In fact, the USGS gap analysis study, which has already started, could be the initial step. The results of that study—which should identify some of the largest and most pressing information gaps—should be used to help design the research program. The largest and most important information gaps almost certainly could be filled in 5-7 years for approximately \$20 million annually. Given the \$2.7 billion in revenue generated from Lease Sale 193 alone and the immense risks from oil and gas activities, this cost is neither exorbitant nor unwarranted. Such a comprehensive plan would provide many of the answers to the unknowns identified in the court proceedings relevant to Lease Sale 193 and the 2007-12 Five-Year Leasing Program and would provide the necessary information to make informed decision about whether to allow industrial activities and, if so, under what conditions.

State of Science About the Arctic Ocean

Very little is known about the Arctic Ocean, and in particular the Chukchi Sea. According to the U.S. Arctic Research Commission, the Arctic is "the least studied and most poorly understood area on Earth."⁴ In particular, "The Arctic Ocean is the least well known ocean on the planet. We know more about the topography of the planets Venus and Mars than we do about the bathymetry of the Arctic Ocean."⁵ Even our knowledge of what species inhabit the U.S. Arctic Ocean, either permanently or seasonally, is substantially incomplete. We recognize that the recent losses of sea ice during summer are fundamentally changing these ecosystems, but we still know little about the abundance and distribution of common species much less how the food webs work in this region.⁶

As part of the Lease Sale 193 litigation, the plaintiffs compiled a 38-page appendix of quotations from the Environmental Impact Statement that recognize the lack of available information about the Chukchi Sea.⁷ These citations are explicit recognitions by DOI and NOAA that there is significant missing information about even the most basic parameters for every one of the largest and most conspicuous animals in the ecosystem—all fish, marine mammals and birds—which in other regions are typically the most highly studied animals of an ecosystem. The missing information for these species includes abundance, distribution, and life history. This lack of basic information makes it difficult, if not impossible, to determine whether there will be significant impacts to the animals and the ecosystem. The state of information about the more charismatic animals in the ecosystem is further evidence of the lack of

(hereinafter "Arctic FMP EA").

⁷ This appendix is Attachment 2 to this document.

information about the rest of the ecosystem, including the clams, worms, sea stars and other species that are important prey for the more conspicuous species.

The lack of baseline science has also been highlighted by several other prominent local and federal agencies as well as international forums. In its comments on the Draft Proposed 2010-15 Five-Year Leasing Program, NOAA recommended using a precautionary approach to oil and gas activities for the Chukchi and Beaufort seas that prevents those activities until more information is available to support sustainable management.⁸ The Arctic Climate Impact Assessment, an international project of the Arctic Council and the International Arctic Science Committee, highlighted basic surveys and monitoring as well as ecosystem-based research as some of the highest priority research actions needed for Arctic marine waters.⁹ Further, the North Slope Borough has called for better baseline science to guide decisions, and Senator Begich has introduced legislation that calls for additional Arctic research and coordination.¹⁰

Moreover, where basic information about the marine ecosystem exists, much of it is old, spotty, and too sparse. For example, the Environmental Assessment for the Arctic Fishery Management Plan states that "data were scarce for estimating the abundance and biomass of fishes in the Alaskan Arctic."¹¹ The review of potential data sources indicated that surveys for fish have occurred about every 15-20 years, but typically over different regions. Even if those surveys over the past 60 years were combined together (which would be inappropriate due to different sampling methodologies and other reasons), there are still major areas of the U.S. Arctic Ocean shelf region that have yet to be surveyed. These areas include those where commercial fisheries could reasonably be expected to develop and those within lease sale areas.

Additionally, the vast majority of existing studies have been conducted in summer months. We need a year-round understanding of the Arctic Ocean ecosystem. One stunning example of this is a seabird, the spectacled Eider. In the summer their population would be widely dispersed, but in the winter, the entire world's population gathers together in a small area of the northern Bering Sea. If studies on this bird were only conducted in the summer, it would result in erroneous conclusions about the impacts of activities on this species, especially if activities occurred at or near their winter gathering area.

In addition, the Lease Sale 193 (Chukchi) and 2003 Multi-Sale (Beaufort 186, 195, 202) environmental impact statements use the same primitive model to estimate how spilled oil might travel in the marine environment. This model, which was developed in 1982, forms the basis for the evaluation of potential impacts from a spill. Much of the environmental data input to the model is old; for example, current and wind information dates from 1979-1996. More sophisticated models are available and better information would allow for more effective analysis of the risks from spilled oil.¹²

While significant resources have been dedicated to studying particular Arctic animals and potential impacts to those animals from offshore oil and gas activities, we still lack critical baseline information about the ecosystem. The only studies designed to provide the comprehensive information and understanding of the health, biodiversity, and functioning of Arctic marine ecosystems and the potential impacts of industrial activities were conducted 30 years ago pursuant to the Outer Continental Shelf Environmental Assessment Program (OCSEAP). The information gained under that program did not initially cover the Chukchi Sea lease area and is so outdated as to be of very limited use in making decisions now for the Beaufort Sea.

⁸ See Letter from Jane Lubchenco, Ph.D. to S. Elizabeth Birnbaum, Re: Comments on the Interior Minerals Management Service Draft Proposed Outer Continental Shelf Oil and Gas Leasing Program for 2010-2015 (Sept. 9, 2009), at 5, available at http://www.peer.org/news/news_id.php?row_id=1265.

¹⁰ See S. 1562, 111th Cong. (2010).

¹¹ Arctic FMP EA at 99.

¹² These problems are explained in more detail in Attachment 3 to this document.

all data and methods for all research projects are made available to the public, it is impossible to give selective results credence in the decisions about oil and gas activities.

Ultimately, when considered with the long list of studies performed over the last 15 years, the 38-page index of recognized unknowns about the Lease Sale 193 area is indicative of a systemic problem with the way research is being conducted in the Arctic. As a result of the narrow focus on applied research questions, while baseline research and monitoring is ignored, large sums have been spent to provide information about specific issues without providing decision-makers the information needed to make informed decisions about Arctic resources. One or two specific studies will not solve this problem. Rather, a more holistic research program is needed to fill the important information gaps related to almost every aspect of the ecosystem.

An Interdisciplinary, Integrated Research and Monitoring Program for the U.S. Arctic Ocean

At this point, it is incontrovertible that there are: substantial information gaps about Arctic marine ecosystems, a laundry list of studies that have been conducted, ongoing processes at BOEMRE in response to court orders to supplement the Lease Sale 193 EIS to better account for missing science and to revise the environmental sensitivity analysis and 2007-12 Five-Year Leasing Program; and a commitment by the new administration to bring science back to decision-making. President Obama and his administration must establish a path forward that harmonizes this situation and provides the basic information required to protect the resources of the Arctic, including the subsistence way of life. The most efficient way to accomplish these goals is through another OCSEAP-type program limited to the Beaufort and Chukchi seas

To provide the basic information required to protect the resources of the Arctic, including the subsistence way of life, and to guide decisions about oil and gas and other industrial activities, a new comprehensive research and monitoring program should:

1. integrate existing information to give a more holistic picture of what is known and conduct an analysis of the gaps in information to determine the most pressing research and monitoring needs;
2. gain a more comprehensive catalogue of identified species, populations and habitats, including seasonal migrations;
3. track the physical forcing factors that modulate biological productivity, habitat occupancy and migration pathways;
4. secure a better understanding of trophic linkages, physical and biological processes affecting productivity and other facets of ecosystem structure and functioning, and effects of anthropogenic perturbations;
5. study potential ecological and sociological impacts; and
6. integrate these scientific data to identify Important Ecological Areas as well as processes and habitats that are sensitive and vulnerable to perturbation, and furnish a basis for marine spatial planning.

This program could easily be conducted in three simple phases over the next 5-7 years: 1) gap analysis and planning (2011-2012); 2) research and monitoring (2013-2016, with monitoring continuing into the future); and 3) integrating new and older information to provide decision-makers the basic understanding needed to make effective decisions (2016-2017). Each of these phases must be informed by local and traditional knowledge, including planning and peer-review.

Phase I: Gap Analysis and Planning

To develop a comprehensive, integrated research and monitoring program, scientists must first understand the existing information and gaps in knowledge. Based on that information, a research program can be devised, with public input, to fill the gaps.

Since the conclusion of the OCSEAP program, DOI's studies in the Arctic Ocean have not been guided by an overarching monitoring and research plan. Instead, research priorities over the past several decades have been guided by an assumption that enough was known about the basics. DOI, therefore, focused "on topical studies in smaller areas to answer specific questions and fill identified information needs."¹³ These applied research questions are important and have led to a better understanding of specific issues, such as the fall bowhead whale migration route through the Chukchi Sea. However, without continued monitoring of key parameters studied in OCSEAP it is now unclear if the base of information gained remains valid. Climate change has altered the region dramatically over the last 30 years and ecosystems have significant variability on yearly to decadal spans.

Thus, DOI stopped examining and monitoring the fundamentals and, instead focused on applied research without even tying those studies together in a framework or committing to update results. As a result, population and distribution data for several vulnerable species that play important roles in the marine ecosystem are either outdated or missing. For example, Arctic cod, which is potentially the most important fish species in this ecosystem, is indicated to be present throughout all of the U.S. EEZ, but no seasonal variation, concentration, or spawning area data are published at this time.¹⁴

The lack of comprehensive planning may account, at least in part, for conflicting statements made by DOI—first through the Bureau of Land Management then Minerals Management Service and now Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE)—about the state of science in the Arctic. On the one hand, DOI has acknowledged repeatedly both that it lacks basic scientific information and needs good information for decision making.¹⁵ On the other hand, the agency points to the fact that it has spent \$350 million on research since 1973 across Alaska's 15 OCS leasing areas and, therefore, has a substantial understanding of the Arctic Ocean.¹⁶ The agency also has argued in court that the research undertaken gives it a sufficient basis for making decisions.¹⁷ The references in the Lease Sale 193 EIS discussed above about the lack of basic information for species runs directly counter to any assertions by DOI or BOEMRE that there is a broad base of information available for the Arctic from which to make decisions.

The National Science Foundation (NSF) also has funded important basic research in the Arctic Ocean. That research has been hypothesis-driven, meaning that it was designed to answer specific, cutting-edge scientific questions, including those about the specific impacts and feedbacks of climate change. While this cutting-edge research is important, it does not provide the basic, baseline information that is critical for making decisions, including what species live there, how many of them are there, and do those populations change from place to place and season to season. Much of that information simply is not available for the Arctic Ocean.

Similarly, industry has invested in significant scientific research, some of which may address important missing information. Currently, however, the results of those studies are not reliable because the data from industry studies are generally not made available publicly, and the degree to which other information about industry research is shared varies from study to study. Given the lack of transparency and the obvious conflict of interest for industry that would not want to share information that could potentially hinder development, there is a substantial risk of bias in the information that is shared. Unless

¹⁵ See <http://www.doi.gov/whatwedo/energy/ocs/AlaskaRegion.cfm> (stating that the Arctic Ocean requires "additional scientific, environmental, and spill risk analysis before new areas are offered for leasing."); see also Attachment 2 to this document detailing unknowns in Lease Sale 193 EIS.

¹⁶ See Alaska Annual Studies Plan Final FY 2011 at 1.

¹⁷ See *Native Village of Point Hope, et al. v. Salazar, et al.*, 1:08-cv-00004 (RRB), Fed. Def. Opp'n Br. at 12-17.

New research and monitoring should build on what has been learned about the Arctic Ocean already. Thus, the first step in this process is to reconcile the large information gaps with the important research that has occurred. Existing information should be compiled and integrated, then an analysis conducted of the gaps that are left. This gap analysis would then drive creation of an integrated research and monitoring program. The USGS Arctic studies initiative is an important step in this direction, and should be followed by a more comprehensive analysis as called for in Senator Begich's Arctic Ocean Research and Science Policy Review Act of 2009.¹⁸

President Obama and Secretary Salazar have directed the USGS to assess "resources, risks, and environmental sensitivities in Arctic areas."¹⁹ The USGS will complete an initial review of Arctic science and issue a report in April 2011 that will "examine the effects of exploration activities on marine mammals; determine what research is needed for an effective and reliable oil spill response in ice-covered regions; evaluate what is known about the cumulative effects of energy extraction on ecosystems and other resources of interest; and review how future changes in climate conditions may either mitigate or compound the impacts from Arctic energy development."²⁰ That report should set the stage for a more comprehensive analysis that forms the basis for implementation of the necessary studies and monitoring.

The USGS study is an important initial effort to gather existing information and identify gaps in knowledge, but it is likely not to be sufficiently comprehensive and inclusive to form the basis of the necessary research and monitoring program. Thus far, DOI has insisted on keeping the study firmly and fully in the control of the USGS and BOEMRE. Despite the important knowledge and experience within those agencies, their expertise clearly does not encompass the broad interdisciplinary breadth inherent in the more comprehensive undertaking needed. Experts are needed from many fields, from climate and oceanographic sciences to population biology and community ecology as well as the social sciences to determine the breadth of potential impacts to local communities. Second, the guidance given by DOI to USGS mandates consideration of four particular subject areas, which focuses their study towards a narrower applied research path rather than the holistic picture of Arctic information needs. Lastly, a gap analysis and research and monitoring plan should be developed with opportunities for public input and a peer review process that helps ensure the study accurately describes the state of, and existing gaps in, Arctic information.

Based on a comprehensive gap analysis, government scientists, together with public input, should define a research and monitoring plan to fill information gaps. In the aftermath of the *Exxon Valdez* oil spill a similar analysis and development of a research plan was put together with the benefit of hindsight to address the shortcomings of knowledge in Prince William Sound and the Gulf of Alaska that became apparent after the spill. The Gulf of Alaska Ecosystem Monitoring and Research (GEM) plan was designed to provide critical information for both quantitatively predicting the potential impacts of another spill and determining the impacts from another spill. The GEM plan should serve as a modern model for the type of plan needed to guide research and monitoring in the Arctic. The research and monitoring plan put together for the U.S. Arctic Ocean should be developed with input from the public and evaluated by an independent panel of experts.²¹

Phase II: Research and Monitoring

Once the information gaps are identified and a research plan devised, the research and monitoring must be executed. As the known gaps in knowledge outlined above show, scientific research and monitoring should include:

²⁰ *Id.*

²¹ An outline for such a plan for the Arctic Ocean is included as Attachment 1.

Ocean Conservancy and PEW Environment Group Comments

10-20-10
DRAFT DRAFT DRAFT

- 1. Marine life assessment to provide a year-round picture of the species in each marine habitat and their population trends;
2. Environmental monitoring to measure atmospheric and physical ocean conditions, such as salinity and temperature, and biological factors, such as productivity and community richness and diversity;
3. Scientific process studies to understand the way in which the ecosystem functions and is likely to respond to stresses;
4. Studies designed to identify patterns of subsistence use and changes in well-being as well as potential impacts from industrial activities; and
5. Documentation of local and traditional knowledge.

This research and monitoring should be interdisciplinary, spanning from climate sciences to social impacts studies, and to the greatest extent possible, it should be conducted in an integrated fashion to better elucidate the processes that underlie the way in which the ecosystem functions.

Integrated research reveals relationships that are not apparent in focused single species or component studies. For example, scientists were able to determine that, as a result of climate change, productivity in the northern Bering Sea ecosystem was shifting from moving through seafloor communities to open water communities.

ConocoPhillips and Shell are conducting integrated research studies in the Chukchi Sea around two of their drilling prospects. They are simultaneously measuring physical, biological and chemical oceanographic parameters along with marine mammals, fish, birds and benthic invertebrates.

This example shows that integrated research can be—and, in fact, is being—conducted in the Arctic Ocean. ConocoPhillips's and Shell's research, however, is confined to areas around two of their drilling prospects during the open water season.

22 Integrated research seeks to provide information about multiple characteristics of the ecosystem and the ways in which they interact.

DRAFT DRAFT DRAFT

Phase III: Data Integration

Once sufficient information is available from the research and monitoring outlined above, that information should be synthesized to demonstrate an understanding of ecosystem structure and functioning, including quantitative and robust models of the food web, and a determination of the important ecological areas of the region.

This new program would provide the answers to the unknowns identified in the Lease Sale 193 litigation by virtue of providing a basic understanding of the marine ecosystem. The missing information is broad in scope and covers major, fundamental components of the ecosystem.

In addition, having this basic information will avoid the problem that has arisen in the Gulf of Mexico, where development occurred with scant attention to the status of the ecosystem beforehand.

Meeting Legal Requirements and Policy Goals

As explained above, an integrated, comprehensive research and monitoring program would be the most efficient way to provide the baseline necessary to make informed decisions about offshore oil and gas activities in the Arctic.

Federal courts have invalidated the 2007-12 Five-Year Leasing Program and Environmental Impact Statement (EIS) for Lease Sale 193 in the Chukchi Sea. While the decisions rest on different grounds, the lack of scientific information about the Arctic Ocean.

DOI has issued a draft proposed 2007-12 Five-Year Leasing Program and a Draft Supplemental EIS for Lease Sale 193. Neither document fully accounts for the missing information or makes an effort to put in place the necessary interdisciplinary, integrated research and monitoring.

As explained above, there are 38 pages of references to scientific unknowns made by DOI and NOAA in planning for Lease Sale 193. The agency has an affirmative duty to get this information, including by performing research itself when necessary, if it is essential to its decision and not exorbitant in cost.

Basic scientific information is essential at the lease sale stage. It is when BOEMRE evaluates alternatives about the size of the sale, deferral areas, and other limitations that may affect exploration and

Ocean Conservancy and PEW Environment Group Comments

DRAFT DRAFT DRAFT

development. Further, once the lease sale is held, companies have additional rights to conduct activities in the water that may affect sensitive species and habitats. Information that would be gathered by a comprehensive research and monitoring effort would allow for more effective consideration of alternatives and better evaluation of potential impacts.

Additionally, at the lease sale stage, BOEMRE should undertake a more detailed analysis than was conducted for the Five-Year Leasing Program, based on better information. This analysis is particularly important given the agency's current practice of preparing an environmental assessment, rather than full EIS to evaluate proposed exploration activities.

Nor, as it appears to have done in the Draft SEIS for Lease Sale 193 should BOEMRE rely on analyses to be conducted by other agencies pursuant to other statutory mandates. Rather, the agency should abide Secretary Salazar's commitment to science and lead the way toward a better understanding of the ocean ecosystem by working with other expert agencies to put in place a comprehensive research and monitoring program.

The cost of this type of research and monitoring program is not exorbitant. The plan outlined in Attachment 1 could be carried out for approximately \$100 million over 5 years. By comparison, Lease Sale 193 alone generated \$2.7 billion in revenue to the federal government.

These cost estimates are consistent with the other programs mentioned above. The GEM program was projected to cost \$120 million in 1999, and the OCSEAP program was estimated to cost \$25 million annually.

Conclusion

A careful, deliberate approach in the Arctic will allow for energy production if it can be done without harming the health of the marine ecosystem or opportunities for the subsistence way of life. The first step in such an approach is to develop and implement a comprehensive research and monitoring program like OCSEAP.

Row 3: 3, Major Problems With Oil Spill Models (October 2010 Draft).

Attachment 1
A Scientific Research and Monitoring Plan for the U.S. Arctic Ocean

Compared with other marine ecosystems, very little is known about the living marine resources in the U.S. Arctic Ocean. We recognize that the recent losses of sea ice during summer are fundamentally changing the ways these ecosystems function, but we still know little about how these food webs work.

The geographic scope of this science plan includes the exclusive economic zone (EEZ) of the U.S. Arctic Ocean, extending from the northern Alaskan coastline to the continental shelf break to the north, from the Bering Strait in the west to the Canadian border to the east.

The essential elements of the plan are grouped into six categories: gap analysis, resource assessment, environmental monitoring, scientific process studies and synthesis. These elements are intended to (1) define existing information and research needs; (2) gain a more comprehensive catalogue of identified species, populations and habitats, including seasonal migrations, (3) track the physical forcing factors that modulate biological productivity, habitat occupancy and migration pathways; (4) secure a better understanding of trophic linkages, physical and biological processes affecting productivity and other facets of ecosystem functioning, and effects of anthropogenic perturbations; (5) study sociological impacts, and (6) integrate these scientific data to identify processes and habitats that are sensitive and vulnerable to perturbation and furnish a basis for marine spatial planning.

I. Gap Analysis

- A. Conduct a comprehensive gap analysis to determine what scientific research is currently being done and what additional information is needed.

II. Marine Life Assessment

- A. Conduct a comprehensive survey of species occupying each marine habitat, including communities in the benthic, pelagic and littoral zones, and ice-associated communities. Whenever feasible these surveys should be conducted seasonally to identify migrations and patterns of periodic habitat use.

- B. Conduct periodic population assessments for exploited and selected important species. These assessments should be spatially explicit, and include migratory species (birds, marine mammals and some fish). These assessments will provide crucial baselines for evaluating impacts of industrial development and ecosystem change.

III. Environmental Monitoring

- A. Establish a network of fixed monitoring stations to track physical forcings and local biological responses. This station network should be patterned along the lines of the National Science Foundation's Long Term Ecological Research Network (LTER) and NOAA's oceanographic buoys adapted to the US Arctic Ocean, with sampling stations allocated to both the Chukchi and Beaufort seas.
B. Support remote monitoring by satellite and aircraft to track sea ice extent, surface albedo and ocean color in collaboration with NOAA, NASA and NSIDC.
C. Establish a systematic process for incorporating LTK for early detection of unanticipated ecosystem change, and for review by LTK experts for accuracy and completeness.
D. Periodically update the resource assessments identified in "II" above to track ecosystem responses to climate change and industrialization.
E. Monitor detection of invasive species, including species displaced by warming seawater temperatures to the south, and exotic species introduced by industrial activities.

IV. Scientific Process Studies

- A. Identify processes strongly coupled with biological production, species' distribution and abundance, and support research that will improve understanding of them aimed at improving prediction of community responses to short- and long-term environmental stressors. This research should include identification of the species interactions that structure the biological community, which includes studies of the food web to determine linkages and energy flow through the ecosystem, as well investigations to determine the processes responsible for nutrient cycling.
B. Prioritize research to initially emphasize known proximate sources of ecosystem stress, including processes strongly affected by transition from light limitation to nutrient limitation resulting from continued sea ice loss, effects of warmer water temperatures on growth and provisioning requirements of selected target species (especially young-of-the-year and juveniles), and sensitivity to acidification from increases in atmospheric carbon dioxide.

V. Sociological and Ecosystem Impact Studies

- A. Identify historical and current patterns of land and subsistence use, and conduct a survey of social and psychological well-being in North Slope communities to document current conditions in these communities.
B. Monitor changes in patterns of land and subsistence use, and in measures of social and psychological well-being in North Slope communities affected by oil development.
C. Conduct studies to determine potential impacts from industrial activities in the Arctic Ocean, such as research on the effects of noise on Bowhead whales, as well as the potential effects from produced waters, drilling muds, routine discharges, and other emissions on the ecosystem.

VI. Data Integration and Marine Spatial Planning

- A. Construct ecosystem models including a quantitative nutrient-phytoplankton-zooplankton (NPZ) model and an Ecopath model to evaluate how predicted ecosystem responses compare with data observed from the monitoring programs. Identified inadequacies will highlight areas requiring further research.
B. Archive monitoring data in a publicly accessible database that is continuously maintained. Also, monitoring results should be periodically included in GIS maps to facilitate identification of Important Ecological Areas (IEAs) and important subsistence areas in the US Arctic Ocean and how they may change through time. Important Ecological Areas are geographically delineated areas with distinguishing characteristics that contribute disproportionately to an ecosystem's health or are particularly vulnerable to disturbance.
C. Integrate the results of the monitoring and research described above with a marine spatial planning effort that identifies IEAs as well as all potential energy sources and their availability to markets to help minimize the likelihood of adverse consequences associated with industrialization.

Attorneys for Plaintiffs

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF ALASKA

NATIVE VILLAGE OF POINT HOPE, et al.,
Plaintiffs,
v.
DIRK KEMPTHORNE, Secretary of the Interior, et al.,
Defendants,
and
SHELL GULF OF MEXICO, INC., and
CONOCOPHILLIPS COMPANY,
Intervenor-Defendants.

DECLARATION OF COUNSEL

I, Erik Grafe, hereby declare:

- 1. I am one of the attorneys representing Plaintiffs Native Village of Point Hope, et al., in this action. I submit this declaration in support of Plaintiffs' opening brief.
2. Attached to this declaration as Attachment A is a compendium of statements made by the Minerals Management Service (MMS) in its Final Environmental Impact Statement

(EIS) for the Oil and Gas Lease Sale 193 and Seismic Surveying Activities in the Chukchi Sea (OCS EIS/EA MMS 2007-026) (May 2007). This contains statements in the EIS acknowledging missing information about the Chukchi Sea environment and the potential effects of the lease sale 193 on wildlife and subsistence. This declaration was compiled by an Earthjustice staff member under my direct supervision and reviewed by me.

I declare under penalty of perjury that the foregoing is true and correct.

Dated this 29th day of January, 2009.

s/ Erik Grafe

LACK OF INFORMATION ABOUT SPECIES/HABITAT

I. FISH

A. General

“Surveys of coastal and marine fish resources in the Chukchi and Beaufort seas are typically conducted during periods that ice cover is greatly reduced (late July, August, or September) and information concerning the distribution, abundance, habitat use, etc., of marine fishes outside this period is limited. Due to the lack of specific information for many species, it is necessary to discuss the biology and ecology at the family level.” EIS at III-32.

“Despite these previous works, several data deficiencies remain. Information of current distribution and abundance (e.g., fish per square kilometer) estimates, age structure, population trends, or habitat use areas are not available for fish populations in the northeastern Chukchi Sea. Many fish studies reporting distribution and/or abundance are 20-30 years old. Other studies are still older. For example, the only survey of demersal fishes in the region is more than 20 years old. Fish assemblages and populations in other marine ecosystems of Alaska (e.g., Gulf of Alaska, Bering Sea) have undergone observable shifts in diversity, distribution, and abundance during the last 20-30 years; it is not known if the findings of Frost and Lowry (1983) still accurately portray the diversity and abundance of demersal fishes in the Alaskan Beaufort Sea. The same is true for other dated studies. It is possible that they no longer accurately and precisely reflect the current distribution, abundance, and habitat use patterns of fish resources in the northeastern Chukchi and western Beaufort seas. Such information could be stale, or in some cases, stagnant. If so, accurate information concerning the distribution, abundance, and habitat use patterns of fish resources is incomplete and/or unavailable from which to accurately and/or precisely assess environmental impacts from the Proposed Action.” EIS at III-32.

“Another important data gap is the lack of information concerning discrete populations for arctic fishes. The literature abounds with casual references made of various fish populations without having delimited the population other than by perhaps using arbitrary boundaries of a study area, or presenting data without discriminating one discrete population unit from another. Additionally, a few marine species are regarded as widespread and/or abundant, yet distribution and density statistics for discrete populations are scarce, unknown, and therefore, incomplete. Several species are known only from a single specimen of each species; others are known from perhaps a handful of specimens collected years to decades ago. Population information is entirely lacking for such species.” EIS at III-33.

“Fish resources of the northeastern Chukchi Sea were last surveyed 15-17 years ago. Additionally, other surveys over the years and area reflect a pattern of temporally and spatially irregular and disjunct sampling. Such disorganized sampling and data reporting greatly influences the information quality necessary to determine population trends and adjustments to environmental perturbations. Establishing a current, accurate, and precise baseline is critical to assessing potential changes to biotic resources. It is unknown if the distribution and abundance information gathered by the last surveys remains an accurate and precise description of arctic fish populations today. This is an important because the Chukchi and Bering seas are considered

to be large marine ecosystems serving as principle bellwethers to climate change in North America and the Arctic Ocean.” EIS at III-40.

“Adjustments by one or more fish populations often require adjustments within or among large marine ecosystems, influencing the distribution and/or abundance of competitors, prey, and predators. Consequently, it appears reasonable to believe that the composition, distribution, and abundance of fish resources in the northwestern Chukchi Sea is changing and is now different from that measured in the surveys conducted 15-17 years ago or earlier. The magnitude of these differences is unknown.” EIS at III-41.

B. Individual Species and/or Species Assemblages

1. Primary Arctic Fish Assemblages

“Marine waters support the most diverse, although least well known, fishes of the Alaskan Beaufort Sea region. Studies of marine fishes in the region are very limited; most of the surveys/studies have been performed in coastal waters landward of the landward of 200-m isobath, with scant surveys having sampled deeper waters. . . . [R]obust population estimates or trends for marine fishes of the region are unavailable. Distribution or abundance data for marine fish species are known only generally at the coarsest grain of resolution (for example, common, uncommon, rare).... Detailed information generally is lacking concerning the spread, density, or patchiness of their distribution in the overall Chukchi Sea region. Data concerning habitat-related densities; growth, reproduction, or survival rates within regional or local habitats; or productivity rates by habitat, essentially are unknown for fishes inhabiting waters seaward of the nearshore, brackish-water ecotone.” EIS at III-34 (internal citations omitted).

2. Neritic-Demersal Assemblage

“Life-history data for many of the demersal species using neritic substrates is lacking (e.g., whitespotted greenling, twohorn sculpin, spinyhook sculpin, veteran poacher); consequently, assessing the species resilience to perturbations is not feasible until additional information becomes available.” EIS at III-35.

3. Neritic-Pelagic Assemblage

“No species of this assemblage are assessed as being of low resilience, because life-history data are lacking.” EIS at III-35.

4. The Cryopelagic Assemblage

“Arctic cod and Pacific sand lance are assumed to be of medium resilience to exploitation; polar cod and toothed cod are data deficient such that an assessment of resilience is not feasible with available information.” EIS at III-36.

5. Oceanic-Demersal Assemblage

“Life-history statistics for most species covered in this assemblage are data deficient, chiefly for lack of fish surveys and studies in oceanic waters of the Alaskan arctic.” EIS III-36.

6. Diadromous Fishes

“A number of diadromous species in the region have complicated life-history patterns that are not fully understood.” EIS at IV-61.

7. Salmon

“Little is known of the movements undertaken during the 18 months the [pink] salmon spend at sea.” EIS at III-39 (quoting Schmidt, McMillan, and Gallaway (1983)).

“Chum salmon fry, like pink salmon, do not overwinter in streams but migrate (mostly at night) out of streams directly to sea shortly after emergence. The timing of outmigration in the arctic is unknown, but occurs between February and June (chiefly during April and May) in more southern waters.” EIS at III-40.

II. MARINE MAMMALS

A. Whales

1. Bowhead Whale

"There is scientific uncertainty about the population structure of bowheads that use the Arctic Ocean." EIS at III-45.
"Recent data to evaluate bowhead use of the Chukchi Sea Planning Area, or adjacent areas to the south, are lacking." EIS at III-45.
"No data are available indicating that, other than historic commercial whaling, any previous human activity has had a significant adverse impact on the current status of BCB Seas bowheads or their recovery." EIS at III-45.
"Conservation concerns include: . . . uncertain potential impacts of climate warming. . ." EIS at III-45.
"The uncertainty of the stock structure adds some uncertainty to summaries of the status of bowheads that may be impacted by the Proposed Action." EIS at III-45.
"[I]f whales become more 'skittish' and more highly sensitized following a hunt, it may be that their subsequent reactions, over the short-term, to other forms of noise and disturbance are heightened by such activity. Data are not available that permit evaluation of this possible, speculative interaction." EIS at III-46 (quoting NMFS' Arctic Region Biological Opinion).
"There is little information regarding causes of natural mortality for BCB Seas bowhead whales." EIS at III-49.
"Little is known about the effects of microbial or viral agents on natural mortality [of bowheads]." EIS at III-49.
"The amount of feeding [by the BCB Seas bowhead stock] in the Bering Sea in the winter is unknown as is the amount of feeding in the Bering Strait in the fall (Richardson and Thomson, 2002)." EIS at III-49.
"The MMS funded large-scale surveys in this [Chukchi Sea lease sale] area when there was oil and gas leasing and exploration, but while surveys in the Beaufort Sea have continued, the last surveys in the Chukchi Sea were about 15 years ago. These data were summarized by Mel'nikov, Zelensky, and Ainana (1997), Moore (1992), Moore and Clarke (1990), and Moore, DeMaster, and Dayton (2000). We have plotted counts of bowheads in the Chukchi Sea during those surveys (Fig. III.B-4), because they visually provide limited insight into areas where bowheads may be exposed to oil and gas activities should they occur in the Chukchi Sea Planning Area.

However, we caution against over-interpretation of these data out of context of survey effort and, because these data were collected between 1979 and 1991, they should not be interpreted as indicating current use of the Chukchi Sea by bowhead whales; they are the best data available." EIS at III-50-51.
"Data are limited on the bowhead fall migration through the Chukchi Sea before the whales move south into the Bering Sea." EIS at III-51.
"The amount of feeding in the Chukchi Sea and Bering Strait in the fall is unknown as is the amount of feeding in the Bering Sea in the winter (Richardson and Thomson, 2002). Richardson and Thomson (2002:xxxviii) concluded that: "...behavioral, aerial-survey, and stomach-content data, as well as certain energetics data...show that bowheads also feed widely across the eastern and central Beaufort Sea in summer and fall." In mid- to late fall, at least some bowheads feed in the southwest Chukchi. Detailed feeding studies have not been conducted in the Bering Sea in the winter." EIS at III-54.
"There are locations in the Beaufort Sea and the western Chukchi Sea where large numbers of bowheads have been observed feeding in many years. However, the significance of feeding in particular areas to the overall food requirements of the population or segments of the population is not clear." EIS at III-55.
"Recent data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available." EIS at III-55.
"[I]mportantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales." EIS at IV-82.
"Bowheads are not randomly distributed throughout the Proposed Action area. The extent of use of particular habitats varies among years, sometimes considerably; therefore, it is difficult to predict, in advance of a given year, exactly how bowheads will use the entire area that is available to them. Some aspects of their habitat use are poorly understood. For example, current data are not available on which to typify the current summer use of the northern Chukchi Sea by bowheads. For example, in the Beaufort Sea in some years, large aggregations of bowheads near Smith Bay have been observed during MMS' Bowhead Whale Aerial Survey Program (BWASP) surveys at the beginning of September. It is unclear if these animals are early migrants that have come from the east, if they summered in the northern portions of the Beaufort Sea and came south, or if they entered from the Chukchi Sea and never migrated east. . . . It is important to note that the Chukchi Sea data are not recent (1979-1991) and thus should not be interpreted as indicating current patterns of bowhead use of the Chukchi Sea." EIS at IV-101.
"We note that the general location of the spring lead system in the Chukchi Sea (and Beaufort Sea) is based on relatively limited survey data and is not well defined." EIS IV-102 (similarly at EIS at IV-105).

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.
2. Fin Whale
"The NMFS has concluded that there is no reliable information about population-abundance trends, and that reliable estimates of current or historical abundance are not available, for the entire Northeast Pacific fin whale stock." EIS at III-46. See also id. at III-56 (similar).
"There are no recent data to confirm their use or lack of use of the Chukchi Sea Planning Area, or adjacent areas to the south." EIS at III-47.
"There is little information about natural causes of mortality (Perry, DeMaster, and Silber, 1999a). The NMFS summarized that "There are no known habitat issues that are of particular concern for this stock" (Angliss and Lodge, 2002, 2005). Perry, DeMaster, and Silber (1999a:51) listed the possible influences of disease or predation as 'Unknown.'" EIS at III-56.
"The importance of specific feeding areas to populations or subpopulations of fin whales in the North Pacific is not understood." EIS at III-57.
"The possible influences of disease or predation and of overutilization [on fin whales] are listed [by NMFS] as 'Unknown.'" EIS at V-28.
3. Humpback Whale
"Available information does not indicate humpback whales inhabit the Chukchi Sea OCS project area. There are no recent data to confirm their lack of use of the Chukchi Sea OCS Planning Area, or adjacent areas to the south." EIS at III-47.
"There is 'no clear consensus' (Calambokidis et al., 1997:6) about the population stock structure of humpback whales in the North Pacific due to insufficient information (Angliss and Lodge, 2002) (see further discussion in USDO, MMS,2003a,b)." EIS at III-58.
"Angliss and Outlaw (2005) stated that: "There are no reliable estimates for the abundance of humpback whales at feeding areas for this stock" (the Western North Pacific Stock) 'because surveys of the known feeding areas are incomplete, and because not all feeding areas are known.' There are not conclusive or reliable data on current population trends for the western North Pacific stock (Perry, DeMaster, and Silber, 1999b; Angliss and Outlaw, 2005)." EIS at III-59.
"Causes of natural mortality in humpbacks in the North Pacific are relatively unknown, and rates have not been estimated." EIS at III-60.

"The threat of disease or predation [on humpbacks] as [sic] unknown." EIS at V-29.
4. Gray Whale
"[E]xisting information is insufficient to understand the dynamics of gray whales and offshore Chukchi Sea habitat relationships, quality and quantity dynamics and distribution of prey resources, or the capability of habitat to support (carrying capacity) long- and short-term whale use." EIS, Vol. II, AC 019-076.
"[T]he relationship between the expanding gray whale population to amphipod community dynamics is unknown but is of considerable interest." EIS at V-35.
5. Beluga Whale
"Understanding the distribution and timing of movements of belugas is important for planning lease sales in the Chukchi Sea and designing possible mitigation measures. Late-summer distribution and fall-migration patterns are poorly known, wintering areas effectively are unknown, and areas that are particularly important for feeding have not been identified (Suydam, Lowry, and Frost, 2005)." EIS at IV-163. See also id. at III-77 (second sentence same).
"Based on recent telemetry studies on eastern Chukchi belugas, it is likely that members from both stocks occur in similar places and at similar times during the fall migration although the significance of this is unknown (Suydam, Lowry, and Frost, 2005)." EIS at III-76.
"Winter food habits of belugas are largely unknown . . ." EIS at III-77.
"Belugas generally are associated with ice and relatively deep water throughout the summer and autumn, which may reflect their preference for feeding on ice-associated arctic cod (Moore et al., 2000). Late-summer distribution and fall-migration patterns are poorly known, wintering areas are effectively unknown, and areas that are particularly important for feeding have not been identified (Suydam, Lowry, and Frost, 2005)." EIS at III-77.
6. Harbor Porpoise
"The harbor porpoise inhabits shallow, coastal areas in temperate, subarctic, and arctic waters of the Northern Hemisphere (Read, 1999). In the North Pacific, harbor porpoises range from Point Barrow, Alaska to Point Conception, California (Gaskin, 1984). In Alaska, three separate stocks have been recommended, although there is insufficient biological data to support the designation at this time." EIS at III-78.

7. Minke Whale

"There are no reliable estimates for the Alaska stock of minke whales. A provisional estimate was made for the Bering Sea of 810 individuals; however, this is not used for the Alaska stock because the entire stock's range was not surveyed." EIS at III-78.

B. Other Marine Mammals

1. Seals

"Little is known about the biology or population dynamics of ice seals, and they have received little attention compared with other Bering/Chukchi Sea species known to be in decline. Accurate population estimates for ice seals are not available and are not easily attainable due to their wide distribution and problems associated with research in remote, ice-covered waters (Quakenbush and Sheffield, 2006). Although little is known about the population status of ice seals, there is cause for concern. Sea ice is changing in thickness, persistence, and distribution (Sec. III.A.4, Sea Ice), and evidence indicates that oceanographic conditions have been changing in the Bering Sea (Sec. III.A.3, Oceanography), which suggests that changes in the ecosystem may be occurring as well (Quakenbush and Sheffield, 2006)." EIS at III-71.

a. Ringed Seal

"No reliable estimate for the size of the Alaska ringed seal stock is available (Angliss and Outlaw, 2005) . . ." EIS at III-71.

b. Spotted Seal

"No reliable estimate for the size of the Alaska spotted seal stock is available (Angliss and Outlaw, 2005)." EIS at III-72.

c. Ribbon Seal

"Ribbon seals inhabit the North Pacific Ocean and the adjacent fringes of the Arctic Ocean. In Alaska, they range northward from Bristol Bay in the Bering Sea and into the Chukchi and western Beaufort seas. They are found in the open sea, on pack ice, and rarely on shorefast ice (Kelly, 1988). As the ice recedes in May to mid-July, they move farther north in the Bering Sea, hauling out on the receding ice edge and remnant ice (Burns, Shapiro, and Fay, 1981). Seal distribution throughout the rest of the year is largely unknown; however, recent information suggests that many ribbon seals migrate into the Chukchi Sea for the summer months (Kelly, 1988)." EIS at III-73.

"No reliable estimate for the size of the Alaska ribbon seal stock is available (Angliss and Outlaw, 2005)." EIS at III-73.

d. Bearded Seal

"No reliable estimate for the size of the Alaska bearded seal stock currently is available (Angliss and Outlaw, 2005). Bengtson et al. (2005) conducted surveys in the eastern Chukchi Sea but could not estimate abundance from their data." EIS at III-74.

2. Pacific Walrus

"No reliable estimate is currently available for the size of the Alaskan stock of Pacific walrus (Angliss and Outlaw, 2005). However, available evidence indicates that the population is likely in decline (Kelly, Quakenbush, and Taras, 1999; Kochnev, 2004)." EIS at III-74. See also *id.* at EIS at III-76 (first sentence same).

"The population size has never been known with certainty; however, the most recent survey estimate was approximately 201,039 animals (Gilbert et al., 1992)." EIS at III-76.

3. Polar Bear

"A reliable estimate for the CBS stock of polar bears, which ranges into the southern Beaufort Sea, does not exist, and its current status is in question. In 2002, the IUCN/SSG Polar Bear Specialist Group estimated the size of the CBS population at 2000+ bears, though the certainty of this estimate was considered poor (Lunn, Schliebe, and Born, 2002)." EIS at III-84.

"Coastal areas provide important denning habitat for polar bears. Terrestrial denning areas for bears of the CBS polar bear stock are less well understood than those for the SBS polar bear stock." EIS at IV-166.

"The maximum reproductive age for polar bears is unknown, but is likely well into their 20's (Amstrup, 2003)." EIS at III-81.

"[W]ith the collapse of the Soviet empire in 1991, levels of illegal harvest dramatically increased in Chukotka in the Russian Far East (Amstrup, 2000; USDO, FWS, 2003). While the magnitude of the Russian harvest from the CBS is not precisely known, some estimates place it as high as 400 bears per year, although the figure is more likely between 100 and 250 bears per year." EIS at III-84. See also *id.* at V-36 (same).

"[B]ecause of the unknown rate of illegal take currently taking place, in 2006 the IUCN/SSG Polar Bear Specialist Group designated the status of the CBS stock as "declining" from its previous estimate of 2000+ animals (IUCN/SSG Polar Bear Specialist Group, 2006)." EIS at III-84.

III. MARINE AND COASTAL BIRDS

1. General

"Despite the importance [for marine and coastal birds] of [Kasegaluk Lagoon, Ledyard Bay, Peard Bay, barrier islands, the spring open-water lead system, and the seabird-nesting colonies at Cape Lisburne and Cape Thompson], as well as the entire Chukchi Sea within the proposed lease-sale area, little recent site-specific data are available on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data are between 15 and 30 years old, making accurate analysis difficult. Because of this long data gap, it is unknown if population abundance or distribution of many species have changed." EIS at IV-145.

2. Threatened Spectacled Eiders¹

"In general, population demography for this species and in particular breeding information (i.e., timing of pair formation and duration of pair bonds, timing of mating, male and female dispersal rates, sex-specific estimates for natal, breeding, and molt-site fidelity, breeding propensity, nonbreeding component, duckling/brood and first-year survival, etc.) is poorly understood due to a lack of long-term marking/monitoring programs and/or low resighting/recapture/recovery rates." BE at 23.

"Few data are available on the overall longevity of spectacled eiders, but if similar to other eiders, they would likely be long-lived." BE at 23.

"Recruitment rate of spectacled eiders is unknown (USFWS 1999)." BE at 25.

"Migration routes [of spectacled eiders] in the spring are not well known . . ." BE at 25.

"The summer range of non-breeding [spectacled] eiders is not known . . ." BE at 26.

"Food habits of spectacled eiders in the Ledyard Bay molting area remain unknown." BE at 27.

"The world population of spectacled eiders has declined substantially during the past 30 years, and may be continuing to decline (USFWS 1999, 2002b). Long-lived species like spectacled eiders typically do not have highly variable populations and unknown mortality factors may be undermining their ability to maintain a stable population. The causes of decline could be varied and are largely unknown . . ." BE at 28.

¹ From Minerals Management Service, Biological Evaluation of Spectacled Eider (*Somateria fischeri*), Steller's Eider (*Polysticta stelleri*), and Kittlitz's Murrelet (*Brachyramphus brevirostris*) for Chukchi Sea Lease Sale 193 (September 2006), incorporated by reference into the Lease Sale 193 EIS at III-61, IV-125, V-30.

"Variability in the abundance of the Alaska breeding population of spectacled eiders is not well understood (USFWS 1999)." BE at 28.

"The Alaskan and Russian populations of spectacled eider were listed as a threatened species on 9 June 1993 (USFWS 1993). Although the factors that caused these declines are unknown, a number of potential contributory factors have been identified. These, or other still-identified threats, have increased mortality above the rate of reproductive replacements. No data are available to show whether similar trends have affected the breeding population in Russia where as many as 40,000 pairs traditionally nested." BE at 29.

3. Threatened Steller's Eiders²

"[T]he length of time that Steller's eiders remain paired is unknown." BE at 13.

"Many life history aspects of Steller's eiders (e.g., timing of pair formation, duration of pair bonds, dispersal rates, sex-specific seasonal site fidelity, first-year survival, etc.) are poorly understood." BE at 13.

"The reason for relatively low nesting success or failure to nest by the Alaska nesting population is unknown, but may be related to predators switching to alternate prey when lemmings are in low abundance (Quakenbush and Suydam 1999)." BE at 15.

"Steller's eider recruitment rates are unknown (USFWS 2002b)." BE at 15.

"Departure from the [Arctic Coastal Plain] to molting areas is poorly documented, but males probably begin departing as early as late June, followed by non- and failed nesting females resumably from late July – late August, and finally successful females and fledged young." BE at 16.

"The population of Steller's eiders molting and wintering along the Alaska Peninsula appears to be declining (USFWS 1999, 2002a). . . . The causes of decline could be varied and are largely unknown, but if the cause of the decline is within the marine environment, it is reasonable to conclude that the Alaska and Russia nesting populations are being affected similarly because a large portion of the Russian population winters with the Alaskan population." BE at 18.

"Variability in the abundance of the Alaskan breeding population of Steller's eiders is not well understood." BE at 18.

"Williamson et al. (1966) listed Steller's eiders as occurring in the Cape Thompson area 25 miles southeast Point Hope during surveys for Project Chariot at Ogotoruk Creek. Steller's eiders were listed as occupying marine littoral, lacustrine, and beach environments in order of affinity. In this

² See note 1.

study, marine littoral waters extended seaward 2 miles from shore. Steller's eiders were listed as present from June 1 through October 4 and uncommon, but possibly breeding in the area. It is not known if Steller's eiders still nest in this area." BE at 20-21.

4. Kittlitz's Murrelets³

"The Kittlitz's murrelet (*Brachyramphus brevirostris*) is one of the rarest and least understood seabirds in North America. There is limited life history information on the Kittlitz's murrelet (i.e., age at first breeding, nest success, hatching success, fledging success, first-year survival, survival to breeding age, proportion of breeding females, proportion of non-breeders, periodic non-breeding, etc.) and mechanisms of population regulation. The limited information available for this species and research on the closely-related marbled murrelet suggests a K-selected life history strategy." BE at 33.

"The longevity of the Kittlitz's murrelet is unknown . . ." BE at 33.

"Age to maturity in Kittlitz's murrelets is unknown . . ." BE at 33.

"Little is known about the reproductive strategy of Kittlitz's murrelet because nesting sites are difficult to find (Day et al. 1999)." BE at 33.

"Annual breeding effort is poorly understood, but is considered highly variable." BE at 33.

"Spring migration for Kittlitz's murrelets in the Chukchi Sea is unknown . . ." BE at 34.

"Little is known about Kittlitz's murrelet recruitment . . ." BE at 34.

"Annual adult survival has not been estimated . . ." BE at 34.

"Though there is some evidence for long-term population declines for *Brachyramphus* murrelets (van Vliet and McAllister 1994, Ralph et al. 1995, Kuletz et al. 2003), Day et al. (1999) argued that evidence for major population declines for the Kittlitz's murrelet was equivocal. In large part, their conclusion stems from the fact that historical population estimates are lacking (but see Isleib and Kessel 1973, Agler et al. 1998, Kendall and Agler 1998)." BE at 34.

"Fall migration in the Chukchi Sea population [of Kittlitz's murrelet] is unknown . . ." BE at 35.

"Post-breeding distribution [of Kittlitz's murrelet] is poorly understood, but is likely farther offshore than pre-breeding season." BE at 35.

"Winter distribution [of Kittlitz's murrelet] is poorly understood, but is probably pelagic." BE at 35.

³ See note 1.

"The diet of the Chukchi Sea summer residents is unknown . . ." BE at 35.

"Winter foods are unknown, but may consist mostly of pelagic euphausiids or other macroinvertebrates." BE at 35.

"Information regarding fidelity to nesting sites is not available (Day et al. 1999)." BE at 35.

"Causes for the declines [in Kittlitz's murrelets] are not well known, but likely include: habitat loss or degradation, increased adult and juvenile mortality, and low recruitment, and we believe that glacial retreat and oceanic regime shifts are the factors that are most likely causing population-level declines in this species." BE at 36 (citing USFWS status review, 2004).

5. Cliff-Nesting Seabirds

a. Murres

Noting "limited data." EIS III-62.

b. Puffins

"The current status of horned puffins in the Chukchi Sea is unknown." EIS III-62.

"The current status of the tufted puffin in the Chukchi Sea is also unknown." EIS III-62.

c. Black-Legged Kittiwake

"The current status of the black-legged kittiwake (*Rissa tridactyla*) in the Chukchi Sea is unknown." EIS at III-63.

"The portion of [Chukchi] population in the proposed lease sale area is unknown, but could be substantial late in the open-water season. Seasonal areas of concentration, if any, are unknown." EIS at III-63. See also *id.* at IV-142 (similar).

"Current population estimates at [Cape Thompson and Cape Lisburne] colonies are unknown." EIS at IV-143.

6. Bering Sea Breeders and Summer Residents

a. Northern Fulmar

"The current status of the northern fulmar (*Fulmarus glacialis*) is unknown." EIS at III-63.

b. Short-Tailed Shearwater

"The current status of the short-tailed shearwater (*Puffinus tenuirostris*) in the Chukchi Sea is unknown." EIS at III-63.

c. Auklets

"The current status of parakeet (*Cyclorhynchus psittacula*), least (*Aethia pusilla*) and crested (*A. cristatella*) auklets in the Chukchi Sea is unknown." EIS at III-63.

7. High Arctic-Associated Seabirds

a. Black Guillemot

"The current status of the black guillemot (*Cepphus grylle*) in the Chukchi Sea is unknown." EIS at III-63.

b. Ivory Gull

"The current status of the ivory gull (*Pagophila eburnea*) in the Chukchi Sea is unknown. Divoky (1987) reported that ivory gulls are closely associated with the ice edge throughout their lifecycle. Ivory gulls are considered uncommon to rare in pelagic waters of the Chukchi during summer, and small numbers migrate through in fall to wintering areas in the northern Bering Sea." EIS at III-64.

c. Arctic Tern

"The current status of the Arctic tern (*Sterna paradisaea*) in the Chukchi Sea is unknown." EIS at III-64.

8. Tundra-Breeding Migrants

a. Jaegers

"The current status of [all three species of] jaegers in the Chukchi Sea is unknown." EIS at III-64.

b. Glaucous Gull

"The current status of the glaucous gull (*Larus hyperboreus*) in the Chukchi Sea is unknown." EIS at III-64.

9. Waterfowl

a. Yellow-Billed Loons

"Compared to what is known about yellow-billed loons near the Beaufort Sea coast, there is very little known about the coastal areas bordering the Chukchi Sea." EIS at III-65.

"The [yellow-billed loon] is little studied and basic biological information (such as the seasonal distribution of immature and non-breeding yellow-billed loons) is unknown." EIS at IV-140.

b. Common Eider

"During spring migration, the common eider (*Somateria mollissima*) typically migrates along the Chukchi Sea coast, using offshore open-water leads. Offshore migration distances are poorly understood for the Chukchi Sea, but in the Beaufort Sea they are usually found within 48 km (29 mi) of shore." EIS at III-66.

c. Pacific Brant

"The current status of the Pacific brant along the Chukchi Sea is unknown." EIS at III-68.

d. Greater White-Fronted Geese

"The current status of greater white-fronted geese along the Chukchi Sea coast is unknown." EIS at III-68.

e. Lesser Snow Goose

"Ritchie et al. (2006) reported that the number of snow geese nesting on the Ikpikpak River delta continued to increase substantially from numbers recorded prior to 1999. There are no comparable data for the Kukpowruk River delta colony." EIS at III-68.

10. Shorebirds

a. Buff-Breasted Sandpiper (species of concern)

Noting "limited data." EIS III-70.

b. Bar-Tailed Godwit (species of concern)

"The abundance and distribution of bar-tailed godwits in northern Alaska and coastal areas of the Chukchi Sea are not well understood." EIS at III-69.

"The North American population of bar-tailed godwits (*Limosa lapponica baueri*) breeds in western and northern Alaska. Postbreeding bar-tailed godwits move to staging grounds along the Bering Sea Coast and then apparently fly nonstop 11,000 km to New Zealand. Recent counts conducted at both breeding and nonbreeding sites provide evidence of a serious and rapid population decline (McCaffrey et al., 2006), but the cause of the decline is unknown." EIS at III-69.

LACK OF INFORMATION ABOUT EFFECTS ON SPECIES

I. FISH

A. General

1. General effects of seismic on fish

"A review of available science and management literature shows that at present, there are no empirical data to document potential impacts from seismic surveys reaching a local population-level effect. The experiments conducted to date have not contained adequate controls to allow us to predict the nature of a change or that any change would occur." EIS at II-33. See also *id.* at IV-51—52 (similar) and IV-74 (similar).

2. General effects of oil spills on fish

"Given a lack of contemporary abundance and distribution information, large oil spill effects on rare or unique species (including potential extirpation) could occur, but would likely go unnoticed or undetected." EIS at II-34. See also EIS at IV-52 and IV-74 (similar).

"While small-spills are required to be reported, the number of unreported spills is unknown. Not all spills would be expected to receive a spill-response. Overall, it is unclear whether, over the long-term and in the absence of a monitoring program to assess effects, any negative impacts to fish resources from chronic small spills would be detected." EIS at IV-72.

B. Effects on Marine Pelagic Species

"Effects on recruitment would be particularly difficult to assess, because very few studies of offshore fishes have been made." EIS at IV-61.

C. Effects on Capelin

"Eggs deposited in the proximity of the contaminated substrate over a series of years likely would be exposed to oil (PAH's) retained in the substrate, as PAH's in weathered oil can be biologically available for long periods and very toxic to sensitive lifestages, subsequently leading to lethal and sublethal effects to those offspring of successive generations. It is not known what such a behavioral response may have on the dynamics of the population; however, the spawning site likely would be unavailable for use for multiple generations, depending on the sensitivity of the capelin to detecting contaminated substrates and how long the oil persists in the localized habitat." EIS at IV-60-61.

"Also unknown are the distribution and abundance of spawning sites used by capelin in the Alaskan Arctic." EIS at IV-63.

D. Effects on Arctic Cod

"Although arctic cod can be extremely abundant in nearshore lagoonal areas, the importance of nearshore versus offshore environments to the lifecycle is not known (Craig et al., 1982). Although it is known that juvenile arctic cod associate with floating ice, it is unknown to what degree this association contributes to the development and survival of young fishes later recruiting to the breeding population. If early lifehistory stages of arctic cod were concentrated in nearshore environments, in patches in the open ocean, or under floating ice, they certainly would be more vulnerable to effects from an oil spill impacting such habitats." EIS at IV-62.

II. MARINE MAMMALS

A. General

1. Effects on Marine Mammals in General

"Based on the paucity of information available on marine mammal ecology in the Chukchi Sea and on specific locations of future developments, we are unable to determine at this time if significant impacts will or will not occur." EIS at II-37.

"[B]ecause of the lack of data on marine mammal distributions and habitat use in offshore areas of the Chukchi Sea, it is uncertain what the level of effects would be in offshore areas [regarding Alt. III]. EIS at II-42. See also *id.* at IV-269 (same) and EIS at II-45 (same, re: Alt. IV).

"Because there are no oil and gas production facilities in the Chukchi Sea, it is difficult to predict with certainty what potential impacts from such development would have on threatened and endangered marine mammals." EIS at IV-111.

"Unfortunately, it has not been possible to predict the type and magnitude of marine mammal responses to the variety of disturbances caused by oil and gas operations and industrial developments in the Arctic. More importantly, it has not been possible to evaluate the potential effects on populations." EIS at IV-152.

"In light of the uncertainty over the potential impacts of exploration and development activities, the earliest possible establishment of long-term monitoring programs for vulnerable species in the project area should be pursued. The design of long-term monitoring should take into account the likely size of any effect and the probability of detecting it within a reasonable time span (IWC, 2006)." EIS at IV-162-63.

"[W]ithout historical data on distribution and abundance, it is not possible to measure the impacts of an oil spill on marine mammals." EIS at IV-156.

"Based on the paucity of information available on marine mammal ecology, and specifically on habitat use patterns, in the Chukchi Sea and based on the lack of specific information regarding the location of future developments, we are unable to determine at this time if significant impacts would or would not occur to marine mammal populations in the project area as a result of the Proposed Action." EIS at IV-145.

"Careful mitigation can help reduce the effects of future industrial developments and their accumulation through time. However, the effects of full-scale industrial development of the waters of the Chukchi Sea likely would accumulate through displacement of marine mammals from their preferred habitats, increased mortality, and decreased reproductive success. Because of the lack of data on which to base informed decisions, it is unknown if noise introduced into the environment from industrial activities, including drilling and seismic operations, will have an

adverse impact on nonendangered and nonthreatened marine mammals in the Proposed Action area. Increasing vessel traffic in the Northwest Passage, defined as the marine route between the Pacific and Atlantic oceans through the Arctic Ocean across the top of North America, which includes the Proposed Action area, increases the risks of oil and fuel spills and vessel strikes of marine mammals." EIS at IV-145-46.

"Because very little is known about the distributions, population sizes or habitat use of marine mammals in the Chukchi Sea, it is difficult to determine if significant impacts will or will not occur to marine mammals as a result of the proposed action." EIS at V-32.

2. Effects of Seismic and Other Noise on Marine Mammals

"Because of the lack of data it is unknown if noise introduced into the environment from industrial activities, including drilling and seismic operations, will have an adverse impact on nonendangered and nonthreatened marine mammals in the Proposed Action area." EIS at II-37. See also EIS IV-145-146 (similar).

"Despite the increasing concern and attention noted above, there still is uncertainty about the potential impacts of sound on marine mammals; on the factors that determine response and effects; and especially on the long-term, cumulative consequences of increasing noise in the world's oceans from multiple sources (NRC, 2003, 2005). The NRC (2005) concluded that it is unknown how or in what cases responses of marine mammals to anthropogenic sound rise to the levels of biologically significant effects. This group also developed an approach of injury and behavioral "take equivalents". These take equivalents use a severity index that estimates the fraction of a take experienced by an individual animal. This severity index is higher if the activity could be causing harassment at a critical location or during a critical time (e.g., calving habitat). Because we have uncertainty about exactly where and how much activity will occur, the recommendations from the NRC (2005) are qualitatively incorporated in MMS analysis." EIS at IV-86.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown . . ." EIS IV-89.

"Although it is unlikely that airgun operations during most seismic surveys would cause [permanent threshold shift to hearing] in marine mammals, caution is warranted given the limited knowledge about noise-induced hearing damage in marine mammals." EIS IV-147.

3. Effects of Oil Spills on Marine Mammals

"There are few post-spill studies with sufficient details to reach firm conclusions about the effects, especially the long-term effects, of an oil spill on free-ranging populations of marine mammals." EIS at IV-115.

B. Whales

1. General

"The need to rely on indirect methods of assessing the environmental impact of human activity on marine mammals is a recurring problem (Inglis and Gust, 2003). Impact assessments for cetaceans typically emphasize immediate behavioral responses to human activities (Samuels and Bejder, 2004), the biological relevance of which is rarely known (Corkeron, 2004)." EIS at IV-154.

"[M]onitoring plans typically emphasize readily obtainable, short-term behavioral measures that can be directly related to disturbance factors (Bejder et al., 2006). However, it is rarely known in what ways short-term responses translate to longer term changes in reproduction, survival, or population size (Gill, Norris, and Sutherland, 2001; Beale and Monaghan, 2004a), and it is seldom possible to infer biological significance based on short-term behavioral observations." EIS at IV-154.

a. Effects from seismic/noise on whales in general

"[T]here is acknowledged . . . scientific uncertainty about the potential effects of noise, especially repeated exposure to loud noise, on baleen whales." EIS at IV-82.

"There are very few, if any, data available about potential effects of . . . noise . . . on cetacean calves." EIS at IV-82.

"[T] here are few instances where data are sufficient to evaluate the total energy exposure of a marine mammal from a given source. At present, we do not have the data necessary to make such a determination or understand how it might change our analysis." EIS at IV-86.

"While there is some general information available, evaluation of the impacts of noise on marine mammal species, particularly on cetaceans, is greatly hampered by a considerable uncertainty about their hearing capabilities and the range of sounds used by the whales for different functions (Richardson et al., 1995a; Gordon et al., 1998; NRC, 2003, 2005). This is particularly true for baleen whales. Very little is known about the actual hearing capabilities of the large whales or the impacts of sound on them, especially on them physically. While research in this area is increasing, it is likely that we will continue to have great uncertainty about physical effects on baleen whales because of the difficulties in studying them. Baleen whale hearing has not been studied directly. There are no specific data on sensitivity, frequency or intensity discrimination, or localization (Richardson et al., 1995a). Thus, predictions about probable impacts on baleen whales generally are based on assumptions about their hearing rather than actual studies of their hearing (Richardson et al., 1995a; Gordon et al., 1998; Ketten, 1998)." EIS IV-87.

"Based on indirect evidence, at least some baleen whales are quite sensitive to frequencies below 1,000 Hz but can hear sounds up to a considerably higher but unknown frequency." EIS IV-87.

"Repeated long exposures to intense sound or sudden onset of intense sounds generally characterize sounds that cause permanent threshold shift in humans. Ketten (1998) stated that age-related hearing loss in humans is related to the accumulation of permanent-threshold shift and TTS damage to the ear. Whether similar age-related damage occurs in cetaceans is unknown." EIS at IV-88.

"There are no data on which to determine the kinds or intensities of sound that could cause a [temporary threshold shift, TTS] in a baleen whale." EIS at IV-88.

"Little data are available about how, over the long term, most marine mammal species (especially large cetaceans) respond either behaviorally or physically to intense sound and to long-term increases in ambient noise levels. Large cetaceans cannot be easily examined after exposure to a particular sound source." EIS at IV-88.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown, and information about the hearing capabilities of large baleen whales is mostly lacking. As noted previously, the assumption is made that the area of greatest hearing sensitivity is at frequencies known to be used for intraspecific communication. However, because real knowledge of sound sensitivity is lacking, we believe it is prudent to assume in our analyses that sensitivities shown by one species of baleen whale also could apply to another. This reasonable approach provides the means to infer possible impacts on other species (such as the fin whale), especially when using studies on a species such as the humpback, which uses a large sound repertoire in intraspecific communication." EIS at IV-89.

"It is not known whether (or which) marine mammals can . . . and do adapt their vocalizations to background noise." EIS at IV-89 (internal citation omitted).

b. Effects from oil spills on whales in general

"There is uncertainty and controversy regarding the potential effects of oil spills on large cetaceans. There are very few, if any, data available about potential effects of . . . oil spills on cetacean calves." EIS at IV-82.

"There are no data available to MMS that definitely link even a large oil spill [associated with seismic surveys] with a significant population-level effect on a species of large cetacean." EIS at IV-103.

"Data are not available that would permit evaluation of the potential for long-term sublethal effects [from oil spills] on large cetaceans." EIS at IV-115.

"[T]he potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from a large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects." EIS at IV-115.

"With whales, even when unusual changes in abundance occur following an event such as the EVOS (as with the disappearance of relatively large numbers of killer whales from the AB pod in Prince William Sound) (Dahlheim and Matkin, 1994), interpretation of the data is uncertain or is often controversial due to the lack of supporting data, such as oiled bodies or observations of individuals in distress (and, in that case, the existence of a viable alternate explanation of the probable mortality). Thus, the potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from a large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects. EIS at IV-115. See also *id.* at IV-117 (latter two sentences similar).

"It is not clear how long crude oil would remain on a free-ranging cetacean's skin once it was oiled." EIS at IV-117.

"The potential effect of crude oil on the function of the cetacean blowhole is unknown." EIS at IV-118. See also *id.* at IV-159.

"The effects of an oil spill on cetacean newborns or other calves and the potential effects of contact or detection of spilled oil by near-term, or post-partum females are not known." EIS at IV-121.

"[T]he potential for long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from large oil spill on cetaceans is unknown. However, observations of cetaceans behaving in a lethargic fashion or having labored breathing has been documented in more than one species, including in gray whales after the EVOS, in which large numbers of individuals were subsequently found dead." EIS at IV-158.

"The potential for there to be long-term sublethal (for example, reduced body condition, poorer health, reduced immune function, reduced reproduction or longer dependency periods) effects on large cetaceans from a large oil spill essentially is unknown. There are no data on large cetaceans adequate to evaluate the probability of sublethal effects. EIS at IV-160.

"The effects of a large oil spill and subsequent exposure of whales to fresh crude oil are uncertain, speculative, and controversial." EIS at IV-161.

2. Bowhead Whale

"There are multiple sources of uncertainty in our analyses. These include, but are not limited to uncertainty about the action: where seismic surveys will occur; how many surveys will occur; how much noise will be produced purposely by the firing of airguns; what the exact shape of related ancillary activities, such as support vessel type and activity will be; where exploration drilling could occur; where leases will be let; where a spill could occur; where production platforms and pipelines may be based; etc. More important, there is acknowledged (NRC, 2003, 2005; minutes from meetings of the Marine Mammal Commission Sound Advisory Panel, 2004, 2005 from their web site) scientific uncertainty about the potential effects of noise, especially

repeated exposure to loud noise, on baleen whales. There is uncertainty and controversy regarding the potential effects of oil spills on large cetaceans. There are very few, if any, data available about potential effects of either noise or oil spills on cetacean calves. Lastly, and importantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales. Thus, it is difficult to predict exposure in some parts of the area where the action could occur and to understand fully the potential effects of any exposure." EIS at IV-82.

a. Effects of seismic and other noise on bowhead whale

"Uncertainty exists about the potential effects of seismic surveys on bowhead whales (especially on calf survival and growth and female reproduction) in the Chukchi Sea due to a lack of current data about their use of the Proposed Action area during periods when seismic surveys could be occurring. What is known, however, is that the observed response of bowhead whales to seismic survey noise varies among studies. Some of the variability appears to be context specific (i.e. feeding versus migrating whales) and also may be related to the whales' reproductive status and/or sex or age." EIS at II-35.

"Bowheads respond to drilling noise at different distances depending on the types of platform from which the drilling is occurring. Data indicate that many whales can be expected to avoid an active drillship at 10- 20 km or possibly more." EIS at II-36. See also *id.* at IV-194 (similar).

"The long-term response of bowheads to production facilities located at the southern end of the migration corridor is unknown." EIS at II-36.

"The response of bowhead whales to construction in high-use areas is unknown and is expected to vary with the site and the type of facility being constructed. Similarly, the long-term response of bowheads to production facilities other than gravel islands located at the southern end of the migration corridor is unknown." EIS at IV-194 (internal references omitted).

"There are multiple sources of uncertainty in our analyses. These include, but are not limited to uncertainty about the action: where seismic surveys will occur; how many surveys will occur; how much noise will be produced purposely by the firing of airguns; what the exact shape of related ancillary activities, such as support vessel type and activity will be; where exploration drilling could occur. . . ." EIS at IV-82.

"More important, there is acknowledged (NRC, 2003, 2005; minutes from meetings of the Marine Mammal Commission Sound Advisory Panel, 2004, 2005 from their web site) scientific uncertainty about the potential effects of noise, especially repeated exposure to loud noise, on baleen whales." EIS at IV-82.

"Data are not sufficient to determine sex, age, or reproductive factors that may be involved in [bowhead] response to vessels. We are not aware of data that would allow us to determine whether females with calves tend to show avoidance and scattering at a greater, lesser, or at the same distances as other segments of the population." EIS at IV-109.

Exhibit 129, Page 30 of 40

"The encounter rate of bowhead whales with vessels associated with exploration would be determined by what areas were being explored. Data are insufficient for us to accurately predict the average geographic zone of activity by the support vessels and thus, to predict the additional area that could be affected by the vessels." EIS at IV-100.

"Data on reactions of bowheads to helicopters are limited." EIS IV-100.

"While it is clear that seismic activity may overlap with bowhead use of the Chukchi Sea during fall migration, it is highly uncertain about the likely extent of overlap between seismic activity and bowhead whales in the summer." EIS at IV-101.

"During fall migration, available, but dated, data indicate that overlap is likely to be greatest in the main migratory pathways, one heading nearly directly to the Bering Strait, and the other heading west from Barrow towards Wrangell Island." EIS at IV-101-102.

"It is clear that if 2D/3D seismic surveys impacted areas of the spring lead and polynya system during the spring migration, impacts could potentially be biologically significant. We note that the general location of the spring lead system in the Chukchi Sea (and Beaufort Sea) is based on relatively limited survey data and is not well defined." EIS at IV-102.

"The second situation for possibly larger than typical impacts exists in the Chukchi Sea in the autumn (e.g., late September on) as whales migrate both towards the Asian coast and toward the Bering Strait. Insufficient data exist to determine the current migration paths or the numbers of whales that might be deflected from those paths. Data are also not available to determine how intensively bowheads feed during the autumn migration in the Chukchi Sea or whether large aggregations exist in certain places due to prey resources." EIS at IV-103.

"The factors associated with the variability [of bowhead responses to drillships and other noise] are not fully identified or understood." EIS IV-105.

"There are few data on the noise [imposed on, e.g., bowheads] from conventional drilling platforms." EIS at IV-105.

"Most observations of bowheads tolerating noise from stationary operations are based on opportunistic sightings of whales near ongoing oil industry operations, and it is not known whether more whales would have been present in the absence of those operations. Because other cetaceans seem to habituate somewhat to continuous or repeated noise exposure when the noise is not associated with a harmful event, this suggests that bowheads will habituate to certain noises that they learn are nonthreatening. Additionally, it is not known what components of the population were observed around the drillship (adult or juvenile males, adult females, etc.)." EIS IV-105.

"The response of bowhead whales to construction in high use areas is unknown and is expected to vary with the site and the type of facility being constructed. Similarly, the long-term response of bowheads to production facilities other than gravel islands located at the southern end of the migration corridor is unknown." EIS at IV-123.

Exhibit 129, Page 31 of 40

"The response of bowhead whales to construction in high-use areas is unknown and is expected to vary with the site and the type of facility being constructed. EIS at IV-194.

"Noise associated with ships or other boats potentially could cause bowheads to alter their movement patterns or make other changes in habitat use. Clapham and Brownell (1999) summarized that "...effects of ship noise on whale behavior and ultimately on reproductive success are largely unknown." EIS at V-23.

"[R]ecent monitoring studies indicated that most fall migrating whales avoid an area with a radius about 20-30 km around a seismic vessel operating in nearshore waters; however, there are no data that indicate that such avoidance is long-lasting after cessation of the activity." EIS at V-25.

b. Effects of oil spill on bowhead whale

"There is uncertainty about the effects on bowheads (or any large cetacean) from the event of a large oil spill." EIS at II-36.

"The potential effects to bowheads of exposure to [polyaromatic compounds, PACs] through their food are unknown. Because of their extreme longevity, bowheads are vulnerable to incremental long-term accumulation of pollutants." EIS at IV-103. See also *id.* at IV-119 (same).

"In the Biological Opinion for Federal oil and gas leasing and exploration by the MMS within the Alaskan Beaufort Sea and its effects on the endangered bowhead whale, the NMFS (2001:51) stated that: "It is difficult to accurately predict the effects of oil on bowhead whales (or any cetacean) because of a lack of data on the metabolism of this species and because of inconclusive results of examinations of baleen whales found dead after major oil releases." EIS at IV-103.

"There is great uncertainty about the potential effects of ingestion of spilled oil on bowheads, especially on bowhead calves. Decreased food assimilation could be particularly important in very young animals, those that seasonally feed, and those that need to put on high levels of fat to survive their environment." EIS at IV-118.

"It is not known if bowheads would leave a feeding area where prey was abundant following a spill." EIS at IV-118.

"The factors associated with the presence of [large aggregations of bowhead whales] are not yet clear. It is not known if they would leave the area heavily contaminated with crude oil." EIS at IV-121.

"Primarily because of the uniqueness of the bowhead and its apparently obligate use of spring lead and polynyas as its migratory path between wintering and summering grounds, MMS is uncertain of the potential severity of impact should a large oil spill occur within such a system, especially if spring migration were underway and hundreds of females were calving in or near those leads." EIS at IV-121.

Exhibit 129, Page 32 of 40

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

"In conclusion, there is uncertainty about effects on bowheads (or any large cetacean) in the event of a large oil spill. There are, in some years and in some locations, relatively large aggregations of feeding bowhead whales within the proposed lease-sale area. If a large amount of fresh oil contacted a significant portion of such an aggregation, effects potentially could be greater than typically would be assumed and we cannot rule out population-level effects if a large number of females and newborn or very young calves [so this would be in spring] were contacted by a very large amount of fresh crude oil." EIS at IV-125.

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

"It is unknown what effects an oil spill would have on bowhead whales, but it is likely that some whales would experience temporary, nonlethal effects from the oiling of skin, inhaling hydrocarbon vapors, ingesting oil contaminated prey, fouling of their baleen, losing their food source, and temporary displacement from some feeding areas." EIS at IV-216-217.

"Limited monitoring data prevent effective assessment of cumulative subsistence-resource damage; resource displacement; changes in hunter access to resources; increased competition; contamination levels in subsistence resources; harvest reductions; or increased effort, risk, and cost to hunters. Limited data also limit our assessment of the effectiveness of mitigation measures." EIS at V-46.

c. Effects of past activity on bowhead whale

"Available data . . . are inadequate to fully address issues about effects of past oil and gas activity specifically in the Chukchi Sea on bowhead behavior." EIS at V-25.

Also, "we cannot adequately assess potential effects on patterns or durations of bowhead habitat use. Because of the inadequacy of the data on activities, and because of the limitations inherent in studying large baleen whales, MMS was not able to assess whether there were any adverse health effects to individuals during the period of relatively intensive seismic survey activity in the 1980's." EIS at V-25.

"However, data are inadequate to fully evaluate potential impacts on whales during this period, including the duration of habitat use effects or numbers and types of individuals that did not use high-use areas because of the activities." EIS at V-27.

Exhibit 129, Page 33 of 40

d. Cumulative effects on bowhead whale

"[D]ata on other potential perturbations (e.g., past seismic surveys and oil spills) are not sufficient to clearly know the level of effects [on bowheads]." EIS at V-20.

"Whether there are long-lasting behavioral effects from [subsistence] activity are unknown, but overall habitat use appears to be relatively unaffected." EIS at V-20.

"There are not sufficient data about past human activities, including, but not limited to, past offshore oil and gas related seismic surveys, or ice-management activities, to address whether there are any long-term impacts on [bowhead] behavior from such activities in either evaluation area." EIS at V-20.

"There are insufficient data to make reliable predictions of the effects of Arctic climate change on bowhead whales." EIS at V-22 (quoting Angliss and Lodge (2002:174)).

"If climate changes occur, it is likely that shipping would increase throughout the range of the bowhead, especially in the southern portions of the Arctic Ocean. If commercial fisheries were to expand, bowhead whale death and or injury due to interactions with fishing gear, possibly injury and/or death due to incidental take in commercial fisheries, and temporary effects on behavior potentially could occur. There are, however, no data that would permit a quantitative prediction of the aforementioned possible effects." EIS at V-22.

"Data on other activities, such as hunting activity, barge traffic, and shipping noise are incomplete. Thus, while it is clear there have been multiple noise and disturbance sources in the Beaufort Sea over the past 30 years, because of the incompleteness of data, even for the 1990's, for many types of activities, we cannot evaluate the cumulative effects on bowhead whales resulting from multiple noise and disturbance sources (e.g., 2D seismic in State and Federal waters, drilling, ice management, high-resolution acoustic surveys, vessel traffic, construction, geotechnical borehole drilling, aircraft surveys, and hunting). Because data also are incomplete for the Chukchi Sea, we reach the same general conclusions." EIS at V-26.

3. *Beluga Whale*

"A large oil spill could have significant impacts to beluga prey species, including anadromous and coastal spawning species such as salmon (Sec. IV.C.1.d). If a significant impact to anadromous and coastal spawning species occurred, the effects on belugas would be detrimental, but the magnitude unknown." EIS at IV-161.

"Given the greater potential for anthropogenic-noise impacts on baleen whales, more research has been done to focus on potential effects on baleen whales than with toothed whales (although data is still considered limited)." EIS at IV-151.

4. *Humpback, Fin, and Other Baleen Whales*

a. Effects of seismic and other noise on humpback, fin, and/or other baleen whales

"Given the greater potential for anthropogenic-noise impacts on baleen whales, more research has been done to focus on potential effects on baleen whales than with toothed whales (although data is still considered limited)." EIS at IV-151.

"No studies are available specific to the effects of seismic-survey noise on minke whales, but the potential for impacts would be considered within the range of other baleen whales. Also, no known long-term impacts have been documented on gray and minke whale behavior as a result of seismic activity." EIS at IV-151.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown, and information about the hearing capabilities of large baleen whales is mostly lacking." EIS at IV-89.

b. Effects of oil spills on humpback, fin, and/or other baleen whales

"[I]t is difficult to predict the impact of a large spill on either humpback whales or especially on fin whales. Based on literature on other mammals indicating severe adverse effects of inhalation of the toxic aromatic components of fresh oil, mortality of cetaceans could occur if they surfaced in large quantities of fresh oil. However, if such mortality occurred, it would be not be consistent with many, perhaps most, published findings of expected impacts of oil on cetaceans. The potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects." EIS at IV-122.

"There are no data available on which to evaluate the potential effect of a large or very large spill on baleen whale calves, on females who are very near term or who have just given birth, or on females accompanied by calves of any age." EIS at IV-161.

c. Cumulative impacts on humpback, fin, and/or other baleen whales

"There are no records of humpbacks killed or injured in the fisheries in which fishers self report (Angliss and Lodge, 2002), but the reliability of such data is unknown." EIS at V-29.

"The impacts of pollution and habitat degradation [on humpback whales] due to coastal development are not known." EIS at V-30.

C. *Other Marine Mammals*

1. *Seals*

"It is uncertain how seismic surveys potentially might impact seal-food resources in the immediate vicinity of the survey." EIS at IV-147.

In the context of seals: "Although it is unlikely that airgun operations during most seismic surveys would cause [permanent threshold shift] in marine mammals, caution is warranted given the limited knowledge about noise-induced hearing damage in marine mammals." EIS at IV-147.

"Little information is known about oil-spill effects on seals although any large oil spill in nearshore marine or coastal riverine environments could cause injury or death to these sea mammals, potentially cause them to move off of their normal course, and make them unavailable for subsistence harvest." EIS at IV-217 (internal references omitted).

2. *Walrus*

a. Effects of seismic

There is "no data available to evaluate the potential response of walrus to seismic operations." EIS at IV-148.

"Quantitative research on the sensitivity of walrus to noise has been limited because no audiograms (a test to determine the range of frequencies and minimum hearing threshold) have been done on walrus." EIS IV-148.

"Although the hearing sensitivity of walrus is poorly known, source levels are thought to be high enough to cause temporary hearing loss in other species of pinnipeds." EIS at IV-148.

"Seismic operations are expected to create significantly more noise than general vessel and icebreaker traffic; however, there are no data available to evaluate the potential response of walrus to seismic operations." EIS IV-148.

3. *Polar Bears*

a. Effects from oil spills

"With the limited background information available regarding large oil spills in the offshore arctic environment, the outcome of a large oil spill is uncertain." EIS at IV-165.

b. Cumulative effects

"Quantitative data are lacking that specifically addresses the potential cumulative impacts of development on polar bears and the effects of disturbance related to human activities on polar bear habitat use, as well as recruitment and survival (Perham, 2005). There also is a high degree of uncertainty regarding the spatial scope of potential Industry activities on the Alaskan OCS." EIS at V-36. *See also id.* at V-52 (same).

III. MARINE AND COASTAL BIRDS

A. Impacts Generally

"Several areas historically documented to be important to marine and coastal birds in Sale 193 area, as well as the entire proposed lease sale area, lack site-specific data on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data is between 15 and 30 years old, making accurate analysis difficult. Overall, several species or species-groups have a high probability of experiencing substantial negative impacts. The risk that several regional bird populations could experience significant adverse impacts is high." EIS at II-37.

"The current distribution and abundance of [bird] predators along the Chukchi Sea coast are unknown." EIS at IV-132.

"Marine and coastal birds could be exposed to a variety of potential negative effects during seismic surveys, exploration drilling, and production including disturbances, collisions, habitat loss, petroleum exposure, and exposure to toxic contamination. The greatest potential for substantial adverse impacts typically would arise from collisions, aircraft disturbance, and large and chronic low-volume spills in important coastal bird habitats. These areas are Kasegaluk Lagoon, Ledyard Bay, Peard Bay, barrier islands, the spring open-water lead system, and the seabird-nesting colonies at Cape Lisburne and Cape Thompson. Despite the importance of these areas, as well as the entire Chukchi Sea within the proposed lease-sale area, little recent site-specific data are available on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data are between 15 and 30 years old, making accurate analysis difficult. Because of this long data gap, it is unknown if population abundance or distribution of many species have changed." EIS at IV-145.

1. Noise impacts on marine and coastal birds

"Seismic airgun pulses have the potential to physically harm or kill diving birds. The threshold for physiological damage, namely to the auditory system, for marine birds is unknown." EIS at IV-127.

"Few studies have assessed the effects of seismic surveys on marine birds and waterfowl." EIS at IV-127.

2. Oil impacts on marine and coastal birds

"There are several areas historically documented to be important to marine and coastal birds in the proposed lease sale area. These areas, as well as the entire proposed lease sale area, lack site-specific data on habitat use patterns, routes and timing to assess impacts. For many species, the most recent data is between 15 and 30 years old, making accurate analysis difficult." EIS IV-126.

"It is unknown if exposed adult[birds] could become permanently sterilized [due to exposure to oil]." EIS at IV-133.

B. Impacts to Threatened Spectacled and Steller's Eiders⁴

"The behavioral response of eiders to aircraft overflights is unknown; some spectacled eiders nest and rear broods near the Deadhorse airport indicating that some individuals tolerate frequent aircraft noise. Individual tolerances are expected to vary, however, and the intensity of disturbance associated with the proposed action would, in most cases, be less than that experienced by birds at the Deadhorse airport. Some birds may be displaced, with unknown physiological and reproductive consequences." BE at 38 (emphases added).

"Collision-related mortality to eiders on the North Slope is not known and is difficult to estimate ..." BE at 44.

Ledyard Bay Critical Habitat Areas: "The loss of seafloor habitats due to exploration or delineation drilling cannot be quantified at this time, but could be in important staging or molt migration areas. The importance of these areas relative to the timing of molt, survival during the molting period, and condition after molting is unknown, however, the availability and quality of key resources in those areas during the prolonged migration period ultimately may influence the survival of the spectacled eiders (Petersen et al. 1999)." BE at 47.

"The disturbance radius from the drilling operation is unknown. Temporal and spatial use patterns for eiders within the Critical Habitat Area are also largely unknown." BE Addendum at 1.

C. Impacts to Kittlitz's Murrelets⁵

"Clearly, there is cause for concern regarding the long-term survival of the [Kittlitz's Murrelet] and the potential negative impacts of offshore oil and gas development; however, management decisions are difficult given the lack of available information." BE at 36-37.

"Though impacts of oil spills [on Kittlitz's murrelets] have been documented (van Vliet and McAllister 1994, Carter and Kuletz 1995), little is known of potential impacts of disturbance on courtship behavior, foraging ecology and feeding, or energetics (Day et al. 1999)." BE at 37.

⁴ See note 1.

⁵ See note 1.

DRAFT DRAFT DRAFT
FEBRUARY 2010

Attachment 3
Major Problems with Oil Spill Models

"Additional information on the response of diving birds to approaching seismic survey vessels is essential to verify assumptions that there is a low potential for seabirds, including Kittlitz's murrelets, to be harmed by airgun noises." BE at 41.

D. Impacts on Waterfowl

1. Impacts on Yellow-Billed Loons

"Yellow-billed loons in the Chukchi Sea are at particular risk [from environmental perturbations such as disturbance, habitat alterations, and oil spills] due to their low numbers and low reproductive rate. The species is little studied and basic biological information (such as the seasonal distribution of immature and non-breeding yellow-billed loons) is unknown. Additional research could improve our understanding of the vulnerabilities of the yellow-billed and other loons using nearshore areas of the Chukchi Sea and western Beaufort Sea." EIS at IV-140-41.

2. Impacts on Common Eiders

"The number of [common eiders] that could be affected [by oil spill] at sea during spring or fall migration is unknown." EIS at IV-142.

E. Impacts on Shorebirds

"Dunlins are another prominent species in Kasegaluk Lagoon and Peard Bay in late summer and fall. As with other species of shorebirds and waterfowl, a spill during periods of peak abundance could impact large numbers of dunlins. Less is known about the numbers, timing, and patterns of habitat use of Kasegaluk Lagoon and Peard Bay by bar-tailed godwits but, given their recent population declines, effects of an oil spill could be particularly important." EIS at IV-144.

The Lease Sale 193 (Chukchi) and 2003 Multi-Sale (Beaufort 186, 195, 202) environmental impacts statements use the same primitive model to estimate how spilled oil might travel in the marine environment. This model, which was developed in 1982, forms the basis for the evaluation of potential impacts from a spill. Because the environmental assessments for the exploration drilling proposed for the Beaufort and Chukchi Seas in 2010 assume that no large spill will occur, they do not contain any additional modeling of, or evaluation of potential effects from, a spill. The model used in the environmental impact statements suffers from substantial deficiencies:

- The model assumes that spilled oil is a point—it does not account for spreading of spilled oil, for the possibility that different parcels of a spreading oil slick may travel along different trajectories, or that these parcels may re-converge at locations distant from the spill origin, all of which are important aspects of the behavior of actual oil spills.
- Much of the environmental data input to the model is old—particularly current and wind information, which is from 1979-1996. Much has changed in the Arctic since then, and better information should be available.
- The model cannot account for the presence of sea ice. It assumes that shorefast ice exists for part of the year and that the ice "masks" the shore, which means that no oil could reach the shore.
- The model divides the leased area into a series of quadrants. Within each quadrant, it predicts that a spill could occur from a number of locations. It treats a spill from each location as equally likely and then provides an estimate of likelihood that a spill from each quadrant would reach land. This method biases the calculation in two ways. Some of the locations are further from land than others, so the model understates the likelihood of spilled oil from one of the closer locations reaching shore. Also, a spill is not equally likely from each location—Shell only wants to drill at some of them.
- The SINTEF model used to evaluate weathering effects on spilled oil is independent of the model used to estimate trajectories, making it impossible to evaluate effects related to, for example, the increasing propensity of oil to sink as it weathers.
- The model does not consider interactions with suspended particulate matter, which is crucial for determining the propensity of spilled oil to sink, thereby affecting the benthic community which is especially important in Arctic coastal marine ecosystems.
- More sophisticated and appropriate models that address the defects listed above have been available for over a decade.

July 11, 2011

Dr. James Kendall, Regional Director
BOEMRE Alaska OCS Region
3801 Centerpoint Dr Ste 500
Anchorage AK 99503-5820

RE: REVISED DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT STATEMENT (OCS EIS/EA BOEMRE 2010-034)

Dear Dr. Kendall:

Thank you for the opportunity to provide comments on the Revised Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (Revised Draft SEIS) prepared by the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) pursuant to the National Environmental Policy Act. TWS submitted comments on the Draft SEIS on November 30, 2010 and those comments are incorporated by reference.

The Wilderness Society (TWS) contributed to and supports the comments submitted by Alaska Wilderness League, *et al.* on this Revised Draft SEIS, however we are submitting these comments to highlight additional items we would like BOEMRE to address. As for my background, I have over 25 years of engineering experience in the private, governmental, and non-profit sectors, and I am a licensed professional engineer in Alaska. I have presented invited testimony to Congress on numerous occasions on oil and gas issues, I served as a technical advisor on the Department of the Interior's report to the President delivered on May 27, 2010 containing recommendations for BOEMRE following the *Deepwater Horizon* spill, and I am the sole Alaskan member of BOEMRE's Ocean Energy Safety Advisory Committee.

TWS has approximately 225,000 members nationwide and over 750 members in Alaska who share an interest in how the Arctic Ocean is managed because of its inherent value and because decisions involving the Arctic Ocean could affect federal lands in northern Alaska. TWS has a strong concern for the sound management and the well-being of the largest public land management unit in the U.S., the National Petroleum Reserve – Alaska, with a good portion of its coastline located adjacent to the Chukchi Sea.

The USGS Report and its Relevance to the Revised Draft SEIS

During a meeting on June 1, 2011 which included Eric Myers from Alaska Audubon, you, and me we discussed the applicability of the United States Geological Survey's (USGS)' science gap and

sufficiency' report¹ that was to be released later in June. I recall you said that if the report was issued prior to the end of the public comment period, its contents and analyses would be considered in the Revised Draft SEIS. Since USGS issued the report on June 23, 2011, TWS requests that BOEMRE respond to the detailed findings in this report, including whether the individual gaps identified (some of which can be remedied relatively easily like some types of oceanographic data and some of which require a long-term plan to address) need to be filled prior to Lease Sale 193 decision-making. While TWS recognizes there always will be scientific gaps, the key question for BOEMRE and the Secretary of the Interior regarding Lease Sale 193 is do we know "what we need to know to develop our Arctic energy resources in the right places in the right way"²? TWS contends that, at this point, there are biological, ecological, weather, oceanographic, and climate change data and considerations that have not been sufficiently investigated and analyzed in order to make "responsible decisions"³ on oil and gas exploration and development in the Beaufort and Chukchi Seas.

The Revised Draft SEIS' Very Large Oil Spill Analysis

TWS is pleased that BOEMRE included in the Revised Draft SEIS quantification of a hypothetical Very Large Oil Spill (VLOS) in the Lease Sale 193 area and discussion of its potential impacts. The Revised Draft SEIS shows that such of spill could be of roughly the same order of magnitude as the BP *Deepwater Horizon* spill in 2010 in the Gulf of Mexico.

While TWS agrees that coastal-area deferrals would minimize many of the impacts from a VLOS, not all adverse impacts are correlated with the SEIS alternatives. For example, in offshore areas which cetaceans frequent during particular times of the year, a VLOS may have very significant feeding implications depending on the location, size, timing, and duration of such a spill. This type of spill scenario has not been sufficiently analyzed in the Revised Draft SEIS given the limitations of looking at only the SEIS Lease Sale alternatives.

Last, according to the Revised Draft SEIS, there has been 1 well control incident per 201 exploration wells drilled (p. 123). As a result of these and other data, BOEMRE characterizes a VLOS in the Revised Draft SEIS as a "low probability, high impact" event. In her testimony to Congress, Dr. Nancy Leveson from MIT - an expert in system safety engineering - advises against such a characterization:

Belief that process accidents are low probability: Referring to accidents as "low probability, high consequence" events is rampant and unique to this industry [and within BOEMRE]. The implication is that accidents are low probability no matter how the system is designed or operated. Labeling is used to prove that accidents are rare. While process accidents may be low frequency, they are not necessarily low probability... This mislabeling leads to the belief that nothing can be done about such events nor does

¹ Holland-Bartels, Leslie, and Pierce, Brenda, eds., 2011, An Evaluation of the Science Needs to Inform Decisions on Outer Continental Shelf Energy Development in the Chukchi and Beaufort Seas, Alaska: U.S. Geological Survey Circular 1370.

² Quote by Secretary of the Interior Salazar in the news release announcing release of the USGS report, USGS Arctic Study Evaluates Science and Knowledge Gaps for OCS Energy Development; Offers recommendations to better inform responsible oil and gas decisions for Beaufort and Chukchi Seas, June 23, 2011.

³ *Ibid.*

3

anything in particular need to be done to reduce their probability—they are by definition already low probability.⁴

TWS urges BOEMRE to use the terminology, "low frequency" rather than "low probability" to describe the likelihood of blowouts or VLOS events.

Thank you for your attention to these comments.

Respectfully submitted,

RE: Comments on *Outer Continental lease Sale*193 *RDSEIS*

Thank you for the opportunity to provide comments on the "*Outer Continental Lease Sale 193 SEIS*". Recent global developments, including unrest in the Arab world, provide abundant justification for exploring and responsibly developing domestic energy and mineral resources that are critical to the economic and strategic security of the United States.

The Alaska Miners Association (AMA) is a non-profit membership organization established in 1939 to represent the mining industry. The AMA is composed of more than 1200 individual prospectors, geologists and engineers, vendors, small family miners, junior mining companies, and major mining companies. Our members look for and produce gold, silver, platinum, diamonds, lead, zinc, copper, coal, limestone, sand and gravel, crushed stone, armor rock, etc. Availability of reasonably priced energy is critical to the mining industry in Alaska. AMA supports responsible exploration for and development of the nation's offshore oil and gas resources and reducing our dependence on foreign sources of supply.

Oil and gas resources provide for more than 60% of the Nation's energy needs and are especially important to the transportation and industrial segments of the U.S. economy (<http://tonto.era.doe.gov/>). This is extremely significant for the mining industry which depends largely on mobile equipment powered by diesel engines. These commodities will continue to provide for the majority of the Nation's energy needs well into the future. They are also used to generate dependable sources of base load energy which cannot be substantially replaced by renewable energy sources like wind and solar which are expensive and unreliable sources of base load energy. The question facing America is whether to develop our own oil, gas, and mineral resources or become increasingly dependent on foreign sources of supply.

The AMA supports affirmation of the 2008 Lease Sale 193 for the following reasons:

Offshore energy exploration and production are vital components of our national energy strategy. U.S. demand for oil and natural gas are projected by the Department of Energy to increase for the foreseeable future. More importantly, OCS development creates and supports hundreds of thousands of jobs throughout the U.S. economy. Offshore energy operations in Alaska stand ready to provide this nation with significant oil and gas resources – resources that

file:///C:/Documents and Settings/BENEDET/Local Settings/Temp/wz619e/Document Li... 7/26/2011

Alaska Miners Association, Inc. Comment

can be produced safely right now. The Alaska OCS lease sale 193 has potential for the discovery of mega fields in relatively shallow water depths (<300 feet).

Offshore energy development is important to the mining industry. AMA supports lease sales that offer additional potential for the production of strategically and economically important quantities of oil and gas. These energy resources are needed by the energy intensive Alaska minerals industry.

Diversification of the Nation's energy supplies is critical to national security. AMA supports efforts by the United States to diversify its sources of energy and encourage an energy policy that advocates domestic development of both renewable and non-renewable energy resources. Development of Alaska's OCS hydrocarbon resources will support this goal by helping to diversify domestic sources of oil and gas away from the Gulf Coast Region (GCR) and help reduce the Nation's energy imports. International unrest and extreme weather conditions will continue to affect hydrocarbon production and availability. However, diversification of our energy sources will help alleviate future energy shortages.

The United States must responsibly move forward with domestic offshore energy exploration and development to meet our future energy needs. OCS Lease Sale 193 is a step in the right direction. We also encourage BOEMRE to include revenue sharing with states and local communities in its leasing plan. Those areas most directly affected by oil and gas development should share in the revenues generated.

Sincerely,

Steven C. Borell, P.E.
 Executive Director

Cc. Senator Lisa Murkowski
 Senator Mark Begich

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, I strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Alaska Safety, Inc.

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea
 Yesterday's disappointing announcement that the economy generated only 18,000 new jobs in June driving unemployment to 9.2 % is disappointing. Accompanied by news that the unemployment rate would be even higher (over 16%), if over a quarter million Americans had not stopped their search for work is alarming and compels me to urge BOEMRE to finalize and affirm the latest Revised Draft Supplemental Environmental Impact Statement (SEIS) as quickly as possible to facilitate rebuilding America's workforce.

file:///C:/Documents and Settings/BENEDET/Local Settings/Temp/wza487/Document Li... 7/26/2011

I have reviewed the Revised Draft SEIS for the Lease Sale 193 Chukchi Sea and believe that it provides sufficient information and analysis to support an informed decision affirming Lease Sale 193 Chukchi Sea. By reference, I endorse and incorporate comments by the Resource Development Council, found at <http://www.akrdc.org>, urging affirmation of this Lease Sale 193. I also incorporate information provided in the reports titled Economic Analysis of Future Offshore Oil and Gas Development: Beaufort Sea, Chukchi Sea, and North Aleutian Basin, March 2009, and Potential National-Level Benefits of Alaska OCS Development, February 2011, prepared by Northern Economics and Institute of Social and Economic Research, University of Alaska Anchorage that project positive employment and economic returns that could be generated over the next 50 years mitigating the alarming and chronic unemployment and discouragement that exists most recently in the nation and for over 15 years in Southeast Alaska.

I urge BOEMRE to consider the positive economic influence that 40 years of oil and gas activity in the North Atlantic has had in creating the in St. John's, Newfoundland, and Labrador Ocean Technology Cluster - an industry le

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea
 Dear Mr. Kendall:

I appreciate all the additional steps the Bureau of Ocean Energy Management, Enforcement, and Regulation (BOEMRE) has taken to assess the risk of drilling in the Chukchi Sea, and I believe the revised Draft Supplemental Environmental Impact Statement (EIS) rightfully determines a very large oil spill remains highly unlikely. While I agree the BOEMRE needs to take all thoughtful precautions, I think this most recent EIS concludes that development of Alaska's offshore resources can proceed safely.

As the revised draft EIS states, a very large oil spill in the Chukchi is highly improbable given the history of exploratory drilling and well control incidents in the Outer Continental Shelf (OCS). Since 1971, 84 wells have been drilled in the Alaska region alone, all without incident. Moreover, the proposed drilling in the Chukchi would occur in waters similar in depth to the shallow-waters in the Gulf of Mexico, which boasts a long history of safe operations. The *Deepwater Horizon* blowout and resulting very large oil spill in the Gulf of Mexico, conversely, was the first incident of this magnitude in nearly 40 years of OCS exploration.

Notwithstanding, producers and regulators have made significant investments - both in time and resources - to ensure all drilling proceeds in the safest manner possible. Pursuant to the Notice to Lessees 06, producers were required to reassess the potential impacts of a worst-case discharge. As such, Shell revised its exploratory plan for the Chukchi Sea using calculations of spill estimates based on the known geology of the basin and has since determined that the company maintains the capacities needed to prevent a blowout and respond swiftly and effectively in the unlikely event a blowout occurs.

The revised supplemental EIS notes that since 1979, for every 130 billion barrels of oil produced, one well incident resulting in a very large oil spill has occurred - though one-third of these spills have been the result of military action. Clearly, the probability of a well incident is very low, even if some risk exists. Given the economic and energy security benefits of increased domestic oil production, I believe this minimal risk is acceptable, particularly because of the advanced response capabilities in place.

I appreciate the opportunity to comment on this important matter, and I urge the BOEMRE to move forward with this process to allow the safe production of these resources.

Sincerely,

John Thompson,
 General Manager

Re: Comments on the Revised Draft SEIS, Lease Sale 193 - Chukchi Sea

Dear Mr. Kendall:

The American Trucking Associations¹ ("ATA") is writing to urge the Bureau of Ocean Energy, Management, Regulation and Enforcement ("BOEMR") to finalize the environmental impact statement supporting the Chukchi Sea Lease Sale 193. Developing our domestic petroleum reserves in the Chukchi Sea is critically important to reducing our dependence on foreign oil.

The trucking industry is the backbone of this Nation's economy with nearly 7 million Americans working in trucking-related jobs. Trucks move 70% of our Nation's freight tonnage and earn 82% of the Nation's freight revenue. The trucking industry delivers virtually all of the consumer goods in the United States.

This year, the trucking industry will consume over 35 billion gallons of diesel fuel. Each one-cent increase in the average price of diesel costs the trucking industry an additional \$356 million a year in fuel expenses. The trucking industry is on pace to spend more than \$135 billion on fuel this year -- \$34 billion more than we spent in 2010, and \$56 billion more than in 2009.

¹ ATA is a united federation of motor carriers, state trucking associations, and national trucking conferences created to promote and protect the interests of the trucking industry. Directly and through its affiliated organizations, ATA encompasses every type and class of motor carrier operation.

Today it may cost over \$1,000 to refuel a long-haul, over-the-road truck. Our industry is overwhelmingly comprised of small businesses that operate in extremely competitive business environments, with narrow profit margins now being radically impacted by high fuel prices.² The future of these trucking companies is at risk when the price of fuel spikes. In addition, soaring and volatile fuel prices are a serious threat to the broader economy, adversely impacting both the cost of goods and our ability to move them affordably throughout the country.

The trucking industry has developed a sustainability plan and continues to pursue new technologies and operating procedures to reduce fuel consumption.³ Even with the most aggressive fuel conservation program, the trucking industry will continue to demand additional diesel fuel to deliver an increasing volume of freight. The trucking industry also embraces the voluntary use of alternative fuels (e.g., renewable diesel and natural gas); however, these alternatives present both economic and operational challenges for many fleet and additional research and investment incentives are needed to overcome these challenges. The trucking industry is a very diverse industry and while some segments of the industry may be able to operate on alternative fuels, large segments of the trucking industry will continue depend upon a plentiful supply of diesel fuel for the foreseeable future.

That is why it is critical to the trucking industry that we have an abundant supply of affordable petroleum-based diesel fuel. We understand that the recent run-up in fuel prices is due to several factors, some of which are beyond the government's ability to control. Regulatory obstacles to increased production, however, can and should be corrected. Current regulatory policy has put our country on a path of declining domestic supply and has resulted in an unnecessary increase in the current price of oil. While some of the price increase may be the result of excessive speculation; this speculation is fueled by a perception that the supply of available crude oil will decline as a result of numerous factors, including the reduction in the U.S. ability to produce crude oil. The United States is the third largest oil producer in the world, but production of oil from Alaska (and the Gulf of Mexico) is declining and new sources of production have been placed off-limits. Without a concerted effort to drill more wells, domestic oil production will continue to decline and the price of we pay for diesel fuel will increase.

Lease Sale 193 has undergone a series of extensive environmental reviews that began more than 4 years ago. The draft SEIS demonstrates that oil and gas development in the Chukchi Sea can be done safely. As such, we urge BOEMRE to finalize the environmental impact statement and move forward with Lease Sale 193 so that

² Roughly 96% of all interstate motor carriers operate 20 or fewer trucks.

³ A copy of ATA's sustainability plan may be viewed through the following link:
<http://www.trucksdeliver.org>.

Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security and generate significant new revenue for the federal government. With an estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy security. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years.

The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. The United States reliance on imported oil places U.S. consumers at greater risk of supply disruptions and damaging price spikes. Volatile diesel prices harm the trucking industry and jeopardize the U.S. economy. Expanding our domestic production will increase our energy security and help meet growing demand. For that reason, we strongly support moving forward with Lease Sale 193.

* * * * *

The benefits of energy production on Alaska's OCS are critically important to our domestic energy security and to the trucking industry, which depends upon a stable supply of diesel fuel to deliver virtually all consumer goods in the United States. As we begin a transition to alternatives, we must not forget that the trucking industry and our economy will continue to depend upon diesel fuel for the foreseeable future. The failure to boost domestic fossil fuel supplies during this transition will simply translate into increased dependence on foreign sources of oil, damaging fuel price spikes, and a continuing threat to our economy and national security.

For these reasons ATA believes there is an urgent need to increase access to and production of our domestic crude supply as a means to help lower fuel prices. We therefore urge BOEMRE to finalize the environmental review process and move forward with Lease Sale 193.

Respectfully submitted,

Richard Moskowitz
Vice President and Regulatory Affairs Counsel

Re: Revised Draft SEIS, OCS Oil and Gas Lease Sale 193, Chukchi Sea, Alaska

Dear Mr. Kendall:

The American Petroleum Institute ("API") and the Alaska Oil and Gas Association ("AOGA") appreciate this opportunity to submit comments on the Revised Draft Supplemental Environmental Impact Statement ("SEIS"), Outer Continental Shelf ("OCS") Oil and Gas Lease Sale 193, Chukchi Sea, Alaska. API is a national trade association that represents over 470 members involved in all aspects of the oil and natural gas industry. AOGA is a private, nonprofit trade association whose member companies account for the majority of oil and gas exploration, development, production, transportation, refining, and marketing activities in Alaska.

We endorse the comments on the Revised Draft SEIS being submitted by Shell Gulf of Mexico Inc. ("SGOMI") and encourage the Bureau of Ocean Energy Management, Regulation and Enforcement ("BOEMRE") to consider and incorporate the suggestions contained therein. We offer the following additional comments.

The purpose of the SEIS is for BOEMRE to provide new National Environmental Policy Act ("NEPA") analysis as directed by the U.S. District Court for Alaska in a July 2010 order. The order instructed BOEMRE to address three specific concerns: (1) the environmental impact of natural gas development; (2) whether missing information identified in the original EIS was essential or relevant under 40 CFR 1502.22; and (3) whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown. BOEMRE completed this analysis and released a Draft SEIS in October 2010. Following a public comment period, BOEMRE announced in March 2011 that it would also analyze a Very Large Oil Spill ("VLOS") from a hypothetical exploration well blowout. API and AOGA believe that the detailed analysis

James Kendall
 Regional Director
 July 11, 2011

BOEMRE recognizes and refers to the VLOS as a "low-probability, high impacts" event, but does not explain how it arrived at this characterization or how unlikely such an event would be. BOEMRE included an assessment of the probability of a VLOS occurring in Appendix B, but not in the text of the SEIS. BOEMRE should cross-reference, summarize, and/or otherwise provide this information in the appropriate sections of the SEIS document to provide more guidance to the reader. BOEMRE should also highlight the extreme assumptions used to construct the VLOS scenario to better contextualize the probability of such an event occurring in the real world. This would avoid the inaccurate potential expectation by decision-makers and the public that the VLOS scenario applies to each and every well for which permit approval is sought.

We commend BOEMRE for including in the SEIS information about oil spills from blowout events on the OCS from 1971-2010. This data shows how rare large scale spill events are. BOEMRE should, however, clarify that spill events do not always result from well control incidents and in fact, past experience and history show that spill events from well control incidents have not occurred more often than they have. For example, as BOEMRE appropriately acknowledges in the SEIS, of the 249 well control incidents that occurred during exploratory and development/production activities over 38 years (1971-2009) only 50 resulted in oil spills. Importantly, the total spilled from these incidents was less than 2000 barrels of oil.

BOEMRE should also clarify that the VLOS scenario analyzed in the SEIS does not include the beneficial effects of cleanup, recovery, and intervention efforts (on the estimated spill volume or spill duration) and explain why the analysis does not include these effects. This distinction is important since oil spill contingency and response plans are required prior to the approval of any OCS exploration or development and production plan. Clearly, in the unlikely event that a blowout does lead to an oil spill, these activities would help decrease the spill volumes reaching the environment and the duration of an uncontrolled flow. Including such a discussion would help provide better context to the VLOS scenario.

The regulatory and administrative changes made by BOEMRE following the Deepwater Horizon incident serve to increase safety and further reduce the risk of blowouts and oil spills on the OCS. We commend BOEMRE for providing a discussion of these changes in the SEIS, including the Notices to Lessees ("NTL"), but believe this discussion could be strengthened by a more complete description of the intent and requirements of the changes as well as the beneficial impacts they will have on safety and the probability of a VLOS or other large scale spill event from occurring. In addition, many new studies and data collection efforts are currently underway that are helpful to the Natural Resources Damage Assessment process. The ongoing nature of these studies, however, which are likely to continue for decades, does not diminish or adversely affect the agency's ability to conclude that there is no incomplete or unavailable information that is deemed relevant to making a determination regarding reasonably foreseeable significant adverse impacts of new leasing operations in the Chukchi Sea Planning Area or that is essential to a reasoned choice among alternatives.

James Kendall
 Regional Director
 July 11, 2011

provided in the Revised Draft SEIS, along with other supporting environmental documents and additional assessments being conducted by BOEMRE, provide a thorough analysis upon which to make decisions related to Lease Sale 193, new or revised exploration and development plans in the Chukchi Sea Planning Area, and future permit applications, without delay. We also support BOEMRE's continued practice of tiering Environmental Impact Statements ("EIS") and Environmental Assessments ("EA") under NEPA. The Revised Draft SEIS, issued on May 27, addresses both the deficiencies identified by the court and a hypothetical VLOS scenario and recommends that Lease Sale 193 be affirmed as held. API and AOGA urge the Secretary to accept the conclusions of the SEIS and expeditiously affirm the sale so that the suspension of operations imposed on the leases may be removed.

Natural Gas Development and Production

The SEIS considers the most viable natural gas development and production scenario for the Chukchi leases – including use and potential expansion of existing infrastructure (due to oil development and production) and an offshore/onshore gas pipeline transportation system in the same corridor as existing pipelines – in the context of the alternatives analyzed (and evaluated to the satisfaction of the Court) in the original EIS for Lease Sale 193. On this point, the SEIS correctly assumes that first commercial gas production would only follow the oil exploration, development, and production activities already analyzed in the Final EIS (and deemed sufficient by the Court). Gas production would utilize the same oil production platform described in the original EIS, no additional exploration seismic surveys are expected, no additional exploration or development well drilling is anticipated, and no produced water discharges would occur. For each resource category identified, BOEMRE determined that natural gas development and production would either not have any significant adverse impacts or that potential impacts could be avoided or mitigated through stipulation and mitigation measures, adherence to construction protocols, and compliance with existing law and regulation. We support this analysis.

Missing Information

BOEMRE conducted an extensive evaluation effort with regard to the missing information identified by the Court and determined that while many items of incomplete, missing or unavailable information were relevant to the issues at hand, none were essential for a reasoned choice among alternatives. We also agree with this analysis and conclusion.

Very Large Oil Spill

We commend BOEMRE for the comprehensive VLOS analysis contained in the SEIS. However, we suggest that BOEMRE clarify exactly what the VLOS scenario is and the differences between the VLOS and the worst case discharge analysis associated with an actual exploratory well plan.

BOEMRE correctly emphasizes that the VLOS is hypothetical, that the discharge numbers associated with it do not reflect any particular well, and that any operator that proposes drilling a well must provide its own worst-case discharge analysis based on the unique characteristics of the well prior to an exploratory plan being approved and well drilled. However, BOEMRE should better explain the probability of a VLOS actually occurring. Throughout the SEIS,

James Kendall
 Regional Director
 July 11, 2011

Important to emphasize moving forward is that this is a lease sale, which authorizes lessees to engage only in "ancillary activities" that do not harm the environment. Parties seeking to conduct ancillary activities are required to notify BOEMRE, and the proposed activities are reviewed for compliance with performance standards contained in federal regulation. A lease sale is not an authorization to drill. Further environmental review, public process and federal agency approvals are required before any exploration, development or production activities may occur.

Lessees seeking to engage in these activities must submit an exploration plan or a development and production plan for BOEMRE review and approval, which involves the preparation of the appropriate level of environmental review by BOEMRE. Importantly, in the SEIS, BOEMRE specifically puts lessees on notice that it intends to prepare an EIS for any development and production plan submitted for a lease issued from Lease Sale 193. As BOEMRE acknowledges in the SEIS, an EIS for development and production activities typically takes 2-3 years, which allows time for exhaustive environmental review and public process of those specific activities. Proposed plans are evaluated for compliance with applicable regulations, lease stipulations, and other requirements, including the adequacy of the oil spill response plan. Prior to conducting any drilling operations, the lessee must submit and obtain approval for an Application for Permit to Drill ("APD"). The rulemaking which followed the Deepwater Horizon incident, as well as the new NTLs, augment and strengthen prior regulatory and administrative requirements for exploration plans, development and production plans, and permitting on the OCS, including the Chukchi Sea.

Importance of New Production for Continued Throughput for the Trans-Alaska Pipeline System

The importance of oil and gas development on Alaska's OCS cannot be overstated. According to resource estimates, including those performed by the U.S. Geological Survey, this largely untapped area may hold as much as 27 billion barrels of oil and 132 trillion cubic feet of natural gas. By comparison, total production from the Alaska North Slope is approximately 16 billion barrels of oil. Development of the oil and gas resources in the Chukchi Sea will not only add to domestic energy supplies and our nation's energy security, but such development is also necessary for the continued operation of the Trans-Alaska Pipeline System ("TAPS"). TAPS has been identified as critical infrastructure for national security because of the transportation link that it provides to present and future development of crude oil resources in Alaska's Arctic region. The significance of the subject of diminishing Alaska production to provide throughput for TAPS merits more detailed discussion.

Since commencement of its operation in August of 1977, TAPS has proven to be a strategically critical component of America's energy infrastructure. Designed as a 48 inch pipeline, TAPS has transported over 16 billion barrels of American oil from the Alaska North Slope to the Valdez Marine Terminal, from which tankers carry the oil to U.S. West coast terminals and refineries. At its peak in the late 1980s, TAPS was transporting about 2.1 million barrels of crude oil per day, or about 25 percent of our nation's domestic crude oil supply. Since 1989, there has been a steady decline in Alaska North Slope production, and current average TAPS throughput is about 600,000 barrels per day compared to 2 million barrels per day in 1988, or about one-third of its

capacity and now approximately 11 percent of our nation's oil production. Over the same period, while production from existing fields has diminished, efforts to find and develop potentially promising new crude oil resources in Alaska's Arctic Outer Continental Shelf have been stymied by regulatory delays and litigation.

Decreasing oil throughput presents significant challenges for the operators of TAPS. Notable among these is the fact that the temperature of the oil flowing through the line decreases as flow or throughput rates decline. With lower flow rates it takes longer for the crude oil to move from the current production areas on the North Slope to the Valdez Marine Terminal where the tankers are loaded. This allows more time for the oil to cool.

During peak production in 1989, it took approximately four and a half days for Alaska North Slope crude oil production to travel the pipeline's 800 mile length to reach Valdez. Today, each barrel takes about 15 days to move through the pipeline. Were the throughput rate to diminish to 300,000 barrels per day, it would take just over a month for a barrel of oil to move the entire length of TAPS. In the not too distant future, were present trends to continue, crude oil temperatures in the line could become cold enough to accelerate wax deposition and even possible ice formation in the pipeline. These situations present operational challenges because they make conditions favorable to corrosion more likely, and greatly increase the cost and complexity of maintenance and repairs along the pipeline.

As noted, TAPS is among the most important components of our nation's energy transportation infrastructure. While its maintenance and operational record has been exemplary, if production from existing Alaska North Slope fields that now moves through TAPS continues to decline, and administrative and litigation-driven barriers prevent the discovery and development of new crude oil resources such as those in the Chukchi Sea, the continued operation of one of America's energy supply lifelines could be prematurely placed at risk decades before the end of its useful design life. Access to the crude oil resource potential both onshore and offshore Alaska is thus important not only for the additional supplies of domestically produced energy that discovery and development of those resources would bring, but the continued viability of TAPS which depends upon increasing safe and environmentally responsible production.

Importance of Chukchi Sea Production to Economic Health of State of Alaska and the U.S.

The oil and gas industry accounts for more than 41,000 jobs in Alaska, which is 9.4 percent of all employment in the state and 11.2 percent of all wages at \$2.4 billion. Employment and payroll include direct impacts of 4,497 jobs and \$643.8 million in payroll for the primary companies. Indirect and induced impacts include \$5 billion in industry spending in Alaska on goods, services and capital, generating 8,000 support industry jobs and \$769.2 million in payroll. Almost 29,000 additional jobs, with \$987 million in payroll, are created throughout the rest of the state by support industry spending on payroll and purchasing, and by primary company employee spending.

advancement of knowledge and conservation of habitat, wildlife, and subsistence resources in the region.

In conclusion, API and AOGA strongly urge the Secretary to affirm Chukchi Sea Lease Sale 193, as recommended by the SEIS. The leases issued under Sale 193 were sold only after exhaustive environmental analysis, and the specific concerns the District Court raised are adequately addressed by the SEIS. Moreover, the SEIS analyzes a VLOS, which is hypothetical and extremely unlikely. Any further exploration or development activities would not occur until additional environmental review, public process, and BOEMRE approval occurs. Failure to affirm Lease Sale 193 would allow the moratorium on exploration and development of Alaska's OCS to continue harming the Alaska and U.S. economies and the nation's energy security without a corresponding benefit to the environment.

If you have any questions on these comments, please do not hesitate to contact Kate Williams with AOGA at 907.272.1481 or Richard Ranger with API at 202.682.8057.

Sincerely,

KATE WILLIAMS
Regulatory Affairs Representative

RICHARD L. RANGER
Senior Policy Advisor

An analysis by the University of Alaska Anchorage showed the oil industry supports as many as 110,000 jobs in Alaska (one-third of the state's workforce), including funding for three-quarters of state government jobs. The report does not merely count the number of jobs that exist in each industry and its support sector. It estimates how many of Alaska's 357,000 jobs rely on cash flow created by a specific sector. The Anchorage Economic Development Corporation has reasoned that the total spinoff from oil and gas activity, state revenues and employment accounts for approximately 40 percent of Alaska's economy.

According to a recent study by Northern Economics and the University of Alaska, an annual average of 54,700 new jobs would be created and sustained through the year 2057 from the Alaska OCS, with 68,600 during production and 91,500 at peak employment. A total of \$145 billion in new payroll would be paid to employees through the year 2057, including \$63 billion to employees in Alaska and \$82 billion to employees in the rest of the U.S. In addition, a total of \$193 billion in government revenue would be generated through the year 2057, with \$167 billion to the Federal government, \$15 billion to the State of Alaska, \$4 billion to local Alaska governments, and \$6.5 billion to other state governments. In short, action to expedite completion of the SEIS and to affirm the lease sale will provide considerable benefit to the nation's economic and employment situations, and will be of profound importance to the economic health and well-being of the State of Alaska.

Concluding Remarks

Lease Sale 193 is one of the most successful oil and gas lease sales in U.S. history, generating \$2.7 billion in revenues for the federal government for 487 leases. However, over four years later, not a single exploratory well has been drilled and production activities are at least a decade away.

Exploring for oil and gas offshore in Alaska is not a new concept. A total of 30 wells have been drilled in the Beaufort Sea and five wells drilled in the Chukchi Sea. These wells were drilled over 20 years ago using older technology. Today's technology has resulted in reduced environmental impacts and footprints for infrastructure for oil and gas development projects. Advancements in 3-D and 4-D seismic technology allow industry to focus their "targets," reducing impacts even more. Moreover, there has never been an oil spill caused by a blowout from offshore exploration and production drilling in state or federal waters off Alaska or the Canadian Arctic.

Alaska's North Slope and OCS are now perhaps the most studied energy basins in the U.S. In the past decade alone, over 250 scientific studies have been funded in the Arctic, with the majority focused the Beaufort and Chukchi Seas. All told, at least \$500 million has been spent on more than 5,000 independent studies since 1973. In this effort, Alaska's oil and gas industry has proven itself to be an important partner not only in the development of the Arctic, but in expanding our knowledge of an Arctic environment in which the industry has explored for and produced energy resources for nearly 40 years. This operating record demonstrates that a balance is achievable in the Arctic between production of valuable and needed energy resources and

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed. We urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC production is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,
ARCTIC CONTROLS, INC.

Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of the Association of Equipment Manufacturers (AEM), I would like to express our support of oil and gas exploration in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to conclude the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th.

AEM is the U.S.-based international trade group serving the off-road equipment manufacturing industry. AEM members number over 850 companies that manufacture equipment products and services used worldwide in the agriculture, construction, forestry, mining and utility fields. AEM members are strong supporters of policies that enhance America's energy independence. Expanded domestic energy production not only improves national security but also generates homegrown economic growth and demand for a wide-array of equipment.

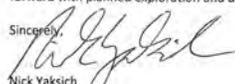

Lease Sale 193 has undergone extensive environmental review and the potential environmental impacts have undergone lengthy and thorough analysis. Oil and gas exploration in the Chukchi Sea can and should be done safely. The time has come for the government to proceed with Lease Sale 193 so that America can fully realize the energy and economic benefits increased domestic energy production will bring. Additionally, the government can expect significant revenues from the oil and gas exploration in Alaska's OCS.

Alaska's OCS is conservatively estimated to contain 27 billion barrels of oil and 132 trillion cubic feet of natural gas. The development of this tremendous national resource is vital to our country's long-term energy supply. It is estimated the economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated.

Furthermore, the opening of Alaska's OCS to oil and gas exploration would help achieve greater price stability for consumers at a time when price volatility is a hindrance to economic growth. The United States also continues to import vast amounts of oil from unstable and hostile countries despite the considerable North American resources available. Forcing us to rely on oil imports puts the United States at greater risk of being held hostage to supply disruptions.

Again, thank you for the opportunity to comment. I urge that the lease-holders be allowed to move forward with planned exploration and development in a safe and responsible manner.

Sincerely,

Nick Yaksich
Vice President
Global Public Policy

James Kendall
Regional Director
BOEMRE – Alaska OCS
3801 Centerpoint Drive
Suite 500
Anchorage, AK 99503-5820

Dear Mr. Kendall:

Associated Industries of Florida (AIF) welcomes the opportunity to provide comments to the Department of Interior's revised Draft Supplemental Environmental Impact Statement, announced by BOEMER on May 20, 2011. We respectfully submit the following comments in support for oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS).

Florida, the fourth largest state, uses 27 million gallons of gasoline and diesel per day and generates more than half of its electricity from clean burning natural gas. Florida's economy, which continues to languish with unemployment hovering around 10.5 percent, is heavily dependent on affordable and reliable oil and natural gas; access to additional domestic resources is critical to rebuild the tourism, agriculture, and manufacturing base of our economy.

The importance of oil and gas development on Alaska's OCS cannot be overstated. This largely untapped area holds 27 billion barrels of oil and 132 trillion cubic feet of natural gas. By comparison, total production from the North Slope is 16 billion barrels of oil. Development of these resources is necessary for the continued operation of the Trans-Alaska Pipeline System ("TAPS"), which delivers 11% of domestic oil production to refineries on the West Coast and has been identified as critical infrastructure for national security. TAPS is currently operating at one-third of its capacity, or 600,000 barrels of oil per day compared to 2 million barrels per day in 1988, and will face operational challenges without additional supply.

Furthermore, an annual average of 54,000 new jobs in Alaska and the rest of the U.S. would be created and sustained by OCS-related development for 50 years. This translates into \$63 billion in payroll to employees in Alaska and \$82 billion to employees in the Lower 48. Federal, state and local governments would realize \$193 billion in revenues. Clearly, development of Alaska's OCS resources is vital to the nation's energy security and would help turn the tide against the economic recession we are now facing. Exploring for oil and gas offshore in Alaska is not a new concept. A total of 30 wells have been drilled in the Beaufort Sea and five wells drilled in the Chukchi Sea. These wells were drilled over 20 years ago using older technology. Today's technology has resulted in reduced environmental impacts and footprints for infrastructure for oil and gas development projects.

It is important to recognize that the administrative action proposed is a lease sale, which authorizes lessees to engage only in "ancillary activities" that do not harm the environment. Parties seeking to conduct ancillary activities are required to notify BOEMRE, and the proposed activities are reviewed for compliance with performance standards contained in federal regulation. Equally important is the point that lease sale is not an authorization to drill. Considerable additional environmental review, additional

public review opportunities and federal agency approvals are required before any exploration, development or production activities may occur.

Lessees seeking to engage in these activities must submit an exploration plan or a development and production plan, as appropriate, for BOEMRE review and approval, which involves preparation of an Environmental Assessment ("EA") and/or an EIS by BOEMRE. Importantly, in the SEIS, BOEMRE specifically puts lessees on notice that it intends to prepare an EIS for any development and production plan submitted for a lease issued from Lease Sale 193. As BOEMRE acknowledges in the SEIS, an EIS for development and production activities typically takes 2-3 years, which allows time for exhaustive environmental review and public process of those specific activities. Proposed plans are evaluated for compliance with applicable regulations, lease stipulations, and other requirements, including the adequacy of the oil spill response plan. Prior to conducting any drilling operations, the lessee must submit and obtain approval for an Application for Permit to Drill ("APD"). The rulemaking which followed the DWH event, as well as the new well as the new NTLs, augment and strengthen prior regulatory and administrative requirements for exploration plans, development and production plans, and permitting on the OCS, including the Chukchi Sea.

Accordingly, AIF urges the BOEMRE to move forward with the Lease Sale of 193 by finalizing the environmental review process. It is essential that manufacturers have access to reliable, secure and affordable energy while recovering from one of the worst recessions in our nation's history.

Sincerely,

Barney T. Bishop III

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of The Bennett Consulting Group, I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplement Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, we strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Kenneth G. Lee
Managing Partner, The Bennett Consulting Group

General Comment

I am writing to ask BOEM to reaffirm the leases sold in sale 193.

The development of offshore oil in the Chukchi Sea is critical to the continued health of the Alaskan economy, as well as the infrastructure required to support continued oil and gas exploration and production.

The product of the continued production is sorely needed in America today, and will provide employment to Alaskan's and others in the US in downstream petrochemical businesses.

To continue to deny access to the area is a defacto moratorium on energy production in the US, while giving lip-service to Americans in need of oil and gas. The producers have met every requirement that the federal government has asked, and continued delays are petty harassment.

The shareholders of the companies interested in working the leases need some return on their investment dollar, before they decide to quit Alaska. Loss of energy development here would mean economic disaster. On the other hand, substantial economic returns to the state and federal governments will be realized when production begins.

Thank you,
 Brian Benson

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, We urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Harry McDonald, President

Re: Comments on the Revised Draft SEIS for Lease Sale 193

Dear Mr. Kendall:

The Chamber of Shipping of America is a trade association for U.S.-based companies that own, operate or charter ocean-going vessels. We were founded in 1917 and have engaged in representing our members relative to government actions since our founding. Our members operate all types of ships and vessels in the international and domestic trades of the U.S. including the important energy trade between Alaska and the rest of the nation. We very strongly urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193.

We recognize that Lease Sale 193 has undergone exhaustive environmental review and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea and transportation of the resulting energy products can and will be done safely and with greatest care for the marine and land environments. We ask that you proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits of increased domestic energy production.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country as equipment manufacturers and suppliers are engaged, and will generate significant government revenue. We understand there are an estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas in the lease area. This is a very large amount of potential energy and to not engage in development would be counter to our national interest particularly as there would be an estimated creation of an annual average of 54,700 jobs nationwide.

As our nation grows and develops, we will need more energy and we will probably continue importing energy from various parts of the world, from those both friendly to the U.S. and perhaps those who are not so friendly. It is in our best interest to develop our own capabilities to meet future demand wherever and whenever possible.

For the above reasons, we strongly support moving forward with Lease Sale 193. At the completion of the process, we respectfully request that the lease-holders be allowed to move forward with planned exploration and production.

Sincerely,

Joseph J. Cox

Re: Comments on Revised Draft Supplemental Environmental Impact Statement - Lease Sale 193

Dear Regional Director:

ConocoPhillips Company (COP) appreciates the opportunity to provide comments on the Revised Draft Supplemental Environmental Impact Statement (Revised DSEIS) for Lease Sale 193.

COP, including its subsidiaries and affiliates, is one of the largest owners of state and federal leases in Alaska, a major owner in the three largest oil fields on the Alaska North Slope, operator of both Kuparuk and Alpine oil fields and an operator in the Alaska Cook Inlet. Our company has decades of safe and environmentally responsible operating experience in Arctic conditions. We also bring decades of experience in preparing our permit applications and operational plans for activities in the Arctic.

COP sees great potential in the Chukchi Sea, as demonstrated by our investment of \$506MM on 98 Outer Continental Shelf (OCS) leases in 2008. As a successful bidder, we immediately began planning for an exploration program on leases near the previously drilled Klondike #1 location. During the summer of 2008, we conducted site clearance and shallow hazard surveys. We also initiated a voluntary multi-million dollar scientific data collection program in the Chukchi Sea, collaborating with other offshore operators, universities, research institutions and local stakeholders on a multi-year program collecting biological, oceanographic and air quality data in the lease area. This program has contributed to the existing scientific knowledge base of the Arctic OCS, and has been well received by North Slope communities and several environmental groups. These studies are being done to support our plans to drill an exploration well in the Chukchi Sea, which could be as soon as the summer of 2013. Since 1973, more than 5,000 independent studies have been conducted in the Alaska OCS by many different entities, at a total cost exceeding \$500 million. Alaska's North Slope and OCS are very likely the most studied energy basins in the United States. In just the past 10

ConocoPhillips Comment

Regional Director
BOEMRE
July 11, 2011
Page 2

years, over 250 scientific studies have been funded in the Arctic, with the majority focused in the Beaufort and Chukchi Seas.

The Revised DSEIS provides a substantially more robust environmental analysis of Lease Sale 193 in a thoughtful and comprehensive discussion, and includes new information on a wide variety of topics. The Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) has clearly and diligently taken "a hard look" at the issues remanded by the court and has thoroughly evaluated the possible environmental consequences of the proposed action and a reasonable range of alternatives. COP believes the agency has more than sufficiently addressed the issues identified by the court in its remand order, and concurs with the BOEMRE's decision to include the analysis of a hypothetical Very Large Oil Spill (VLOS) scenario.

The American Petroleum Institute (API) and the Alaska Oil and Gas Association (AOGA) are supplying detailed comments to this Revised DSEIS. COP supports and adopts the API/AOGA comments by reference, and additionally provides the following specific comments.

Comments

- Section 1.A - Background.** The agency explains on page 2 that there was a reorganization and the MMS was renamed the BOEMRE; however there are some locations in the document that use the name MMS. Where applicable, use of the agency's new name should be conformed.
- Section 1.D - Regulatory and Administrative Framework** (pages 5-7). COP suggests that BOEMRE update and correct references to the Alaska Coastal Zone Management Program (ACMP) as the ACMP statutory authorization recently expired and has not been renewed or extended by the state legislature.
- Section II.B - Alternatives** (pages 15-16). COP supports the alternatives carried forward in the Revised DSEIS and considered in the original Lease Sale 193 Final EIS. These alternatives adequately cover the possible scenarios for exploration drilling and development in the area. COP supports the existing Alternative IV as the alternative that provides appropriate mitigation measures to minimize environmental impacts and protect subsistence resources. COP would not support implementation of Alternative III, which would double the deferral corridor with very little added environmental protection.
- Section II.D - Summary of Environmental Impacts** (page 20). COP disagrees with the agency's assumption that larger deferral areas decrease environmental impacts. As discussed below, setting larger deferral areas does not necessarily equate to better environmental protection.

5. **Section II.D.1** (page 22). In the previous DSEIS, the agency stated that the impacts to fish resources were not expected to be significant, but in the Revised DSEIS, the agency states that the impacts are localized and minor. For clarity and consistency, the Revised DSEIS should include an explanation of why the text was changed and the intent of the changed wording.
6. **Section II.D.3** (pages 31-34). In the Threatened and Endangered Marine Mammals section, the statement is made that enlarging the deferral area would remove industrial activity from the spring-migration route of the bowhead whales. Increasing the deferral areas will not necessarily add protection to the migration pathways but will likely move development and infrastructure further offshore and distant from onshore resources. This increase in distance may increase risk and adverse impacts due to an increased use of marine vessels and aircraft. In this section, the agency should consider a more in depth discussion of the balancing of risks and impacts, such as the following: the low probability of an oil spill, the likelihood of adequate response mechanisms, and the certainty of increased emissions and risks to human life and marine mammals associated with increased air and marine traffic necessary for more distant development and infrastructure. The current deferral area, along with the current mitigation measures in the Sale 193 FEIS, provide ample protection to marine mammals and subsistence activities. Given the potential adverse impacts associated with moving facilities further offshore, it is not clear that Alternative III presents decreased environmental impacts, as the Revised DSEIS suggests.
7. **Section III.B.4** (pages 51-52). In the Cetaceans section, BOEMRE describes bowhead whale movements during the spring migration and then states that a sample of tagged bowhead whales "traveled through some portion of the Lease Sale 193 Area." For clarity, the description should better define the difference between the spring migration and the fall migration of the bowhead whale through the Chukchi Sea. It should also explain that subsistence activity for the bowhead whale does not occur more than 20 miles from the coast based on historical accounts. The majority of the bowhead harvest occurs during the spring migration when the whale follow ice leads to the north, parallel to the coast line.
8. **Section IV. D – The Very Large Oil Spill (VLOS)** (pages 121-136). The VLOS scenario evaluates an extremely unlikely, if not impossible, spill event, which the text acknowledges. The VLOS scenario description correctly states that it is a hypothetical event and the discharge numbers associated with it do not reflect any particular well, and that each operator will submit a worst-case discharge analysis based on the individual characteristics of their exploration well. The agency would be well served to explain how low the probability is that a VLOS could ever occur. BOEMRE should also be extremely clear that the Revised DSEIS, with respect to the VLOS, does not account for the beneficial impacts of cleanup, recovery and intervention efforts. These factors could have significant reduction on the estimated spill volume or spill duration. This distinction is

important since oil spill contingency and response planning is required before any approval would be granted for OCS exploration or development to move forward. BOEMRE provides an adequate explanation in the Revised DSEIS of how it derived each of the reservoir parameters, but does not describe or explain the basis for the tubing hydraulics correlation selected to be used in the calculation. If there is no well hydraulics correlation incorporated into the model, the flow is most certainly overstated and that fact should be clarified. The agency would be well served to also explore other well control intervention technologies that could be employed and might be more applicable and likely to be used in such a catastrophic situation in lieu of a relief well.

There have been a total of 30 wells drilled in the Beaufort Sea and 5 wells drilled in the Chukchi OCS over the past 30 years. OCS exploration and development are not new to the Arctic. The development of more advanced drilling technologies, along with the incorporation of effective mitigation measures, allows industry to conduct Arctic exploration and development operations in a manner that results in a smaller footprint with less environmental impacts. Technology advancements in seismic surveys allow the industry to better focus on subsurface targets and reduce the surface impacts even more. Finally, and importantly, there has never been an oil spill caused by a blowout from an offshore exploration and production drilling in state or federal waters off Alaska or the Canadian Arctic.

In summary, COP supports the Revised DSEIS and requests that the comments above be incorporated into the administrative record and considered to strengthen the analysis and discussion. COP also requests that the BOEMRE move swiftly to finalize the EIS and affirm the 193 Lease Sale.

If you have questions about these comments, please call me at (907) 265-1470 or Bruce St. Pierre at (907) 265-6417.

Sincerely,

Michael J. Faust
Manager,
Chukchi Project Integration

Consumer Energy Alliance Comment

another oil spill. In particular, operators in the region have amassed an unprecedented level of onsite spill-response capabilities in the event a discharge does occur and have adopted additional, redundant measures to ensure blowout preventers operate properly and can be secured if they fail.

In assessing Lease Sale 193, we must also acknowledge the vast economic and energy security benefits that will come with its development. For the State of Alaska alone, development of Alaska's OCS has the potential to create over 35,000 jobs over the course of the next 50 years. These jobs will bring a total payroll of approximately \$72 billion, much of this revenue remaining in the state to support local industries and small businesses. Even though development occurs on northern coast of Alaska, tens of thousands of American workers will also benefit: from steel manufacturing in the Midwest to pipefitters in the Gulf Coast region to refiners on the West Coast, support industries from Coast to Coast rely on offshore development for demand for their goods and services.

In addition to boosting U.S. economic growth, Alaska OCS development has the capacity to prevent the Trans-Alaska Pipeline System (TAPS) from closing if production proceeds within the next decade. As illustrated by the January 2011 temporary closure, the TAPS has become increasingly susceptible to leaks, which is a direct result of idled oil and debris that build up with low throughput. Even when the pipeline closes for a short period, West Coast refineries that are dependent on Alaskan oil must import oil from overseas markets, driving up the price of oil and forcing millions of American consumers to rely on oil from Russia and other volatile producers. While many may argue that resources from the Beaufort and Chukchi Sea will not come online to save TAPS from closing permanently, continually delaying development of our offshore resources only increases the likelihood that TAPS will close in this generation. TAPS was once authorized and built at a time of great peril for our nation's energy security; its closure may force a return to an era of great uncertainty and energy insecurity.

I appreciate the opportunity to comment today, and I look forward to seeing the BOEMRE finalize the Revised Draft SEIS as soon as possible. If you have any questions about CEA or these comments, please contact Natalie Joubert at njoubert@consumerenergyalliance.org.

Very sincerely,

David Holt
President

July 11, 2011

James Kendall, Regional Director
Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS for Lease Sale 193

Dear Mr. Kendall:

On behalf of Consumer Energy Alliance (CEA), I appreciate the opportunity to submit the following comments to the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) in support of the planned oil and gas development of Lease Sale 193 in the Chukchi Sea and the finalization of the environmental review process for this lease sale.

CEA is a non-profit, non-partisan organization committed to working with elected leaders, affected stakeholders and consumers to help create sound energy policy and maintain stable energy prices. We support improved domestic and global energy security and provide information on expanding the use of all energy resources, including oil, natural gas and alternative energy, as well as increasing energy efficiency. CEA has more than 160 affiliated organizations, including energy suppliers and producers, manufacturers, small businesses and community organizations, as well as a nationwide network of almost 300,000 consumer-advocates.

The Revised Draft Supplemental Environmental Impact Statement (SEIS) thoroughly addresses the concerns raised during the last comment period on the SEIS and rightfully concludes that the probability of a very large oil spill in the region remains very low. While I appreciate the efforts the Bureau of Ocean Energy Management, Regulation, and Enforcement (BOEMRE) and the federal government have taken to ensure development in Lease Sale 193 can proceed safely, I urge the BOEMRE to finalize expeditiously this review process and permit development to move forward.

As the Revised Draft SEIS clearly argues, the likelihood of a very large oil spill occurring in the Chukchi Sea – or any other region – remains extremely low, particularly for levels of discharge experienced during the Gulf of Mexico spill in 2010. Since 1971, out of over 41,000 wells drilled in the U.S. Outer Continental Shelf, only one resulted in a spill of greater than 1,000 barrels: the Gulf of Mexico spill in 2010. Therefore, the historical incidence rate of a very large oil spill over the last forty years has been 0.0000239%. In Alaska, 84 wells have been drilled offshore since 1971, all without incident. Clearly, the risk remains extremely low that a blowout and large oil spill would occur if exploratory drilling is allowed to proceed in the Chukchi Sea.

Following the *Deepwater Horizon* tragedy in April 2010, the federal government and industry have properly augmented their oversight and preparedness capabilities to further minimize the risk of

Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.

Rescinding the leases will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment. Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.

Sale 193 is critical to Alaska's future economy and the nation's long-term energy security. The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.

The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.

Comment from Steve Denton, Denton Civil and Mineral

Submitter Information**Name:** Steve Denton**Address:**PO Box 149
Healy, AK, 99743**Email:** dcandm@mtaonline.net**Organization:** Denton Civil and Mineral**General Comment**

I encourage the BOEM to expeditiously affirm OCS lease sale number 193.

The resources of the Chukchi Sea have been estimated at 29 billion barrels of oil and 209 tcf of gas. If 25% of that is recoverable it could supply 5% of the nation's oil demand (about the excess capacity in the Alaska pipeline) for 20 years and 10% of the nation's gas demand for 22 years. Absent a true fatal flaw in the proposed development, it is unconscionable that development of this resource should not proceed. The positive impact in jobs, tax revenue and general stimulus to local, State and US economies are benefits too significant to be squandered.

The BOEM has done a thorough job of assessing the potential environmental impacts to exploration and development in the Chukchi Sea. Mitigation measures in place, and agreed to by the lessees, provide a high level of protection of the environment and the local use of wildlife resources. Oil development in Alaska's Arctic, both onshore and offshore, has a stellar record of environmental stewardship and safety. 30 wells have already been drilled in the Chukchi Sea using far less refined technology than will be employed today, and there have been no significant incidents. Because of the relatively shallow depth of water, exploration can be done using techniques that are tried and proven. Exploration in the Chukchi Sea will be more of a

file:///C:/Documents and Settings/BENEDET/Local Settings/Temp/wzd8ec/Document Li... 7/26/2011

Denton Civil and Mineral Comment

demonstration of improved conventional and proven drilling techniques than it will be an exercise in development of new techniques.

We have the technology, experience and will to allow responsible development of the Chukchi Sea oil and gas resources without having to sacrifice our natural wonders, as Alaskans have done in many other resource development venues. Please confirm lease sale 193 and allow the United States to benefit from the great treasure in the Arctic once again, as it did from oil development on Alaska's North Slope.

June 2011

James Kendall, Regional Director
 Alaska OCS Region
 Bureau of Ocean Energy Management, Regulation and Enforcement
 3801 Centerpoint Drive, Suite 500
 Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC production is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Brandon Perb

see attached files for signed letter and additional comments*

Dear Mr. Kendall:

On behalf of Eagles' Enterprises, I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. Thank you for the opportunity to comment.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,
 Catkin Kilcher Burton

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of Eagles' Enterprises, I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. Thank you for the opportunity to comment. Lease Sale 193 has already undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, we strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Catkin Kilcher Burton

General Comment

Exploration and development of oil and gas reserves in the Chukchi Sea is vitally important to the economic welfare of the United States and Alaska in particular. There is no reason to believe that oil development in the OCS off Alaska's northwest coast cannot be done in a safe manner without harm to the environment or other activities in the area, such as whaling. Adequate safeguards are available and will be implemented by Shell Oil Company and other operators in the area. The government should act expeditiously to release and approve the EIS and other required permitting documents so that exploration can move forward as soon as possible.

RE: Outer Continental Lease Sale 193 Supplemental Environmental Impact Statement (SEIS)

Greetings:

The Bureau of Ocean Energy Management, Regulation and Enforcement has done an excellent job in the Supplemental Environmental Impact Statement (SEIS) through addressing all the issues raised in the legal challenge to the Draft Environmental Impact Statement for OCS Sale 193.

Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.

The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.

Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.

Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water.

Thirty wells have been drilled in the Beaufort and five in the Chukchi - all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.

Independent third parties have estimated that an annual average of 54,700 new jobs shall be created and sustained over 50 years by OCS-related development in Alaska. An estimated \$63 billion in payroll shall be paid to employees in Alaska as a result of OCS development.

Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.

Sincerely,

The Greater Fairbanks Chamber of Commerce

Richard Heieren

General Comment

I am writing in support of responsible development of the area encompassed by Lease Sale 193. After reviewing the Revised Draft SEIS it is clear that the additional analyses of the three specific areas of concern, combined with the prior analyses and conclusions put forth in the 193 Final EIS, provides an accurate depiction of real and hypothetical considerations.

Safe and responsible development requires diligent regulatory oversight. Your agency is charged with this task. After the unfortunate Gulf of Mexico blow-out and subsequent oil spill, BOEMRE was created and mandated to require a regulatory regime which would be an effective means to ensure that development would continue while at the same time ecosystems and socio-economic/cultural systems would be protected.

As the Director of the Fairbanks Pipeline Training Center, I am particularly concerned that Alaska's First Indigenous People affected by development be provided employment opportunities

Fairbanks Pipeline Training Center Comment

to help mitigate disruptions to their rural subsistence socio-economic culture. In order to effectively take advantage of employment opportunities, Alaska's First People of the Arctic must be trained to acquire the needed technical and safety skill sets.

In closing, let me reiterate that I support safe and responsible development of the 193 Area.

Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing on behalf of First National Bank Alaska, a national banking association, with its main office in Anchorage, Alaska to express our support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected

First National Bank Alaska Comment

by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

David A. Lawer

Re: Comments on Revised Draft SEIS, Lease Sale 193, Chukchi Sea

Dear Mr. Kendall:

On behalf of The Industrial Energy Consumers of America (IECA) we welcome the opportunity to make comment on the Department of Interior's revised Draft Supplemental Environmental Impact Statement for the Outer Continental Shelf, Alaska OCS Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale 193. IECA supports the BOEMRE to move forward with the Lease Sale 193 by finalizing the environmental impact review process.

The Industrial Energy Consumers of America is a nonpartisan association of leading manufacturing companies with \$800 billion in annual sales and with more than 750,000 employees nationwide. It is an organization created to promote the interests of manufacturing companies through advocacy and collaboration for which the availability, use and cost of energy, power or feedstock play a significant role in their ability to compete in domestic and world markets. IECA membership represents a diverse set of industries including: plastics, cement, paper, food processing, brick, chemicals, fertilizer, insulation, steel, glass, industrial gases, pharmaceutical, aluminum and brewing.

Especially important is the well documented fact that the Trans-Alaska Pipeline System that delivers oil production to the West Coast has experienced a throughput reduction from 2.1 million barrels per day to only 650,000 barrels per day. Increased Alaska production is needed to fill this vital pipeline.

It is vitally important that the US produce more oil and natural gas domestically because it increases energy security and creates good paying jobs. Increased production also supports lower energy prices that are needed by our manufacturing sector to compete globally, create jobs and exports. We strongly encourage Lease Sale 193 to proceed.

Sincerely,

Paul Cicio

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, I strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Daryl Sobek

RE: IOGCC Comments on Revised Draft SEIS, Lease Sale 193, Chukchi Sea

Dear Mr. Kendall,

The Interstate Oil and Gas Compact Commission supports enhanced domestic energy production in general and an environmentally safe but robust OCS and on-shore leasing programs. It is my understanding that the OCS Lease Sale 193, in particular, has received a thorough review by the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE). Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes; and that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up to 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecasted to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in mind, it is imperative that BOEMRE allow America to develop its abundant energy resources, including those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable areas of the world, despite the vast North American resources available.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. As a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Carl Michael Smith

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, We urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC production is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Sabrina Conrad

Comments on Revised Draft SEIS
Lease Sale 193 Chukchi Sea

Lynden is a multi-modal transportation and logistics company, with over 700 Alaska employees, a history of scheduled service to Alaska starting in 1954, and extensive activity throughout the state of Alaska, including support for all segments of the economy. Lynden has provided support services for the oil industry including significant logistics support for ICS and emergency response on virtually every incident in Alaska. In addition to providing transportation and logistics services, one of our companies provides training to industry and government responders at our facility in Fairbanks.

Our assessment is that Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.

Furthermore, we believe the potential for industry investment and the economic benefit to Alaska is vital. Shell, in particular, has made unprecedented provisions for proceeding with safe, environmentally responsible development in the OCS.

Additional points that support affirming Lease sale 193.

- ✓ Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- ✓ Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- ✓ The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- ✓ The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- ✓ Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous mitigation measures, including seasonal operating

- restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.
- ✓ Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- ✓ Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.
- ✓ Thirty wells have been drilled in the Beaufort and five in the Chukchi - all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- ✓ The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- ✓ An estimated annual average of 54,700 new jobs would be created and sustained over 50 years by OCS-related development in Alaska. As estimated \$63 billion in payroll would be paid to employees in Alaska as a result of OCS development.
- ✓ New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states - in manufacturing, computer technology, construction and maintenance. \$82 billion in payroll would be paid to employees in the Lower 48.
- ✓ Federal, state and local governments would all realize substantial revenue from OCS development, with the base case totaling \$193 billion, of which the federal government would collect \$167 billion.
- ✓ Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.
- ✓ Given the impact of high energy prices on Americans and their economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore.

Our company has commented and/or testified on every scenario that continues to arise on development of resources within Federal leases. We are standing by with employees, vessels (which are included in the plan), aircraft, trucks, hovercraft, and all manner of logistics capabilities to assist Shell, we are simply waiting for the green-light from the Federal agencies to proceed and put our personnel and assets to work.

Sincerely,

LYNDEN LOGISTICS

General Comment

"I urge you to adopt the Supplement Environmental Impact Statement (SEIS) and reaffirm Chukchi Sea Oil and Gas Lease Sale 193. As an Alaskan, I support the development of Alaska's Outer Continental Shelf. The SEIS is just for the lease sale only, which authorizes a lessee to engage only in "ancillary activities" that do not harm the environment. The lease holders have been waiting for over three years since the historic lease sale in 2008 to explore and hopefully develop these leases. But before any exploration, development or production activities can occur, further environmental review and approval will be required.

Alaskans have and continue to support the development of our state's OCS as it is not only vital to our economy and the continued operation of the Trans-Alaska Pipeline System, but it is important for our nation's energy security. Alaska's OCS is estimated to hold 27 billion barrels of oil and 132 trillion cubic feet of natural gas. That could fuel 25 million cars for 35 years. Alaska's North Slope region has already produced 16 billion barrels of oil in the last years, so the OCS really could fuel Alaska's economy and provided much needed energy for the nation for decades.

Again, please adopt the SEIS and reaffirm Lease Sale 193."

Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, We urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, I strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Evan J. Griffith

Anchorage, Alaska 99503

Dear Mr. Kendall:

I am writing to express Matanuska Electric's support for Lease Sale 193 as well as to indicate appreciation for the thorough review the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) has undertaken. This latest Revised Draft Supplemental Environmental Impact Statement (SEIS) pointedly addresses the concerns raised about the potential for a large oil spill and concludes that the risk is minimal. Now that Lease Sale 193 has been fully reviewed, I urge the BOEMRE to finalize the SEIS and allow the development of these vital resources.

Clearly, the United States is overly reliant on foreign imports of the oil that is crucial to our nation's economic health; hence, it is imperative that BOEMRE permit development of our abundant energy resources, especially those in Alaska's Outer Continental Shelf (OCS). Continuing to import oil from unstable and adversarial countries despite the vast North American resources available makes no sense whatsoever. Relying on oil from countries like Saudi Arabia, Libya and Venezuela places the United States at risk for disruptions in supply and price spikes and supports repressive and anti-American regimes.

In conclusion, I believe the BOEMRE must move quickly to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Evan J Griffith, General Manager

General Comment

We are writing collectively to support OCS drilling in the Chukchi Sea, specifically in the area of Lease Sale 193. We encourage BOEMRE to move forward with responsible development of the Chukchi Sea.

The federal government has a tremendous opportunity at hand in terms of economic revitalization, strengthening national security, and job creation for everyday Americans. Today's economic outlook is bleak; with many state government and our federal government creeping further into debt, it's time for these entities to partner with the private sector in order to generate public revenue and begin the process of freeing ourselves from the financial chains that hold us back from success. Resource development is one of the major solutions to the problems before our country.

Supporting Alaska supports our entire country, and this issue is proof that we are a key component to building a better America. Oil and gas development in Alaska is one of the steps our country can take the assure national and energy security.

Sincerely,

Benjamin Mohr
 Chair, Anchorage Young Republicans

June 2011

James Kendall, Regional Director
 Alaska OCS Region
 Bureau of Ocean Energy Management, Regulation and Enforcement
 3801 Centerpoint Drive, Suite 500
 Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. As a small business owner the importing of foreign oil concerns me, because it takes away from the American economy and affects the number of jobs for Americans. Alaska has known oil reserves in the OCS and on other federal lands in Alaska, these oil reserves when allowed to produce not only create jobs, it also generates significant income for the federal treasury in royalties and lease sale. It is the duty of the United States government to not allow this valuable resource to become stranded and create an environment that allows for production of the Alaskan OCS.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Iraq, Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

 Matthew Fagnani

National Association of Manufacturers Comment

Paul A. Yost
 Vice President
 Energy and Resources Policy

July 11, 2011

National Association of Manufacturers Comment

revenue. Currently, it is estimated that there are 27 billion barrels of oil and 132 trillion cubic feet of natural gas in Alaska's OCS. This resource is imperative for our nation's long-term energy supply. More importantly, the Trans-Alaska Pipeline System (TAPS), which delivers 14% of domestic oil production to refineries on the West Coast, has seen a decrease in throughput from 2.1 million barrels per day to 650,000 barrels a day. TAPS will need additional oil development in order to remain operational. Exploration and development in Alaska's OCS can help extend the operating life of this critical infrastructure.

Furthermore, offshore drilling is a tremendous source for jobs. It is estimated that exploration and development activities in the Alaskan OCS can create a total of 68,600 jobs, during production and 91,500 at peak employment across the country. Also, exploration and development can generate some \$193 billion in government revenue in the next 50 years. The safe exploration and development of Alaska's OCS is vital for manufacturing, energy security, job creation and the overall economy.

Accordingly, the NAM urges the BOEMRE to move forward with the Lease Sale of 193 by finalizing the environmental review process. It is essential that manufacturers have access to reliable, secure and affordable energy while recovering from one of the worst recessions in our nation's history.

Sincerely,

 Paul A. Yost
 Vice President
 Energy and Resources Policy

James Kendall
 Regional Director
 BOEMRE – Alaska OCS
 3801 Centerpoint Drive
 Suite 500
 Anchorage, AK 99503-5820

Dear Mr. Kendall:

The National Association of Manufacturers (NAM) welcomes the opportunity to provide comments to the Department of Interior's revised Draft Supplemental Environmental Impact Statement, announced by Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) on May 20, 2011. We respectfully submit the following comments in support for oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS).

By way of background, the NAM is the largest manufacturing association in the U.S., representing nearly 13,000 small, medium and large manufacturers in all 50 states. We are the leading voice in Washington, D.C. for the manufacturing economy, which provides millions of high-wage jobs in the U.S. and generates more than \$1.6 trillion in GDP. In addition, two-thirds of our members are small businesses, which serve as the engine for job growth.

Our mission is to enhance the competitiveness of manufacturers and improve American living standards by shaping a legislative and regulatory environment conducive to U.S. economic growth. While the Manufacturers support environmental regulations designed to protect the environment and public health, we consistently oppose regulations that create adverse economic impacts on manufacturing without providing any real environmental or public protection. Therefore, we ask that the BOEMRE allow access to the Chukchi Sea by finalizing the environmental review process for lease sale 193 in a timely manner and without excessive delays.

Manufacturers use one-third of the nation's energy. As such, a reliable, secure and affordable source of energy is vital. At a time when gas prices are at an all-time high, the nation needs to safely and effectively develop its own energy resources. Despite the vast domestic sources of energy, the U.S. continues to rely on foreign countries for energy. As a result, the U.S. is put at a greater risk for disruption in supplies, leading to price spikes. By exploring and developing our own domestic resources, we will have access to safe, reliable and affordable sources of energy for manufacturers in the U.S.

Moreover, offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government

Comments on the Revised Draft SEIS
Lease Sale 193 Chukchi Sea
c/o Regional Director James Kendall
BOEMRE - Alaska OCS
3801 Centerpoint Drive Ste. 500
Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of National Tank Truck Carriers (www.tanktruck.org) , I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193.

I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply.

Serving as the Industry's Voice for over 60 years

REGIONAL DIRECTOR, ALASKA OCS

NTTC-2

Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy - not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

John L. Conley

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I am the President and Managing Director of Nautilus International LLC., an offshore energy technology service company. My company focuses on riser technologies which provide safe and low environmental impact alternatives to conventional exploration and well intervention.

I am expressing the same position as the majority of the American public, who want to increase domestic oil and gas production in a safe and environmentally responsible manner. There is widespread support for the development on Alaska's Outer Continental Shelf today, and are perplexed that the federal government continues to delay the finalization of the environmental review for Lease Sale 193 which would allow access to the Chukchi Sea.

I would like to express my strong support for oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193.

Alaska's OCS is critical to our country's long-term energy supply. I have seen reliable statistics that estimate the economic activity from the development of the Chukchi and Beaufort Seas to create an annual average of 54,700 jobs nationwide.

The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

I have been involved in the energy business in the US, internationally and in Alaska for over 30 years, including experience as project manager for the first Department of Energy funded gas hydrate exploration program in Alaska. I am convinced (and the majority of the public is convinced) that the Chukchi and Beaufort Seas will be developed in a safe and environmentally responsible manner.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Thomas E. Williams

General Comment

I urge you to adopt the Supplement Environmental Impact Statement (SEIS) and reaffirm Chukchi Sea Oil and Gas Lease Sale 193. As an Alaskan, I support the development of Alaska's Outer Continental Shelf. The SEIS is just for the lease sale only, which authorizes a lessee to engage only in "ancillary activities" that do not harm the environment. The lease holders have been waiting for over three years since the historic lease sale in 2008 to explore and hopefully develop these leases. But before any exploration, development or production activities can occur, further environmental review and approval will be required.

Alaskans have and continue to support the development of our state's OCS as it is not only vital to our economy and the continued operation of the Trans-Alaska Pipeline System, but it is important for our nation's energy security. Alaska's OCS is estimated to hold 27 billion barrels of oil and 132 trillion cubic feet of natural gas. That could fuel 25 million cars for 35 years. Alaska's North Slope region has already produced 16 billion barrels of oil in the last 34 years, so the OCS really could fuel Alaska's economy and provided much needed energy for the nation for decades.

General Comment

- Over 81% of Alaskans consistently support OCS activities.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states – in manufacturing, computer technology, construction and maintenance.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- Demand for energy is continuing to rise and will require continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.
- Given the impact of high energy prices on Americans and their economy, the U.S. has an obligation to develop domestic energy sources, both onshore and offshore.

file:///C:/Documents and Settings/BENEDETD/Local Settings/Temp/wz134b/Document Li... 7/26/2011

NMS Staffing Comment

• The Very Large Oil Spill Analysis is hypothetical and so extremely unlikely as to be irrelevant. From 1971 to 2009, 41,514 wells were drilled on the OCS with 50 well control incidents (0.1%) resulting in spillage, of 1,829 barrels (0.0000115% of the volume produced). Learnings from the BP Deepwater Horizon blowout in 2010 have been documented and numerous new prevention measures have been implemented as a result. Having learned how to prevent the one-in-40-thousand tragedy, we should not sacrifice the enormous benefits of domestic energy production on the altar of fear.

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of the member companies of the National Ocean Industries Association (NOIA), I am writing to express strong support for oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and complete the leasing process initiated with Lease Sale 193.

The National Ocean Industries Association (NOIA) represents companies engaged in all aspects of domestic offshore energy production, including exploration -- both majors and independents -- production, equipment manufacture, service and supply, transportation and other related offshore support sectors. Either directly or indirectly, our member companies are all working to explore for and produce energy resources from the nation's Outer Continental Shelf (OCS) in a safe and environmentally sensitive manner. Accordingly, Lease Sale 193 and the future prospects for production in the federal waters off Alaska's coasts are of great interest to us.

Lease Sale 193 has undergone exhaustive environmental review and the potential environmental impacts have been subjected to extensive and thorough analysis. The Draft Supplemental Environmental Impact Statement (SEIS) sufficiently analyzes the existing information and has determined that any missing or unavailable information was not essential for a well-reasoned choice among the alternatives. The SEIS sufficiently identifies and considers the potential of a very large oil spill and the potential gas development that might occur as a result of Sale 193. In addition, the SEIS identifies and analyzes the potential effects on the other natural resources in the region and the economy.

Oil and gas development can and should be done safely and BOEMRE should proceed with the sale results of Lease Sale 193 so the American people can fully realize the energy security and economic benefits resulting from increased domestic energy production.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue from royalties, rents and bonus bids. Conservative estimates put Alaska's OCS reserves at an estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas. Alaska's offshore is clearly critical to our nation's domestic energy portfolio.

NOIA Comment

Additionally, economic activity from the development of the Chukchi and Beaufort Seas could create an annual average of 55,000 jobs nationwide and generate nearly \$50 billion for the treasury over the next fifty years. The benefits of moving forward with Lease Sale 193 – and with broader Alaska OCS development – are abundantly clear.

NOIA strongly encourages BOEMRE to move forward now to complete this environmental review and complete the leasing procedures of Lease Sale 193 as soon as possible.

Sincerely,

Michael Kearns
Director, External Affairs

General Comment

James Kendall, Regional Director Alaska OCS Region Bureau of Ocean Energy Management, Regulation and Enforcement 3801 Centerpoint Drive, Suite 500 Anchorage, Alaska 99503 RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

I wish to encourage affirmative action to accept the Revised Draft SEIS. As a near life-long Alaskan working and living in all regions of the State (including 6 years as president/CEO of a large ANCSA Corporation, 6 years as the CFO/VP Finance for the University of Alaska System and 25 years in finance/banking positions, and having experienced visitation to remote regions offshore and outside of the North Slope, ANWR and Point Barrow - I wish to communicate my personal and professional confidence in the ability of this Stage of the Sale/Lease to perform in complete compliance with the plan. As I reviewed the 180 pages of Analysis of Incomplete or Missing Information as included in Appendix A of the SEIS I was overwhelmed with the efforts to get distracted with the appeal process - absent evidence of constructive intent. I am convinced that this Draft SEIS sets an extremely high standard for compliance and that these significant companies are committed to absolute compliance and should be permitted to pursue their exploratory process. Future phases can and will undoubtedly experience additional oversight, but please proceed to approve this phase for the benefit of all concerned. The Plan, science, controls, oversight, commitment and liability combine to make this project fully supportable by any rational, reasonable and prudent authority.

July 6, 2011

Subject: Comments on the Revised Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193 Chukchi Sea OCS

To Whom It May Concern:

On behalf of North Star Terminal & Stevedore Co and North Star Equipment Services I would like to express our support for the approval of this draft SEIS for lease sale 193 for offshore drilling on Alaska's outer continental shelf because:

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 208 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the

North Star Terminal & Stevedore Co. LLC Comment

geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.

- Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- An estimated annual average of 54,700 new jobs would be created and sustained over 50 years by OCS-related development in Alaska. As estimated \$63 billion in payroll would be paid to employees in Alaska as a result of OCS development.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states – in manufacturing, computer technology, construction and maintenance. \$82 billion in payroll would be paid to employees in the Lower 48.
- Federal, state and local governments would all realize substantial revenue from OCS development, with the base case totaling \$193 billion, of which the federal government would collect \$167 billion.
- Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.
- Given the impact of high energy prices on Americans and their economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore.

In conclusion, to obstruct/prevent/deny the OCS lease sales would be detrimental to the people of Alaska, to the local/state economies and to the national need to be energy independent.

Respectfully Submitted,

Jeff Bentz
President

The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the

geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.

- Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- An estimated annual average of 54,700 new jobs would be created and sustained over 50 years by OCS-related development in Alaska. As estimated \$63 billion in payroll would be paid to employees in Alaska as a result of OCS development.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states – in manufacturing, computer technology, construction and maintenance. \$82 billion in payroll would be paid to employees in the Lower 48.
- Federal, state and local governments would all realize substantial revenue from OCS development, with the base case totaling \$193 billion, of which the federal government would collect \$167 billion.
- Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.
- Given the impact of high energy prices on Americans and their economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore.

In conclusion, to obstruct/prevent/deny the OCS lease sales would be detrimental to the people of Alaska, to the local/state economies and to the national need to be energy independent.

Subject: Comments on the Revised Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193 Chukchi Sea OCS

To Whom It May Concern:

On behalf of North Star Terminal & Stevedore Co and North Star Equipment Services I would like to express our support for the approval of this draft SEIS for lease sale 193 for offshore drilling on Alaska's outer continental shelf because:

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the

North Star Terminal & Stevedore Co., LLC Comment

geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.

- Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- An estimated annual average of 54,700 new jobs would be created and sustained over 50 years by OCS-related development in Alaska. As estimated \$63 billion in payroll would be paid to employees in Alaska as a result of OCS development.

June 21, 2011

Mr. James Kendall, Regional Director
Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review undertaken by the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE). We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns posed regarding the potential for a very large oil spill and that it rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes even during a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from 2010. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health and security.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only puts the United States at risk for disruptions in supply and price spikes, it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Mary E. Shields

RE: Comments on Revised Draft SEIS, Lease Sale 193, Chukchi Sea

Dear Director,

I am in full support of affirming Lease Sale 193 as held in 2008. I was present at that sale and witnessed first hand the bid openings for the offshore tracts. I was at first surprised at the amount of money that was offered for some of the blocks, then I realized that the companies that were offering the most were also the companies that knew the potential of the area and were willing to make the investment to explore and develop for a much needed domestic oil and gas supply. It is absolutely shocking to me that the same government that would offer the tracts for lease would also deny the companies the ability to explore their potential at a time when our economy is teetering on recovery (or collapse) and America's dependence on foreign oil continues to increase.

Alaska and the U.S. have had the highest environmental and safety standards in the world, before BOEMRE added more regulations.

More than two dozen wells have been drilled in the Beaufort Sea, and five in the Chukchi Sea without incident, and that was back in the 1980's. In fact most Alaskan's didn't even know there was drilling activity going on at that time. Not to mention the dated drilling technology that was used compared to today's modern and safer practices.

In summary, I would ask that you add my comments to the "Affirm Lease Sale 193" side, and for your agency to encourage, rather than condemn, responsible resource development in Alaska and elsewhere in the United States.

Sincerely,

Judy Patrick

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy -- not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, I strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Re: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

The Resource Development Council (RDC) is writing to urge the Bureau of Ocean Energy Management to affirm Lease Sale 193 as held in 2008. The Supplemental Environmental Impact Statement (SEIS) provides sufficient information and analysis to support a decision affirming the sale.

OCS oil and gas development is absolutely critical to Alaska's future economy. With the Trans-Alaska Pipeline System now running at one-third capacity, exploration blocked in ANWR, and non-development activists working toward Wilderness designations in the National Petroleum Reserve, nothing less than Alaska's future economy is at stake.

The responsible development of potentially immense oil and gas deposits in the Chukchi Sea would significantly boost the economy and extend the life of the oil pipeline. Without new federal oil production, TAPS could be uneconomic to operate at some point in the next decade.

If there is no oil and gas development in ANWR and the OCS, and the best prospects in NPR-A are taken off the table, the federal government must then accept the consequences, including heavier reliance on foreign oil, soaring trade deficits, a weaker national economy, and compromised national security. For Alaskans, our future will be bleak with the state losing much of its economic base.

Not developing federal oil in Alaska makes no sense from an economic and energy security standpoint, especially given the fact that America imports over 50 percent of its oil, and at a great cost.

With its enormous potential reserves, the OCS can sustain Alaska's economy for generations. The public interest should compel the Obama

Resource Development Council Comment

administration to move forward with policy that encourages job creation, supports national energy security while growing the economy, and providing the nation with much needed domestic energy supplies.

RDC has a high level of confidence that exploration and development can occur safely in the Arctic and that mitigation measures can be put in place to address most concerns. Development can and does occur without harm to polar bears, caribou and other species.

Since the 2010 oil spill in the Gulf of Mexico, opponents of offshore drilling are calling for an indefinite ban on new exploration and development in Alaska. RDC sharply disagrees. Operating conditions in these waters are categorically different than those in the deep waters of the Gulf of Mexico and pose much lower risk. Moreover, the processes and safeguards in place today in Alaska should allow leasing and exploration activity to resume in the Alaska OCS.

Drilling in the Arctic offers distinct difference than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska, where wells would be in very shallow water. In addition, the relatively shallow water depth in the Chukchi Sea would allow blowout preventers to close much more rapidly than those in deep water. The blowout preventers would also be directly accessible to dive teams, unlike the Gulf where any maintenance or repairs had to be accomplished by remote control vehicles. Another distinction is that many Alaskan offshore operations are seasonal in nature. For example, Shell has proposed conducting its exploratory drilling during the summer and fall open water season. Ice management vessels will be positioned on site to deflect any ice flows that could potentially approach a rig. There are also major differences between state and federal oversight and regulatory frameworks, as well as fundamental differences in the geology of the regions. All of these contrasts warrant special consideration in public policy decisions and should lead the BOEMRE to conclude that exploration should move forward in the area covered by Lease Sale 193.

Advances in technology provide an additional measure of confidence in Alaska drilling. Energy development in Alaska is subject to in-depth analysis by federal law, a stringent permitting process, and oversight by state and federal agencies. In every instance, development is preceded by extensive studies.

RDC recognizes that subsistence whaling is vitally important, both economically and culturally to North Slope villages. Industry and government working together have the ability to protect subsistence resources while producing needed domestic energy for the nation. Strong regulatory oversight, combined with other mitigation measures, can be employed to protect all resource and subsistence users.

While the Chukchi and Beaufort Seas are considered frontier areas, exploration activity has occurred there before. In fact, thirty wells have been drilled in the Beaufort and five in the Chukchi - all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today. Moreover, there has never been a blowout in the Alaska or the Canadian Arctic that has resulted in an oil spill.

Opponents of oil exploration have cited the lack of infrastructure in the Arctic as a reason not

Resource Development Council Comment

to drill in the region. However, it is important to note that additional infrastructure will be built to accommodate future needs once exploration and development activities move forward. The lack of infrastructure today is due directly to the fact that there has been virtually no ongoing development or commercial activity of any kind offshore in the Arctic.

The SEIS concludes that the probability of a very large oil spill is very minimal and Shell has defended its ability to quickly cap blowouts and to contain and clean up spilled oil. Shell has committed to stage extensive resources onsite to immediately respond to any incident. The company has also committed to building and staging in the region a pre-fabricated dome to place over a troubled well. Moreover, virtually all functions of Shell's operations will be monitored at remote sites off the rig, giving industry and government critical "real-time" data and allowing for early detection of potential problems. In addition, the Alaska Clean Seas consortium has substantial resources and experience in the Arctic and has done extensive mapping to identify sensitive areas. The consortium has also conducted extensive safety and oil spill drills in the Arctic and has active research programs dating back into the early 1980s.

Some groups opposing offshore development will insist that all scientific and research data gaps be eliminated before exploration is even considered. In our view, this is unreasonable. A significant scientific record exists in the Arctic and industry and others are well positioned to add to it with new studies, while exploration moves forward in a cautious and responsible manner. The North Slope and the offshore are now perhaps the most studied energy basins in America. The federal government has spent more than \$500 million on studies in Alaska and in the past decade the agency has funded hundreds of studies here, with the majority of those focused on the Beaufort and Chukchi Seas. Rather than wait for all the questions to be answered, drilling should proceed as research continues to advance our knowledge of the Arctic.

Those who oppose exploration in the Arctic would study this issue indefinitely and use any data gaps as an excuse for inaction. There will always be gaps and unanswered questions, no matter where exploration and development occur. In fact, significant gaps existed before and during development of the North Slope's most prolific oil fields. Despite these gaps, development moved forward in a responsible manner while at the same time our knowledge and understanding of the Arctic advanced. But not all questions and concerns regarding oil and gas exploration and development can be answered and met. Not all risks can be eliminated. If we wait until we have all the answers, drilling will never occur. That may be the goal of some, but that ignores the nation's need for domestic sources of oil. If the federal government insists that every risk be eliminated, then it must be prepared to significantly increase foreign imports to meet future needs. It must then also accept the consequences of a heavier reliance on foreign oil, including higher trade deficits, a weaker and more vulnerable economy, and compromised national security. Put another way, failure to move forward with OCS development in Alaska will put the state economy at risk, as well as the nation's security.

Between ANWR, NPR-A and the Alaska OCS, there could be nearly 40 billion barrels of oil in place. By comparison, 16 billion barrels of oil have been produced on state lands across the North Slope in 33 years. The sustainability of TAPS and Alaska's economy will largely depend on some combination of oil production from these federal areas, which represent the nation's best onshore and offshore prospects for major discoveries.

Resource Development Council Comment

New production in the Alaska OCS would reduce America's reliance on foreign energy. The Alaska OCS is an important future source of U.S. energy supply with up to 29 billion barrels and over 235 trillion cubic feet of natural gas potentially in place. The potential recoverable reserves offshore Alaska is more than all the current total proven U.S. oil reserves of approximately 21 billion barrels. Alaska could have the ninth largest oil resources in the world ahead of Nigeria and Libya - if access is granted to these potential reserves. Moreover, OCS gas reserves would significantly improve the long-term economic viability of the proposed gas pipeline from the North Slope to the Lower 48 - a clean energy priority of the Obama administration. To become a reality, the pipeline requires additional gas reserves beyond what has already been discovered onshore.

Given its potential for immense recoverable reserves and enormous economic benefits to the state and nation, the Alaska OCS should be opened to responsible development. OCS development would generate hundreds of billions of dollars in royalty and tax revenues to the state and federal governments and aid the nation's economic recovery by reducing the trade deficit and creating tens of thousands of new jobs. Indeed, OCS leases off Alaska's coast have already generated billions of dollars to the federal treasury.

The OCS can sustain Alaska's economy for generations. Currently there are more than 108,000 Alaskan jobs tied to the discovery, production and shipment of Alaskan oil and natural gas, accounting for more than 15 percent of Alaska's population. According to a University of Alaska study, OCS production could provide an annual average of 54,700 jobs nationwide with an estimated cumulative payroll of \$145 billion over the next 50 years. Moreover, revenues generated from OCS development in the Arctic could amount to \$193 billion in revenues to federal, state and local governments over a 50-year period.

RDC and many Alaskans share President Obama's view that America needs to conserve more and put new emphasis on renewable and alternative energy. By doing so, the nation can ultimately break its reliance on foreign oil. Yet while America must conserve more and move toward renewable energy, it still needs to pursue new domestic oil and gas production, given the fact it will take decades before renewable energy becomes a dominant energy source. Even with the Obama administration's goal to decrease dependence on oil, it is projected that fossil fuels will still account for two-thirds of this nation's energy consumption in 2025. Meanwhile, every barrel of oil that is not produced in the U.S. will be imported from abroad to meet our needs. Given economic, environmental and geopolitical concerns, America must produce more of the oil it consumes - under American laws, regulations and oversight, and by American workers.

It is vital that our nation's abundant energy resources be fully utilized for compelling economic and energy security reasons. RDC encourages BOEMRE to re-affirm Lease Sale 193 as held in 2008. Thank you for the opportunity to provide comments.

Sincerely,

Carl Portman

Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of H & M enterprises, I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy - not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, we strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Herman & Myra Schliesing

Re: Comments on Revised Draft Supplemental Environmental Impact Statement, Lease Sale 193 Chukchi Sea

Dear Dr. Kendall,

As a successful bidder in Oil and Gas Lease Sale 193, Shell Gulf of Mexico Inc. ("Shell") is pleased to have the opportunity to comment on the Bureau of Ocean Energy Management, Regulation, and Enforcement's ("BOEMRE's") Chukchi Sea Planning Area Oil and Gas Lease Sale 193 Revised Draft Supplemental Environmental Impact Statement (May 2011) ("Revised Draft SEIS"). These comments supplement the comments Shell submitted on November 29, 2010, on the original Draft Supplemental Environmental Impact Statement ("Draft SEIS") BOEMRE released for public comment on October 15, 2010. For convenience, those comments are attached.

BOEMRE originally undertook this environmental review in response to remand instructions issued by the U.S. District Court for the District of Alaska. The court instructed BOEMRE to supplement its review of Lease Sale 193 under the National Environmental Policy Act ("NEPA") by analyzing three issues: (i) the environmental impact of natural gas development; (ii) whether missing information identified in the Final Environmental Impact Statement for Oil and Gas Lease Sale 193 and Seismic-Surveying Activities in the Chukchi Sea ("193 FEIS") was essential or relevant under 40 C.F.R. § 1502.22; and (iii) whether the cost of obtaining the missing information was exorbitant, or the means of doing so was unknown. Following the completion of the public comment period for the Draft SEIS, BOEMRE decided to undertake an additional review of the impacts of a Very Large Oil Spill ("VLOS"). BOEMRE has now released the Revised Draft SEIS including the results of the VLOS analysis as well as additional information relating to the issues originally comprised the remand analysis.

These comments first address the BOEMRE's VLOS analysis and then address the additional information added to the Revised Draft SEIS on the original remand issues.

I. Very Large Oil Spill Analysis

BOEMRE has provided a thorough and detailed VLOS analysis in the Revised Draft SEIS. To better present the information for informed decision-making, Shell advises that BOEMRE make two general changes to the document.

First, BOEMRE should use more explicit language to clarify what it is analyzing in the VLOS, and what is excluded from the analysis. As discussed in the comments below, BOEMRE's inclusion of spill response and intervention efforts throughout the VLOS analysis is confusing. While Shell acknowledges BOEMRE's intention to ensure proper analyses of impacts from a very large oil spill in the Chukchi Sea, it is also important for the public to understand that the analysis presented in the Revised Draft SEIS does not take into consideration an operator's ability to respond immediately to an emergency that results from a well control situation while operating in the Chukchi Sea. For example, Shell's Exploration Plans since 2009 have identified and provided specific information on all response vessels that would accompany a drilling operation in the Chukchi Sea. Shell's response time to a well control scenario is one hour from the time of such event and is documented in all Chukchi Sea exploration planning. Shell notes that BOEMRE has provided a description of Shell's plans in the VLOS analysis (Revised Draft SEIS Section IV.D.3c). To avoid creating confusion, Shell urges BOEMRE to use all appropriate language to distinguish the impacts analyzed in the VLOS analysis, which disregard response efforts, from the discussion of the efficacy of response efforts, including the description of Shell's spill response plans (which are, of course, designed for Shell's EP and not for the extreme VLOS scenario constructed by BOEMRE for a different prospect).

Second, and also discussed in the comments below, Shell suggests that BOEMRE make a greater effort to contextualize the risk of a VLOS to minimize the possibility that the public and decision-makers overweigh the risk of this low probability event. Shell commends BOEMRE on the detailed analysis of the potential impacts of a VLOS contained in Section IV.E. of the Revised Draft SEIS. However, Shell is concerned that Section IV.D. does not adequately put the risk of those impacts in appropriate context. BOEMRE has not provided a quantitative probability assessment of the likelihood of a VLOS occurring in the text of the Revised Draft SEIS. This analysis appears to be included in Appendix B, but that information is not cross-referenced, summarized, or otherwise provided to readers of the Revised Draft SEIS in the appropriate sections. This omission leaves the public without a meaningful way to evaluate the likelihood of the impacts described in Section IV.E.

A. Probability Analysis

Section IV.D. provides background on the VLOS analysis, describes the method by which BOEMRE constructed the specific VLOS scenario analyzed, and discusses the efficacy of intervention, cleanup, and spill response techniques. This section should be revised to include a probabilities analysis. Although the Revised Draft SEIS states that a VLOS is a "low-probability, high impacts event," (see, e.g., Revised Draft SEIS at 121) the Revised Draft SEIS does not include an analysis of the quantitative probability of such an event or a cross-reference to Appendix B, which appears to provide that analysis. Multiple parts of Section IV.D. should be revised to put the risks analyzed in the appropriate context.

2

Section IV.D.1. Background. Section IV.D.1. provides updated information on Outer Continental Shelf ("OCS") well control incident rates including information from 2010. However, the section does not take the necessary next step of putting that information in context to inform the reader on the likelihood of a well control event that leads to a release of liquid hydrocarbons occurring as a result of the Lease Sale 193 in light of the data provided. This omission could be partially resolved by cross-referencing or summarizing the data and conclusions in Appendix B. Appendix B appears to conclude that when the OCS well control data from 1971-2010 are considered, the fault tree analysis used in the Sale 193 FEIS remains valid. Revised Draft SEIS, Appendix B at B4. The fault tree analysis used in the Sale 193 FEIS estimates the frequency of a VLOS in the Chukchi Sea at 3.9×10^{-6} per well. *Id.* This is highly relevant information that should be made easily available to the reader to put the data on spill impacts provided in the text in the appropriate context. To completely resolve the potentially confusing description of the probability of a VLOS, Shell suggests that BOEMRE inform the public that this modeled rate overestimates the probability of a VLOS based on historical data (according to Section IV.D.1., the actual empirical rate of OCS incidents that have resulted in spills greater than 150,000 bbls is 1 in 41,781, which puts the unadjusted frequency of a VLOS at 2.39×10^{-5} per well; this actual empirical rate should be made available to the reader). Finally, Shell advises a careful review of terminology used to describe "OCS well control incidents." Because only approximately 20% of OCS well control incidents result in the release of any liquid hydrocarbons, the more relevant number for public review is the number of actual spills. Shell suggests that BOEMRE revise the text to clarify the distinction and properly focus on the risk of spills.

Further, the discussion later in Section IV.D.1. regarding rule changes following the Deepwater Horizon event provides only summaries of the regulatory changes, without any discussion on the anticipated safety impacts of those changes and consequent decreases in the probability of a VLOS. This omission should be rectified to provide the public with the most accurate prediction of the likelihood of a VLOS in the post-Deepwater Horizon regulatory environment.

B. Construction of the VLOS Scenario

The method by which BOEMRE constructed the hypothetical VLOS scenario analyzed in the Revised Draft SEIS is of critical importance. To properly evaluate the impacts discussion in Section IV.E., the reader must understand the likelihood of the actual event being analyzed. To do that, BOEMRE must provide a clear, plain language description of its methodology. While Shell generally approves of the descriptive language used in Section IV.D.2., there are some key concepts that should be further clarified.

Introductory Section. The three introductory paragraphs in this section make critical points regarding the use of the VLOS scenario, which, in some cases, should be strengthened with a quantitative reference to the low probability of a VLOS.

First, the text clarifies that the VLOS scenario is a planning tool to evaluate hypothetical events and should not be "confused with what would be expected to occur as a result of any of the action alternatives." Revised Draft SEIS at 126. Shell strongly agrees with this position and believes that BOEMRE could make the purpose of the VLOS more clear by providing the public with a cross-reference to the quantitative assessment of the likelihood of a VLOS in Appendix B, to further define what BOEMRE means by "hypothetical."

3

Second, the text explains the similarities and differences between a VLOS and a worst-case discharge analysis ("WCD") for an Exploration Plan. Shell supports the inclusion of this critical distinction in the text to provide clarity to readers.

Third, the text states that the "VLOS scenario is predicated on an unlikely event—a loss of well control during exploration drilling that leads to a blowout and a resulting VLOS." Revised Draft SEIS at 126. What is lacking from this paragraph (and the description of OCS well control incidents it cross-references) is a description of how unlikely such an event would be. Shell urges BOEMRE to include (i) a cross-reference to the quantitative analysis of the overall probability of a VLOS based on the historic OCS well control data provided in Appendix B, and (ii) a qualitative assessment of the probability of the actual VLOS scenario modeled and analyzed in the Revised Draft SEIS, taking into account the extreme assumptions BOEMRE used to construct the scenario. The qualitative assessment of the probability of the actual VLOS scenario modeled is important because, although BOEMRE provides a description of the assumptions used to construct the scenario, the text does not convey to the reader the realistic impact of those assumptions — i.e., that BOEMRE has attempted to create an absolute worst case scenario so unlikely as to be extremely unlikely under real world conditions. Shell acknowledges that, because well control events are rare, providing a precise prediction of probabilities is challenging. However, without any attempt to put this risk in context, BOEMRE will fail in its responsibility to adequately inform the public of the realistic risks posed by the lease sale, thus, potentially causing the public and BOEMRE decision-makers to overweigh the risks of this low-probability event.

Rate, Time and Composition of Hypothetical Spill. This section is one of the most critical of the Revised Draft SEIS because it describes that construction of the actual VLOS scenario analyzed, thus describing the fundamental assumptions underlying the entire VLOS analysis. The VLOS scenario is described as "a hypothetical oil discharge model that estimates the highest possible uncontrolled flow rate that could occur from any known prospect in the Sale 193 area, given real world constraints." Revised Draft SEIS at 126. There are three assumptions described in this description, all of which should be explained in plain language for the reader: (i) uncontrolled flow rate, (ii) any known prospect, and (iii) real world constraints.

The confusion stemming from BOEMRE's inconsistent use of an uncontrolled flow rate, while also evaluating the negative impacts of intervention and response is addressed in the next section.

The use of the term "known prospect" is particularly problematic because it misleadingly implies that the subsurface characteristics of the geographical formation that BOEMRE used in the VLOS analysis are "known." In fact, as BOEMRE acknowledges in Appendix D (but not in the text of the Revised Draft SEIS), "[t]he particular prospect is not known to contain oil or to offer rocks capable of performing as petroleum reservoirs." Revised Draft SEIS, Appendix D, at D1-D2. Shell suggests that BOEMRE clarify in the text of the Revised Draft SEIS why it chose the geological formation used to create the VLOS and the limits of the analysis (i.e., if the formation does not contain oil, there is no risk of a VLOS from this prospect). Further, BOEMRE's use of the phrase "any known prospect" could lead the casual reader to infer that any prospect in the Lease Sale 193 area has the potential for a VLOS of the type modeled. Shell suggests that BOEMRE revise the language to clarify that the VLOS scenario was constructed to be the worst possible spill in the Lease Sale 193 area and that other known and mapped prospects do not have the physical capacity to flow at the rate analyzed.

4

Finally, Shell suggests that BOEMRE define what it means by "real world constraints." As discussed in the following section, BOEMRE used many assumptions that are inconsistent with a "real world" response to a spill. BOEMRE should clarify that it does not include intervention and response in the phrase "real world constraints" and should describe what is included and what is excluded in the concept.

C. Impact of Intervention and Response

Shell agrees with BOEMRE's decision to discuss both recovery and cleanup methods (Revised Draft SEIS at 134-136) as well as intervention and response efforts (Revised Draft SEIS at 138-140). Shell believes that these efforts will significantly limit the impact of a spill in the unlikely event that a well control incident should occur. However, the current organization of the text is ambiguous in its treatment of these efforts.

As a preliminary matter, Shell strongly urges BOEMRE to explain to the reader why it has constructed a VLOS analysis that completely discounts the positive and mitigation effects of such efforts. Because intervention and response plans are required for any OCS well approval, Shell should explain to the public why it has constructed a scenario that assumes intervention and response will have, at best, no effect.

Regardless of BOEMRE's reasons for discounting the beneficial impacts of intervention and response, the current draft is confusing in its description of the impacts of these efforts. The Revised Draft SEIS states that recovery and clean-up efforts are "not factored into the spill volume posted by this scenario and considered during [Oil Spill Risk Analysis] modeling." (Revised Draft SEIS at 136) and that intervention and response efforts "are not factored into the estimated spill duration as described in the VLOS scenario" (Revised Draft SEIS at 139). Nevertheless, Section IV.E. includes the impacts of both recovery and cleanup as well as intervention efforts as Phase 4 of the VLOS event (Spill Response and Cleanup). Revised Draft SEIS at 137-38. Thus, the impacts of response and cleanup activities on the various resources are analyzed in Section IV.E., but the beneficial impact of those activities in decreasing the volume of oil reaching the environment and shortening the duration of an uncontrolled flow, is not.

Shell is not opposed to this approach, particularly given BOEMRE's position that it is using the VLOS scenario as a planning tool to identify the impacts of a spill based on the "highest flow rate of hydrocarbons and the aggregate discharge that could plausibly occur from any known prospect in the Sale 193 lease area." Revised Draft SEIS, Appendix D, at D1. Nevertheless, as it currently reads, the Revised Draft SEIS fails to adequately emphasize that Section IV.E., is analyzing both the adverse impacts of the uncontrolled flow volume modeled in the VLOS scenario, without reference to any benefits from response or intervention efforts, and the adverse impacts of response and intervention efforts. Specifically, Shell is concerned that the Revised Draft SEIS allows the incorrect impression that the adverse impacts of the VLOS identified in Section IV.E. are impacts that would be possible even with successful cleanup, response, and intervention efforts. Shell suggests the section titled "Scenario Phases and Impact-Producing Factors" (Revised Draft SEIS at 137-38) be revised to clarify this potential source of confusion. Shell further suggests that BOEMRE consider adding similar clarifying language as appropriate throughout Section IV.E.

5

D. Context of the Effects Analysis

Section IV.E. provides an excellent and thorough discussion of the potential impacts resulting from the VLOS scenario BOEMRE constructed. As BOEMRE acknowledges, these impacts are highly unlikely. To put the 145-page analysis in proper perspective, Shell suggests providing further clarification in the introductory section in two ways.

First, Shell recommends providing, at a minimum, a cross reference to the probabilities analysis in Appendix B to provide the reader adequate context on the likelihood that the various adverse impacts described in the section could actually occur as a result of the lease sale. As it currently reads, the text merely states that the section "presents a detailed analysis of the environmental impacts that could occur in the event of the hypothetical VLOS scenario described in the preceding section." Without any reference to the extreme assumptions BOEMRE used to construct the VLOS scenario, a reader does not have the appropriate context to understand how unlikely such an event would be.

Second, Shell suggests providing a narrative description of the VLOS scenario. In various parts of the Revised Draft SEIS, BOEMRE refers to the VLOS scenario as "low probability, high impacts" (Revised Draft SEIS at 121), "a hypothetical oil discharge model that estimates the highest possible uncontrolled flow rate that could occur from any known prospect in the proposed Sale 193 area, given real world constraints" (Revised Draft SEIS at 126), and a "simulation [that] ascertains the highest flow rate of hydrocarbons and the aggregate discharge that could plausibly occur from any known prospect in the Sale 193 lease area" (Revised Draft SEIS, Appendix D at D1). Elsewhere, the text also states that the VLOS scenario does not include the beneficial impacts of cleanup, recovery, and intervention efforts. Revised Draft SEIS at 136, 139.

If the reader has the patience to search through the document and is able to assemble all of this disparate information, then improbability of the hypothetical VLOS scenario analyzed in Section IV.E. becomes clearer. Critically, within Section IV.E. itself, when any reference is made to the likelihood of VLOS, the scenario is merely described as "hypothetical." See, e.g., Revised Draft SEIS at 140, 143, but see 149 (making no reference to likelihood of VLOS). Nowhere in the document is the hypothetical clearly and succinctly defined as being an extreme, entirely speculative scenario; a scenario that the objective data establishes would be an exceedingly remote occurrence. A concise explanation of the basis for the hypothetical should be included to avoid confusion about the likelihood of the impacts described in Section IV.E.

Shell suggests that BOEMRE state in the introductory paragraphs of Section IV.E. and throughout the section as appropriate that the VLOS scenario was intentionally designed to model the maximum plausible uncontrolled and unmitigated flow from the prospect in the lease sale area with the greatest hypothetical potential flow rate, acknowledging that the particular prospect is not known to contain oil or to offer rocks capable of performing as petroleum reservoirs. Further, throughout Section IV.E., Shell suggests that discussions of Phase 4 acknowledge that the impacts of spill response, cleanup, and intervention efforts are being examined solely to identify adverse impacts, and that the mitigating value of those efforts in reducing the time or volume of the spill has not been considered.

6

II. Original Remand Issues

A. Inconsistencies with Draft SEIS

BOEMRE updated and revised the discussion of the original remand issues in this Revised Draft SEIS. In doing so, BOEMRE has created some potential inconsistencies between the Draft SEIS and the Revised Draft SEIS. Shell suggests that BOEMRE consider providing additional explanation in the text for the following apparent inconsistencies:

- **Generally:** In Section III of the Draft SEIS, BOEMRE stated for a variety of resources that "analysts reviewed additional information for natural gas production and development" and that with respect to the given resource, "the information would not change the analysis or alter the environmental consequences." Shell commented that, in light of the Court's remand instructions, it would be desirable to identify the new information referenced by these statements. In the Revised Draft SEIS, BOEMRE has identified that information for certain resources, but for other resources, BOEMRE now states that no new information regarding the resources has been introduced in the supplement. See Revised Draft SEIS at 41 (physiography), 46 (water quality, air quality, and the acoustic environment), 68 (terrestrial mammals), 69 (wetlands), 72 (sociocultural systems), and 73 (archeological resources and environmental justice). Shell is concerned that the discrepancy between the language used in the Draft SEIS and the Revised Draft SEIS creates the appearance that information was reviewed for the Draft SEIS that was disregarded in preparation of the Revised Draft SEIS. Shell suggests revising the language to clarify BOEMRE's review process.
- **Page 22:** BOEMRE previously concluded that the impacts of natural gas development on fish resources was not expected to be significant, but in this document states merely that they are expected to be localized and minor.
- **Page 23:** BOEMRE previously stated that significant impacts to polar bears would "only occur during the unlikely event of a large oil spill," but in this document, BOEMRE states that "[s]ignificant impacts to polar bears could occur during a large oil spill, depending on the location of the spill."
- **Page 45:** BOEMRE previously described water quality in the Alaska Arctic region OCS as "relatively pristine," but in this document BOEMRE states only that the U.S. Chukchi Sea experiences little nonpoint source pollution due to runoff.
- **Page 103:** BOEMRE previously stated that an estimate of 25 spectacled eider takes and 2 Steller's eider takes as a result of 20 years of natural gas development "likely overstates the risk of collisions," but in this document, BOEMRE merely provides the estimates without comment on whether the estimates overstate the risk.
- **Page 114:** BOEMRE previously discussed the impacts of helicopter traffic, as opposed to fixed-wing aircraft on female/juvenile walrus, as well as the impact of ship activities on the same, but in this document that analysis is not included.

7

B. Shell comments on the Draft SEIS not addressed in the Revised Draft SEIS

- In Section IV.C.2, discussing the air quality impacts of natural gas exploration and production, the Draft SEIS does not specify why it forecasts emissions and impacts for some pollutants (VOCs, ozone, greenhouse gases and visibility), but not others. Specifically, the basis for the comment "any increase in the concentrations of criteria pollutants from these activities would be small, local, and temporary" is unclear. Shell suggests BOEMRE clarify the scope of the air analysis performed for the natural gas development and production scenario and provide a basis for the conclusion that increases in pollutants due to natural gas development and production are likely to be small, local, and temporary. Further BOEMRE should identify the applicable air quality standards against which it measured the anticipated air quality impacts and provide the basis for its determination of the applicable air quality standard. *The air quality analysis is unchanged in the Revised Draft SEIS.*
- Shell commends BOEMRE on the explanation of its approach to missing information in the natural gas section provided on page A4 of Appendix A. To provide the reader with a full understanding of BOEMRE's approach to missing or incomplete information, Shell suggests that BOEMRE provide a similar explanation of its approach to missing or incomplete information in the VLOS section as appropriate.

III. Conclusion

The various environmental documents that support BOEMRE's decision to proceed with Lease Sale 193 (those completed prior to the decision to lease as well as those prepared in response to the court's remand) are thoughtful, detailed, carefully developed analyses that fully satisfy the requirements of the OCSLA, NEPA and the court's order on remand. Those documents reflect a significant investment of agency resources; an investment that holds tremendous promise for advancing the Nation's future energy security.

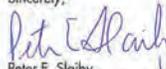

Like BOEMRE, Shell has invested heavily in Lease Sale 193. In addition to establishing its substantial leasehold position, Shell has now twice prepared comprehensive Exploration Plans, Environmental Impact Assessments and multiple supporting permit applications/environmental analyses for exploration drilling programs on several of those leases. Together with BOEMRE, it successfully defended the first of those plans against ENGO challenge at the Ninth Circuit, and success in any challenge to the second is anticipated. Shell also has purchased, modified and/or constructed multiple vessels that are designed and built for the specific environmental conditions that will be encountered during the proposed exploration drilling program. Shell has also assembled a team of experts in the multiple, relevant technical and environmental disciplines that will enable it to complete its proposed program in a safe, environmentally responsible manner. In addition, Shell's exploration program, which is only possible as a result of the agency's hard work in reaching the decision to lease, will create hundreds of new jobs for Americans.

We encourage the agency to finalize this SEIS, ratify its earlier decision to lease and promptly complete its review of Shell's most recent proposed Chukchi Sea Exploration Plan. Shell is prepared to move forward with its exploration drilling program starting in the summer of 2012. However, any

8

further delays likely will mean the loss of another drilling season and the jobs that would be created by the program.

Sincerely,

Peter E. Slaby
Vice President, Shell Alaska

Comments on the Revised Draft SEIS
Lease Sale 193 Chukchi Sea
c/o Regional Director James Kendall
BOEMRE - Alaska OCS
3801 Centerpoint Drive Ste. 500
Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, I strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Sodexo Remote Sites – North America
On-site Service Solutions.

Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC production is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes, it also supports repressive and anti-American regimes.

Re: SEIS, Lease Sale 193, Chukchi Sea

Dear Mr. Director:

Lease Sale 193 should be allowed to proceed at once. The U.S. economy is feeble; the budget deficit and the national debt are alarmingly serious. This great country is strapped down and rendered as helpless as Gulliver among the Lilliputians because of so many cautionary regulations, so many incentives to buy our petroleum abroad, and so many disincentives to produce domestic petroleum. If the capital and labor involved in the production and shipping of foreign oil were instead invested in the American oil business, a hefty start will have been made towards righting our country.

You may be tempted to recoil from any duty to invigorate the American economy on the grounds that your work is confined by the statutes concerned, that you do not serve on the President's Council of Economic Advisors. However, if any citizen serving in government would have a care to make our economy grow at a brisk rate – say four to five percent per annum – our debt and deficit problems would disappear and our citizens would be enlivened in "the pursuit of happiness."

I ask you to rise to your nation's needs, and do all possible to make Lease Sale 193 a monumental and early success.

Thank you, and good luck!

Sincerely yours,

Joseph R. Henri

REGIONAL DIRECTOR, ALASKA OCS
MINERALS MANAGEMENT SERVICE
ANCHORAGE, ALASKA

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Sodexo Remote Sites

Re: **Comments of Statoil USA E&P Inc. on the Revised Draft SEIS for Lease Sale 193 Chukchi Sea**

Dear Director Kendall:

Statoil USA E&P Inc. (Statoil) appreciates the opportunity to submit comments on the Revised Draft SEIS for Lease Sale 193 in the Chukchi Sea. We believe that the opportunity for input and active engagement with stakeholders and the public is necessary to ensure a balanced and environmentally responsible approach to management of Arctic resources.

Statoil and its affiliates comprise an international energy enterprise with operations in forty countries. We have more than thirty-five years of experience from oil and gas production on the Norwegian Continental Shelf, where we operate 80% of the production. Statoil is the largest offshore operator in the world, and we are committed to accommodating the world's energy needs in a responsible manner, applying technology, and creating innovative business solutions.

Statoil began building its upstream petroleum assets in the US market in 2002, and we have invested over \$14 billion to grow our upstream business. Statoil is one of the largest leaseholders in deepwater Gulf of Mexico and holds significant positions in the Alaska Chukchi Sea. Over the past two years, we entered into joint venture agreements for onshore gas production in several eastern states and Texas.

In 2008, Statoil acquired sixteen leases during the MMS's OCS Lease Sale 193 in the Alaska Chukchi Sea. We successfully completed a 3-D marine seismic program on our leases and adjacent areas during the open water season of 2010 and are planning a shallow hazards and soil investigation program for the 2011 open water season. Statoil is also a 25% owner in ConocoPhillips' Devils Paw prospect in the Chukchi Sea and has worked cooperatively with Shell and ConocoPhillips to collect environmental baseline data in the region over the past three years.

Statoil recently participated in an extensive research program regarding oil spill response capabilities in Arctic waters. We aim to continue to improve our knowledge about oil spill response and are playing an active part in joint industry efforts to further strengthen oil spill technology in Arctic conditions. We will continue to incorporate the most advanced and effective spill response techniques in any future exploration in the Chukchi Sea.

Overcoming the challenges to exploration in the Chukchi Sea requires significant investment and a regulatory environment that is predictable, stable, and transparent. Exploration in the Alaska Arctic is at a critical stage. To ensure continuing investment, it is important that BOEMRE expeditiously finalize the SEIS, reaffirm Lease Sale 193, and vigorously defend its decision-making from any challenges.

Statoil has reviewed the Revised Draft SEIS for Sale 193 and believes it thoroughly addresses the concerns identified by the District Court of Alaska. Further, the addition of the Very Large Oil Spill (VLOS) scenario represents a thorough analysis of a hypothetical, catastrophic spill. We have two requests of BOEMRE with respect to the VLOS analysis.

First, the SEIS would benefit from an unambiguous description of the components that are included and excluded from the VLOS analysis. For example, reference to spill response in the VLOS discussion is confusing insofar as it may cause some readers to assume—incorrectly—that spill response efforts play a role in the calculation of the VLOS. Similarly, the SEIS should include a clear discussion of risk to put the probability of impacts resulting from a low probability VLOS into context.

Second, the SEIS should more clearly address the distinctions between the VLOS analysis— which BOEMRE has undertaken under NEPA— and the worst case discharge (WCD) analysis that occurs under the auspices of an Exploration Plan. The VLOS scenario is a planning tool for environmental impacts analysis that represents an improbable, extreme case. This hypothetical VLOS scenario differs from the WCD calculation, which is site-specific and calculated in accordance with applicable regulations. We believe there is potential for the public, organizations and government agencies to confuse the VLOS and the WCD methodology when the WCD is being developed in the context of individual Exploration Plans. Hence, we encourage BOEMRE to more clearly address and emphasize the distinctions between the VLOS analysis and the WCD. This will minimize the possibility that the VLOS will, in any subsequent proceedings, be inappropriately taken out of context.

In closing, Statoil commends BOEMRE for developing the Revised Draft SEIS on a quick timeframe and looks forward to BOEMRE's timely adoption of the preferred alternative. The preferred action is a solid step towards fostering a predictable regulatory climate that encourages responsible oil and gas investment in the Chukchi Sea, while ensuring a balanced and environmentally responsible approach to management of Arctic resources.

Thank you for consideration of our comments.

Very truly yours,

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

While Texlore is not currently active in Alaska, I am writing to express my support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. I believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, I urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed, in order to maintain America's domestic energy supply.

Currently the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped in 2011 while OPEC projection is slated to increase in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health, contributing to our trade imbalance, weakening the dollar, and increasing public debt.

It is imperative that BOEMRE allow America to develop all of its abundant energy resources, those in Alaska's Outer Continental Shelf included. The United States continues to import oil from unstable, adversarial countries, despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only puts the United States at risk for disruptions in supply and price instability; it also supports repressive and anti-American regimes and endangers American lives.

I believe BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's and my personal support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, I urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

As I am sure you know, the United States currently imports more than half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 to a total of only slightly above 5 million barrels per day, while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health. This situation is not sustainable for USA economic security.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move quickly and efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly

Re: **BOEM - 2010-0043**
Comments on the Revised Draft SEIS, Lease Sale 193 - Chukchi Sea

Dear Mr. Kendall:

The Transportation Institute (TI) wishes to urge the Secretary of the Interior and the Bureau of Ocean Energy, Management, Regulation and Enforcement ("BOEMRE") to finalize the Environmental Impact Statement (EIS) and affirm the Chukchi Sea Lease Sale 193 as held in 2008. In so doing the agency will assure a steady flow of oil and gas is available to our nation, sustain the economy of Alaska, provide critical tax and leasehold revenue for the federal budget, increase America's energy security, and support the U.S.-flag merchant marine.

The Transportation Institute was established in 1967 as a Washington-based, non-profit organization dedicated to maritime research education and promotion. The Institute companies participate in all phases of the nation's deep sea foreign and domestic shipping trades, and barge and tugboat operations on the Great Lakes and on the 25,000 mile network of America's inland waterways. These operations embrace deep-sea and river passenger vessels, and liquid, dry-bulk, container and special purpose ships. Many are contracted to the U.S. military services. All are of U.S. registry -- crewed by American citizens operating under the world's highest safety standards, and proudly flying the American flag. With offices on the east and west coasts, the Transportation Institute supports a wide range of programs that promote the strength of America's maritime capability. Our member carriers in the Alaska trade directly impacted by this crucial EIS decision include Crowley Maritime Corporation, Horizon Lines, Alaska Tanker Company, Seabulk, Inc., and Totem Ocean Trailer Express, Inc.

Offshore oil and gas development in Alaska will strengthen our energy security and generate significant new revenue for the federal government. Recent estimates peg this region as having 27 billion barrels of oil and 132 trillion cubic feet of natural gas. Consequently, energy production on Alaska's Outer Continental Shelf (OCS) is critical to our country's long-term energy security. Furthermore, government revenue generated from the Chukchi Sea is estimated to approach \$50 billion over the next fifty years.

The United States continues to rely on oil and gas from nations whose stability and existence remain uncertain or who are in open conflict with us. Such dependency invariably leads to supply disruptions and threatening economic pressures. Such volatility is ever more intimidating to a population having withstood years of economic decline or stagnation. Despite efforts to diversify our energy resource base through non-fossil fuel, alternative wind, current, and solar energy, and significantly reduce energy consumption, we will be dependent upon petroleum for a good measure of our energy needs for decades to come.

Development of Alaska's OCS is estimated to create and sustain 55,000 jobs over 50 years in Alaska alone. The oil to be developed from Alaska's OCS will flow through the Trans-Alaska Pipeline System (TAPS). This pipeline has seen years of declining oil output and experts have become concerned that continued low levels of oil throughput will result in significant and prolonged strain on the line and consequent rupture or premature

Transportation Institute Comment

closure. OCS oil resources will reverse this trend and help to reduce operational deficiencies on a pipeline that currently provides 12 percent of our nation's domestic supply of oil.

Furthermore, the oil flowing through TAPS to tidewater in Valdez is then carried on U.S.-flag merchant vessels along the West Coast and Hawaii. These vessels and the officers and crew that operate them have considerable military utility and are relied upon by our government and military to be counted upon when facing defense and emergency contingencies. Other vital skilled maritime positions would be created through the development and exploration of OCS oil and gas as well as those jobs hauling additional cargo from the Lower 48 as Alaska's economic growth gives rise to additional business, industrial, and personal expenditures.

The benefits of energy production on Alaska's OCS are critically important to our domestic energy security and to the maritime industry, which depends upon a stable supply of fuel to deliver cargo throughout the United States. The abundance of quality Alaskan oil and gas will help our industry meet the imposition of federal Environmental Protection Agency requirements for drastic marine engine emission reductions as promulgated for all transits within 200-miles of the North American shoreline. These new strict rules were imposed through the U.S. and Canada adopting via treaty a North American Emission Control Area. Furthermore, the maritime industry, as encouraged by federal policymakers, environmentalists, and transportation planners, is seeking to create an alternative to our deteriorating road infrastructure through a burgeoning maritime highway system. This freight transportation alternative would drastically reduce emissions and pollution per ton/mile of cargo carried and averts growing congestion on our highways and rail corridors. However, its viability is greatly dependent upon access to a dependable supply of fuel at a reasonable cost. Alaska's OCS assets are a most certain part of this equation.

We trust Secretary Salazar and BOEMRE will recognize these concerns, finalize the environmental review process, and quickly move forward with Lease Sale 193. Thank you for providing this opportunity to share our thoughts on this matter.

Respectfully submitted,

Richard Berkowitz
Director, Pacific Coast Operations

General Comment

Dear Mr. Kendall,
I am writing to support the oil and gas development in the Chukchi Sea and to urge the Bureau of Ocean Energy Management, Regulation, and Enforcement to proceed with the lease sale 193. I believe that the draft supplemental environmental statement for the lease sale 193 represents a thorough analysis of the concerns raised by those who oppose oil and gas development on Alaska's Outer Continental Shelf.
We as Americans should work together to utilize the resources that we have available to both help reduce our dependency on foreign oil and to promote jobs and economic growth. The proposed drilling in the Chukchi Sea would occur in water depths that are close to those in the shallow waters of the Gulf of Mexico, drilling in the shallow waters in the Gulf of Mexico has been done for years with a long history of safe operation.
Thank you for the opportunity to comment on this issue and I urge BOEMRE to affirm the Chukchi Sea Lease sale 193, and promote the reinvestment in America.

Sincerely,
Charlie Allen

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my company's support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. We believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, we urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC production is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, we believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

James Gilbert

RE: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplement Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, I strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

Robert Kendall

General Comment

I urge you to adopt the Supplement Environmental Impact Statement (SEIS) and reaffirm Chukchi Sea Oil and Gas Lease Sale 193. As an Alaskan, I support the development of Alaska's Outer Continental Shelf. The SEIS is just for the lease sale only, which authorizes a lessee to engage only in "ancillary activities" that do not harm the environment. The lease holders have been waiting for over three years since the historic lease sale in 2008 to explore and hopefully develop these leases. But before any exploration, development or production activities can occur, further environmental review and approval will be required.

Alaskans have and continue to support the development of our state's OCS as it is not only vital to our economy and the continued operation of the Trans-Alaska Pipeline System, but it is important for our nation's energy security. Alaska's OCS is estimated to hold 27 billion barrels of oil and 132 trillion cubic feet of natural gas. That could fuel 25 million cars for 35 years. Alaska's North Slope region has already produced 16 billion barrels of oil in the last 34 years, so the OCS really could fuel Alaska's economy and provided much needed energy for the nation for decades. Again, please adopt the SEIS and reaffirm Lease Sale 193

Dear Secretary Salazar,

On behalf of the undersigned Minnesota citizens, we urge you hold on any risky development in America's Arctic Oceans until more information is known about the ecosystem, wildlife and needs of local communities, and there is dependable, reliable, and realistic technology and infrastructure to clean up an oil spill in the Arctic's icy, stormy conditions.

Please accept these signatures for the record:

Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea to the Regional Director, Bureau of Ocean Energy Management, Regulation and Enforcement, Alaska OCS Region, 3801 Centerpoint Drive, Suite 500, Anchorage, Alaska 99503-5820.

Representative of Petition from Alaska Wilderness League

Petition to Protect America's Arctic Ocean

Dear Secretary Salazar:

The future of America's Arctic Ocean may be decided this summer. I'm writing to ask that no decisions about drilling in Arctic waters are made before a plan is in place to gather basic essential information and there is proven technology to clean up a spill in the Arctic's unique conditions. The Presidential Commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

The Arctic's rich marine environment is the least understood area in the world. There is a lack of basic science - from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has critical missing information.

Secretary Salazar, please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters. There is too much at stake.

please print clearly and fill out the information completely.

This oil will only be sent to the Chinese or Japanese and will not alleviate any shortages here or reduce our prices. It will only enrichen Shell and the fat cats in the old boy network

Patricia Abbott
264 Ponce De Leon St, Royal Palm Beach, FL 33411
*In addition to the physical environmental damage of oil drilling, we now have the dire predictions of the newly released report on the state of the oceans.
<http://www.bbc.co.uk/news/science-environment-13796479>
Adding more carbon from oil wells to this already critical situation and in an ecologically fragile area makes absolutely no sense at all.
More eco-friendly alternatives to oil drilling must be made a priority.
No more oil drilling. Period.*

RIBA Abe Hayeem
100 Whitchurch Lane, London, DC 20000
*No way should BP or any other company be allowed to take the risky steps to destroy the Arctic eco system.
There should not now or ever be allowed any oil exploration on these precious remaining seas.*

Martha Abell
390 Pleasant Street, Rome, PA PA 18837
Right now, I am drinking water from our spring, which gets tested once a week because there is natural gas drilling going on in the vicinity. It is not just the wildlife, but we humans who could be affected. Do you want the name Ken Salazar to be up there with Benedict Arnold? Don't sell us off on an ice floe.

Robert Acker
1542 Saint Andrews Cir, Elgin, IL 60123
Please do not approve permits for Shell Oil to drill in the Arctic Ocean. I shudder to think of the devastation that would result when (not if) there is an oil spill of any dimension there. It would dwarf the disaster caused by the spill in the Gulf last year.

Richard Acuzzo
400 Mission Ranch Blvd Apt 152, Chico, CA 95926
Why ruin such beautiful pristine land???

Eric Adam
Prescott, AZ 86305
Go Solar..

Brenda Adams
Portland, OR 97217
SHAME ON YOU MONEY GRUBBING HOUNDS! Must you ruin the entire works? Get thos SIX WELLS OUTTA THERE! You aren't prepared to handle a mishap any better now than BP was in the Gulf? Get out of there entirely!

Carol Adams
14851 Jeffrey Rd Spc 63, Irvine, CA 92618
Isn't it interesting how you (Shell Oil Co.) are playing God, distroying part of the world forever for money! How much money do you need anyway??!

Tracey Adams
9475 Santa Barbara Rd, Atascadero, CA 93422
What are you guys thinking, this will destroy more of our fragile ecology and not produce enough or in a timely enough manner to make a bit of difference.

Frank Aguilera
Itasca, IL 60143
The oil industry receive subsidies while we receive nothing except more taxes to pay off debt. High gas prices and the speculators who buy then sell it weaken our economy. Rewarding greed victimizes millions while propelling this nation

This needs to stop. This is our only planet and we need to protect it! Future generations dont care about money, they care about having a healthy living planet to live on. You would rob them of this for money? Shame and karma on you!!

Sigrid Asmus
4009 24th Ave W, Seattle, WA 98199
This is a watershed moment with respect to contracting with private corporations making private profits to drill in the Arctic. I ask you to resist lobbyist pressure, and reject Shell's expanding plan to now drill TEN new wells in the Arctic. Please do not permit this; Shell is no more concerned with our irreplaceable environment than BP was: both are dangerously unsafe, environmentally disastrous, and drastically unrealistic.

David Atwood
10641 S Hale Ave, Chicago, IL 60643
Based on General Electric's projections for alternative energy in the short term, there appears to be little reason to plunder our natural resources by further drilling. Fossil fuel demand is on its way down.

Kristie Atwood
13990 N Sutherland Trl, Tucson, AZ 85739
This administration needs to do more to protect our environment. It is partly why I voted for President Obama, but I am becoming more and more disappointed. Please don't disappoint me again.

Frances Aubrey
764 Coventry Rd, Kensington, CA 94707
"Serious concerns" and "special considerations" mean STOP, until ALL the SCIENCE IS IN. In 2008 I campaigned hard in Pennsylvania to elect President Obama, driving up from Baltimore every weekend for the eight weeks before the election. I BELIEVED THAT HE WOULD RESPECT SCIENCE, NOT IGNORE IT. Now I need him and his secretaries to honor that pledge!

get the oil in the Dakotas and Montana first, I understand there is a trillion barrels there

Jennifer Barnes
5229 W Michigan Ave Lot 342, Ypsilanti, MI 48197
We need wind farms and solar panels not more oil wells, especially in the Arctic.

John Barnes
4729 Kilpatrick Ave., Fort Worth, TX 76107
Enough is enough!!

Linda Sue Barnes
6713 Wade Stedman Rd, Wade, NC 28395
At the current time there is no safe way to drill for oil in the Arctic. Oil from the Exxon Valdez spill in 1989 is still present on those shores and scientific studies estimate that is is decreasing at well below four percent per year, probably less than one percent per year. The oil is still highly toxic and still affecting wildlife.

Betsy Barnett
13132 Verbenia Pl NE, Albuquerque, NM 87112
*This from the ISPO et al. expert workshop on ocean stresses, June 2011. <http://www.stateoftheocean.org/pdfs/1906IPSO-LONG.pdf>. "The workshop enabled leading experts to take a global view on how all the different effects we are having on the ocean are compromising its ability to support us. This examination of synergistic threats leads to the conclusion that we have underestimated the overall risks, that the whole of marine degradation is greater than the sum of its parts, and that degradation is now happening at a faster rate than predicted."
Mr. Secretary, we do not need that oil. I am so tired of the Administration's inclination to cave to the spin of the industries and corporate media. The Intergovernmental Panel on Climate Change says renewable energy can power the world. Renewable energy can be developed much faster than oil extraction in the Arctic and transportation to consumer populations.*

Teresa Barnhill
1002 S 202nd St, Des Moines, WA 98198
The environmental price is too high, simply recall the devastation caused by BP in the Gulf. A disaster of that magnitude in Alaska would be even more catastrophic. This country must pursue alternative energy, not destroy the planet to continue supporting greed and profits of big oil.

Sheila Barrand
28032 Festivo, Mission Viejo, CA 92692
Extinction is forever.

The whole Country is going to hell in a hand basket. Please dont let this happen.

Edith Borie
Friedrich-Naumann-Str 109, Karlsruhe Germany, NY 12561
The food resources from the Arctic Ocean are much more important than oil. No one can eat or drink oil. And company profits should not be more important than people's survival.

Annette Bork
4505 Sandburg Way, Irvine, CA 92612
*Preserve this part of Earth.
Find other sources of energy.*

George Borkenhagen
Beloit, WI 53511
Drilling at sea is uncalled for at this time. Drill in the lower 48 in the dirt.

Deborah Born
520 SE 30th Ave, Ocala, FL 34471
Please tell Shell Oil to have a plan to cope with an oil spill before they begin drilling new wells.

Ronald Bosch
41 Norwood St, Greenfield, MA 1301
Does this benefit the American People? No, it benefits the already filthy rich stockholders at everyone else's expense. That's why this land must remain as it is with no chance of it getting ruined by a spill like we have never witnessed before.

Patrick Bosold
202 N 5th St, Fairfield, IA 52556
Moratorium on ANY new oil wells in the Arctic Ocean. PLEASE!!!

Margaret Bosse
1836 Estrada Pkwy, Irving, TX 75061
How can you believe oil companies whose very attitude is to lie to you just so they can fill their coffers at the expense of our world ecosystem. It is beyond stupidity, it is criminal to allow this expansion of fossil fuel drilling when we have sufficient green energy and methods to power the world. Please don't allow these earth rapists to continue to do so.

Kiah Bosy
18 Grove Ln, San Anselmo, CA 94960
What will it take for you to stand up and stop the destruction of our environment. If we haven't noticed we actually need the stability of the environment to have a somewhat balanced weather system on our earth and if that changes we ain't gonna have any food, including you and your family!!!! Wake up!

Marla Bottesch
PO Box 458, Norridgewock, ME 4957
We cannot eat or drink oil. That is really the bottom line. We CAN find better energy sources, even tho we may have to tighten our belts to do so, and perhaps even do without for a while. But that will NOT kill us off. Messing with the environment will eventually.

Bo Boudart
PO Box 7395, Menlo Park, CA 94026
There is no technology to clean up oil spills in broken ice conditions of the Beaufort or Chukchi Seas where currents push around ice packs the size of Manhattan. Any sudden movements would flatten wells and prevent blow out preventers from even being accessed. So the bottom line is that drilling for oil in the arctic is a catastrophe waiting to happen-not

Representative Form Letters of 29,676 submitted by Alaska Wilderness League

Just a question of if, just a question of when. The Inupiat people of the arctic coast have always warned that to gamble with the forces of the arctic ice is not worth sacrificing an ocean. Say no to all offshore drilling in the arctic seas, because the technology is not there to clean up accidents at all. Past oil spill response exercises have proven that beyond any doubt. So oil companies have no right to drill because their technology is totally inadequate.

Paula Bourgeois
108 Cedar Trl, Woodland Park, CO 80863
Don't let Shell or any other oil company drill in the Arctic till it is a proven fact beyond a doubt that the Arctic ecosystem can not be jeopordized in any way.

Cynthia Bower
1804 N Spanish Moss Ave, Tucson, AZ 85715
Must we move to alternative, renewable energy resources has never been more urgent. Do not approve ANY oil wells in Arctic waters without full review of their potential impacts. With its billions of dollars in profits, Shell and the other big oil companies can certainly afford to invest in less destructive sources of energy and should be encouraged to do so.

Anne Bowman
14101 Arbor Hills Rd, Tampa, FL 33625
Don't end up like Florida.

Glynis Boyd
1609 Stanhope Kelloggsville Rd, Jefferson, OH 44047
this is an appalling development. the arctic is too fragile for this drilling operation. the ecosystem will not recover a spill like the Gulf. the gulf has not recovered this spill.

Lorraine Brabham
1313 Grand St Apt 511, Hoboken, NJ 7030
Lets begin NOW in taking care of the earth!! Help us find alternatives to fossil fuels!!

joyce bradley
Laguna Beach, CA 92651
When there is a spill, Then what? The ecosystem is gone. We need different types of energy. We can't destroy anymore ecosystem.

Sabine Bradley-Phillips

I have numerous friends in Alaska. In the past year, one of them made a trip to see what the Sound looked like twenty years after Exxon Valdez. Unsurprisingly, the beach is full of oil. It's under every rock. There is no way to clean up oil spills, particularly so far north.

Dianne George
Wildomar, CA 92595-0101
I only saw plans for 'a' new well in the Arctic -- Not six or ten; They are really escalating the price tag for future oil reserves-- think of the devastation if the probability of a spill goes from 1 in 1 oil rig, to 1 in 10 oil rigs --this is a simplification, but the probability DOES escalate. And no way to clean it up in the cold & extreme ice conditions of the Arctic -- "glorified mops & brooms," in deed!!

Representative Form Letters of 29,676 submitted by Alaska Wilderness League

Kitty Johnson
123 E 8th St Apt 132, Frederick, MD 21701
I have had it with Corporate interests superceding the public interest. The whole right wing agenda is based in lies and has no logical justification since it's goal is to enrich and empower a small number of extremely arrogant individuals who think they are God's chosen. Don't allow yourselves to be bought. There is no price that justifies the destruction of the environment.

Larry Johnson
2555 S Dakota St, Butte, MT 59701
How come we here in the USA pay as much for gas supposedly owned by the citizens as we do the stuff we buy from abroad. there is something fishy about this whole darned set up. Oil like all publicly owned resources should not consered property of the oil companies. They are stealing public property and then selling it back to us. ???We are stupid letting this happen.

Marci Johnson
PO Box 641, Kotzebue, AK 99752
As a wildlife biologist in the arctic, I acknowledge the paucity of baseline data on marine and coastal environments and have not witnessed sufficient dialogue with local residents, policy makers, researchers, and industry together in a productive forum. With an entire ecosystem and culture at stake, our nation can afford to wait for the technology to catch up with industry's ambitions. Furthermore, while a corporation must describe how they intend to address a spill at the rig (frequently inadequate), the process should require foresight into response to spills from tankers supporting the drilling at full operations and address the overland pipeline's route, maintenance, and response before exploration even begins. Until our federal government can effectively promote and demonstrate energy conservation, our people and environment should not be asked to sacrifice for additional production.

Mary L. Johnson
Winchester, NH 3470
We need to stop expanding oil production and increase our clean energy sources, such as wind, water, and solar.

Michele Johnson
216 lake tahoe dr, slidell, LA 70461
Did we not learn anything from BP's disaster in the Gulf of Mexico and the Exxon Valdez disaster in Prince William Sound, amongst many others that we rarely hear about? We cannot trust these oil companies to put safety first. Our health and environment should be the first priority. We need to stop trashing our planet - our only home - and start focusing our efforts toward clean sustainable environmentally friendly energy, conserving energy.

Michelle Johnson
2721 F St Apt 7, Sacramento, CA 95816
Save Alaska's environment!!!

Randy Johnson
2751 NW Scandia Loop, Bend, OR 97701
Simple, instead of drilling and continuing to do build an antiquated infrastructure that will have oil companies trying to utilize regardless of its negative impact, put the money into alternatives!!!!

Sharon Johnson

General Comment

James Kendall, Regional Director
 Alaska OCS Region
 Bureau of Ocean Energy Management, Regulation and Enforcement
 3801 Centerpoint Drive, Suite 500
 Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea
 Dear Mr. Kendall:

Thank you for the opportunity to comment on the Revised Draft SEIS, Lease Sale 193, Chukchi Sea.

The development of oil production in the Chukchi Sea is paramount in achieving energy security in the United States not to mention the economic benefits to the United States.

Time and industry awareness have proven that Lease Saile 193 and other leases in the Chukchi Sea can be developed safely and responsibly.

Again, thank you for the opportunity to comment and I strongly urge the BOEMRE to move forward with this process to allow the safe production of these resources.

Best regards,
 Paul Axelson

General Comment

In Washignton D.C. we hear about it almost daily, a cry from citizens across the country, "where are the jobs?"

Guess what? Alaska has the jobs if we develop our OCS resources. According to a study at the University of Alaska Anchorage by the Institute of Social and Economic Research, an annual average of 54,000 jobs, nationwide, over the next 50 years. But these jobs only manifest themselves if we say yes to OCS. Additionally, there is \$193 billion dollars in potential local, state and federal revenue. We can't afford not to develop Alaska's OCS.

The facts:

1. The USGS estimates there are 25 billion barrels of oil and 209 trillion cubic feet of natural gas in the Chukchi Sea.
2. We can safely and responsibly develop Alaska's Outer Continental Shelf. What we can no longer do, is delay what is best for our country.
3. Shell has a long, safe and successful history of drilling in Alaska, with wells drilled in the

Arctic in the 1980s.
 4. Drilling in OCS Alaska is shallow water drilling, will only happen during the open season, and will stop during subsistence whale hunting.
 5. Demand for energy is increasing and the U.S. has an obligation to develop its own resources for the good of our nation.
 6. There is plenty of science.

It's time. Time to create revenue and jobs for the United States. Time to do what's right for our country.

Thank You,
 Megan Baldino

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous

Alice Barnett Comment

mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.

- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well

Comment from Jerome Birch, n/a personal

Submitter Information**Name:** Jerome Birch**Address:**4740 E 115th Aveue
Anchorage, AK, 99516**Email:** jbirch@taigaming.com**Organization:** n/a personal**General Comment**

Lease Sale 193 should be affirmed as originally held in 2008. The extensive information accumulated and the analysis of it was more than adequate the first time. The practice of constantly coming up with reasons to redo a comment period or re-examine the comment period removes faith in the process and discourages business from investing in our countries oil future.

Offshore exploration is a critical aspect of our future energy needs and our nation's security. The Chukchi OCS is one of the best prospects our nation has for additional oil inventory. In addition to it being important to our nation's needs, it is also vital to Alaska's economic future. The environmental record of oil exploration and development in Alaska is the envy of the world. We have proven that responsible development can co-exist with with protecting the environment. Our country is in dire need of new energy sources. We will get them either by the high standards of environmental stewardship in our own development or by purchasing energy from sources that develop with a much lower environmental standard. It's obvious that for us to be responsible stewards of the environment, we should be doing our own development at our high standards.

Our nation is at a critical economic period. Our high energy costs on top of our high unemployment is a tragedy that we should be trying to solve. Producing our own oil, both onshore and offshore, is a major factor in solving our economic problems.

Respectively submitted,
 Jerome I. Birch

Comment from Susan Bucknell, self

Submitter Information**Name:** Susan Bucknell**Address:**PO Box 1401
Kotzebue, AK, 99752**Email:** susanbucknell@gmail.com**Phone:** 907-442-2508**Organization:** self**General Comment**

I'm concerned about an incident at the June 21st BOEMRE hearing in Kotzebue.

In response to a question of mine about what happens to oil in the ocean, Conoco Phillips spokesperson Bruce St. Pierre replied that oil floats. End of discussion.

But when I had a chance to actually look at the revised draft supplemental EIS for Lease Sale 193, I found lots of references to oil both sinking to the ocean floor, and remaining in the water column. (See pages 146 and 147.) This seems particularly relevant because people at the hearing were saying the Chukchi Sea is safer to drill because it's so shallow. But those shallow waters are important marine mammal feeding grounds. Information about the possibility of oil and tarballs on the seabed and in the water column should have been an essential part of the discussion.

It's concerning that misleading information was presented during a BOEMRE hearing. And it's concerning the eight BOEMRE people in the room let that incorrect science pass without a word, because people didn't receive the benefit of accurate and full scientific information on which to base their comments.

file:///C:/Documents and Settings/BENEDETD/Local Settings/Temp/wz0293/Document Li... 7/27/2011

Susan Bucknell Comment

Before the meeting, we were told that "subject matter experts" would provide answers to questions. I'm confused about whether the ConocoPhillips representative acting as a subject matter expert for BOEMRE?

To sum up, it troubles me that an oil industry spokesperson was given the floor to respond to public questions and comments during the BOEMRE hearing, he used that opportunity to derail questions and discussion by stating inaccurate information, and BOEMRE staff allowed that misleading statement to stand.

I wonder if this is acceptable practice, and if industry representatives were allowed to make similar misleading statements, unchallenged, at other BOEMRE hearings on Chukchi Sea Lease Sale 193.

- Rescinding the leases and allowing a de facto moratorium to continue will harm America's economy and discourage future industry investment.
- Allowing leases to go forward from Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Alaska OCS is a critical U.S. energy supply with up to 27 billion barrels of oil and 132 trillion cubic feet of natural gas potentially in place.
- Alaska OCS will create almost 55 thousand jobs per year, \$145 billion in payroll, and roughly 200 billion in government revenue over 50 years.
- The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- OCS production will bolster TAPS, which is now operating at one-third of its 1988 peak flow.
- Over 81% of Alaskans consistently support OCS activities.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states – in manufacturing, computer technology, construction and maintenance.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law.

General Comment

I am writing to support drilling in the Chukchi Sea, in the area of Lease Sale 193. I also encourage the idea of drilling in the Beaufort Sea, and support a cooperative relationship with the State of Alaska and the federal government that yields revenue sharing from the proceeds of this venture.

It's not hard to explain why I am supportive of this action. Drilling is a technology that is more environmentally-friendly than it has been in past years, especially here in Alaska where our State Department of Environmental Conservation works so hard to protect the beauty and cleanliness of our beautiful state. "Drilling" is not a term that is feared or rejected here in Alaska; drilling provides access to Alaska's resources. Resource development is the bread and butter of Alaska's economy; Prudhoe Bay employs many up on "The Slope" and the oil they extract from the ground flows through the pipeline, and, really, straight into our state budget.

Oil puts people to work, places food on the table, builds roads and schools, keeps energy prices down, and provides a decent chunk of domestic oil production in the United States. As oil begins to not surge but trickle through the Pipeline, we can expect employment on "The

file:///C:/Documents and Settings/BENEDET/Local Settings/Temp/wz14d5/Document Li... 7/26/2011

Danielle Carlson Comment

Slope" to decrease, paychecks helping families to buckle, and the overall Alaska economy to suffer. Truth be told—if our state is going to survive, we need oil. Not only does it ensure our state's survival, but it also ensures our country's best interests. The less we rely on dangerous foreign oil coming from countries who do not operate in our best interests—and have in the past used revenue from oil to harm civilians and our men and women in uniform serving overseas—the better off our country and our allies are.

Drilling in the area of Lease Sale 193 has far too many benefits for it to be denied. The federal government is gazing at a tremendous opportunity for resource development and the establishment of fiscal stability. Thank you!

EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale

Dear EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale,

As a marine biologist and college professor who understands the ecological consequences of destroying the vital functions of our earth's ecosystems I ask you to learn more about the essential role of our Arctic marine and terrestrial ecosystems. The science shows that if we are to have a sustainable ocean into the future, one that allows a certain level of harvest, much less, limit the catastrophic consequences of human-caused global warming, we should be setting aside significantly large areas of our ocean as marine reserves, not opening them up for exploitation by oil companies who reap obscene rewards from the destruction of habitat.

The future of America's Arctic Ocean may be decided as soon as this summer. I'm writing to ask that no decisions about drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region. Furthermore, decisions should be withheld until proven, accessible technology exists to clean up a spill in the Arctic's unique conditions. The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place. There is too much at stake.

Sincerely,

 Ms. Diane Carney

RE: Comments on Revised Draft SEIS, Lease Sale 193, Chukchi Sea

Dear Mr. Kendall:

Please accept the enclosed comments in support of the Revised Draft EIS and oil and gas development in the Chukchi Sea from individual Consumer Energy Alliance supporters as well as stakeholder organizations. In an effort to conserve energy and paper, you will find three electronic discs that contain these individual letters and the data of their signatories:

- Disc I contains 26,630 letters;
- Disc II contains 43,655 letters; and
- Disc III contains 57,299 letters.

In total, you will find **127,584** letters.

In addition, I have included official comments from the following:

- Consumer Energy Alliance;
- The Honorable Derrick Seaver;
- Wayne Wilkinson;
- Sailwinds Station; and
- Mid-Atlantic Petroleum Distributors' Association.

If you have any questions on these comments, their signatories, or any other matter, please contact me at ajoubert@consumerenergyalliance.org or 202-778-2103.

I appreciate the opportunity to comment on this important matter.

Thank you,

Natalie T. Joubert

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

I am writing to you today as someone who understands the burden of public decision-making, as well as someone who takes very seriously the well-being of our nation. It has been brought to my attention that the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) will soon be deciding on Lease Sale 193. I would urge your support of this sale.

It was a great honor for me to serve in the Ohio House of Representatives for six years. For four of those six years, I sat on the Energy and Natural Resources Committee, Ohio, though an inland state, was responsible for the management of much of the Great Lakes system, a body of water that represents twenty-percent of our globe's fresh water. During my tenure, I was supportive of natural gas drilling in Lake Erie, a proposal that has been highly beneficial to our state's economy and energy sector.

As well as this has worked for my state, the reality of nature is that our waters do not possess the abundance of natural resources that Alaska's Outer Continental Shelf (OCS) possesses. It is believed that 30% of the world's undiscovered natural gas, and 13% of its undiscovered oil, are located there. It would be a shame for our nation not to utilize these precious natural resources. Lease Sale 193 has the potential to provide for the entire nation what drilling Lake Erie has done for Ohio: an increase in energy sector jobs, an increase in energy independence, and a decrease in rising energy costs.

I also remember clearly the pressure that one is put under when making these decisions. However, just as we used due diligence in Ohio, it appears to me that due diligence has been done on Lease Sale 193. The Environmental Impact Statement was positive; eighty-four OCS oil wells have gone without incident since 1971; and the public comment phase concludes on July 11. As a former representative of the people, I believe strongly in the right of citizens to speak on these issues, but upon completion of this process, I also believe strongly that you should take the appropriate action and approve Lease Sale 193.

I would like to thank you for taking the time to consider my opinion on this issue, and I would also like to thank you for the work you do. I realize it can often be thankless and exceedingly difficult. Ohio has shown the benefits of increased energy production, and I hope that you will approve Lease Sale 193 and allow these benefits to be realized nationwide.

Sincerely,

 Honorable Derrick Seaver
 Fmr. Member - Ohio House of Representatives

 Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

It has come to my attention that Lease Sale 193, which would allow for increased natural gas and oil drilling in the Chukchi Sea, will conclude its public comment period on July 11. I would ask that you approve the lease sale upon the completion of this process.

I am the owner of a local gas station, Sailwinds Station, in Cambridge, Maryland. As such, I am on the front lines of America's energy crisis. Every day I see the impact of reduced supply on the oil markets. It increases prices, frustrates my customers, and makes them less willing to purchase the fuel they need to operate their daily lives. Like all business owners, I already am dealing with the deep recession. Add in a reduced supply of my product, and the eventual outcome is the laying off of employees. Lease Sale 193 specifically, and oil and natural gas drilling in Alaska in general, could prevent this outcome.

It is an oft-quoted mantra that small business is the backbone of America. This is cliché, but it is also reality. The people hardest hit by the economic downturn are those small employers who get very little help from the government, but are also asked to pick up more and more of the burden. We operate small fleets of vehicles, purchase natural gas and heating oil for our homes and businesses, and in my case, sell the oil at the end of its production line. Lease Sale 193 provides the opportunity for you, as a person in authority, to assist small business owners while also enhancing our international standing.

The Department of Interior estimates that the Outer Continental Shelf (OCS) of Alaska possesses twenty-seven billion barrels of oil and one hundred thirty-two trillion cubic feet of natural gas. Alone it would be the eighth largest oil reserve in the world, ahead of Nigeria, Russia, Libya, and other areas we associate with heavy oil production. I understand that we already extract plenty of these resources, but in light of the fact that Lease Sale 193 has met all environmental and societal standards, I see no reason why this production should not be increased by this sale.

In closing, I would urge you to approve Lease Sale 193 to improve the economic situation of our smallest employers - those people who truly are the backbone of our economy. You are assuredly aware of the macro level benefits of this agreement. I would ask that you take even more seriously into consideration the micro level benefits, and keep us in mind when making this decision.

Sincerely,

 Tim Miller
 President, Sailwinds Station, LLC

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I appreciate all the additional steps the Bureau of Ocean Energy Management, Enforcement, and Regulation (BOEMRE) has taken to assess the risk of drilling in the Chukchi Sea, and I believe the revised Draft Supplemental Environmental Impact Statement (EIS) rightfully determines a very large oil spill remains highly unlikely. While I agree the BOEMRE needs to take all thoughtful precautions, I think this most recent EIS concludes that development of Alaska's offshore resources can proceed safely.

As the revised draft EIS states, a very large oil spill in the Chukchi is highly improbable given the history of exploratory drilling and well control incidents in the Outer Continental Shelf (OCS). Since 1971, 84 wells have been drilled in the Alaska region alone, all without incident. Moreover, the proposed drilling in the Chukchi would occur in waters similar in depth to the shallow-waters in the Gulf of Mexico, which boasts a long history of safe operations. The *Deepwater Horizon* blowout and resulting very large oil spill in the Gulf of Mexico, conversely, was the first incident of this magnitude in nearly 40 years of OCS exploration.

Notwithstanding, producers and regulators have made significant investments – both in time and resources – to ensure all drilling proceeds in the safest manner possible. Pursuant to the Notice to Lessees 06, producers were required to reassess the potential impacts of a worst-case discharge. As such, Shell revised its exploratory plan for the Chukchi Sea using calculations of spill estimates based on the known geology of the basin and has since determined that the company maintains the capacities needed to prevent a blowout and respond swiftly and effectively in the unlikely event a blowout occurs.

The revised supplemental EIS notes that since 1979, for every 130 billion barrels of oil produced, one well incident resulting in a very large oil spill has occurred – though one-third of these spills have been the result of military action. Clearly, the probability of a well incident is very low, even if some risk exists. Given the economic and energy security benefits of increased domestic oil production, I believe this minimal risk is acceptable, particularly because of the advanced response capabilities in place.

I appreciate the opportunity to comment on this important matter, and I urge the BOEMRE to move forward with this process to allow the safe production of these resources.

Sincerely,

Joy Hardacre

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

As an American and an energy consumer, I am writing to express support for oil and gas development in the Chukchi Sea and to urge the Bureau of Ocean Energy Management, Regulation, and Enforcement (BOEMRE) to proceed with Lease Sale 193.

The Revised Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193 represents a thorough analysis of the concerns raised by those who oppose oil and gas development on Alaska's Outer Continental Shelf. Now that the Lease Sale 193 has been fully reviewed, I ask BOEMRE to move promptly to finalize this process so that Americans can realize the benefits of increased domestic production.

In addition to increasing our domestic supply of energy, development of our energy resources in Alaska's Outer Continental Shelf would have a tremendous ripple effect throughout the nation's economy – creating tens of thousands of jobs nationwide. At a time when Americans are struggling to find work and unemployment remains high in many states, the jobs and economic growth associated with Alaska's OCS are significant. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide with a cumulative payroll of \$154 billion over the next 50 years. Outside Alaska, development of the Chukchi Sea would generate approximately 15,200 U.S. jobs annually during the production phase and an average of 12,100 jobs annually through 2050.

Offshore oil and gas development in the Chukchi Sea, as well as the Beaufort Sea, has the potential to help the United States meet its energy demand, create jobs, and grow the economy. Proceeding with Lease Sale 193 is in the best interest of all Americans. There has been ample opportunity for environmental review and public input on Lease Sale 193. Therefore, upon conclusion of this public comment period, I urge BOEMRE to move forward so that Americans can reap the economic and energy security benefits of Alaska's Outer Continental Shelf.

Sincerely,

Theresa Lussi
156 Glen Eaton Dr.
Pagosa Springs, CO 81147

Representative Form Letters 127,584 submitted by Consumer Energy Alliance

July 2011

James Kendall, Regional Director
Alaska OCS Region, Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS for Lease Sale 193

Dear Mr. Kendall:

I am writing today to encourage you to finalize the environmental review process for Lease Sale 193 as expeditiously as possible and allow for oil and natural gas development in the Chukchi Sea to proceed.

I appreciate the extensive efforts the Bureau of Ocean Energy Management, Enforcement, and Regulation has taken to ensure appropriate changes to offshore processes and regulations are made so that we are better prepared in the unlikely event of a future oil spill. Lease Sale 193 has undergone a thorough, exhaustive environmental review, and it is clear that safe exploration and production can occur in the Chukchi Sea. Both regulators and operators in the region have undertaken extraordinary efforts to augment their blowout prevention and spill response capabilities if an incident were ever to occur.

While I applaud all of these noteworthy precautions, I believe the Revised Draft Supplemental Environmental Impact Statement (SEIS) rightfully concludes that the probability of a very large oil spill is very low. Moreover, the proposed drilling depths in the Chukchi Sea are similar to that of shallow-water operations that have occurred safely in the U.S. Gulf of Mexico for decades. In these shallower waters, the blowout preventer is more easily accessible and will not likely experience the challenges present during the *Deepwater Horizon* blowout in 2010.

Finally, if a discharge were to occur, the anticipated spill volumes in the Chukchi Sea would be much lower than the values used in the BOEMRE's hypothetical analysis. In accordance with the Notice to Lessees 06, Shell Gulf of Mexico Inc./Shell Offshore Inc. revised its anticipated spill impacts in its exploration plan for the Chukchi and concluded that the company maintains capabilities that meet or exceed the standards for blowout prevention and spill response.

I appreciate the opportunity to comment today, and I applaud the Obama Administration's efforts to ensure offshore energy development proceeds in the safest manner possible. Following the conclusion of this last iteration of the SEIS, I urge the BOEMRE to finalize the review process and allow the exploration of the Alaska OCS.

Sincerely,

Glenda WOLFE

Re: Revised Draft Supplemental Environmental Impact Statement – Lease Sale 193

Dear Mr. Kendall:

As you know, energy production is a key driver of the American and Alaskan economies. At the same time, energy remains one of the top expenses for American businesses and individual consumers. This cost has been driven up substantially by many factors in recent months, including overseas volatility in the Middle East and stalled offshore production in the United States. Compounding these problems, the natural decline in onshore production in Alaska jeopardizes the longevity of the Trans-Alaska Pipeline, which is already running at one-third of its capacity. With abundant resources offshore, Alaska is an obvious place for the United States to augment its production to meet domestic demand.

With global supply of oil increasingly strained, price volatility will continue to cause hardship for many American businesses and families. While the United States cannot completely insulate itself from the global economy, there are actions we can take to bolster our energy security and provide positive signals to the market. Moving forward with development of our abundant OCS resources is one such measure that will provide relief to American consumers now and in the future.

The federal government estimates that the Chukchi and Beaufort Seas contain approximately 25 billion barrels of oil and 130 trillion cubic feet of gas. With current U.S. daily consumption over 19 million barrels, these resources are equivalent to over three and a half years of U.S. demand. Furthermore, bringing these Alaskan OCS resources online would decrease foreign imports, helping to lessen the influence countries like Saudi Arabia, Libya and Venezuela have on the United States and on global oil markets. Finally, if the United States were to produce these domestic resources, trillions of dollars would remain in the United States increasing our burgeoning trade deficit.

Given the tremendous impact Alaskan OCS development can have for our economic and energy security outlook, it is imperative that BOEMRE proceed with Lease Sale 193 in a timely manner.

Sincerely,

ROBERT SALASEK

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

Dear Mr. Kendall:

I am writing to express my support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. I believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, I urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

I appreciate all the additional steps the Bureau of Ocean Energy Management, Enforcement, and Regulation (BOEMRE) has taken to assess the risk of drilling in the Chukchi Sea, and I believe the revised Draft Supplemental Environmental Impact Statement (EIS) rightfully determines a very large oil spill remains highly unlikely. While I agree the BOEMRE needs to take all thoughtful precautions, I think this most recent EIS concludes that development of Alaska's offshore resources can proceed safely.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

As the revised draft EIS states, a very large oil spill in the Chukchi is highly improbable given the history of exploratory drilling and well control incidents in the Outer Continental Shelf (OCS). Since 1971, 84 wells have been drilled in the Alaska region alone, all without incident. Moreover, the proposed drilling in the Chukchi would occur in waters similar in depth to the shallow-waters in the Gulf of Mexico, which boasts a long history of safe operations. The *Deepwater Horizon* blowout and resulting very large oil spill in the Gulf of Mexico, conversely, was the first incident of this magnitude in nearly 40 years of OCS exploration.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

Notwithstanding, producers and regulators have made significant investments – both in time and resources – to ensure all drilling proceeds in the safest manner possible. Pursuant to the Notice to Lessees 06, producers were required to reassess the potential impacts of a worst-case discharge. As such, Shell revised its exploratory plan for the Chukchi Sea using calculations of spill estimates based on the known geology of the basin and has since determined that the company maintains the capacities needed to prevent a blowout and respond swiftly and effectively in the unlikely event a blowout occurs.

In conclusion, I believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

The revised supplemental EIS notes that since 1979, for every 130 billion barrels of oil produced, one well incident resulting in a very large oil spill has occurred – though one-third of these spills have been the result of military action. Clearly, the probability of a well incident is very low, even if some risk exists. Given the economic and energy security benefits of increased domestic oil production, I believe this minimal risk is acceptable, particularly because of the advanced response capabilities in place.

Sincerely,

I appreciate the opportunity to comment on this important matter, and I urge the BOEMRE to move forward with this process to allow the safe production of these resources.

General Comment

General Comment

I write to support the adoption of the Supplementary Environmental Impact Statement on Oil and Gas Lease Sale 193. The SEIS provides the Secretary with sufficient information and analyses to make an informed decision to affirm Sale 193. Contrary to what some may assert, there has already been oil and gas exploration and development in the US Arctic Ocean. In fact, since the 1980's some 35 wells have been drilled without incident including five in the Chukchi. These wells are also significantly different in nature than those in the deepwater Gulf of Mexico as it relates to depth, pressure and temperature. I am a concerned Alaskan who believes that study of this issue has gone on too long. The time for endless process has passed. An effort to rescind these leases will effectively result in a moratorium which is inconsistent with federal policy and the needs of Alaskans and Americans. The exploration and development of America's oil and gas resources are critical to Alaska's future economy and the nation's long-term energy security.

I encourage Secretary Salazar, the BOEMRE and other regulating officials to promptly affirm Oil and Gas Lease Sale 193, Chukchi Sea. Development of our offshore resources, including the Chukchi leases, is critical to our national prosperity and security. The Deepwater Horizon incident has greatly heightened sensitivities to the risks of a very large oil spill (VLOS). However, it must be recognized that the risks of a VLOS in the Chukchi are significantly lower than in the deepwater Gulf of Mexico due to the much shallower water depth and lower reservoir pressure.

Thank you for your consideration of this matter.

 Bureau of Ocean Energy Management, Regulation and Enforcement
 3801 Centerpoint Drive, Suite 500
 Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea
 Dear Mr. Kendall,
 I am writing to express support for oil and gas development in the Chukchi Sea and to urge the Bureau of Ocean Energy Management, Regulation, and Enforcement (BOEMRE) to proceed with Lease Sale 193.

The Revised Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193 represents a complete analysis of the concerns raised by those who oppose oil and gas development on Alaska's Outer Continental Shelf. Now that the Lease Sale 193 has been

reviewed, I ask BOEMRE to move promptly to finalize this process so that Americans can realize the benefits of increased domestic production.

America has for long relied on foreign oil while we have it here at home. The federal government by stopping the exploration and utilization of USA owned and controled does unnecessarily cause high petroleum prices.

Now is the time to start using some common sense and move forward on this project.

I appreciate the opportunity to comment on this important matter, and I urge the BOEMRE to move forward with this process to allow the safe production of these resources.

Sincerely,

Richard L. Coose

General Comment

Considering the impact of high energy prices that affect each American and our economy, the United States has an obligation to develop domestic energy sources. Demand continues to rise and our country needs to continue to develop the resources we have. Lease 193 should be affirmed as held in 2008. There is sufficient information and analysis to support an informed decision affirming Sale 193. If the leases are rescinded, it will, no doubt, harm Alaska's economy, as well as the rest of the country's.

The Chukchi OCS is an important future source of energy. Lease Sale 193 has the potential to refill the alaska oil pipeline and produce much needed energy and jobs.

The industry has committed to preventing spills that are beyond legal requirements. The wells in Alaska would be in very shallow water where pressures are much lower than in deep water drilling, thus lowering risk. All current wells in Alaska were drilled without incident, even though most were drilled using 1980's technology.

It is my belief that the Lease Sale 193 should be affirmed.

General Comment

Please affirm Lease sale 193 as held in 2008. It is vitally important to Alaska and the nation's economy.

Industry has gone above and beyond to implement environmental protections. There is NO reason not to move forward in the OCS.

I say this as a 30-year resident of Alaska. I SUPPORT OCS development.

Thank you!

July 11 2011

James Kendall, Regional Director
Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

As an American and an energy consumer, I am writing to express support for oil and gas development in the Chukchi Sea and to urge the Bureau of Ocean Energy Management, Regulation, and Enforcement (BOEMRE) to proceed with Lease Sale 193.

The Revised Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193 represents a thorough analysis of the concerns raised by those who oppose oil and gas development on Alaska's Outer Continental Shelf. Now that the Lease Sale 193 has been fully reviewed, I ask BOEMRE to move promptly to finalize this process so that Americans can realize the benefits of increased domestic production.

In addition to increasing our domestic supply of energy, development of our energy resources in Alaska's Outer Continental Shelf would have a tremendous ripple effect throughout the nation's economy—creating tens of thousands of jobs nationwide. At a time when Americans are struggling to find work and unemployment remains high in many states, the jobs and economic growth associated with Alaska's OCS are significant. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide with a cumulative payroll of \$154 billion over the next 50 years. Outside Alaska, development of the Chukchi Sea would generate approximately 15,200 U.S. jobs annually during the production phase and an average of 12,100 jobs annually through 2050.

Offshore oil and gas development in the Chukchi Sea, as well as the Beaufort Sea, has the potential to help the United States meet its energy demand, create jobs, and grow the economy. Proceeding with Lease Sale 193 is in the best interest of all Americans. There has been ample opportunity for environmental review and public input on Lease Sale 193. Therefore, upon conclusion of this public comment period, I urge BOEMRE to move forward so that Americans can reap the economic and energy security benefits of Alaska's Outer Continental Shelf.

Sincerely,

Les Cronk

General Comment

We have recently seen an uncontrolled oil spill in the Gulf Coast region of the southern US. The ability to stop and mitigate the effects of a similar spill in the Arctic Ocean is more than questionable.

BOEMRE's own analysis shows that very large oil spills could occur from drilling in the Chukchi Sea. An oil spill would have catastrophic effects on species and communities in the region. The oil spill in the Gulf of Mexico taught us that preparation is key. Shell Oil Co.'s oil spill prevention plan for the Chukchi Sea is wholly inadequate. It is based on flawed and unrealistic assumptions. The Coast Guard and other agencies agree -- we are woefully unprepared to respond to a large oil spill in the Arctic Ocean were one to occur.

Many basic questions about the Arctic Ocean ecosystem remain unanswered. There is much more that must be understood in this remote area -- through a comprehensive research and synthesis plan -- before leasing and drilling can be allowed to proceed. Without this basic information, we cannot know the potential consequences of oil development there and we cannot manage those activities in a way that protects the people and resources of the region, particularly in the face of ever growing climate change threats.

I urge you to not to move forward with risky, aggressive leasing and drilling plans in America's Arctic Ocean.

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea: Arctic Ocean Oil Drilling is a Bad Idea

Dear Bureau of Ocean Energy Management, Regulation and Enforcement,

The Bureau of Ocean Energy Management, Regulation, and Enforcement and the Department of the Interior are currently making important decisions about the Arctic Ocean that threaten long-term consequences for the region. BOEMRE is currently in the process of reconsidering the Bush-era Chukchi Sea Lease Sale 193 that was sent back to the agency by an Alaska Federal court last summer. It is also considering plans by Shell Oil Co. to drill for oil in the Chukchi and Beaufort seas starting in 2012 and revisions to the accompanying oil spill response plans.

It is too soon to permit oil and gas activities in the Arctic Ocean. BOEMRE and Interior should not reaffirm the Chukchi Sea leases and should not approve Shell's plans to drill until fundamental questions about the Arctic Ocean have been answered through more scientific study and synthesis and before realistic and effective plans to respond to a large oil spill are put in place. I urge you to not to move forward with risky, aggressive leasing and drilling plans in America's Arctic Ocean.

Until BOEMRE has conducted a thorough scientific analysis about the effects of oil and gas activities on fish, birds, and marine mammals, leases in the Chukchi Sea should not be affirmed and oil drilling should not proceed. There is far too much at risk: the Arctic Ocean is a pristine, remote region, home to many threatened and endangered species, including bowhead whales, polar bears, walrus, seals and much more. This region is also of great significance to Alaska Native communities which rely on the bounty of the Arctic Ocean to sustain their thousands year old way of life.

BOEMRE's own analysis shows that very large oil spills could occur from drilling in the Chukchi Sea. An oil spill would have catastrophic effects on species and communities in the region. RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea: Arctic Ocean Oil Drilling is a Bad Idea

Dear Bureau of Ocean Energy Management, Regulation, and Enforcement,

If they can prove they have the technology and capability of stopping a deep-water oil leak within 48 hours after it begins, then they may drill at that depth. Simple. The Bureau of Ocean Energy Management, Regulation, and Enforcement and the Department of the Interior are currently making important decisions about the Arctic Ocean that threaten long-term consequences for the region. BOEMRE is currently in the process of reconsidering the Bush-era Chukchi Sea Lease Sale 193 that was sent back to the agency by an Alaska Federal court last summer. It is also considering plans by Shell Oil Co. to drill for oil in the Chukchi and Beaufort seas starting in 2012 and revisions to the accompanying oil spill response plans. It is too soon to permit oil and gas activities in the Arctic Ocean. BOEMRE and Interior should not reaffirm the Chukchi Sea leases and should not approve Shell's plans to drill until fundamental questions about the Arctic Ocean have been answered through more scientific study and synthesis and before realistic and effective plans to respond to a large oil spill are put in place. I urge you to not to move forward with risky, aggressive leasing and drilling plans in America's Arctic Ocean. RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea: Arctic Ocean Oil Drilling is a Bad Idea

Dear Bureau of Ocean Energy Management, Regulation, and Enforcement,

I urge you to not to move forward with risky, aggressive leasing and drilling plans in America's Arctic Ocean. Just a year ago we witnessed a devastating oil spill in the Gulf of Mexico. If a spill was that difficult to contain in the warm waters of the Gulf, how much more difficult might a spill in the cold icy waters of the Arctic be? It is not worth the risk, considering the many threatened and endangered species that make the Arctic their home, and considering the Alaska Native communities who's thousands of years old way-of-life would be endangered if the ecosystems upon which they depend is damaged. It is especially not worth the risk considering that the future of the world depends on our stopping climate change by getting off oil. Why risk so much to feed an addiction that is killing us? It is time to say "no" to drilling in the Arctic, as well as to offshore drilling elsewhere, and to redirect the resources we expend on oil and gas extraction into developing renewable non-polluting alternatives.

Sincerely,

Lois Braun

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea: Arctic Ocean Oil Drilling is a Bad Idea

Dear Bureau of Ocean Energy Management, Regulation, and Enforcement,

No drilling until these corporations can without a doubt --contain any spills or be able to leave no footprint. The world is watching. If they drill now and spills due occur --it is without a doubt in my mind that as a species ourselves we don't care about anything in this world but us--damn the planet and its wonderfulness. Why dont we push alternative energies now for our use here in the US, use up other countries oil first then we will literally have black gold under our feet and will maintain our dominance in the marketplace and ensure our survival.

Sincerely,

gerry lamanski

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea: Arctic Ocean Oil Drilling is a Bad Idea

Dear Bureau of Ocean Energy Management, Regulation, and Enforcement,

After the BP disaster, it is clear that there isn't the knowledge needed to react to another similar catastrophe in the ocean. We can't afford to make these mistakes any longer. We depend on the health of the planet, and the planet depends on us to care for it. The Bureau of Ocean Energy Management, Regulation, and Enforcement and the Department of the Interior are currently making important decisions about the Arctic Ocean that threaten long-term consequences for the region. BOEMRE is currently in the process of reconsidering the Bush-era Chukchi Sea Lease Sale 193 that was sent back to the agency by an Alaska Federal court last summer. RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea: Arctic Ocean Oil Drilling is a Bad Idea

Dear Bureau of Ocean Energy Management, Regulation, and Enforcement,

To drill anywhere in the Arctic would be catastrophic. Offshore drilling is an enormous risk. The explosion of Deep Horizon was a foregone conclusion. The question was never IF it would happen, the question was WHEN. Just as it was inevitable that there would be a nuclear meltdown sooner or later, it is inevitable that if we are foolish enough to let anyone drill in the Arctic, an accident will inevitably happen. Oil companies don't mind taking risks, because they are all about profit, keeping us dependent on fossil fuels, and they don't care what they destroy. That is not true of the rest of us. Most of us want to leave behind a world fit for our children and their children to live in. Please discard this insane idea.

Sincerely,

Jeris Turner

General Comment

Please allow development of the outer continental shelf of Alaska. The oil and gas companies in Alaska have done a good job to date of developing our resources in a responsible manner. The development of these resources has led to clean water, good housing, energy, the development of roads and schools for all of us here in the state. The companies have followed state, local, and federal laws and done a good job of protecting the environment. If the state and companies feel that these resources can be developed safely, and permit review by all the agencies is within guidelines, then they should be allowed to develop these leases they have bought in good faith.

General Comment

"I urge you to adopt the Supplement Environmental Impact Statement (SEIS) and reaffirm Chukchi Sea Oil and Gas Lease Sale 193. As an Alaskan, I support the development of Alaska's Outer Continental Shelf. The SEIS is just for the lease sale only, which authorizes a lessee to engage only in "ancillary activities" that do not harm the environment. The lease holders have been waiting for over three years since the historic lease sale in 2008 to explore and hopefully develop these leases. But before any exploration, development or production activities can occur, further environmental review and approval will be required.

Alaskans have and continue to support the development of our state's OCS as it is not only vital to our economy and the continued operation of the Trans-Alaska Pipeline System, but it is important for our nation's energy security. Alaska's OCS is estimated to hold 27 billion barrels of oil and 132 trillion cubic feet of natural gas. That could fuel 25 million cars for 35 years. Alaska's North Slope region has already produced 16 billion barrels of oil in the last 34 years, so the OCS really could fuel Alaska's economy and provided much needed energy for the nation for decades.

Again, please adopt the SEIS and reaffirm Lease Sale 193."

Government Agency: Tribal member of Native Village of Point Hope

General Comment

I am against exploratory drilling, or any type of drilling for Oil in the Chukchi Sea. I am Inupiat, an enrolled tribal member of the Native Village of Point Hope. My people have survived and thrived for centuries here in the Arctic. Anthropologists believe it is one of the oldest continually inhabited places in North America. Why? Point Hope is on a peninsula that juts out into the Chukchi Sea; it is rich in marine life, such as Bow head whales, bearded seals, polar bears, arctic fox, walrus and many more animals. Our ancestors have survived for centuries in the most extreme arctic environment. This did not happen by chance. As Patrick Attungana, a respected whaling captain once said: our blood is mixed with that of the animals, with the bowhead whales. Point Hope is a complex whaling society. Our identity and our social and cultural laws and customs are derived from the lands, our waters, the animals, the fish and the birds. All of this knowledge has been handed down orally through generation after generation. It is very hard to fathom, to even wrap one's brain around what it actually means to be out on the ice on the Chukchi Sea; survival is paramount. The currents, the weather conditions, the ice and the extreme force and power of the elements can never be underestimated. I do not care what sort of "technology" Shell Oil or any oil company thinks they have, it is no match for mother nature. Drill where it is safer, on land. Thank You

 Anchorage, Alaska 99503-5820

Regional Director

I urge you to affirm the lease sale 193.
 Oil and gas development is critical to our Nations energy security.
 By affirming this sale you could help create 54,000 new Alaskan jobs for the next 50 years. Alaska has some of the worlds highest safety and environmental standards.
 These outer continental shelves have been drilled before in the 1980 with old technologies with out incident.
 The impact the high oil prices have on the nation's poor and less fortunate people is an important factor that is often disregarded by the environmental attorneys lobbying to stop all OCS oil development. I believe drilling in Alaska's OCS will help stabilize oil prices. It is our nation's

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

The future of America's Arctic Ocean may be decided this summer. I'm writing to ask that no drilling is permitted in Arctic waters given the lack of essential information on the ecosystem and technology to clean up a spill in the Arctic's unique conditions.

The Arctic's rich marine environment is the least understood area in the world. There is a lack of basic science from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. There is no way to doil a polar bear. Should a spill occur, and we know it can, you are giving a death sentence to these creatures. The Department of Interior (DOI) must not move forward with decisions about drilling before it has critical missing information, particularly against the backdrop of sea ice loss and ocean acidification, two existential threats caused by fossil fuel burning that could rip out the very foundation of the Arctic Ocean ecosystem.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the threatened polar bear as well as endangered birds and whales. As if this were not serious enough, BOEMRE's predecessor agency, the Minerals Management Service previously stated that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. The threat of oil spills and the inability to clean them up are reason enough to cancel any plans for proposed drilling.

As a people who have lived off the bounty of the Arctic Ocean for thousands of years, the Inupiat traditionally spend weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their garden and we must protect it for future generations.

Secretary Salazar, please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters. There is too much at stake.

Sincerely,
 Mrs. Patricia Benward

James Kendall

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

The future of America's Arctic Ocean may be decided this summer. DEATH BY GREED, OR LIFE BY LOVE.

I'm writing to ask that no drilling is permitted in Arctic waters given the lack of essential information on the ecosystem and technology to clean up a spill in the Arctic's unique conditions. AS WELL AS PAST PERFORMANCE FROM THE OIL INDUSTRY WITH EVEN THE SMALLEST OF LEAKS.

The Arctic's rich marine environment is the least understood area in the world. AS IS THE DRILLING INDUSTRY'S SAFETY PRACTICES.

There is a lack of basic science from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. THERE IS ALSO A BASIC LACK OF COMPOSURE FROM THE OIL INDUSTRY TO EXPLOIT THESE LANDS FOR PRIVATE PROFIT.

The Department of Interior (DOI) must not move forward with decisions about drilling before it has critical missing information, particularly against the backdrop of sea ice loss and ocean acidification, two existential threats caused by fossil fuel burning that could rip out the very foundation of the Arctic Ocean ecosystem. THUS BURGEONING THE EFFORTS TO SAVE OUR PLANET'S DEMISE.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the threatened polar bear as well as endangered birds and whales. THIS SAYS NOTHING ABOUT THE SMALL SPILLS THAT AREN'T REPORTED, ARE UNDER-REPORTED OR ARE TAKEN AS PART OF "DOING BUSINESS".

As if this were not serious enough, BOEMRE's predecessor agency, the Minerals Management Service previously stated that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. The threat of oil spills and the inability to clean them up are reason enough to cancel any plans for proposed drilling. THERE ARE MANY OTHER PLACES ALREADY APPROVED FOR OIL DRILLING THAT ARE LAYING UNTAPPED.

As a people who have lived off the bounty of the Arctic Ocean for thousands of years, the Inupiat traditionally spend weeks at a time on the water, hunting to feed their families and their communities. The

James Kendall

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

The future of the planet's Arctic Ocean may be adversely decided this summer.

I'm writing to ask that no drilling is permitted in Arctic waters given the lack of essential information on the ecosystem and technology to clean up a spill in the Arctic's unique conditions.

The Arctic's undoubtedly rich marine environment is one of the least understood area in the world. There is a lack of basic science ranging from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems.

The Department of Interior (DOI) must not and should not move forward with decisions about drilling before it has critical missing information, particularly against the backdrop of sea ice loss and ocean acidification, two existential threats caused by fossil fuel burning that could rip out the very foundation of the Arctic Ocean ecosystem.

BOEMRE, as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the threatened polar bear as well as endangered birds and whales. If this alone was not serious enough, BOEMRE's predecessor agency, the Minerals Management Service previously stated that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. The threat of oil spills and the inability to clean them up are reason enough to cancel any plans for proposed drilling.

I would further add to this the deplorable track record and attitude demonstrated over many years by Shell in the Niger Delta.

The Inupiat people, who have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spend weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their garden and we must protect it for future generations. It is also part of the world's ocean garden - when will brute common sense prevail?

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

I have lived and worked in the arctic for the past 36 years and know that much of it is no longer pristine because of oil exploration and development. I have tried to clean up oil spills there and know it is very difficult to impossible. therefore i request that any massive drilling effort, like the shell proposal be denied until the industry develops a technology and procedure that can be effective for clean up because spills are unavoidable apparentlyl. The future of America's Arctic Ocean may be decided this summer. I'm writing to ask that no drilling is permitted in Arctic waters given the lack of essential information on the ecosystem and technology to clean up a spill in the Arctic's unique conditions.

James Kendall

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

We've sacrificed too much of the environment to drilling and mining, as it is. When oil companies can PROVE they have the capability of stopping a spill at a given depth within 48 hours of its occurrence, maybe then we could reconsider allowing them to drill. Until then, no dice.

The future of America's Arctic Ocean may be decided this summer. I'm writing to ask that no drilling is permitted in Arctic waters given the lack of essential information on the ecosystem and technology to clean up a spill in the Arctic's unique conditions.

General Comment

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Setting a precedent of halting projects after they have gone through the NEPA process will show industry and the world that the US does not understand or respect it's own environmental process - one of the most rigorous in the world.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- New offshore oil and gas development in Alaska would generate thousands of new high-paying jobs throughout all 50 states - in manufacturing, computer technology, construction and maintenance. \$82 billion in payroll would be paid to employees in the Lower 48.
- Federal, state and local governments would all realize substantial revenue from OCS development, with the base case totaling \$193 billion, of which the federal government would collect \$167 billion.
- Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.

Regional Director, BOEMRE ALASKA OCS Region,

The Chukchi Sea is a place of immeasurable value. It is valuable as a home for endangered polar bears, walrus, seals, fish and cycles of aquatic life. It is valuable as the ancestral homeland of the Inupiat people who have been living in this place for centuries before Western scientists discovered that the earth was round. It is valuable in ways that we simply cannot conjecture about at this point. These values are the kind that will last forever, if we are wise enough to protect them.

To grant Shell Gulf of Mexico, inc. a free pass to wreak havoc in our fragile Arctic Oceans with their current inadequate plan would be intolerably irresponsible. The revised Draft SEIS does not remedy the missing information that made the first draft so flawed.

With our oceans, we must at least have the humility and wisdom to know and admit how little we know. Shell openly admits that there is not enough basic scientific information about the Arctic - from simple species counts of marine and coastal fish and marine mammals such as walrus to information about currents and tidal systems - to fully understand the potential impacts of development to this already imperiled place. Without this vital information, how can Shell possibly make intelligent decisions regarding our common waters?

I am very concerned about the possibility of a major oil spill in the Chukchi Sea if Shell is allowed to drill. If the corporation can't manage to clean up a spill in the Gulf of Mexico, there is no way they can deal with the Arctic Ocean they now threaten with development. Shell's plans for cleaning up a spill in a region characterized by extreme cold, extended periods of darkness, hurricane-strength storms and pervasive fog include glorified mops and buckets. To make matters worse, the nearest coast guard station is 1,000 miles away!

I urge you to hold off decisions about drilling in America's Arctic Ocean until there is a plan that gathers and synthesizes adequate baseline ecological information basic essential information and the technology exists to clean up an oil spill in the Arctic Ocean's extreme conditions. Please mandate more environmental including the impacts from a potential blowout oil spill during the proposed drilling. Please mandate MMS to fill in the data gaps and work with agencies like NMFS and USGS to obtain information about the Arctic Ocean. The way it stands, the Chukchi Sea Lease Sale 193 is not a risk America can afford to take. Please protect our land and sea from corporate haste and greed.

With trust and hope,

Jenna Hertz

James Kendall, Regional Director
Alaska OCS Region
Bureau of Ocean Energy Management, Regulation & Enforcement
3801 Centerpoint Drive, Ste. 500
Anchorage, AK 99503

Dear Mr. Kendall:

This is to provide comments relative to the proposed Outer Continental Lease Sale 193 in the Chukchi Sea. I support this sale and encourage you to move forward as soon as conceivably possible to enable this lease. The draft EIS has been reworked in compliance with US District Court order to include a "worst case" oil spill scenario. Considerable information is now included to make an informed decision. I would like to add certain comments in support of my position:

- Lease Sale 193 should be affirmed as held in 2008; the SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without an corresponding benefit to the environment
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security
- The Chukchi OCS is an important future source of US energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place; the Chukchi Sea is considered the most prospective unexplored offshore basin in the country
- The goal of Lease Sale 193 is to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits; the OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards; activities will be governed by stringent lease stipulations; numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities
- Industry has committed to unprecedented provisions from prevention and spill response that go above and beyond what is required by law; these provisions, combined with a stringent

Richard A. Hughes Comment

permitting process, give Alaskans a high level of confidence that exploration and development can occur safely

- Drilling in the Arctic offers distinct differences than deep water exploration and development in the Gulf of Mexico; the pressure encountered in deep water drilling is multiple times greater than in Alaska where wells would be in very shallow water; there are also major differences in well designs, as well as fundamental differences in the geology of the regions
- Thirty exploration wells have been drilled in the Beaufort and five in the Chukchi - all without incident; these wells were drilled in the 1980's, utilizing older technology compared to what exists today
- The North Slope and the offshore are now one of the most studied energy basins in America; in the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas
- An estimated annual average of 54,700 new jobs would be created and sustained over 50 years by OCS-related development in Alaska; as estimated \$63 billion in payroll would be paid to employees in Alaska as a result of OCS development
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout the US - in manufacturing, computer technology, construction and maintenance; \$82 billion in payroll would be paid to employees in the Lower 48
- Federal, state and local governments would all realize substantial revenue from OCS development, with the base case totaling \$193 billion, of which the federal government would collect \$167 billion
- Demand for energy is continuing to rise and the US requires continued development of America's oil and gas resources as the nation transitions to alternative energy sources of the future
- Given the impact of high energy prices on Americans and their economy, the US has an obligation to develop domestic oil and natural gas sources, both onshore and offshore.

Thank you for your consideration.

Yours truly,

Richard A. Hughes

Representative of Form Letter Campaign to Congress over 1,000 received

Wednesday, July 06, 2011

The Honorable Representative Pete Visclosky
2256 Rayburn House Office Building
Washington, DC 20515

Subject: Urge the Administration to Allow more Oil Production

Representative Visclosky:

June 2011

James Kendall, Regional Director
Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503

Dear Mr. Kendall:

I write to express my strong support for energy development from Alaska from federal lands and waters, and specifically, to urge your agency to do what is necessary to move forward with Lease Sale 193 in the Chukchi Sea.

Now that the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) has revised its analysis of the environmental information surrounding offshore energy development in Alaska, I am convinced that operations in Alaska's OCS can proceed in much the same way that operations are proceeding throughout the world where countries recognize that oil and gas are essential to economic growth and a strong economy. I hope that BOEMRE shares my belief that a strong America with opportunities for future generations requires that Alaska's resources not be placed off limits, as some have urged. We need jobs, and Alaska's energy will help.

I was very surprised to recently learn that less than 3% of America's OCS is leased for energy production, and that includes the leases in question in Alaska. It seems to me that if the government is truly concerned about job creation and economic growth, it will follow through on those few areas that have been leased like the Chukchi Sea and allow those who have already paid the government for the right to explore the opportunity to explore. By some accounts, expected production of oil from Alaska's OCS could create over 50,000 jobs. Additionally, any oil found and produced would help fill the Trans-Alaska Pipeline System (TAPS) that is running at below one-third of its capacity. The 1.5 million+ barrels

Representative of Form Letter Campaign to Congress over 1,000 received

of oil that the US must import every day to replace oil that was once transported through TAPS costs our nation over \$50 Billion per year at today's prices, and is more oil than Libya exported daily before its exports were cut off. As you know, the loss of that oil on world markets was sufficient to compel President Obama to release our strategic petroleum reserves, even while the US could transport more than that daily to our markets but for delays and lack of permits. The US needs more energy in its most important oil pipeline, and no other nation on earth would neglect such an energy asset if it had oil available to refill it.

The United States needs more energy; it needs more jobs; it needs more federal revenue. You have it within your power to ensure the United States gets what it needs to make us stronger. I ask that you make the right decision and allow Alaska's energy resources to contribute to that strength.

Sincerely,

Arline Seeman
9331 Olcott Ave
Saint John, IN 46373

Sarah A. Keller Comment

July 10, 2011

To whom it may concern:

Frankly, I am reluctant to endorse any oil exploration in the Chukchi Sea given recent events such as the Deepwater Horizon oil spill in 2010 and now the current spill from a broken pipeline into the Yellowstone River in Wyoming. Spills, blowouts and other incidents, regardless of the reasons behind them, shake the nation's confidence in oil companies and their partners as well as in regulatory agencies.

It seems more than reasonable to suggest a shift in the mindset from "it will never happen" to "it WILL happen" and to choose to be prepared. I would urge all to take up the full recommendations of the findings of the National Commission on the BP Deep Water Horizon Oil Spill and Off Shore Drilling. Regardless of the depth of the water, any oil exploration and drilling needs to follow these recommendations to safeguard the environment and establish financial responsibility.

In addition, Congress needs to fully fund the regulatory agencies involved so they can function as partners in prevention and response to any incidents. For example, there needs to be increased investment in the Coast Guard so it can receive equipment, staff and training to be ready to respond to all manner of incidents in the arctic. Coupled with this, NOAA needs support to increase its abilities and do its part for improved quality of necessary weather forecasting and real-time sea ice conditions. If the funding isn't there, then drilling should be delayed.

We need to have a transparent and traceable inclusion of science and expertise in a more effective way. I strongly support the recommendations from the 2011 excellent report by Holland-Bartels and Pierce of the USGS (An evaluation of the science needs to inform decisions on Outer Continental Shelf energy development in the Chukchi and Beaufort Seas, Alaska: U.S. Geological Survey Circular 1370, 278 p.) In that report, there is evidence of the wide gaps in our current knowledge and our understanding of the arctic ecosystems. Comprehensive research should be integrated and focused in helping us understand how the ecosystem works. Much work is needed to establish baseline data before any drilling. If the funding isn't there to support such work, then drilling should be delayed.

As Gulf Oil Commissioner and fellow Alaskan, Frances Ulmer noted in a public forum in Fairbanks, AK this past spring, the arctic doesn't just belong to the US; it belongs to a group of nations. A collaboration of arctic nations should ahead of time establish best practices methods and training appropriate to the special challenges of the arctic. Any spill will become an international incident. We as a nation need to be prepared to respond. We have seen what happens when there is ill preparedness for the inevitable. No one benefits from that. Again, a spill, blowout or similar incident WILL happen and we should do all we can to be prepared. It will cost, but it will cost much more if we do not.

Sarah A. Keller Comment

General Comment

As an American and an energy consumer, I am writing to express support for oil and gas development in the Chukchi Sea and to urge the Bureau of Ocean Energy Management, Regulation, and Enforcement (BOEMRE) to proceed with Lease Sale 193.

The Revised Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193 represents a thorough analysis of the concerns raised by those who oppose oil and gas development on Alaska's Outer Continental Shelf. Now that the Lease Sale 193 has been fully reviewed, I ask BOEMRE to move promptly to finalize this process so that Americans can realize the benefits of increased domestic production.

In addition to increasing our domestic supply of energy, development of our energy resources in Alaska's Outer Continental Shelf would have a tremendous ripple effect throughout the nation's economy - creating tens of thousands of jobs nationwide. At a time when Americans are struggling to find work and unemployment remains high in many states, the jobs and economic growth associated with Alaska's OCS are significant. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs

Daniel Kelly Comment

nationwide with a cumulative payroll of \$154 billion over the next 50 years. Outside Alaska, development of the Chukchi Sea would generate approximately 15,200 U.S. jobs annually during the production phase and an average of 12,100 jobs annually through 2050.

Offshore oil and gas development in the Chukchi Sea, as well as the Beaufort Sea, has the potential to help the United States meet its energy demand, create jobs, and grow the economy. Proceeding with Lease Sale 193 is in the best interest of all Americans. There has been ample opportunity for environmental review and public input on Lease Sale 193. Therefore, upon conclusion of this public comment period, I urge BOEMRE to move forward so that Americans can reap the economic and energy security benefits of Ala

Industry got this state going and has sustained it through the years. Sale 193 is important in ensuring a future for our state, our children and our businesses. The cost of energy is rising and we have a solution in our midst- it's time to take action and get a move on the OCS.

Without opposition we can become complacent... We, as Alaskans, have never been complacent in keeping our land/sea safe and will continue to make every effort to do just that.

General Comment

Due to declining rates of oil production in the onshore North Slope region, offshore resources are desperately needed to offset these production losses, fill the pipeline and keep the Trans-Alaska Pipeline flowing for generations to come. The economic activity from the development of the Chukchi and Beaufort Seas would also create an annual average of 54,700 jobs nationwide with a cumulative payroll of \$154 billion over the next 50 years.

The time is now to help the U.S. meet its energy demand and grow the economy by developing the resources in Alaska's Outer Continental Shelf. From hauling produce across the nation to flying people home, it is important to acknowledge how much energy we consume and realize how the Trans-Alaska Pipeline impacts our nation's energy security infrastructure.

To grow our economy, within Alaska and throughout the nation, I urge BOEMRE to move forward and proceed with Lease Sale 193. Thank you.

RE: Lease Sale 193 Chukchi Sea

Dear Mr. Kendall

I'm writing to represent my family of four, and express concern over oil and gas development in the Chukchi Sea and to urge the Bureau of Ocean Energy Management, Regulation, and Enforcement (BOEMRE) to reconsider Lease Sale 193.

Though we all need to think seriously about energy and sustainability, this needs to encompass all areas life, including that of our children, and other species, on which we mutually inter-depend.

Pro-development supporters have deep pockets to influence decision-making, so it is even more important to also listen to little people without loud voices. While the deep pockets say they seek development to save costs, I suspect the first one they benefit its themselves.

I believe there are less harmful ways to accomplish these goals without the damage these actions may cause. I agree with the MIT professor's quote that an oil spill in the Chukchi Sea is a "low frequency, high impact" event, much as the others have been (Exxon Valdez, BP Horizon, etc.) Is this the price we want to pay for our stubbornness and refusal to inconvenience ourselves enough to find clean energy and altar our lifestyles a bit? It's like irresponsibly driving down a crowded freeway, causing a lot of collateral damage to innocent people. While that would never be tolerated, removing the damage to our oceans, and causing harm on such a large scale boggles the mind to the point of immobilization and denial.

God gave us natural resources to figure out what to do with them. He also gave us intelligence and creativity. It's time to explore alternatives God has also given us, which do not negatively impact so many of his other creations.

I hope you consider this point of view when you conduct the environmental review and public input on Lease Sale 193. There are other ways Americans can reap economic and energy security benefits without damaging the Outer Continental Shelf and risking so much harm. Thank you.

Sincerely,

Colleen Leibert

Subject: Protect Wildlife in America's Arctic from Drilling -- Environmental Impact Statements; Availability, etc.: Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale (Document ID BOEM-2011-0044-0001)

Dear Secretary Salazar and BOERME Alaska OCS Regional Director,

The Bureau of Ocean Energy Management, Regulation, and Enforcement (BOERME) and the Department of the Interior (DOI) are currently making important decisions about the Arctic Ocean that threaten long-term consequences for the region. The BOERME is currently in the process of reconsidering the Bush-era Chukchi Sea Lease Sale 193 that was sent back to the agency by an Alaska Federal court last summer. It is also considering plans by Shell Oil Co. to drill for oil in the Chukchi and Beaufort seas starting in 2012 and revisions to the accompanying oil spill response plans.

"It is horrifying that we have to fight our own government to save the environment."
-- Ansel Adams

Disappointingly (but not surprisingly), the revised draft supplemental EIS does not sufficiently account for missing information and, as a result, the BOEMRE should not move forward with Lease Sale 193. The BOEMRE and the DOI should not reaffirm the Chukchi Sea leases and should not approve Shell's plans to drill until fundamental questions about the Arctic Ocean have been answered through more scientific study and synthesis (such as research on the effects of oil and gas activities on fish, birds, and marine mammals) and not before realistic and effective plans to respond to a large oil spill are put in place. I urge you not to move forward with risky, aggressive leasing and drilling plans in America's Arctic Ocean. At a minimum, the BOEMRE should suspend the leases sold until the necessary baseline information is available to determine whether drilling activities should occur and, if so, under what conditions. The decisions you make as part of this process will provide important direction for our ocean resources, in particular for Alaska's Chukchi Sea.

"Every man who appreciates the majesty and beauty of the wilderness and of wild life, should strike hands with the farsighted men who wish to preserve our material resources, in the effort to keep our forests and our game beasts, game-birds, and game-fish—indeed, all the living creatures of prairie and woodland and seashore—from wanton destruction. Above all, we should realize that the effort toward this end is essentially a democratic movement."

Christopher Lish Comment

-- Theodore Roosevelt

There is far too much at risk. The Arctic is one of the most beautiful and forbidding places on Earth, where temperatures regularly plunge well below zero and the time between sunset and sunrise is sometimes measured in months rather than hours. Despite these difficult conditions, a variety of people and animals have adapted to thrive at the top of the world. The Arctic Ocean is a pristine, remote region, home to many threatened and endangered species, including many of our nation's most iconic wildlife species: polar bears, walrus, ice seals, bowhead whales, beluga whales and more. This region is also of great significance to Alaska Native communities which rely on the Arctic Ocean to sustain their way of life. As a people who have lived off the bounty of the Arctic Ocean for thousands of years, the Inupiat traditionally spend weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their garden and we must protect it for future generations. Unfortunately, facing pressures of climate change and industrialization, a bottleneck for survival has been created in the Arctic Ocean, ultimately threatening wildlife and putting Arctic community's subsistence way of life at risk.

"As we peer into society's future, we—you and I, and our government—must avoid the impulse to live only for today, plundering for our own ease and convenience the precious resources of tomorrow. We cannot mortgage the material assets of our grandchildren without risking the loss also of their political and spiritual heritage. We want democracy to survive for all generations to come, not to become the insolvent phantom of tomorrow."
-- Dwight D. Eisenhower

It is also beyond dispute that many basic questions about the Arctic Ocean ecosystem remain unanswered. The Arctic's unique marine environment is one of the least understood areas in the world, so a base-line scientific understanding of the area is also critical for future development. There is a lack of basic science—from simple species counts of marine mammals, such as the threatened polar bear and the endangered bowhead whale, to information about currents and tidal systems. There is much more that must be understood in this remote area—through a comprehensive research and synthesis plan—before leasing and drilling can be allowed to proceed. Without this basic information, we cannot know the potential consequences of oil development there and we cannot manage those activities in a way that protects the people and resources of the region, particularly in the face of ever growing climate change threats. Even the National Marine Fisheries Service has told the BOEMRE that it should obtain more information about the effects of oil and gas activities—especially seismic testing—on fish before proceeding with decisions about drilling. Additionally, the recent US Geological Survey analysis of the ocean's science needs concluded that further research should take place before drilling in the Arctic Ocean, including establishing a baseline scientific understanding.

Christopher Lish Comment

"Our government is like a rich and foolish spendthrift who has inherited a magnificent estate in perfect order, and then has left his fields and meadows, forests and parks to be sold and plundered and wasted."
-- John Muir

It is too soon to permit oil and gas activities in the Arctic Ocean. Oil drilling companies must have basic, essential information and technologies to clean up an oil spill in Arctic conditions beyond today's inadequate means. The Presidential commission on the BP-Deepwater Horizon disaster identified there are "serious concerns" and "special considerations" regarding Arctic drilling. The BOEMRE's own analysis shows that very large oil spills similar in size to that of the BP-Deepwater Horizon disaster could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's communities and species, such as the threatened polar bear as well as endangered birds and whales. As if this were not serious enough, BOEMRE's predecessor agency, the Minerals Management Service previously stated that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. There are no trained personnel or equipment in the region capable of carrying out an effective response plan and there is a clear lack of basic scientific information about the ocean ecosystem. The vibrancy and biodiversity of the Arctic ecosystem depends on how we manage future development.

"Then I say the Earth belongs to each generation during its course, fully and in its own right, no generation can contract debts greater than may be paid during the course of its own existence."
-- Thomas Jefferson

Last year's disaster in the Gulf of Mexico taught us that preparation is key. However, Shell Oil Company's oil spill prevention plan for the Chukchi Sea is wholly inadequate. It is based on flawed and unrealistic assumptions. The Coast Guard and other agencies agree—we are woefully unprepared to respond to a large oil spill in the Arctic Ocean were one to occur. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that there is more to the oil industry's response plans than just glorified mops and buckets. The threat of oil spills and the inability to clean them up are reason enough to cancel any plans for proposed drilling.

"It is our task in our time and in our generation, to hand down undiminished to those who come after us, as was handed down to us by those who went before, the natural wealth and beauty which is ours."
-- John F. Kennedy

With all of this in mind, it is clear that exploratory drilling resulting from Lease Sale 193 in the Chukchi Sea should be postponed until there is a better understanding of the Arctic Ocean. The Arctic Ocean is too special a place to risk with incomplete data on the ocean's marine resources and poor spill response plans. Now is the time to take proper precautions and ensure that drilling is done only after we have confidence that spill risks

Christopher Lish Comment

are minimized. The oil in the Arctic Ocean isn't going anywhere, and can wait for proper research and preparedness.

"I think America will have come to maturity when it will be possible to erect somewhere in the United States a great bronze marker which will read: "Beneath these lands which surround you there lies enormous mineral wealth. However, it is the judgment of the American people, who looked up this area, that these lands shall not be disturbed, because we wish posterity to know that somewhere in our country, in gratitude to nature, there was at least one material resource that we could let alone."
-- Freeman Tilden

Until issues such as the lack of science and the inability to clean up an oil spill in Arctic waters are addressed, the federal government cannot possibly make informed decisions about whether oil and gas activities should occur in Arctic waters, particularly against the backdrop of sea ice loss and ocean acidification, two existential threats caused by fossil fuel burning that could rip out the very foundation of the Arctic Ocean ecosystem.. BOEMRE must ensure that Shell Oil's plans to drill in the Chukchi Sea for 2012 and 2013 address these issues, including the impacts from a potential blowout during drilling.

"Our duty to the whole, including to the unborn generations, bids us to restrain an unprincipled present-day minority from wasting the heritage of these unborn generations. The movement for the conservation of wildlife and the larger movement for the conservation of all our natural resources are essentially democratic in spirit, purpose and method."
-- Theodore Roosevelt

America's Arctic Ocean is in your hands. We need to ensure that any offshore development puts our coastal communities, wildlife, and waters first. Please do not allow Shell Oil's risky and aggressive offshore drilling plan to occur in ecologically-critical Arctic waters before basic essential information is gathered and there are proven technologies to clean up spills in the Arctic's icy waters. There is too much at stake.

"A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise."
-- Aldo Leopold

Thank you for the opportunity to comment on the Revised Draft Supplemental Environmental Impact Statement (EIS) and Lease Sale 193 in the Chukchi Sea. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish

General Comment

I urge you to affirm Lease Sale 193, and allow exploration to move forward in the Chukchi Sea. This could be an important source of domestic energy for the U.S., and could help keep the trans-Alaska pipeline operating well into the future. New jobs would be created and revenues from the OCS could help offset the federal deficit. Industry is committed to exploring in a way that respects the environment and the lifestyle of local residents. More studies are in progress to better understand the science of the Arctic, but even now, the Chukchi Sea is one of the most studied basins in the world. I support the SEIS and believe it provides sufficient information and analysis to move forward with Lease Sale 193. Thank you,
 Natalie Lowman
 A lifelong resident of Alaska

Regional Director, Bureau of Ocean Energy Management,
 Regulation and Enforcement, Alaska OCS Region
 3801 Centerpoint Drive, Suite 500
 Anchorage, Alaska 99503-5820

July 8, 2011

Dear Director:

I would like to respectfully request that no decisions regarding drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region. Additionally, any decisions that would recommend drilling should be put on hold until proven, accessible technology exists to clean up a spill in the Arctic's unique conditions. The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Consider that the Arctic's diverse marine environment is one of the least understood in the world. There is a lack of basic science—from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) should not move ahead with decisions about drilling before it has collected crucial information which is lacking -- including the potential impact of an oil spill in the Arctic Ocean ecosystem and how it would adversely affect life in this fragile area.

The National Marine Fisheries Service has informed the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish should be an indicator that additional work needs completed prior to any decision being made regarding the Arctic. The DOI should fill such data gaps before making any leasing decisions.

The Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we have an obligation to protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's wildlife, such as the polar bear, numerous bird species, and a large number of whale species.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis really need to be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I strongly urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these truly unique areas until the necessary information is collected and reasonable spill cleanup plans are incorporated and are ready to go. Anything less would be a serious tragedy and is totally unacceptable.

Thank for this opportunity to express my thoughts and concerns about this highly volatile, dynamic, and emotional topic.

Best Regards,

David Lee Marshall

General Comment

With high energy prices in the United States and the impact on our economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore. We need to stop these delays by the EPA and BOEM in the Chukchi Sea now!

General Comment

The revised SEIS should contribute to Lease Sale 193 being affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193. Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and most certainly discourage future industry investment without a corresponding benefit to the environment. Several large oil and gas firms have already spent billions of dollars preparing to responsibly explore and produce oil from this area and to rescind the leases at this point would be tragic. The Chukchi OCS is an important future source of US energy supply and now more than ever, the US needs domestic sources of energy. Plus, this production can help offset the declining flow through the Trans-Alaska pipeline at a time when it will be very critical to do so.

I firmly believe the oil and gas industry can produce oil in a safe and environmentally responsible manner. My family's future and my children's future, along with my State's future, depend upon continued oil and gas exploration and production.

Re: Chukchi Sea Lease Sale 193 Revised Draft Supplemental Environmental Impact Statement, OCS EIS/EA BOEMRE 2010-034 (May 2011)

Dear Regional Director Kendall:

I wish to provide a few additional individual comments based on my long history in reviewing Beaufort Sea and Chukchi Sea lease sale documents, as well as exploration and development plans. I also served as a peer reviewer to the National Research Council's 2003 study, Cumulative environmental effects of oil and gas activities on Alaska's North Slope and served on the Alaska OCS advisory committee during the 1990's.

ACMP... Gone. A significant new piece of information that must be considered in this SEIS is that the state of Alaska has abolished its Alaska Coastal Management Program (ACMP) as of July 1, 2011. The lack of the ACMP to meet the nation's goals for protecting vital coastal estuaries and sensitive shorelines so important to fish, wildlife, and people that had been achieved through this opt-in mechanism for implementing the Coastal Zone Management Act is a huge change that constitutes significant new information.

This is highly relevant to evaluating data gaps and the necessity for the federal government to obtain the relevant information so that it can assess impacts, consider a full range of lease sale alternatives, and also to design and require adequate mitigative measures for the lease sale and subsequent exploration and production activities. It is also relevant to the consideration of the Very Large Oil Spill analysis due to the grave impacts that blowout spills could pose including to the coastal zone. This change is also significant for your evaluation of impacts from natural gas development (especially in the nearshore waters, shoreline landfall and transition zone, and where it traverses onshore tundra wetlands), as the coastal standards that used to be in place through the ACMP no longer exist.

Pamela A. Miller Comment

While the ACMP had already been weakened by Gov. Frank Murkowski to eliminate local district enforceable standards, now this important program with its statewide standards and role for addressing Alaskan public concerns is completely gone. This program not only contained important standards for protecting the human and natural environment onshore and in the state's 3-mile zone it also applied to the impacts from offshore activities and infrastructure that had impacts to the coastal zone including to subsistence, recreation, and ecological integrity.

Since it just expired this month¹ due to failure of the Alaska state House to pass an extension to the ACMP in the face of lack of support from Governor Parnell,² it is too soon to provide a thorough analysis of all of the coastal measures that are no longer in place. The simple truth is that as an Alaskan resident, I can no longer look to the state of Alaska to provide any meaningful avenues for addressing the impacts of offshore development.

The State of Alaska can no longer claim that it has high environmental standards for coastal or offshore development now that the ACMP is dead. The ACMP had enforceable standards, in addition to a streamlined way to provide public comment. Alaska's track record of environmental impact review and regulation has hit rock bottom.³

Sea Ice... Going... (in summer) but More Dynamic. The recent USGS study noted that the complexity and predictability of Arctic Ocean sea ice has changed dramatically. It said, "although portions of the Chukchi and Beaufort Seas are expected to be ice-free for a greater period of time each year, the pack ice is predicted to be more dynamic at certain times, increasing the risk of accidents and making oil-spill response more difficult during these times." (p. 217-218).

The revised draft SEIS fails to address how this may affect pileups, pressure ridging, ice movements, ice gouging, streudal scouring, and the force of ice that can affect the integrity of offshore exploratory and production platforms, including for natural gas development, subsea buried pipelines especially in the transition zone at landfall, and coastal erosion which could affect the integrity of offshore pipelines. If the (oil and) natural gas pipeline landfall is near Wainwright, how might gas pipeline breaks, leaks, and explosions affect local residents?

During prior exploratory well drilling, sea ice and major weather factors such as wind and waves caused drilling operations to need to be shut down and the rigs moved offsite. This operation is called critical curtailment. The attachment provides information obtained from MMS about the Chukchi Sea and Beaufort Sea drilling critical curtailments as of 1993 when the analysis was done, as is described in the following

¹ The program ended July 1, 2011 per AS 44.66.030. <http://www.alaskacoast.state.ak.us/> (accessed July 11, 2011)

Pamela A. Miller Comment

section from P.A. Miller, et al, 1993, Oil in Arctic Waters, Chapter 8, p.74⁴ (see Attachment). At all three Chukchi Sea wells for which records could be obtained, there were critical curtailments of operations. The movement of wells off the drill location and suspension of operations adds considerable risks to the drilling operation.

There have been many gas blowouts in Alaska, including in Cook Inlet (see P.A. Miller, 1993, p. 78) and along the coasts of the Beaufort Sea. In June 1989, the Kulluk drillship which is now proposed for use in Shell's Beaufort Sea drilling program had a natural gas blowout in the Canadian Arctic. This was also the same rig used for the earlier Kuvlum well in the U.S. Beaufort Sea.⁵ A more thorough assessment of natural gas blowouts should be done, especially in light of the assumption that natural gas drilling will be done on the same exploratory rigs and production platforms as oil exploration and development.

The revised draft SEIS fails to address the risks from critical curtailment operations, and their expected frequency, and this additional risk from natural gas drilling (as well as combined with risks from oil well drilling) needs to be considered along with more specific information regarding movements of sea ice during the year. This could affect not only mitigation measures regarding timing of exploratory and production drilling but also geographic scope of lease sale areas and where particular activities and operations are prohibited due to the nature of the conditions.

I have been told by an environmental scientist from BOEMRE that if there is an oil spill in the Chukchi Sea it will go "all over the place." This is not the impression that the convoluted presentation of the trajectory analysis in the OSRA presents.

I strongly urge the agency to go back to the drawing board, get the proper oceanographic, sea ice, and biological information (including critical migration, staging, nesting, feeding areas and conservation system units including Alaska Maritime and other national wildlife refuges, national parks and preserves, wilderness areas, marine protected areas, state critical habitat areas) that is needed. Then use modern GIS overlay analyses along with a graphic designer to show meaningful animations where the oil spill would spread from various drilling, pipeline, tanker (including those used for well testing, fuel hauling and oil spill cleanup tankers). The New York Times did a great job of presenting this information in a way that was understandable and presented the relevant layers of information, including the dozens of impacted national wildlife refuges, during the crisis period of the Deepwater Horizon Gulf of Mexico disaster.

⁴ P.A. Miller et al. 1993. Data Source: MMS, 9 April 1991. Letter for response to Greenpeace USA FOIA request dated 2 October 1990. Summary of Critical Operations and Curtailment Plans: Implementation Resulting in Suspension of Operations.

⁵ Letter from George N. Ahmaogak, Sr., North Slope Borough Mayor, 11 October 1989, to John A. Krause, Undersecretary for Oceans and Atmosphere, about State of Alaska objection to consistency certification for Amoco Galahad Prospect.

Pamela A. Miller Comment

Please do not wait until the first disaster in the sensitive Arctic Ocean and surrounding coasts to provide relevant and meaningful information upon which to consider the long-term risks and environmental impacts that Chukchi Sea Lease Sale 193 sets in motion.

I also urge you to consider to provide the full public comment letters, with the annotations by BOEMRE indicated right on them for the response to comments. Much of the significance and context of comments results from the whole body of thought and knowledge that is provided in a letter and particularly during the public hearings (the entire hearing transcript also should be provided, intact).

I urge the Interior Department to go back to the drawing board with a new review once the scientific data gaps are addressed and a comprehensive scientific baseline program has undertaken adequate studies. As the Arctic Ocean faces potentially a huge transformation from a wild, remote ocean to an industrialized zone into the indeterminate but very long-term future, it is wise to proceed with ample caution. No new drilling should take place in the Arctic Ocean in light of the huge data gaps and the woeful inability to respond to – much less clean up – oil spills in icy seas.

I have looked out at the Chukchi Sea with a subsistence fisherman and hunter in Point Hope who pointed out four different currents moving before us. He watched subtle changes in the surface of the water to see the fish coming then set his net. He followed the low flight of eiders winging the shore, showed me a whale spout, shared great respect for the ocean and its life. A seal looked at us for a long time. My friend sat so still for many long hours gazing at the ever changing ocean that provides for him and his family and has forever.

Why would we risk all this?

Sincerely,

Pamela A. Miller
Wildlife Biologist

Common Occurrences

Critical Curtailment of Drilships in Arctic Waters

These incidents involved drilships operating in the Arctic which were required to suspend operations, secure the well and wait for hazardous ice floes or weather to pass. All Chukchi wells drilled to date, and 60 percent of wells drilled in the Beaufort Sea Lease Sale 57 area had operations curtailed. The incidents below represent a total of over 2,000 hours, or 84 days, in which natural conditions exceeded operating limitations of the drilling technology from 1985-1990. The bowhead whale migration was underway during these hazardous suspensions of drilling. The Hammerhead, Corona, and Belcher wells are all offshore of the Arctic National Wildlife Refuge.¹⁶

Beaufort Sea "Hammerhead" Well (UNOCAL) 1985
August 17 - 23 90 percent ice cover, thick multi-year ice with ridges; disconnect and move off location.
Aug. 23, Aug. 29 Hazardous ice in vicinity.
Sep. 16-22 Thick ice encroaching; 44 knot winds; disconnect and move off location.

Beaufort Sea "Hammerhead" Well (UNOCAL) 1986
Sep. 21-22 45 knot winds; 15 foot seas; excessive vessel motion.

Beaufort Sea "Corona" Well (Shell Western E&P Inc.) 1985
Sep. 26-27 Move off location; ice floe 3 miles long by 3/4 mile wide; whales migrating.
Sep. 28-Oct. 30 Disconnect and move off location for 754 hours; 70 percent ice cover moving at .5 knots; whales migrating.

Beaufort Sea "Corona" Well (Shell Western E&P Inc.) 1986
July 31-Aug. 1 Disconnect and move off location; 75 percent ice cover moving .3 knots.
Aug. 10-11 Disconnect and move off location; 5 large floes with rubble ice, 22 miles long by 5 miles wide; 14 knot wind.
Aug. 21-30 Disconnect and move off location; large unmanageable floes near drill site, moving .9 knots, 50 knot winds.
Aug. 31- Sep. 2 Disconnect and move off location; ice floe mile wide, 19 knot winds; heavy ice concentrations moving over site at 1.8 knots.

Beaufort Sea "Belcher" Well (Amoco) 1988-89
Sep. 13, 1988 Hazardous ice near location.
Sep. 19 80 percent ice cover, moving 1 knot; 40 knot winds.
Sep. 20-26 Disconnect and move off location; movement of several large multi-year ice floes into area in excess of 1 knot; 33-45 knot winds.
Sep. 30 Monitor ice movements; gale force winds and heavy ice cover in vicinity.
Oct. 4 Disconnect; 90 percent ice cover with 0.4 knot drift.
Oct. 8 Wait on weather; giant floe 20 miles south of location.
Oct. 16-26 Disconnect and move off location for 216 hours; ice 8 feet thick, 100 percent cover; 21 knot winds.
Aug. 6-11, 1989 Disconnect and move off location; ice 8 feet thick, 90 percent cover; drift with ice.

Chukchi Sea "Popcorn" Well (Shell Western E&P Inc.) 1989-90
Oct. 16, 1989 Wait for weather; 35 knot winds, 10 foot seas; excessive vessel motion.
Aug. 26, 1990 Wait for weather; 50 knot winds, 20 foot seas; excessive vessel motion.
Aug. 31 Wait for weather; 10 knot winds, 8 foot seas; excessive vessel motion.
Sep. 11-15 Wait for weather; 50 knot winds, 20 foot seas; excessive vessel motion.
Sep. 17 Wait for weather; 50 knot winds, 20 foot seas; excessive vessel motion.

Chukchi Sea "Crackjack" Well (Shell Western E&P Inc.) 1990
Sep. 24 Wait for weather; 45 knot winds, 20 foot seas; excessive vessel motion.

Chukchi Sea "Klondike" Well (Shell Western E&P Inc.) 1989
Sep. 9 Wait for weather; 16 knot winds, 18 foot seas; excessive vessel motion.

General Comment

I attended a hearing this evening in Fairbanks, Ak. regarding the DSEIS for 193. I am not against oil exploration and/or development, but wish only to see that it is done in the most environmentally save manner. My concerns are as follows;

- 1; weather, extreme cold, high winds, making any clean-up efforts more difficult.
- 2; shifting ice; very powerful, unstoppable forces that could damage or destroy drill rigs/platforms
- 3; fragile ecosystem, very sensitive to contamination by petroleum products
- 4; lack of any experience any where in the world with oil recovery from spills in extreme cold regions, in broken ice, or even under-ice spills, which could go undetected
- 5; a fragile, local food chain for the Inuit who have lived along this cost for thousands of years and whose livelihood and culture depend on maintaining a healthy ocean environment
- 6; regarding the DSEIS itself, I see mention of cleanup, response, etc., but no mention of PREVENTION. If industry can develop foolproof methodology, perhaps spill response would be a moot point; we did, after all, land men on the moon!
- 7; the DSEIS actually seems to admit a 27-54% possibility for a large oil spill from drilling activities in this area; is that really a risk we should be taking for our ocean?
- 8; with the lax permitting for, lack of strict governmental agency scrutiny of, and in some cases actual covering up of abuses, oversights, and mistakes by the oil companies by agencies charged

Karl Monetti Comment

with protecting the environment, I find it hard to look at the process under discussion with a level eye. The district court has asked for clarification of many point that had been left out of the original EIS, and I still do not see them addressed in the current draft. Issues concerning baseline environmental information, wildlife populations, etc., needs to be fully studied, reported and addressed.

I feel some of these concerns can be addressed adequately, but, if not, then the leases should not go ahead in area 193.

Thanks

Dear Bureau of Ocean Energy Management, Regulation and Enforcement,

Mr. Bob & Tallie M. Moore-Bush
 507 County Road 32050
 Brookston, TX 75421-2513

The future of America's Arctic Ocean may be decided this summer. I'm writing to ask that no decisions about drilling in Arctic waters are made before there is demonstrated, proven technology to clean up a spill in the Arctic's unique and extreme conditions. The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Jun 30, 2011

The revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193 shows that very large oil spills could occur from drilling in the Chukchi Sea and could have catastrophic effects on the region's species, such as endangered bowhead whales as well as polar bears, birds and other Arctic wildlife.

James Kendall
 3801 Centerpoint Drive, Suite 500
 Anchorage, AK 99503

Please do not allow the oil industry to move forward with risky plans to drill in these one-of-a-kind waters, with so much at risk should a large spill occur.

Subject: Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

Sincerely,

DON'T LET THEM NEAR THE ARCTIC: AFTER THE BP SPELL IN THE GULF WE HAVE PROOF THAT OIL COMPANIES ARE DIRTY AND HAVE LOTS OF HELP HIDING FROM THEIR MESSES!!

I'm writing to ask that you make no decisions about drilling in the Arctic Ocean until a plan is in place to gather basic scientific information about the region and there is proven technology to clean up a spill in the Arctic's unique conditions. The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

The Arctic's rich marine environment is the least understood area in the world. There is a lack of basic science from simple species counts of marine mammals to information about currents and tidal systems. The Department of Interior (DOI) must fill missing data gaps before moving forward with any leasing decisions. The National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, before proceeding with decisions about drilling. This information is an essential part of creating a plan to manage America's Arctic Ocean.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, including polar bears, birds and whales. Before BOEMRE considers any drilling in the Arctic Ocean, such as Shell Oil's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed, including the impacts from a potential blowout oil spill during the proposed drilling.

Furthermore, BOEMRE's predecessor agency, the Minerals Management Service, previously confirmed that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that there is more to the oil industry's response plans than just glorified mops and buckets.

Representative Form Letters from NRDC submittal of 51,975

We must also protect the Arctic Ocean for the Inupiat, who have lived off the bounty of its waters for thousands of years, and for future generations who will continue to do so.

I urge you not to allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until important information is gathered and a plan is in place to clean up an oil spill in the Arctic's extreme conditions. There is too much at stake.

Sincerely,
 Mr. Bob & Tallie M. Moore-Bush

The National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, before proceeding with decisions about drilling. This information is an essential part of creating a plan to manage America's Arctic Ocean.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, including polar bears, birds and whales. Before BOEMRE considers any drilling in the Arctic Ocean, such as Shell Oil's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed, including the impacts from a potential blowout oil spill during the proposed drilling.

Representative Form Letters from NRDC submittal of 51,975

Furthermore, BOEMRE's predecessor agency, the Minerals Management Service, previously confirmed that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that there is more to the oil industry's response plans than just glorified mops and buckets.

We must also protect the Arctic Ocean for the Inupiat, who have lived off the bounty of its waters for thousands of years, and for future generations who will continue to do so.

I urge you not to allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until important information is gathered and a plan is in place to clean up an oil spill in the Arctic's extreme conditions. There is too much at stake.

Sincerely,
Mr. Max Macauley

Subject: Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

I don't need to tell you that BOEMRE conducted an analysis showing that very large oil spills could occur from drilling in the Chukchi Sea. And that such a spill could have catastrophic effects on the region's species, including polar bears, birds and whales.

I don't need to tell you that the Minerals Management Service, previously confirmed that no technology exists to clean up a spill in the Arctic's sea ice environment. But here I am doing it anyway. Why? Because some things matter should (and do!) matter more than the rush for yet more profits by an industry that does not possess the necessary knowledge or skill to prevent or control a spill or blowout in this volatile and irreplaceable environment

I urge you not to allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until important information is gathered and a plan is in place to clean up an oil spill in the Arctic's extreme conditions. There is too much at stake.

Sincerely,
Mr. Jim Cokas

Dear James Kendall,

My feelings are less measured than those of NRDC. I say, after Deepwater Horizon and Fukushima: no new underwater drilling, no new nukes. We've had our chance at being responsible enough to handle this stuff, now it's time to admit that the planet is already awash in wind, sunlight, and other renewables, which together should become 99% of our sources of energy ASAP.

Best,
Thomas Marshalek

Subject: Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

Stop this insanity of allowing big oil to destroy our environment! We are demanding this from YOU.

You MUST rely on science, not greed, to be true guardians of this nation's resources. We are really tired of government that can easily be bought!!!

I'm writing to ask that you make no decisions about drilling in the Arctic Ocean until a plan is in place to gather basic scientific information about the region and there is proven technology to clean up a spill in the Arctic's unique conditions. The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

The Arctic's rich marine environment is the least understood area in the world. There is a lack of basic science from simple species counts of marine mammals to information about currents and tidal systems. The Department of Interior (DOI) must fill missing data gaps before moving forward with any leasing decisions. The National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, before proceeding with decisions about drilling. This information is an essential part of creating a plan to manage America's Arctic Ocean.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, including polar bears, birds and whales. Before BOEMRE considers any drilling in the Arctic Ocean, such as Shell Oil's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed, including the impacts from a potential blowout oil spill during the proposed drilling.

Furthermore, BOEMRE's predecessor agency, the Minerals Management Service, previously confirmed that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to

Subject: Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

This organization wants me to ask that you make no decisions about drilling in the Arctic Ocean until a plan is in place to gather basic scientific information about the region and there is proven technology to clean up a spill in the Arctic's unique conditions. I want to go one step further and say that there should be NO DRILLING in the Arctic, period.

Everyday I get requests from organizations trying to protect this planet, asking me to TAKE ACTION. I'm happy to do it, but I am dismayed and disgusted that I or they even have to ask. What part about polluting this planet we all have to live on do you not understand? The concept is pretty simple. If we keep polluting this planet, it will become inhabitable. We've been given a perfect environment that we mess up constantly w/oil drilling, toxic emissions, and various other atrocities. Didn't we learn the lesson w/the Gulf oil spill?

I urge you not to allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters. There is too much at stake.

Sincerely,
Mrs. Robin Swennes

Subject: Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

Sir: Please read my concluding comments.

I'm writing to ask that you make no decisions about drilling in the Arctic Ocean until a plan is in place to gather basic scientific information about the region and there is proven technology to clean up a spill in the Arctic's unique conditions. The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

The Arctic's rich marine environment is the least understood area in the world. There is a lack of basic science from simple species counts of marine mammals to information about currents and tidal systems. The Department of Interior (DOI) must fill missing data gaps before moving forward with any leasing decisions. The National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, before proceeding with decisions about drilling. This information is an essential part of creating a plan to manage America's Arctic Ocean.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, including polar bears, birds and whales. Before BOEMRE considers any drilling in the Arctic Ocean, such as Shell Oil's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed, including the impacts from a potential blowout oil spill during the proposed drilling.

Furthermore, BOEMRE's predecessor agency, the Minerals Management Service, previously confirmed that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that there is more to the oil industry's response plans than just glorified mops and buckets.

We must also protect the Arctic Ocean for the Inupiat, who have lived off the bounty of its waters for thousands of years, and for future generations who will continue to do so.

James Kendall
3801 Centerpoint Drive, Suite 500
Anchorage, AK 99503

Subject: Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear James Kendall,

The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response. With the on-going impact that the most recent oil spills continue to have on our eco-system, I'm writing to ask that you make no decisions about drilling in the Arctic Ocean. We must first execute a plan to gather basic scientific information about the region and also have a proven technology to clean up a spill in the Arctic where unique conditions abound.

The Arctic's rich marine environment is the least understood area in the world and if we make a mistake now, there are no "do overs". There is a lack of basic science from simple species counts of marine mammals to information about currents and tidal systems. The Department of Interior (DOI) must fill missing data gaps before moving forward with any, preferably short term, leasing decisions. The National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, before proceeding with decisions about drilling. This information is an essential part of creating a plan to manage America's Arctic Ocean. We must also protect the Arctic Ocean for the Inupiat, who have lived off the bounty of its waters for thousands of years, and for future generations who will continue to do so. There should be concern for the lack of adequate maintenance and replacement of parts of the existing Alaska pipeline and the prevention of oil spills for drilling sites that already exist.

As part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis that shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, including polar bears, birds and whales. Before BOEMRE considers any drilling in the Arctic Ocean, such as Shell Oil's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed, including the impacts from a potential blowout oil spill during the proposed drilling.

Furthermore, BOEMRE's predecessor agency, the Minerals Management Service, previously confirmed that no technology exists to clean up a

Representative Form Letters from NRDC submittal of 51,975

spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that the oil industry's response plans actually work and match in magnitude the level of oil that can be lost in just one day! We can't be so stupid as not to have learned by our past mistakes. Greed and profits are not an excuse for taking risks when we already know the price that would be paid should such a catastrophic oil spill be repeated!

There is too much at stake to allow aggressive drilling in these one-of-a-kind waters. We are far from having the level of needed important information gathered nor is there a proven plan in place to clean up an oil spill in the Arctic's extreme conditions given the diverse species that would be directly impacted.

If there has ever been a time when caution should be followed, that time is now. Given the aquatic, mammal, and animal diversity as well as ecological importance of the Arctic land and sea environment, this area is unique in so many ways.

Sincerely,
Ms. Kay Woods

Form Letter and representative list of 20,020 concerned citizens submitted by Oceana

Dear Regional Director, Bureau of Ocean Energy Management, Regulation and Enforcement,

Thank you for the opportunity to comment on the Revised Draft SEIS and Lease Sale 193 in the Chukchi Sea. The revised draft supplemental EIS does not sufficiently account for missing information and BOEMRE should not move forward with Lease Sale 193. At a minimum, the agency should suspend the leases sold until the necessary baseline information is available to determine whether drilling activities should occur and, if so, under what conditions. The decisions you make as part of this process will provide important direction for our ocean resources, in particular for Alaska's Chukchi Sea.

The Arctic is one of the most beautiful and forbidding places on Earth, where temperatures regularly plunge well below zero and the time between sunset and sunrise is sometimes measured in months rather than hours. Despite these difficult conditions, a variety of people and animals have adapted to thrive at the top of the world. The Arctic is home to many of our nation's most iconic wildlife species: polar bears, walrus, ice seals, bowhead whales, beluga whales and more. Facing pressures of climate change and industrialization, a bottleneck for survival has been created in the Arctic Ocean, ultimately threatening wildlife and putting Arctic community's subsistence way of life at risk.

Currently, there is no proven method of cleaning up an oil spill in Arctic conditions. There are no trained personnel or equipment in the region capable of carrying out an effective response plan and there is a clear lack of basic scientific information about the ocean ecosystem. The vibrancy and biodiversity of the Arctic ecosystem depends on how we manage future development.

Until issues such as the lack of science and the inability to clean up an oil spill in Arctic waters are addressed, the federal government cannot possibly make informed decisions about whether oil and gas activities should occur in Arctic waters.

Sincerely,
20,020 concerned citizens

Comments on the Revised Draft SEIS
 Lease Sale 193 Chukchi Sea
 c/o Regional Director James Kendall
 BOEMRE - Alaska OCS
 3801 Centerpoint Drive Ste. 500
 Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

It has been one of the greatest honors of my life to serve the United States of America as a reservist in the United States Military. For over two centuries, the United States of America has been a beacon of hope for people around the world in need of assistance whether militarily, diplomatically or economically.

Oftentimes, our policies at home make the jobs of our military all the more difficult. Some of these policies are clear; others are more covert. One of the chief concerns facing United States strategic operations today is the need for more energy independence. Policies and decisions that limit the US in its ability to enhance domestic energy production put our military in harm's way. Lease Sale 193 would help to increase United States energy independence. I am writing to urge its approval.

It is no secret that the wars of modern times have been fought on soil currently controlled by those who sustain their power by the production, and sale to the US, of crucial oil reserves. Afghanistan and Iraq are the clearest examples, but recently we have seen outbreaks of violence in Egypt and Libya, as well as other Middle Eastern nations, all of which require the attention, and sometimes the involvement, of United States security personnel.

We possess a valuable resource in this fight on the Outer Continental Shelf (OCS) of Alaska, an area that falls under the regulatory arm of the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE). This responsibility, which you have assumed, is an enormous one. You must weigh environmental and societal concerns, while at the same time being cognizant of the dramatic economic benefits that oil and natural gas production could create.

However, even with these great questions to weigh, I am writing today to ask you to consider one more – one that is arguably the most crucial. The approval of Lease Sale 193, and others like it, will decrease our dependence on foreign oil that flows from some of the globe's hottest spots, and in turn, keep our military personnel safe. This is a very personal plea from me, and I trust you will take it in to strong consideration.

On behalf of those of us who serve, I want to thank you for your attention to this issue and my opinion thereon. I look forward to seeing the approval of Lease Sale 193.

Sincerely,

 Mark Palmer
 Army National Guard

General Comment

After the Gulf Oil spill last year haven't we proven that the oil companies are incapable of protecting our environment? The Chukchi area is so harsh and extreme in it's weather conditions that a spill there would not be a matter of if, but rather, when. This area is irreplaceable and irreparable. From my understanding, the Prince William spill still has residual problems to this day and it was no where near as remote or untouched. Yes, we're addicted to oil but this is an incredibly short-sighted response to our problems. Let's put a stop to this foolish give-away of a National treasure.

Representative Form Letters of 9,719 submitted by PEW

Mrs. Karen Frutchey

 Mail Stop 7229
 Washington, DC 20240

Subject: Don't Risk a Spill in U.S. Arctic Waters

Dear Secretary Salazar,

As a biologist that served in the response for the deep water horizon oil spill, I have a request that you acknowledge the following concerns.

You are considering important decisions regarding the future of offshore drilling that will set a precedent for oil and gas exploration in U.S. Arctic waters. I do not want the administration going forward without critical information on the ecosystem and on industry's spill response capability. Before approving drilling in the U.S. Arctic, the administration should implement a comprehensive, science-based plan that includes local indigenous knowledge and protects ecologically important habitats in the U.S. Arctic Ocean. And before allowing exploration to begin, you should ensure there is the spill response capacity proven to clean up oil in icy arctic conditions.

Improve Exploration and Oil Spill Response Plans

The Arctic is a challenging environment where operators may encounter harsh conditions year-round, such as dense fog, high winds, and freezing temperatures even in the summer months; in the late fall and winter months, sea ice and darkness pose additional challenges. These conditions increase the risks of a potential spill and would likely hamper oil spill response. Given the lack of infrastructure to support a significant spill response, the remote location of the lease sites and the challenging weather, potential Arctic operators must be equipped to contain and clean up an oil spill with the resources they bring.

Current exploration and oil spill response plans submitted for the Beaufort and Chukchi Seas are larger in scope, with planned simultaneous drilling and increased worst-case oil discharge estimates. But they lack many improvements to response capacity and technology to respond to and clean up an oil spill.

Before exploration and spill response plans are approved, the Administration should require that operators have built and tested a containment system in arctic conditions to be stationed near the drill site. Additionally, a second drilling vessel should be available nearby that is capable of operating in December ice conditions to drill a

Representative Form Letters of 9,719 submitted by PEW

potential late season relief well. Also, operators must be able to provide adequate nearshore and shoreline protection that includes identification of important ecological areas and pre-staged equipment. Currently, the oil spill response organization for the Arctic slope is unable to respond to a spill in the nearshore and shoreline in the presence of broken ice.

The Revised Draft Supplemental Environmental Impact Statement (DEIS) is Not Sufficient

The Bureau of Ocean and Energy Management failed to determine which of the missing information from the EIS was important to know in order to determine whether, when, where and under what conditions to issue oil and gas leases before conducting the Chukchi 193 lease sale in 2008. Oil and gas activities could have significant impacts on marine life (such as bowhead whales, walrus, ice seals and fish), yet this is not fully considered in the DEIS. The DEIS should be revised to incorporate the recently completed U.S. Geological Survey science review on the Arctic Ocean to help address missing information that would have informed which areas should have been included in the 2008 lease sale. A modified alternative should be selected that protects marine species and subsistence communities.

Fully informed decisions regarding the Arctic Outer Continental Shelf require balancing potential resource extraction and development with maintaining the ecological integrity of the ocean.

Sincerely,
Mrs. Karen Frutchey

Subject: Don't Risk a Spill in U.S. Arctic Waters

Dear Secretary Salazar,

Before approving drilling in the U.S. Arctic, the administration should implement a plan that protects ecologically important habitats in the U.S. Arctic Ocean. And before allowing exploration to begin, you should ensure there is proven plan to clean up oil in icy arctic conditions. And considering what happened in the Gulf, I don't think we're ready to drill in the Arctic.

The Arctic is a challenging environment where operators may encounter dense fog, high winds, and freezing temperatures even in the summer months and in the late fall and winter months, sea ice and darkness pose additional challenges. Given the lack of infrastructure to support a significant spill response, the remote location of the lease sites and the challenging weather, the response would be inferior to what happened in the Gulf and that was a major catastrophe. Remember? There are still animals dying in the Gulf due to that spill fourteen months ago. Oil is still present. It is still not cleaned up and you want to drill in the Arctic???

The Revised Draft Supplemental Environmental Impact Statement (DEIS) is Not Sufficient

Sincerely,
Ms. Sheri Kuticka

Washington, DC 20240

Subject: Don't Risk a Spill in U.S. Arctic Waters

Dear Secretary Salazar,

BEFORE allowing exploration to begin, PLEASE ensure there is the spill response capacity proven to clean up oil in icy arctic conditions.

You are considering important decisions regarding the future of offshore drilling that will set a precedent for oil and gas exploration in U.S. Arctic waters.

I do not want the administration going forward without critical information on the ecosystem and on industry's spill response capability.

Before approving drilling in the U.S. Arctic, the administration should implement a comprehensive, science-based plan that includes local indigenous knowledge and protects ecologically important habitats in the U.S. Arctic Ocean.

Improve Exploration and Oil Spill Response Plans

The Arctic is a challenging environment where operators may encounter harsh conditions year-round, such as dense fog, high winds, and freezing temperatures even in the summer months; in the late fall and winter months, sea ice and darkness pose additional challenges. These conditions increase the risks of a potential spill and would likely hamper oil spill response. Given the lack of infrastructure to support a significant spill response, the remote location of the lease sites and the challenging weather, potential Arctic operators must be equipped to contain and clean up an oil spill with the resources they bring.

Current exploration and oil spill response plans submitted for the Beaufort and Chukchi Seas are larger in scope, with planned simultaneous drilling and increased worst-case oil discharge estimates. But they lack many improvements to response capacity and technology to respond to and clean up an oil spill.

Before exploration and spill response plans are approved, the Administration should require that operators have built and tested a containment system in arctic conditions to be stationed near the drill site. Additionally, a second drilling vessel should be available nearby

Representative Form Letters of 9,719 submitted by PEW

that is capable of operating in December ice conditions to drill a potential late season relief well. Also, operators must be able to provide adequate nearshore and shoreline protection that includes identification of important ecological areas and pre-staged equipment. Currently, the oil spill response organization for the Arctic slope is unable to respond to a spill in the nearshore and shoreline in the presence of broken ice.

The Revised Draft Supplemental Environmental Impact Statement (DEIS) is Not Sufficient

The Bureau of Ocean and Energy Management failed to determine which of the missing information from the EIS was important to know in order to determine whether, when, where and under what conditions to issue oil and gas leases before conducting the Chukchi 193 lease sale in 2008. Oil and gas activities could have significant impacts on marine life (such as bowhead whales, walrus, ice seals and fish), yet this is not fully considered in the DEIS. The DEIS should be revised to incorporate the recently completed U.S. Geological Survey science review on the Arctic Ocean to help address missing information that would have informed which areas should have been included in the 2008 lease sale. A modified alternative should be selected that protects marine species and subsistence communities.

Fully informed decisions regarding the Arctic Outer Continental Shelf require balancing potential resource extraction and development with maintaining the ecological integrity of the ocean.

Sincerely,
Ms. Wendy Moylan

Subject: Don't Risk a Spill in U.S. Arctic Waters

Dear Secretary Salazar,

Repeatedly in energy-related decisions I see the US making decisions without the benefit of science. A case in point is local – the Army Corp of Engineers as the US representative on the Delaware River Basin Commission, voted to release proposed natural gas drilling rules without having initiated or waited for the results of a comprehensive study of the environmental impacts of natural gas extraction on the ecosystems of the Delaware River watershed.

As a Democratic administration I have hoped that science would inform decisions. I am still hopeful that science will become a leading factor in decisions. However I am a former scientific investigator and I know just as you do, that science can't inform decision making if decisions occur before scientific studies are completed.

Now you are considering important decisions regarding the future of offshore drilling that will set a precedent for oil and gas exploration in U.S. Arctic waters. I do not want the administration going forward without critical information on the ecosystem and on industry's spill response capability. Before approving drilling in the U.S. Arctic, the administration should implement a comprehensive, science-based plan that includes local indigenous knowledge and protects ecologically important habitats in the U.S. Arctic Ocean. And before allowing exploration to begin, you should ensure there is the spill response capacity proven to clean up oil in icy arctic conditions.

Improve Exploration and Oil Spill Response Plans

The Arctic is a challenging environment where operators may encounter harsh conditions year-round, such as dense fog, high winds, and freezing temperatures even in the summer months; in the late fall and winter months, sea ice and darkness pose additional challenges. These conditions increase the risks of a potential spill and would likely hamper oil spill response. unable to respond to a spill in the nearshore and shoreline in the presence of broken ice.

The Revised Draft Supplemental Environmental Impact Statement (DEIS) is Not Sufficient

The Bureau of Ocean and Energy Management failed to determine which of the missing information from the EIS was important to know in order to determine whether, when, where and under what conditions to issue oil and gas leases before conducting the Chukchi 193 lease sale in 2008. Oil and gas activities could have significant impacts on marine life (such as bowhead whales, walrus, ice seals and fish), yet this is not fully considered in the DEIS. The DEIS should be revised to incorporate the recently completed U.S. Geological Survey science review on the Arctic Ocean to help address missing information that would have informed which areas should have been included in the 2008 lease sale. A modified alternative should be selected that protects marine species and subsistence communities.

Fully informed decisions regarding the Arctic Outer Continental Shelf require balancing potential resource extraction and development with maintaining the ecological integrity of the ocean.

Until and unless the DOI requires oil companies to adequately address the requirements of NEPA in a responsible manner, the American public will continue to bear the costs and burden of petroleum exploration. The American public has subsidized the risks of oil exploration and extraction long enough. It's time for the oil companies to internalize their external costs of doing business. Tell the Republicans and yellow dog Democrats that's the way the free market capitalist system actually works...in a DEMOCRACY!!!!

Sincerely,
Mr. Randall Abrams

Subject: Don't Risk a Spill in U.S. Arctic Waters

Dear Secretary Salazar,

As the granddaughter of an Appalachian coal miner and the wife of a former Shell Oil employee, I tell you that coal and oil are resources whose time has come and GONE. They are filthy, dangerous, and hazardous to human health at EVERY stage of development and use; they destroy the environment and leave nothing but grief and destruction in their wake. It is long past time we STOPPED burning any kind of filthy and dangerous fossil-based fuels and grew up to a healthy and SANE relationship to and with the environment upon which ALL OUR LIVES DEPEND. Had we listened to President Carter decades ago, we could be living RIGHT NOW in a cleaner world, and thousands of lives lost-to accidents, disease, oil-based wars, oil-funded terrorism, poor air quality aggravating asthma and lung disease, and on and on--would still be with us, to the delight of their families and to potentially great benefit to the world. Perhaps you could not do anything about the loss of THOSE lives; but unless you take every possible action in your power to encourage--indeed, to INSIST that our culture develop TRULY clean and TRULY sustainable sources of energy, then you will be to blame for future deaths.

The only thing necessary for evil to prevail is for good people to do nothing. Please, do what is right--even if it is difficult. Indeed, ESPECIALLY if it is difficult. Do your duty; see to it that the world is left a BETTER place for your having served in the privileged position which you now hold.

You are considering important decisions regarding the future of offshore drilling that will set a precedent for oil and gas exploration in U.S. Arctic waters. I do not want the administration going forward without critical information on the ecosystem and on industry's spill response capability. Before approving drilling in the U.S. Arctic, the administration should implement a comprehensive, science-based plan that includes local indigenous knowledge and protects ecologically important habitats in the U.S. Arctic Ocean. And before allowing exploration to begin, you should ensure there is the spill response capacity proven to clean up oil in icy arctic conditions.

Improve Exploration and Oil Spill Response Plans

The Arctic is a challenging environment where operators may encounter

Representative Form Letters of 9,719 submitted by PEW

harsh conditions year-round, such as dense fog, high winds, and freezing temperatures even in the summer months; in the late fall and winter months, sea ice and darkness pose additional challenges. These conditions increase the risks of a potential spill and would likely hamper oil spill response. Given the lack of infrastructure to support a significant spill response, the remote location of the lease sites and the challenging weather, potential Arctic operators must be equipped to contain and clean up an oil spill with the resources they bring.

Current exploration and oil spill response plans submitted for the Beaufort and Chukchi Seas are larger in scope, with planned simultaneous drilling and increased worst-case oil discharge estimates. COMMENT

I am a citizen of the U.S. concerned about the hampering of the US Oil and Gas industry by over-regulation by our federal agencies.

The TAPS pipeline is 2/3 empty and declining. The U.S. has resources and shouldn't be importing billions of dollars worth of oil while exporting tens of thousands of American jobs to foreign jurisdictions.

Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future investment.

Lease Sale 193 must be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.

Sincerely,

Diane Provost

Mr. James Kendall, Regional Director

June 20, 2011

Dear Mr. Kendall;

I certainly hope that you support offshore drilling for Alaska!

As a WW11 veteran that spent several years at Ladd Air Force Base at Fairbanks I came to appreciate the beauty and vastness of the State. I don't think that offshore drilling per Lease Sale 193 Chukchi Sea will adversely affect Alaska's charm.

Since gas prices, mostly based on foreign sources, surged past \$4 per gallon recently the USA should develop its own resources to avoid international difficulties that might drive gas costs even higher.

Additional benefits that can be attributed to Alaska's off shore oil drilling include: creating a multiplicity of jobs, primarily, in Alaska; adding billions of tax revenue dollars to both state & nation; and most importantly muting the wild gas price rises created by disruptions to foreign sources.

To conclude I hope this has helped you to recognize the impact that your vote will have on energy security and job opportunities for your state and the nation. Please support offshore drilling for Alaska.

Sincerely,

Gordon T. Ray

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall:

I am writing to express my support for Lease Sale 193. I believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, I urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

As you well know the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. We must stop relying on oil from countries like Saudi Arabia, Libya and Venezuela.

In conclusion, I believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources without further delay and obfuscation. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Ernest R. Reese

As a concerned member of the public and a supporter of Defenders of Wildlife, I'm writing to urge you to protect polar bears and other Arctic wildlife by ensuring that no drilling takes place in Arctic waters before a plan is in place to gather essential information and there is proven technology to clean up a spill in the Arctic's unique conditions. The original environmental analysis for Chukchi Lease Sale 193 was rejected by a federal court because of its failure to fill critical data gaps, yet the revised draft Supplemental Environmental Impact Statement still does not remedy these errors. As the agency well knows, Shell Oil is pursuing an aggressive drilling plan in the Beaufort as well as the Chukchi making the environmental analysis for the rugged and pristine Chukchi sea all the more important. Furthermore, the government has admitted that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that there is more to the oil industry's response plans than just glorified mops and buckets. The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response. The agency must take these concerns seriously and address them in its final Environmental Impact Statement. The Arctic's rich marine environment is one of the least understood areas in the world. There is a lack of basic science from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. The Department of Interior must not move forward with decisions about drilling before it has critical missing information. The revised draft Supplemental Environmental Impact Statement for Chukchi Lease Sale 193 shows that very large oil spills could occur from drilling in the Chukchi Sea. If such a spill does occur, it could have catastrophic effects on the region's species, such as the iconic polar bear as well as birds and whales. An oil accident like the one Exxon created last week in the Yellowstone River or last year's BP Deepwater Horizon tragedy would be truly disastrous here. Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters, until important information is gathered and a plan is in place to clean up an oil spill in the Arctic's extreme conditions. There is too much at stake. Thank you.

As a concerned member of the public and a supporter of Defenders of Wildlife, I oppose the proposal to allow Shell Oil to drill ten wells in the coastal waters of the Arctic over the next two years. The national commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response. Yet Shell Oil is barreling ahead with plans to begin new operations in the Arctic as soon as next summer. The Bureau of Ocean Energy Management, Regulation and Enforcement is currently considering an aggressive drilling plan that would allow Shell to drill ten wells in the coastal waters of the Arctic over the next two years. But these waters provide vital habitat for threatened polar bears, endangered bowhead whales, imperiled walrus and other sensitive wildlife. An oil accident -- like the one ExxonMobil

file:///C:/Documents and Settings/BENEDETD/Local Settings/Temp/wz928d/Document Li... 7/27/2011

Representative Form Letters from Defenders of Wildlife 48,000 comment letters

created recently -- in the Yellowstone River or last year's BP Deepwater Horizon tragedy would be truly disastrous here. The Arctic's rich marine environment is one of the least understood areas in the world. There is a lack of basic science -- from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. As of now, there is no effective way to de-oil a polar bear should tragedy strike as it too often does. And Shell has yet to demonstrate the ability to implement a clean-up in such remote and icy waters. For all of these reasons, I strongly urge you to reject Shell's drilling plans for this special area. Thank you.

Sunday

As a concerned member of the public, I oppose the proposal to allow Shell Oil to drill ten wells in the coastal waters of the Arctic over the next two years. The national commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response. Yet Shell Oil is barreling ahead with plans to begin new operations in the Arctic as soon as next summer. The Bureau of Ocean Energy Management, Regulation and Enforcement is currently considering an aggressive drilling plan that would allow Shell to drill ten wells in the coastal waters of the Arctic over the next two years. But these waters provide vital habitat for threatened polar bears, endangered bowhead whales, imperiled walrus and other sensitive wildlife. An oil accident -- like the one ExxonMobil created recently -- in the Yellowstone River or last year's BP Deepwater Horizon tragedy would be truly disastrous here. The Arctic's rich marine environment is one of the least understood areas in the world. There is a lack of basic science -- from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. As of now, there is no effective way to de-oil a polar bear should tragedy strike as it too often does. And Shell has yet to demonstrate the ability to implement a clean-up in such remote and icy waters. For all of these reasons, I strongly urge you to reject Shell's drilling plans for this special area. Thank you.

I AM ANGRY THAT SUCH DRILLING IN THE ARCTIC IS EVEN BEING CONSIDERED given the proven irresponsibility of the oil companies and their related contractors to develop the technology for an immediate containment and clean up in case of a spill. As a concerned member of the public and a supporter of Defenders of Wildlife, I'm writing to urge you to protect polar bears and other Arctic wildlife by ensuring that NO DRILLING takes place in Arctic waters before a plan is in place to gather essential information and there is MANDATORY AND PROVEN technology to clean up a spill in the Arctic's unique conditions. The original environmental analysis for Chukchi Lease Sale 193 was rejected by a federal court because of its failure to fill critical data gaps, yet the revised draft Supplemental Environmental Impact Statement still does not remedy these errors. As the agency well knows, Shell Oil is pursuing an aggressive drilling plan in the Beaufort as well as the Chukchi making the environmental analysis for the rugged and pristine Chukchi sea all the more important. Furthermore, the government has admitted that no technology exists to clean up a spill in the Arctic's volatile sea ice environment. As you consider all proposed activities in the Chukchi and Beaufort Seas, I urge you to ensure that there is more to the oil industry's response plans than just glorified mops and buckets. The Presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response. The agency MUST TAKE these concerns SERIOUSLY and address them in its final Environmental Impact Statement. The Arctic's rich marine environment is one of the least understood areas in the world. There is a lack of basic science from simple species counts of marine mammals such as the threatened polar bear and the endangered bowhead whale to information about currents and tidal systems. The Department of Interior MUST NOT move forward with

Representative Form Letters from Defenders of Wildlife 48,000 comment letters

decisions about drilling before it has critical missing information. The revised draft Supplemental Environmental Impact Statement for Chukchi Lease Sale 193 shows that very LARGE OIL SPILLS COULD OCCUR from drilling in the Chukchi Sea. If such a spill does occur, it could have catastrophic effects on the region's species, such as the iconic polar bear as well as birds and whales. An oil accident like the one Exxon created last week in the Yellowstone River or last year's BP Deepwater Horizon tragedy would be truly disastrous here. PLEASE DO NOT ALLOW the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters, UNTIL IMPORTANT INFORMATION IS GATHERED AND A VALID PLAN IS IN PLACE TO CLEAN UP AN OIL SPILL in the Arctic's extreme conditions. There is too much at stake. Thank you.

As Exxon demonstrated just this past week, the oil companies have not yet learned how to protect the environment. Either that, or the bottom line is important enough to justify only half way investing in protecting the environment. They talk the talk, but you have to admit, they damage the environment often, and in BIG ways. As a concerned member of the public and a supporter of Defenders of Wildlife, I'm writing to urge you to protect polar bears and other Arctic wildlife by ensuring that no drilling takes place in Arctic waters before a plan is in place to gather essential information and there is proven technology to clean up a spill in the

Have you ever seen a heroin addict looking for his next hit? It's not a pretty sight. He'll act out violently, threatening his wife and kids. He'll steal, he'll attack. He'll do whatever he thinks he needs to do to get drugs. Drugs that will ruin his body; that are ruining his life. He'll do anything, even though the next syringe-full might kill him. That's what I think of when I hear about plans to drill for oil in the Arctic. Global warming is what makes this drilling feasible -- the carbon we've dumped into the air from our prior use of oil, coal, and natural gas has warmed the Arctic, melting the summer ice and all but eliminating the thick perennial winter ice. We know this has happened. We're already suffering consequences: more severe weather events, drought in the south and midwest, loss of trees in the Rockies and Sierra Nevadas from beetle damage. The oceans are becoming more acidic. It takes half a century for the sea to reach equilibrium with carbon concentrations in the atmosphere. We can measure the change in acidity, yet what we see represents equilibrium with atmospheric carbon from 1961. Krill populations are declining and coral reefs are bleaching now. What will be the damage in 50 years? And yet we can't seem to restrain ourselves from looking for our next hit. Shell is seeking permits to drill ten wells in shallow Arctic water -- wells that are possible because of global warming; wells that will provide us with more oil to burn, more carbon to emit. Yet the House wants to hamstring the EPA, and won't even consider meaningful caps on carbon emissions. How can we stop this insanity? I strongly urge you to make a start now. Reject Shell's drilling plans for the Arctic. Start to send Big Fossils a new message: We can quit. We won't keep buying their harmful product. We are ready to help ourselves; to put ourselves on a healthier path. Thank you.

RE: Comments on Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Mr. Kendall,

I am writing to express my support for Lease Sale 193 as well as my appreciation for the thorough review the Bureau of Ocean Energy Management, Enforcement and Regulation (BOEMRE) has undertaken. I believe this latest Revised Draft Supplemental Environmental Impact Statement (SEIS) thoughtfully addresses the concerns raised about the potential for a very large oil spill and rightfully concludes the risk is minimal. Now that Lease Sale 193 has been fully reviewed, I urge the BOEMRE to finalize the SEIS and allow the development of these vital resources to proceed.

Currently, the United States imports roughly half of the crude oil that it consumes. And that has been amid a recession that has tempered demand significantly. Still, according to the Energy Information Administration, the United States will consume over 19 million barrels per day of crude oil and liquid fuels in 2011, up 140,000 barrels per day from the year before. Further, U.S. demand is projected to increase by an additional 170,000 barrels per day in 2012, while global demand is forecast to increase by 1.4 million barrels per day and 1.6 million barrels per day in 2011 and 2012, respectively. At the same time, U.S. oil production has dropped slightly in 2011 while OPEC projection is slated to increase significantly in comparison to non-OPEC production. Clearly, the United States is overly reliant on foreign imports of a commodity that is critical to our nation's economic health.

The Administration's "Energy Policy," or at least what appears to be a policy, is to cripple energy production of all types at home and make more arrangements for imports. The President sees to be laboring under the false assumption that if we help develop their exploration capabilities, they will remain our suppliers. This is very dangerous ground to tread. And while most people agree "Green Energy" is a possibility, it still remains in the future. It makes no sense to cut off nearly all energy production in this country while we wait for someone else to develop an alternative. America should be leading the way on research and development while slowly decreasing our dependence on traditional energy resources. I fear the path the administration is currently on is madness and will lead to an economic catastrophe.

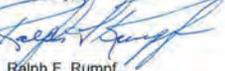

With these facts in hand, it is imperative that BOEMRE allow America to develop its abundant energy resources, especially those in Alaska's Outer Continental Shelf. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. Relying on oil from countries like Saudi Arabia, Libya and

Page 1 of 1

Venezuela not only places the United States at risk for disruptions in supply and price spikes; it also supports repressive and anti-American regimes.

In conclusion, I believe the BOEMRE must move efficiently to finalize this process and allow the development of our domestic resources. At a time when global energy security is increasingly affected by supply disruptions and political unrest, the United States must do all that is possible to bolster its energy security.

Sincerely,

Ralph F. Rumpf

General Comment

Dear protectors of the public trust,

The idea of allowing oil extraction in the location of Oil Lease Sale 193 is ludicrous. What does it take for us to learn? The most fundamental natural resource of all, upon which we DEPEND as a species, is our oceans. They (key life-forms there) are already shown to be at increasing risk due to climate change, over-fishing, and factors still not identified (pollution a likely culprit).

Existing technology, and technology in the foreseeable future, is simply inadequate to even BEGIN to make a claim that this sale is anything less than a recipe for disaster.

To allow this sale would be irresponsible in the worst sense of the word. Do YOU want to be the ones we point back to when the question is asked: WHO approved this? PLEASE take Oil Lease Sale 193 OFF the auction block.

Thank you for your consideration and responsible public service in this matter.

Sincerely,

Mark Sabol, PhD

General Comment

I have reviewed the SEIS regarding Lease Sale 193 and find that it sufficiently and substantially addresses all potential impacts of activities that would commence upon the approval of these leases.

The exploration and potential production of oil and gas from these areas are critical to the future of Alaska and these activities should no longer be held hostage to a never-ending "what-if" analysis.

This lease sale should be affirmed as it was originally in 2008.

Thank you,

Michael Satre
Juneau, Alaska

General Comment

I have had the incredible fortune to travel through much of the Arctic this summer for work, observing it from both the ground and the air as I map the Alyeska Pipeline. It is an incredibly harsh, breath-taking landscape. There are people who live here, throughout the North Slope and on the coast of the Chukchi Sea, surviving subsistently off of the sea ice while highly valuing their way of life.

Daniel, a native Inupiat from Barrow, shared his perspective at the public hearing in Fairbanks and his story shook me to my core. Most of us do not know what it is like to come from a traditional culture, one that nurtures a relationship to the land and sea. His is a lifestyle that is hard, but balanced. To hear the passion with which he spoke about his home...it was powerful to witness that such cultures are still alive in the U.S.

The SEIS was written by folks in Washington D.C. who have never lived in the Arctic. Their plan for an oil spill clean-up relies heavily on air support, when there are no airstrips anywhere near close enough to be effective. The winds and weather are so violent at times that simply accessing an oil boom in the Chukchi Sea would be impossible, let alone cleaning up a spill. Not to mention that it is completely dark for months on end- the sun simply does not rise. We are fooling ourselves if we think we would be able to clean up an oil spill in the middle of the Chukchi Sea-

Katherine Schake Comment

we simply don't have the skill to do this. One thing I've learned working in a technological field: no matter how great our technology is, it will still break down. We cannot assure that an oil spill would not occur, let alone foresee all consequences that an oil drilling operation in the midst of sea ice may have for the natives who depend on this ecosystem for their existence. Please do not drill for oil in the Chukchi Sea.

Please do not drill in the Chukchi Sea as we don't have the technology to immediately stop and clean up a spill should one occur. Please learn from what happened in the Gulf. Protecting the delicate balance of nature and the lives of the people who live in the region is far more important than feeding our oil dependent lifestyles. We can shed our cars and rely on public transportation. That is the right and responsible thing to do.

Thank you.

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.

Douglas Smith Comment

- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water.

General Comment

I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy – not less. The United States continues to import oil from unstable and adversarial countries despite the vast

file:///C:/Documents and Settings/BENEDETD/Local Settings/Temp/wz0677/Document Li... 7/26/2011

Lori Stepansky Comment

North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, we strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

 3801 Centerpoint Drive, Suite 500
 Anchorage, Alaska 99503-5820

Sir or Ma'am,

I believe that OCS Lease Sale 193 should be affirmed as held in 2008. Sufficient information and analysis, as provided by the SEIS, is available to support Sale 193.

file:///C:/Documents and Settings/BENEDETD/Local Settings/Temp/wzb460/Document Li... 7/27/2011

It is of paramount importance for Alaska's economy, National economy, and National Defense that Sale 193 be affirmed.

The Chukchi Sea will likely be a major supplier of energy for the United States in the future and ease our importation of oil from undesirable foreign sources.

Thank you.

Bill Stevens

Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193. Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species. The North Slope and the offshore are the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas. The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow. An estimated annual average of 54,700 new jobs would be created and sustained over 50 years by OCS-related development in Alaska. As estimated \$63 billion in payroll would be paid to employees in Alaska as a result of OCS development.

General Comment

The full ramifications of exploration and development in the Chukchi Sea still needs further study.

As the permanent northern polar ice cap continues to shrink, it is inevitable that new shipping lanes through and across the Arctic Ocean will evolve. This can only further complicate the migratory and feeding patterns of marine and sea bird life across the whole area.

Climate changes are likely to continue; this will further affect the weather and sea ice flow patterns. Can there be ANY proper planning and preparation for disasters when these factors have yet to develop and be studied?

It is already known that the climate and weather in the area can be extreme. During the war in the early 1940s, it is on record that the military --on both sides-- LOST MORE equipment from WEATHER EVENTS than enemy action! How much more severe weather would anyone expect north of the Bering Strait?

Oil and gas reserves are already known to exist, and are yet to be developed, onshore on Alaska's North Slope and near coastal areas. It would be totally foolhardy to explore and develop resources on the fragile OCS prior to development in these immeasurably safer areas.

Interior Secretary Ken Salazar

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Interior Secretary Ken Salazar,

The Arctic Ocean is home to hundreds of thousands of marine animals, including seals, walrus, whales and polar bears, and is depended upon by Native villagers for food.

Please do not allow drilling in ecologically-critical Arctic waters before basic essential information is gathered and there are proven technologies to clean up spills in the Arctic's icy waters. The Presidential Commission on the BP Deepwater Horizon tragedy specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Additionally, the recent US Geological Survey analysis of the ocean's science needs concluded that further research should take place before drilling in the Arctic Ocean, including establishing a baseline scientific understanding. With this in mind, it is clear that exploratory drilling resulting from Lease Sale 193 in the Chukchi Sea should be postponed until there is a better understanding of the Arctic Ocean.

The Arctic Ocean is too special a place to risk with incomplete data on the ocean's marine resources and poor spill response plans. The oil in the Arctic Ocean isn't going anywhere, and can wait for proper research and preparedness.

A Deepwater Horizon-scale oil spill which the Bureau of Ocean Energy Management, Regulation and Enforcement acknowledges hypothetically possible - would be catastrophic for the Arctic Ocean and the wildlife and people that depend on it. Now is the time to take proper precautions and ensure that drilling is done only after we have confidence that spill risks are minimized. How can you even consider drilling in the Arctic after knowing all the risks and irreversible damage? We need to reduce the use of fossil fuel. A decision to drill in the Arctic is just a donation to the coffers of the greedy oil industry.

Sincerely,
 Ms. Anne Lazarus

Interior Secretary Ken Salazar

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Interior Secretary Ken Salazar,

I lived in Arctic Alaska for one year and know well the vulnerability of the land-tire tracks last more than a hundred years--and how much the native people and wildlife rely on a clean habitat.

After the destruction and pollution of the Gulf oil spill, we must not drill in such a vulnerable remote place until we are absolutely sure we can do it without harm.

The Arctic Ocean is home to hundreds of thousands of marine animals, including seals, walruses, whales and polar bears, and is depended upon by Native villagers for food.

Please do not allow drilling in ecologically-critical Arctic waters before basic essential information is gathered and there are proven technologies to clean up spills in the Arctic's icy waters. The Presidential Commission on the BP Deepwater Horizon tragedy specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Interior Secretary Ken Salazar

Subject: Comments on the Revised Draft SEIS, Lease Sale 193 Chukchi Sea

Dear Interior Secretary Ken Salazar,

We have no idea how to clean up an oil spill in the Arctic Ocean, and the more we drill up there, the more likely we are to have one. Our dependence on foreign oil should be addressed through conservation (like increased CAFE standards for cars and trucks), not extremely risky offshore drilling in the Arctic, with disastrous consequences when the inevitable spill occurs.

So please, do not allow drilling in ecologically-critical Arctic waters before basic essential information is gathered and there are proven technologies to clean up spills in the Arctic's icy waters. The Presidential Commission on the BP Deepwater Horizon tragedy specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Additionally, the recent US Geological Survey analysis of the ocean's science needs concluded that further research should take place before drilling in the Arctic Ocean, including establishing a baseline scientific understanding. General Comment

The isolation and extreme climate of the Chukchi Sea make it nearly impossible that an accident or spill could be effectively contained or cleaned up. Oil spills in active drilling areas are not a question of "if," but rather of "when?" Pack ice, darkness for months on end, extreme cold, and lack of access by plane or ship make clean up of an inevitable accident a technological challenge for which no one is prepared.

The revised SEIS shows a lack of understanding of this area and the unique environmental challenges of working there.

EIS: Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale

Dear EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale:

How can the Obama Administration even consider allowing new oil drilling anywhere near water? Considering BP's ability to clean up its mess from the Deepwater Horizon disaster, I don't think the oil industry has put enough/any of its profits into researching/developing new technology for clean ups after oil spills. If BP can't clean up its mess in the Gulf, where it is nice and warm, how is Shell going to clean up its mess in the Arctic?

I just heard on the news that Exxon makes 5 million dollars profit per hour, 24 hours a day, 365 days per year. PROFIT. Yet they cannot clean up their disgusting leak into the Yellowstone River, ongoing currently. Let us not forget that other little oil spill Exxon produced, the Valdez... still not truly cleaned up.

Why? Because it doesn't matter how much money you have, oil spills do not respond adequately to money being thrown at them. They are stubbornly resistant to the persuasions of money. That's why there is no miracle technology; that's why the oil industry doesn't waste its time developing said technology, because it will never exist.

Just forget about filthy, dirty, 20th century fossil fuel and let's put our money, energy, research, new technology into clean energy sources. Oil companies should be required to put 25% of their profits into clean energy, so they can become the energy companies of tomorrow, but of a kinder, gentler sort.

COME ON, GET REAL!!!

Sincerely,

Genie L. Tillisch

Genie Tillisch

Please - no new permit for oil drilling until the gas company has proven it can clean up 100% of all leaks. jt

General Comment

I am writing in support of the revised draft Supplemental Environmental Impact Statement (SEIS) for the 2008 Chukchi Sea lease sale. This new SEIS—three years in the making—answers not only the technical issues cited by Judge Ralph Beistline in his July 2010 ruling, but also the potential impacts of a theoretical “worst case” oil spill.

As it now stands, the SEIS provides a clear path forward to responsible development in Alaska’s Outer Continental Shelf (OCS). This path is a long-time coming. Oil and gas exploration in the Alaska OCS dates back to the early 1980s. The company I work for, in fact, provided numerous surveying and geotechnical projects to aid in these activities. Industry drilled more than 30 exploratory wells during this time, including five wells in the Chukchi; all without incident.

This prior experience underscores a couple of important points. First, the Alaska OCS isn’t “uncharted territory” as some would argue. Rather, industry has a proven record of success working in these waters, even without the advanced surveying and drilling technology available

file:///C:/Documents and Settings/BENEDETD/Local Settings/Temp/wz5e08/Document Li... 7/27/2011

Scott Widness Comment

today. Second, while the region poses unique challenges, it is not inherently more dangerous or difficult than other offshore locations. The risks are simply different.

In developing the revised SEIS, government has identified the unique challenges of offshore exploration in the Chukchi and has formed rigorous stipulations that will ensure the safety of the ocean environment and coastal communities. Let us adopt these regulations and lead other Arctic nations in responsible development. Doing so could help refill the Trans Alaska Pipeline System, create nearly 55,000 new jobs over the next 50 years and provide billions of dollars for the federal treasury.

Thank you for considering my comments.

EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale

The future of America's Arctic Ocean may be decided as soon as this summer. I'm writing to ask that no decisions about drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region. Furthermore, decisions should be withheld until proven, accessible technology exists to clean up a spill in the Arctic's unique conditions. The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Consider that the Arctic's rich marine environment is one of the least understood in the world. There is a lack of basic science--from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has gathered critical missing information--including the potential impact of an oil spill on the life in the Arctic Ocean ecosystem.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish. DOI must fill such data gaps before making any leasing decisions.

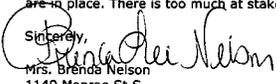

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we must protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that such a spill could have catastrophic effects on the region's species, such as the iconic polar bear, birds, and whales.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place. There is too much at stake.

Sincerely,

 Mrs. Brenda Nelson

 Shakopee, MN 55379-2066

We should not be rolling the dice in this area. The price could be way too high if we are unprepared. Do the right thing.

Comments on the Revised Draft SEIS - Lease Sale 193 Chukchi Sea
 c/o Regional Director James Kendall
 BOEMRE - Alaska OCS
 3801 Centerpoint Drive Ste. 500
 Anchorage AK 99503-5820

Re: Revised Draft Supplemental Impact Statement for Lease Sale 193

Dear Mr. Kendall:

On behalf of myself, Katherine A. Wilken, I would like to express my strong support of oil and gas development in the Chukchi Sea and other areas of Alaska's Outer Continental Shelf (OCS) and to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to finalize the environmental review process and move forward with Lease Sale 193. I appreciate the opportunity to submit a public comment on the revised Draft Supplemental Impact Statement, released by BOEMRE on May 20th. Lease Sale 193 has undergone exhaustive environmental review, and the potential environmental impacts have undergone a very lengthy and thorough analysis. Oil and gas development in the Chukchi Sea can and should be done safely, and it is past time for the government to proceed with Lease Sale 193 so that Americans can fully realize the energy and economic benefits increased domestic energy production can bring.

Offshore oil and gas development in Alaska will strengthen our energy security, create jobs in Alaska and across the country, and generate significant government revenue. With a conservatively estimated 27 billion barrels of oil and 132 trillion cubic feet of natural gas, energy production on Alaska's OCS is critical to our country's long-term energy supply. It is estimated that economic activity from the development of the Chukchi and Beaufort Seas would create an annual average of 54,700 jobs nationwide. Government revenue generated from the Chukchi Sea is estimated to be nearly \$50 billion over the next fifty years. The benefits of energy production on Alaska's OCS cannot be overstated; development of our domestic energy resources is an asset to the entire economy.

In order to achieve greater price stability for consumers, America needs more energy -- not less. The United States continues to import oil from unstable and adversarial countries despite the vast North American resources available. We are forced to rely on oil imports, which put the United States at greater risk for disruptions in supply and price spikes. Volatile energy prices hinder economic growth and make it extremely difficult to do business. But expanding our domestic production will increase our energy supply and help meet growing demand. For that reason, we strongly support moving forward with Lease Sale 193.

Upon conclusion of this public comment period, I respectfully request that the lease-holders be allowed to move forward with planned exploration and production. I appreciate BOEMRE's attention to this important matter and look forward to safe and responsible energy production in the Chukchi Sea.

Sincerely,

 Katherine A. Wilken

EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale

Dear EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale,

The future of America's Arctic Ocean may be decided as soon as this summer. I'm writing to ask that no decisions about drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region. Furthermore, decisions should be withheld until proven, accessible technology exists to clean up a spill in the Arctic's unique conditions. The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Consider that the Arctic's rich marine environment is one of the least understood in the world. There is a lack of basic science--from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has gathered critical missing information--including the potential impact of an oil spill on the life in the Arctic Ocean ecosystem.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish. DOI must fill such data gaps before making any leasing decisions.

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we must protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the iconic polar bear, birds, and whales.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place. There is too much at stake.

Sincerely,

Ms. Becky Kocis

Please do not approve drilling in the Arctic. We need to protect one of our nation's greatest natural resources from a potential and devastating oil spill. This is a cost-prone place that wildlife and Alaska natives call home.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place. There is too much at stake.

Sincerely,

Mrs. Carol Scott

P.S. Please do not drill here until a specific plan is written for cleaning up an oil spill. We do not want another BP oil spill. An oil spill in that magnitude would destroy a pristine area in the Arctic and probably never recover. This area is priceless!

The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Consider that the Arctic's rich marine environment is one of the least understood in the world. There is a lack of basic science—from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has gathered critical missing information—including the potential impact of an oil spill on the life in the Arctic Ocean ecosystem.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish. DOI must fill such data gaps before making any leasing decisions.

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we must protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the iconic polar bear, birds, and whales.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place. There is too much at stake.

Sincerely,

Ms. Jean Adams

EIS: ALASKA OUTER CONTINENTAL SHELF REGION, CHUKCHI SEA PLANNING AREA, OIL AND GAS LEASE SALE

Dear EIS, Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale,

The future of America's Arctic Ocean may be decided as soon as this summer. I'm writing to ask that no decisions about drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region.

Consider that the Arctic's rich marine environment is one of the least understood in the world. There is a lack of basic science--from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish.

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place.

Sincerely,

Ms. Monica Duclaud

I know I speak for millions of Americans who are writing to send you letters in saying to please protect one of the last beautiful, pristine, important environmental ecosystems in the world, both for ourselves + future generations. There are hardly any beautiful, amazing animals left in their natural habitats on planet Earth. At what point will we stop destroying them if not for whales + polar bears in the Arctic? Thank you.

There is a lack of basic science--from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has gathered critical missing information--including the potential impact of an oil spill on the life in the Arctic Ocean ecosystem.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish. DOI must fill such data gaps before making any leasing decisions.

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we must protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the iconic polar bear, birds, and whales.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

Please do not allow the oil industry to move forward with aggressive, risky plans to drill in these one-of-a-kind waters until the necessary information is gathered and feasible spill cleanup plans are in place. There is too much at stake.

Sincerely,
Betsy A. Leonard

Jul 7, 2011

EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale

The future of America's Arctic Ocean may be decided as soon as this summer. I'm writing to ask that no decisions about drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region. Furthermore, decisions should be withheld until proven, accessible technology exists to clean up a spill in the Arctic's unique conditions. The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Consider that the Arctic's rich marine environment is one of the least understood in the world. There is a lack of basic science--from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has gathered critical missing information--including the potential impact of an oil spill on the life in the Arctic Ocean ecosystem.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish. DOI must fill such data gaps before making any leasing decisions.

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we must protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the iconic polar bear, birds, and whales.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

EIS; Alaska Outer Continental Shelf Region, Chukchi Sea Planning Area, Oil and Gas Lease Sale

The future of America's Arctic Ocean may be decided as soon as this summer. I'm writing to ask that no decisions about drilling in Arctic waters be made before a plan is in place to gather basic and essential information about the potential environmental impact of an oil spill in this region. Furthermore, decisions should be withheld until proven, accessible technology exists to clean up a spill in the Arctic's unique conditions. The presidential commission on the BP Deepwater Horizon disaster specifically concluded that there are "serious concerns" and "special considerations" regarding Arctic drilling and oil spill response.

Consider that the Arctic's rich marine environment is one of the least understood in the world. There is a lack of basic science--from simple species counts of marine mammals (for example, threatened polar bears and endangered bowhead whales) to information about currents and tidal systems. The Department of Interior (DOI) must not move forward with decisions about drilling before it has gathered critical missing information--including the potential impact of an oil spill on the life in the Arctic Ocean ecosystem.

Consider that the National Marine Fisheries Service has told the Bureau of Ocean Energy Management Regulation and Enforcement (BOEMRE) that it should obtain more information about the effects of oil and gas activities, especially seismic testing, on fish. DOI must fill such data gaps before making any leasing decisions.

Consider that the Inupiat people have lived off the bounty of the Arctic Ocean for thousands of years, traditionally spending weeks at a time on the water, hunting to feed their families and their communities. The Arctic Ocean is their chief food source, and we must protect it for future generations.

Consider that as part of the revised draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Lease Sale 193, BOEMRE conducted an analysis which shows that very large oil spills could occur from drilling in the Chukchi Sea. This analysis shows that such a spill could have catastrophic effects on the region's species, such as the iconic polar bear, birds, and whales.

And finally, consider that even BOEMRE's predecessor agency, the Minerals Management Service, previously stated that no technology exists to clean up a spill in the Arctic's volatile sea-ice environment.

It is beyond my comprehension...after the oil spill in the Gulf of Mexico, the break in the oil pipeline in Montana...it is obvious that man is unable to contain and maintain oil in a more habitable environment, much less in such a harsh environment as the arctic.

What is it that these people do not understand? Do they not have enough money? Is their goal in life to pollute and destroy as much of this precious earth as possible in their lifetime?

Where do we "draw the line"? It is my opinion that plain ole common sense demands that we step back and review the situation. It is, without a doubt, that there will be tragic oil polluting event. This earth and its waters do not need more damage. Man has done enough already.

Before BOEMRE considers any drilling in the Arctic Ocean, including Shell's plans in the Chukchi for 2012 and 2013, more environmental analysis must be completed. This missing information is an essential component of a much-needed plan to conserve and manage America's Arctic Ocean. And I urge you to ensure that the oil industry's response plans are sufficient to meet the challenges of a spill in the Arctic.

PROCEEDINGS

THE REPORTER: On the record, 7:06 p.m.
(On the record at 7:06 p.m.)

JEFFERY LOMAN: Good evening and welcome -- thank you very much for taking your time to attend our meeting. Again my name is Jeffery Loman J-E-F-F-E-R-Y L-O-M-A-N -- I am the Deputy Regional Director of the Bureau of Ocean Energy Management Regulation and Enforcement, Alaska Region. We'd like to start this meeting with introductions. But first, Dorcas if you would be so kind to say a blessing for us -- we would appreciate that.

DORCAS ROCK: Stand up please. (Blessing given in Native language.) Amen -- thank you.

MR. LOMAN: Thank you very much Dorcas. To make it easier for the court reporter who is memorializing this hearing, I'd like to go around the room, starting with Earl, and have you introduce yourself and spell your name. Hopefully, then we'll only do it once as we exchange information and communicate.

EARL KINGIK: Earl Kingik, Native -- I'm a member of the Native village of Point Hope. I work out there -- Environmental Liaison for Alaska Wilderness League. And I started working with Alaska Wilderness League a few months back. Now I'm the Native Liaison for Alaska Wilderness League, in which we take tribal members to Washington D.C. -- anywhere they have any kind of meeting like that -- thank you.

MR. LOMAN: Earl, could you spell your last name please?

MR. KINGIK: K-I-N-G-I-K.

DORCAS ROCK: Dorcas Rock -- I'm working for (indiscernible) as a Subistent Advisor. And I have to go to the meetings whether I like it or not. But it was good to see you again. Thank you.

MORRIS OVIOK: My name is Morris.

MR. LOMAN: R-O-C-K, right?

MS. ROCK: Uh-huh (affirmative)

MR. LOMAN: Last name is R-O-C-K.

MR. OVIOK: My name is Morris B. Oviok O-V-I-O-K. I'm born and raised here at Point Hope. I don't associate myself with -- I'm a past member of Tribal Council before.

COURT REPORTER: Okay. Could you spell your last name for me again?

MR. OVIOK: O-V-I-O-K.

COURT REPORTER: I'm sorry.

MR. OVIOK: O-V-I-O-K.

GEORGE KINGIK: I'm George Kingik, a member of the Native Village of Point Hope, also with the City of Point Hope. I'm also with the History and Culture -- with the History -- Language and Culture with the North Slope Borough. I'm a Commissioner. And I have known Jeff too and his bosses. The reason why I'm here -- back in the time when you guys celebrated and it was a disgrace to me and my community when you had that

1 big cake. So you're going to be hearing some few things from me
2 as a member of the tribe and also a community member.
3 COURT REPORTER: Could George spell his last name please?
4 MR. GEROGE KINGIK: My last name is K-I-N-G-I-K.
5 COURT REPORTER: Thank you.
6 KAREN WEBER: Karen Weber, one b.
7 COURT REPORTER: K-A-R-E-N?
8 MS. WEBER: Uh-huh (affirmative).
9 COURT REORTER: W-E-B-E-R?
10 MS. WEBER: Uh-huh (affirmative).
11 COURT REPORTER: Thank you.
12 RICKY NASHOOKPUK: My name is Ricky Nashookpuk.
13 COURT REPORTER: Spell your last name.
14 MR. LOMAN: Spell it please.
15 MR. NASHOOKPUK: N-A-S-H-O-O-K-P-U-K.
16 COURT REPORTER: N-A-S-H?
17 MR. NASHOOKPUK: O-O-K-P-U-K.
18 CCOURT REPORTER: Thank you.
19 MR. LOMAN: Yes.
20 KEN PAUL: Ken Paul -- P-A-U-L.
21 COURT REPORTER: What was your first name?
22 MR. PAUL: Ken, K-E-N.
23 COURT REPORTER: Thank you.
24 AGGIE L. FRANKSON-HENRY: I'm Aggie L. Frankson-Henry
25 tribal member.

KRON ASSOCIATES

Anchorage, Alaska 99503
(907) 276-3554

1 RAYMOND ATTUNGANA: I'm Raymond Attungana.
2 COURT REPORTER: Could you spell your last name?
3 MR. ATTUNGANA: A-T-T-U-N-G-A-N-A.
4 COURT REPORTER: Thank you.
5 MR. LOMAN: Okay real quick we'll introduce ourselves
6 starting with John.
7 MR. CALLAHAN: My name's John Callahan -- I'm the Public
8 Affairs Officer with the Alaska Region and I'm fairly new with
9 the Agency and the (indiscernible).
10 JUDY BRADSHAW: I'm Judy Bradshaw -- I'm the court
11 reporter for tonight.
12 MIKE HALLER: Mike Haller -- I'm the new Community Liaison
13 with the Agency.
14 ROBERT PETERSON: I'm Robert Peterson -- I'm a Geologist
15 with the Agency.
16 MIKE ROUTHIER: I'm Mike Routhier -- I'm a NEPA
17 Coordinator with the Agency.
18 MARY CODY: Mary Cody -- I'm a Wildlife Biologist with the
19 Agency.
20 SHARON WARREN: Sharon Warren -- I'm a Program Analysis
21 Officer.
22 TIM HOLDER: Tim Holder -- I'm from the Washington D.C.
23 Office -- I'm the only one of our members here that's from that
24 office in Anchorage and Liaison from Headquarters to the
25 (indiscernible).

1 MR. LOMAN: Okay we'll try to go quickly. But if anybody
2 has any questions, just stop me and I'd be happy to answer them.
3 Two more members -- real quick folks if you could before you
4 sign in -- introduce yourself for the court reporter and spell
5 your last names.
6 RONALD OVIOK: I'm Ronald Oviok -- (indiscernible) Point
7 Hope Tribal Member.
8 COURT REPORTER: Could you spell your last name please?
9 MR. OVIOK: O-V-I-O-K.
10 COURT REPORTER: A-K?
11 NINA OVIOK: O-K.
12 COURT REPORTER: Thank you.
13 NINA OVIOK: Nina Oviok.
14 COURT REPORTER: Spell your last name.
15 MS. OVIOK: O-V-I-O-K.
16 COURT REPORTER: Thank you.
17 JACK SCHAEFER: Hi.
18 MR. LOMAN: Hi Jack, how are you?
19 MR. SCHAEFER: Winded.
20 MR. LOMAN: Jack could you, for the court reporter,
21 introduce yourself and spell your last name?
22 RACHAEL CANNON: I am Rachael Cannon. C-A-N-N-O-N --
23 Rachael Cannon.
24 MR. LOMAN: Thank you. And Jack Schaefer has just joined
25 us.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Okay. So our primary purpose tonight is to take your
2 comments on a draft Supplemental Environmental Impact Statement
3 that we've prepared. As I think almost everyone knows, the
4 Minerals Management Service, now the Bureau of Ocean Energy
5 Management Regulation and Enforcement -- did an Environmental
6 Impact Statement for a oil and gas Lease Sale -- Sale number 193
7 in the Chukchi Sea. Yes ma'am?
8 MS. FRANKSON-HENRY: Why did you change your name from
9 Minerals Management Service to BOEMRE?
10 MR. LOMAN: They changed the name because the Secretary of
11 the Interior wanted to reorganize the Agency.
12 MS. FRANKSON-HENRY: What was the purpose of it?
13 MR. LOMAN: He wants to restore public trust.
14 MS. FRANKSON-HENRY: And was it because of the corruption
15 with Minerals Management Service in the Lower 48?
16 MR. LOMAN: I think that was one of the reasons -- one of
17 many. Yes ma'am. So the Agency did an Environmental Impact
18 Statement for Lease Sale number 193 in the Chukchi Sea. And in
19 February of 2008 they held a Lease Sale in the Chukchi Sea and
20 issued 465 leases, for a total of about \$2.6 billion with Shell
21 Oil Company being the largest holder of leases -- \$2.1 billion
22 worth of leases in the Chukchi Sea.
23 The Agency was challenged in Federal Court and the
24 challenge involved the Agency's compliance with the National
25 Environmental Policy Act or NEPA. And the people that brought

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 that litigation asserted that the Agency didn't comply with
2 NEPA. And the court found that, with respect to a couple of
3 elements, the Agency did not fully comply with NEPA. And Sharon
4 is going to explain to you that court decision. Sharon.

5 MS. WARREN: Thank you. And thank you for allowing us to
6 come into your community.

7 The court found, on most parts, that we -- that the Agency
8 complied with NEPA. But there was three things that they said -
9 - the court said -- that we had to go back. And we had to do a
10 better job of what we did in the Environmental Impact Statement.
11 And so we failed to analyze the environmental impact of natural
12 gas. There was an incentive for natural gas to put into the
13 leases, but that portion had not been analyzed in the
14 Environmental Impact Statement. So the court says, you have to
15 go back and you have to analyze that.

16 Other things that we failed to do is, we failed to
17 determine whether the missing information that we said in the
18 EIS in a number of places that there was missing information or
19 uncertainty or lacking. The court said that we had to go back
20 and look at that and determine whether or not it was essential
21 to the decision. So we had to go back and look at that. And
22 then we also had to look at if -- if it was essential to the
23 decision, then we had to determine whether or not we could
24 obtain it and what would be the cost of getting the information.

25 So the court ruled July 21st of this year -- 2010 -- the

1 court still has jurisdiction of the case. That means the judge
2 still has the case. And so this Supplemental EIS that we did is
3 because of what the court told us to do. So it's narrow in
4 scope based on the court ruling. Once the EIS -- we're here at
5 public hearings taking comments. The comment period will close
6 the 29th of November. But how this will work is -- once the
7 final EIS is done, it will be filed with the court. And then
8 the parties that sued us -- the Native Village of Point Hope was
9 one of the litigants -- we'll look to see what we did and be
10 able to comment on it through the court -- through the briefs
11 and the court and then the judge will let us know and rule
12 whether or not we met the court remand on that. So that's where
13 we're at with that litigation.

14 So it's still in litigation. And the government has to
15 take a look at this before anything else can be done.

16 MR. LOMAN: Thank you Sharon. Any questions?

17 UNIDENTIFIED FEMALE: Can you explain to our elders of
18 what NEPA is?

19 MR. LOMAN: The National Environmental Policy Act?
20 National Environmental Policy Act is probably the premiere of
21 Federal environmental legislation that does -- it was signed
22 into law by President Nixon and it does a number of things. It
23 forces the Federal government to analyze the effects on the
24 human environment of a major Federal action. In this case, the
25 major Federal action was holding an oil and gas lease sale in

1 the Chukchi Sea -- in your garden -- in your backyard -- in a
2 place where you have subsisted since time memorial. I don't
3 think anyone in the Native Village of Point Hope or any
4 community member of Point Hope would disagree that it was a
5 major Federal action. So this law forces the Agency to analyze
6 the effects to the human environment from that action. And it
7 requires that we do so openly provide, for example, our draft
8 documents for your scrutiny and hold meetings like this and take
9 comments from you on those drafts.

10 And, in addition to that, when it's finalized it has to
11 inform the decision maker, which could be the Secretary of the
12 Interior who is -- sometimes delegates it to the Assistant
13 Secretary of Land and Minerals Management. And he did so in the
14 case of Chukchi Sale 193. I was there in Washington D.C. when
15 they briefed him. Or even the President has, as you probably
16 know from reading the papers, the President himself has made
17 some decisions with respect to what happens in the Arctic
18 involving oil and gas exploration. So it informs the decision
19 maker. It's open to the public. It calls for public
20 involvement and it requires the Agency to do an in-depth
21 analysis of the effects to the human environment. What's the
22 human environment? Subsistence resources -- people -- all
23 natural resources -- the social cultural aspects -- the economic
24 aspects and so on and so forth.

25 UNIDENTIFIED FEMALE: What effects of the Gulf of Mexico

1 oil spill -- is NEPA going to be in court to help those
2 communities along the coast as similar to this that we will be
3 100 percent granted -- that we will be helped by (indiscernible)
4 with effects?

5 MR. LOMAN: Well NEPA requires us to analyze the effects
6 of anything that the Agency intends to undertake. The
7 connection of the -- to the spill in the Gulf and our activities
8 up here -- they're multi-faceted. With respect to NEPA -- worst
9 case -- discharge is something. And a very rigorous analysis of
10 the effects of a spill -- that's gotten heightened interest.
11 And will receive heightened attention in our environmental
12 documents that we do, pursuant to NEPA. But there are other
13 things that came about as a result of that spill.

14 It was the primary driver for the name change -- why
15 you're changing your name. We're changing our name again too,
16 by the way. But I can talk about that later.

17 So we've prepared this draft Supplemental Environmental
18 Impact Statement and Mike was a primary person that prepared it.
19 Mike you want to just describe very briefly what this document
20 contains -- what it sets out to do? Mike.

21 You have a question -- yes sir?

22 UNIDENTIFIED MALE: You mentioned about being a better job
23 next time -- what was that better job for?

24 MR. LOMAN: The court wanted to do a better job --
25 (indiscernible) said you have to do a better job?

1 UNIDENTIFIED MALE: Yes.
2 MR. LOMAN: Do a better job because we didn't analyze the
3 effects of any natural gas that would be developed as a result
4 of these leases. Do a better job of analyzing each and every --
5 and it's 40 pages -- of missing information that the plaintiffs
6 submitted to the court and asserted -- you have all this missing
7 information that you noted in your document -- how can you make
8 a decision with all of this information? So the court was
9 requiring us to do what's called a 1502.22 Analysis.
10 What does it mean when something is missing? I'll give
11 you one example. One of the things that they say in the
12 document is, there is substantial uncertainty with respect to
13 the population structure of the bowhead whale. That's what it
14 said in the Sale 193 EIS -- okay. That was sometime between
15 2004 and 2007. At that point in time, the Scientific Committee
16 with the International Whaling Commission was debating -- is
17 there many stocks amongst the bowhead -- a Bering stock -- a
18 Beaufort stock -- multiple stocks? They settled that argument
19 or scientific debate in 2007. And they decided, these
20 scientists, that there is one stock. Well, our job is to do
21 even more. Is there any significance to it with respect to
22 making decisions to explore for oil, produce oil, produce
23 natural gas if there were multiple stocks? I would say no --
24 there's no context.
25 It doesn't make any difference to us primarily because it

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 doesn't make any difference to you. The subsistence whalers
2 never differentiated between the bowhead in taking them and
3 hunting them, et cetera. So if the scientist said, there's a
4 Bering stock and there's a Beaufort stock, it wouldn't make any
5 difference to you, so it doesn't make any difference to the
6 decision maker with respect to making decisions to let industry
7 explore for oil. Does that make any sense?
8 UNIDENTIFIED MALE: Because -- .
9 MR. LOMAN: That's one example of 40 pages of things.
10 UNIDENTIFIED MALE: Because one little mistake could
11 become a big problem. Thank you for your answer.
12 MR. LOMAN: So Mike, explain very briefly please the
13 document that we produced.
14 MR. ROTHIER: Sure thing. Most of the document itself
15 pertains to that first item that was remanded by the judge back
16 to us. And that is the natural gas analysis that was missing --
17 yes?
18 UNIDENTIFIED MALE: Could you ask people in here -- how
19 many people see your document?
20 MR. ROTHIER: Sure. How many people have seen the
21 document? And if anyone would like to acquire, you know, copies
22 of the document, we could certainly get those to you.
23 MR. LOMAN: There is one -- for the record -- we have
24 looked for it because we sent it here -- here in the library.
25 Who saw it? And we mailed it to a number of the Native Village

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 of Point Hope -- to the library here and to a number of other
2 key stakeholders who had asked for the document and others here
3 in Point Hope. The mail is pretty slow even when you send it by
4 FedEx or the fastest means that are available. Go ahead.
5 MR. ROTHIER: Just wanted to -- if anyone would like an
6 extra copy -- you could take this one after the meeting. I'll
7 just need it for a few moments here.
8 So basically again -- the first thing was the lack of a
9 Natural Gas Analysis in the original document. At the time we
10 prepared the original document, we didn't really feel like
11 natural gas development, as opposed to oil development, was
12 really that perceivable. We didn't analyze it. Certain things
13 changed between -- on the issue of that first document and the
14 time that the judge issues his ruling. Judge felt, yeah, we
15 should have analyzed the gas. So that's the first thing that we
16 set out to do, analyze the environmental impacts of natural gas
17 development and production.
18 So to figure out exactly what it was we should analyze,
19 our Environmental Analysis Section consulted with our Resource
20 and Economics Analysis Section. I'm just going to turn it over
21 to our expert Bob here. He can speak to that.
22 JACK SCHAEFER: Before you do -- Jack Schaefer for the
23 record -- S-C-H-A-E-F-E-R. As far as I know, neither the
24 Regional Tribes of the Inupiat Community of the Arctic Slope or
25 the Native Village of Point Hope -- has never seen the 40 page

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 document that was referred to in regards to missing information.
2 Nor was ICAS -- the Inupiat Community of the Arctic Slope --
3 informed as to what was missing, including the natural gas
4 that's in that Environmental Impact Statement. So I am really
5 confused as to how you got to that point as to, was it the judge
6 that came to an understanding that the natural gas portion was
7 left out or -- and 40 pages, or was he -- or told by
8 representation of those people that were involved with the law
9 suit?
10 MR. LOMAN: The Native Village of Point Hope is a
11 plaintiff. And it didn't --.
12 MR. SCHAEFER: Right. Now was it the judge that made the
13 decision to come up with that criteria for that Environmental
14 Impact Statement, did he come up with that decision by himself
15 or was he told by legal representation of, you know, ICAS and --
16 I'm trying to understand because I was completely unaware that,
17 you know, the natural gas portion was that. And the majority of
18 that Environmental Impact Statement just focuses on natural gas?
19 And I've never seen the 40-page document that regards to what is
20 missing, you know, the information that is missing.
21 MR. LOMAN: That's the plaintiffs -- you're a member of
22 the Native Village of Point Hope.
23 MR. SCHAEFER: Right, right, right.
24 MR. LOMAN: That's your exhibit.
25 MR. SCHAEFER: Right -- exactly.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: You went to the court and said here's 40 pages
2 of stuff that this document -- Agency --.
3 MR. SCHAEFER: It wasn't us, though.
4 MR. LOMAN: -- didn't include.
5 MR. SCHAEFER: It wasn't us.
6 MR. LOMAN: Well it wasn't you, Jack. But it was your
7 lawyer that --.
8 MR. SCHAEFER: Right -- right.
9 MR. LOMAN: -- submitted the thing.
10 MR. SCHAEFER: (indiscernible).
11 MR. EARL KINGIK: Excuse me, a point of reference for you
12 -- that Jack continue on? You're here to listen.
13 MR. LOMAN: Sure -- I'm listening.
14 MR. SCHAEFER: So you know we -- we didn't have a real
15 clear understanding what was going on in regards to our
16 representation. They never clearly explained to us what
17 information was missing, you know, and the natural gas portion
18 of that. And nor were we given an opportunity to make a comment
19 in regards to whether or not that document and that conclusion
20 is accurate. And, you know, and to find out later on that it
21 was whittled down to natural gas, you know, was really
22 disturbing for me personally. And I don't know, you know, what
23 the other Council members' interpretation of that is. And I
24 don't know what Native Village of Point Hope's position on that,
25 but we were not -- the Regional Tribe was not told what that

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 missing information was.
2 We never were consulted on it so that we could get back to
3 the attorneys and say, oh, you left out this, this, this and
4 this and this. Why did you come up with just the conclusion
5 with natural gas like that was the practically the only thing
6 that was there. And given it on the face that -- you know our
7 response is extremely weak. And so, you know, I don't really
8 know how this path was -- was made in regards to what control we
9 had in the court itself and what was being said. We were
10 essentially told by, you know, these lawyers, this is what we
11 want you to do. We want you to give statements to this regard
12 and then we'll take the ball and run with it.
13 And never got back with us regards to exactly, you know,
14 what had taken place and how we felt about that. So, you know,
15 I foresee another stage where we're going to be reviewing that
16 document and saying, you know, where did this really come from
17 and -- providing input as to what is missing, besides the 40
18 pages that we've never seen, you know. And I do hope that you
19 know that legal representation had provided evidence of, you
20 know, that being a -- proven to be seen and reviewed. Because,
21 you know, I -- to this day I haven't seen those 40 pages. I
22 requested it from legal counsel and never received it.
23 Also I've never received the Environmental Impact
24 Statement, even though it was sent by FedEx. I just looked at
25 what was emailed to me and so that's -- you know one thing that

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 I wanted to indicate because, you know, that document is so
2 small -- it's only 300 pages long -- 143 pages is a question and
3 answer thing in regards to whether a type of puffin or certain
4 type of snow geese that some type of significance and all of
5 that is, you know -- we haven't really reviewed that or, you
6 know, had any feedback as to what was in there and what
7 questions were asked. I don't know if that means anything.
8 But, you know, it certainly was surprising to me to see that
9 most of that document only refers to natural gas. When we were
10 concerned about the professional integrity of those federal
11 employees that had to deal with their report that was submitted
12 for the Environmental Impact Statement that was done in 2007,
13 when they were forced to alter their positions by this
14 supervisor, which resulted in law suit by a non-profit that
15 represented them. And so, you know, there's some confusion.
16 I don't know. I can't speak for the Native Village of
17 Point Hope. I was just speaking for ICAS in regards to that
18 document. And what had taken place through that litigation and
19 what we missed and what we can do as a government to government
20 relationship. I mean, some people would feel comfortable with
21 this done because it did buy time or it will buy time. But just
22 the process of how it was done and how it was handled is
23 somewhat confusing. And maybe there was -- the timeframe might
24 have been too short, I'm not sure.
25 MR. LOMAN: Well it's obvious that you read the document

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 because you saw what's in there. You actively described what
2 you were looking at there. Go ahead, Bob.
3 ROBERT PETERSON: Well, maybe just as an introduction --
4 Jack one of the benefits of --.
5 MR. SCHAEFER: Can you introduce yourself?
6 MR. PETERSON: I'm sorry. I'm Bob Peterson. I'm the
7 Geologist with the Agency that's come up.
8 I was going to say this is one of the benefits that NEPA
9 has is -- we have an opportunity to hear your comments directly.
10 There's no counsel or anyone, you know, between us and you to
11 receive these comments. But, again I'm the Geologist and Mike
12 mentioned in the Supplemental. It is a Supplemental, the oil
13 portion of any of the oil scenario that was analyzed is in the
14 original EIS, the Environmental Impact Statement. So the work
15 we did was just based on gas.
16 The possibility of gas has increased a little bit with all
17 the discussion we've seen of the potential pipeline. But I
18 think the judge was really concerned that there were incentives
19 that -- built into the leases for gas. And we hadn't really
20 analyzed gas.
21 And what we -- in my group have done is come up with a
22 reasonable scenario on what a gas -- oil and gas development
23 would look like. We started with the same oil development --
24 oil is the very more valuable of the two components. Oil would
25 be produced first. There would then be a period after 10 or 15

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 years -- again this is a scenario so we don't have all the
2 details, but a period where we would see oil and gas
3 development. Well, what would this mean to the area. We would
4 have an additional gas pipeline to shore -- same shore land
5 follows the oil pipeline, gas treatment facilities on shore and
6 a parallel pipeline somewhere, probably across NPRA following
7 the same pathway, the same right-of-way as the oil pipeline.
8 There would be a period of -- our model looks at about 10 years
9 where we have both oil and gas development. And oil would
10 gradually decline and then would be terminated with the
11 continuation for another 10 or so years of gas production alone
12 before the end of the model, as we see it.

13 Yes?

14 MS. FRANKSON-HENRY: Aggie Frankson-Henry, F-R-A-N-K-S-O-N
15 hyphen H-E-N-R-Y. For the record. I was curious, with the Gulf
16 of Mexico oil spill and the disaster that it posed in the nation
17 -- with NEPA that will be here making sure that this doesn't
18 affect our communities along the Arctic Slope. With NEPA being
19 involved with this Act, with the Federal government, will you
20 guys be able to clean up in these pristine waters with the Coast
21 Guard when it's gusting up to 20 to 50 below? Really, you know
22 with that north wind gust -- will you make sure you're there
23 cleaning up that mess, just like the Gulf of Mexico? Will you
24 be willing to cut your hair to make sure that we have enough
25 hair to control the disaster that may be imposed upon us?

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Ma'am I'm willing to cut my hair and I will be
2 here. But, I'm not going to lie to you and say that anybody's
3 going to be very effective at cleaning up an oil spill in the
4 worst weather conditions in the Chukchi Sea. And when the
5 Assistant Secretary of Land and Minerals approved, or right
6 before he approved the Chukchi Sea Lease Sale, he asked the
7 question. He asked question first -- he asked, do the people on
8 the North Slope now understand or believe that the oil companies
9 can respond effectively to a major spill after the Secretary of
10 Interior has gone up there and talked to Shell and talked to his
11 people, did all of these things. Do they feel that the industry
12 can respond effectively? Dead silence in the room. Nobody
13 likes to tell somebody what they don't want to hear or they
14 don't (indiscernible). So I've just been up here -- I just met
15 with many folks that are in this room and other people in the
16 communities. And I said, no they don't feel that there is an
17 effective cleanup. And then he asked the question, well can
18 they? And I said, on the worst weather day, no. I put my money
19 on prevention. But on the worst weather day in the Arctic it
20 will be a struggle just to stay alive much less clean anything
21 up. And so, at least he asked the question. And I gave him the
22 best answer which I thought was an honest answer that I could
23 give him.

24 That's what NEPA's about, inform the decision maker. I
25 think it's pretty clear now that when a decision is made to

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 allow industry to explore, conduct exploratory drilling, that
2 there is a risk. I don't think any President, at least in our
3 lifetime, could honestly get before the country and say, I was
4 assured that it was 100 percent risk free or absolutely safe.
5 It's not risk free and it's not absolutely safe. And we -- it's
6 our job to tell the decision makers the truth, the truth about
7 your concerns and the truth about industry's effectiveness.
8 That being said, because of the Deepwater Horizon spill, Shell
9 has done a lot of things, put extra things in their plan to
10 better respond to a spill. Go ahead.

11 MR. PETERSON: I guess any other questions?

12 EARL KINGIK: Earl Kingik for the record K-I-N-G-I-K. You
13 kind of mentioned the word pipeline.

14 MR. PETERSON: Yes.

15 MR. KINGIK: What kind of recommendation are you doing for
16 our oil pipelines? Are you go into inland or are you going to
17 go through the coast, ocean or --.

18 MR. LOMAN: We support working with the North Slope
19 Borough and --.

20 MR. KINGIK: Are you giving your Impact Statement or maybe
21 --?

22 MR. PETERSON: No, I think when you looked at our Impact
23 Statement -- again this is a scenario. This is -- we don't know
24 where the oil and gas is going to be discovered because the
25 wells haven't been drilled yet. So what we have done is -- done

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 something that is a reasonable model. You know -- here looks
2 like a good place for some discovery. Based on that, here's
3 where we think would be a reasonable place to come ashore. That
4 could change depending where the actual oil or gas deposit is
5 found. That could change after additional NEPA work,
6 consultation with other governmental agencies -- Tribal
7 agencies, could change for any number of reasons. So, where you
8 have seen it come ashore is just a place where we can draw a
9 line and say, now we have something to study. So those are only
10 recommendations. It is the MMS' policy that we want to see oil
11 and gas pipeline to shore, if possible. And then from there we
12 said, the most reasonable case that we saw was across NPRA. And
13 it would be a gas -- I'm sorry -- an oil pipeline first and then
14 a gas pipeline along the same right-of-way. Did that sort of
15 answer your question?

16 MR. KINGIK: No, it just kind of --. Wondering, because
17 the State of Alaska, you know, got this coastline and North
18 Slope oil, I was wondering how are you going to go to the
19 mainland from your pipeline where you find the oil? How are you
20 going to -- pipe it all the way to Seattle or go the main land
21 of the State of Alaska?

22 MR. PETERSON: The scenario that we had is the most
23 reasonable look would bring a pipeline from somewhere offshore
24 to a shore base across the NPRA over to Prudhoe Bay where the
25 oil pipeline would join up with the TAPS, Trans-Alaskan

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Pipeline. And, of course, that terminates in Valdez. And the
2 gas pipeline would go to Prudhoe Bay. And I don't think anyone
3 knows where a gas pipeline, Denali or AGIA, is really going to
4 go. But it would hook up with that facility.

5 MR. KINGIK: In other words, you'll be talking to the
6 Department of Transportation?

7 MR. PETERSON: We would be talking to a number of people,
8 one could be --.

9 MR. KINGIK: You're talking about (indiscernible).

10 MR. PETERSON: Yes. I mean this has a great number of
11 uncertainties. And again I'm going to stress, a scenario is
12 important because we lay out something that is reasonable to
13 give us something to critically analyze.

14 MR. LOMAN: Let me just say, if we run out of coffee,
15 please let us know. We'll make another pot. And there are --
16 there is coffee and some pies and some really good cakes that we
17 got from a charity effort that was taking place at the store
18 today, and it's good. So help yourself, please, to that stuff
19 in the back while we talk. Jack.

20 MR. SCHAEFER: The pipeline that was referred to, that
21 exists now, in 1989 there was an employee that had leaked
22 information that resulted in public knowledge that there were
23 over 200 holes in that pipeline, the Trans-Alaska Pipeline. And
24 this was 1989. And this was essentially kept in a low profile
25 for quite some time since that. And that person was persecuted

1 for leaking that information and making it known. I was
2 wondering -- can, in that Environmental Impact Statement,
3 whether it's a 2007 or this one, was that pipeline looked at as
4 to whether or not it can handle, knowing that condition of that
5 pipeline had exceeded its life?

6 BOEM UNIDENTIFIED MALE: I have no knowledge. Are you
7 talking about the TAPS, the existing oil pipeline?

8 MR. SCHAEFER: Yes.

9 UNIDENTIFIED MALE: No, neither of these documents went so
10 far as to analyze the TAPS. We assume that other regulations
11 from other agencies in all this would ensure that, but we didn't
12 quite get that far in the area that we looked at. We
13 concentrated more on the Chukchi?

14 MR. LOMAN: Between 1989 and now, because of malfeasance
15 associated with TAPS' maintenance, industry has pled guilty or
16 otherwise been found guilty of two misdemeanors and a felony.
17 So the long arm of the law has swung a few times at that kind of
18 negligence. And we're going to assume that that long arm will
19 continue swinging until they maintain that pipeline
20 appropriately and stop behaving like that.

21 MR. SCHAEFER: And this thing that's being developed --
22 there is this law that was passed called the Coastal Zone
23 Management Act, and it dealt with States. And a few years ago
24 Frank Murkowski, who was our Governor, had done something as a
25 Governor of Alaska that caused that Act to be considerably weak

1 in the eyes of stakeholders, voiced through the North Slope
2 Borough to us here in this Village, that they had no way of
3 influencing and addressing concerns that fell under that Act.

4 And, so I'm wondering what Federal laws have been looked
5 at and how our Governor had caused problems with this. And how
6 it affected the North Slope Borough and how it left the Federal
7 government's partner, for lack of a better phrase, to federally
8 recognized tribes which we have this government to government
9 arrangement.

10 And this Coastal Zone Management plan was done by the
11 State of Alaska, with some input by the North Slope Borough
12 which was not passed on to the Tribe whether it be Native
13 Village of Point Hope or the Regional Tribe Inupiat (ph)
14 Community of the Arctic Slope in responding to that particular
15 law and program. And what affect that program has on this
16 project with that critical missing link. It's hard to
17 understand how us, as tribes, with this government to government
18 partnership, forced upon us, arrangement had been pushed aside
19 in favor with the State of Alaska and how they moved forward
20 with this, without our input. And whether or not the State was
21 just as semi-corrupted as the supervisors of the Federal
22 employees that put that document together. We had no real idea
23 as to what this animal was, this Coastal Zone Management program
24 was, other than hearing that it had some mechanism for control
25 and funding for gathering information and trying to come up with

1 solutions. So we were completely left out, the Native Village
2 of Point Hope, the Inupiat (ph) Community of the Arctic Slope.
3 And, how does that affect this process now as to this missing
4 link and --. Are there other tribes in the United States,
5 whether it be the McCaw (ph) Tribe that are, you know, whalers
6 also, or other tribes along the coast that have participated or
7 may have involvement with this Coastal Zone Management program
8 whether it be on an agreement arrangement with their respective
9 States, or whether they had this one-on-one government to
10 government relationship with the United States? You know, we
11 don't know that information.

12 I tried to ask. And I've been having a difficult time
13 from whoever I asked. I guess this question was really never
14 asked. And, whether it's something that is useful, but I feel
15 the act of not involving the Tribes on this is something that is
16 very important, and really needs to be addressed. So I -- I'm
17 still confused on that as to that and how does that play with
18 this, you know, this proposed project that's being presented to
19 us. How does this Coastal Zone Management program play and --.
20 Because we have this government to government relationship.

21 MR. LOMAN: Thank you Jack. Very quickly, because I want
22 to give some folks that have to leave at 8:00 the chance to
23 comment before they have to go. If the Native Village of Point
24 Hope or ICAS, both federally recognized Tribes, feel that the
25 State of Alaska's plan is insufficient, inadequate or they don't

1 agree with it otherwise, we can listen to that and sympathize
2 with you. We have an obligation under Executive Order 13175 to
3 listen to ICAS, is the Native Village of Point Hope. Other
4 affected Tribes tell us why they think our proposed action would
5 be inconsistent with the State's plan. So that should take
6 place if we're doing business the way these Executive Orders and
7 the law tells us to. That may not be enough. But, at least
8 that should happen. Dorcas, you mentioned you needed to leave
9 at eight and maybe some others, so I wanted to give you the
10 opportunity to come, and even though we're not quite to the
11 comment period -- in case you had something to say. Because I
12 know that you wanted to get to another important activity. If
13 there is anyone that needs to comment before 8:00, the floor is
14 open to you. Okay I'm going to give that up -- Earl.

15 MR. EARL KINGIK: For the record, natcsi, N-A-T-C-S-I-Q.
16 Earl Kingik, K-I-N-G-I-K, member of Native Village of Point
17 Hope. First of all, I would like to send my condolences to the
18 family of my cousin. It is very important, knowing him, that we
19 should continue what we are doing of what's going on in our
20 ocean with, we love the most, the garden we treasure. The
21 gardens that keeps our unity together. The gardens that keep
22 our koptchio (ph) way of life together for thousands of years.
23 And he would be very happy that you are here, even though he's
24 gone. Thank you very much.

25 I work as a Native Liaison for Alaska Wilderness League

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 and we have put something together in which we have attorneys
2 and some geologists. We have some other people. I look at your
3 draft proposal here and we've got -- we have something we want
4 to leave behind here, you know, additional. Shell Oil on
5 October 5, 2010, letter to BOEM asking for approval to drill and
6 explore oil in the Beaufort and not the Chukchi.

7 That is just the point ignored and nothing learned from BP
8 Deepwater Horizon tragedy. BOEM needs to take the time needed
9 to make scientifically justified decisions before allowing
10 leasing and new drilling in the Arctic Ocean. At the minimum,
11 the commentary needs to be extended beyond the November 29th
12 deadline to give communities more time to provide many folks'
13 input of additional scientific studies to be completed.

14 You all heard that North Slope Borough and Shell Oil has
15 signed a Memorandum of Understanding, some kind of agreement, to
16 do scientific studies, and we are aware of that. Chukchi Sea --
17 Chukchi draft SEIS which you've got there, BOEM needs to include
18 information and a new draft SEIS from upcoming USGS and National
19 Commission reports and reassess with scientific information in
20 Appendix A. The 1502-22 analyzed, of the draft, the SEIS
21 obtainable at the (indiscernible) does not (indiscernible).
22 Mission to get -- need to gather some information such as BOEM
23 has done enough draft SEIS. But dismissing, once again, by
24 dismissing the need to gather such information, BOEM, under
25 President Obama, after 24 (ph) Horizon spill is saying the same

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 thing as MMS under President Bush.

2 That is, no matter what that fact will be -- it be
3 allowed to drill, to proceed. As example that SEIS says that if
4 a large oil spill occurred, scientific significant impact to
5 cetaceans, including whales, could follow. And it is well
6 understood that environmental impact associated with large oil
7 spill could be quite severe, page one and two of 143 and 1502-22
8 analyzed respectively. Yet BOE (sic) still, once again, yet
9 BOEM still choose to proceed with drilling. Once again, yet
10 BOEM still choose to proceed with drilling while Alaska Region
11 of BOEM has stated that it needs to meet the court deadline of
12 January 2011 for its SEIS. The court has carefully -- they
13 imposed no strict deadline in owner required (indiscernible) to
14 file status report with the court if analyze (sic) requires more
15 time.

16 Anxiously, hastily, they issued draft SEIS -- run counter
17 to the law, and Department of Interior recent commitment to an
18 American public. The consequences of rushing through offshore
19 oil and gas drilling approvals without understanding, and this
20 showing to the public and potential impact with tragedies
21 displayed in the Gulf of Mexico.

22 BOEM should not allow the Arctic Ocean, its wildlife, its
23 people to experience a similar disaster. Responsible
24 development needs not to proceed faster and to be justified.
25 Thank you very much.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 I had a chance to go down to Louisiana to witness for my
2 first hand (sic). Because what I talk about to my people, when
3 I go to public meeting, is what I see. And we don't want that
4 to happen in my area. It is very sad. Our own government would
5 go pointing fingers of the industry and the industries were even
6 pointing fingers. And we don't want that to happen. We don't
7 fight. We work together we do things together. Thank you.

8 MR. LOMAN: Thank you very much Earl.

9 MR. ROUTHIER: Just to, sort of finish up a few notes
10 about the structure of this Supplemental document. Once we got
11 the analysis, the scenario, from Bob and the rest of the
12 geologists downstairs from us, we turned that scenario over to
13 our scientists, our departmental analysts. And they looked at,
14 you know, the possibility of the offshore pipeline, possibility
15 of on-shore pipeline, possibility of all these natural gas
16 production activities. And they did their environmental
17 analysis of those potential activities. And that's what
18 comprises the bulk of, the body of this document.

19 So, basically we go resource area by resource area, you
20 know, bentic (ph) organisms, marine mammals, subsistence
21 activities, each resource area. And we organize into analyzing
22 the impacts of natural gas development and analyzing the impacts
23 of natural gas production. We also summarized the impacts of
24 the oil production.

25 Basically, that final EIS we did a couple years ago, we

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 tried to summarize that so the main points are in here so it'll
2 be easier to reference and give context to the gas impacts. So
3 that addressed the first item of the court's remand. The second
4 and third concerns the judge had both pertained to that
5 regulatory requirement, that 1502-22 process.

6 It's all kind of related, so what we tried to do is boil
7 it down into a logical sequential process which our analysts
8 could use to analyze each piece of the incomplete or missing
9 information and see how important they would be. So that
10 process is captured in Appendix A. And I think it's been
11 mentioned here for tonight. It's a rather lengthy Appendix --
12 it's in a very --. I'm sorry, did you have a question?

13 MS. FRANKSON-HENRY: Yes, Aggie Frankson-Henry, for the
14 record, F-R-A-N-K-S-O-N hyphen H-E-N-R-Y. Regarding the
15 analysis of -- would it be possible for you to also get the
16 results and analysis of the Sakhalin Island Shell disaster and
17 the Gulf of Mexico shelf -- disaster of the Deepwater spills and
18 make that public? With your -- with results that may happen
19 with these lease sales, so that things like that will not occur
20 within the environment biologically, geologically. We are
21 impacted even before it starts.

22 MR. LOMAN: Towards -- after the comment period I'm going
23 to -- if you'd like me to tell you -- I want to explain to
24 everybody that cares to listen. The rest of the reasons for the
25 reorganization of our Agency and the other part of the Agency

1 that is yet to come to -- at least officially -- come to
2 existence the Bureau of Safety Environmental -- Safety and
3 Environmental Enforcement, BSEE. And to tell you about the
4 effort that's underway at the direction of the President and the
5 Secretary of the Interior to develop a regulatory agency that
6 will not only restore public trust, but prevent those kinds of
7 disasters that you mentioned ma'am.

8 MS. FRANKSON-HENRY: Will they be able to -- Aggie
9 Frankson-Henry for the record, F-R-A-N-K-S-O-N hyphen H-E-N-R-Y.
10 Will you be able to -- can you put the (indiscernible) -- 100
11 percent, fine and regulate those companies that will buy these
12 lease sales or that have already bought the lease sales before
13 we were undergoing Environmental Impact Statements in our
14 communities -- effective.

15 MR. LOMAN: We'll talk about that when I explain it. With
16 respect to a 100 percent, I think you know the answer to that.
17 The answer is, it's never a 100 percent.

18 MS. FRANKSON-HENRY: We can try though.

19 MR. LOMAN: I agree. Try for 150 but safety and
20 environmental responsibility is done through endless
21 demonstration, not patting each other on the back for our good
22 record. So, I think people are starting to understand that.
23 And I'll talk a little more after we take -- after we get done
24 with the public comment period about what we've recommended that
25 we do to the people who are working on the reorganization. So

1 pretty much a wrap?

2 MR. ROUTHIER: Pretty much all I had.

3 MS. FRANKSON-HENRY: One other comment for the Geologist
4 and the Biologist?

5 MR. LOMAN: Sure.

6 MS. FRANKSON-HENRY: Move forward -- do the right -- do
7 the right thing regardless as to what your colleagues may have
8 against you in documenting these documents -- scientifically,
9 geologically, within the air, the land and the seas and the
10 rivers. Make sure that you stand up for a good purpose. I know
11 you guys have been affected in these -- in your -- within your
12 knowledge. I know that if you say something, they will give you
13 that boldness, BOMRE, used to be MMS. Now they're supposed to
14 change and honor your decision as geologists and biologists that
15 make these studies. So I would encourage you to do the right
16 thing in your -- within your area of expertise.

17 MR. LOMAN: Thank you for that and I really appreciate
18 that because our scientists and our other experts very rarely
19 hear that they have the support of people, especially people in
20 the communities to do the right thing. Thank you.

21 MR. SCHAEFER: There's a mention of reorganization to
22 BOMRE and the BSS or whatever that was, Bureau of Safety and
23 Regulation or something like that. Do you foresee this
24 reorganization following the same path as a BIA realignment that
25 took place in 1989 and where it wound up?

1 MR. LOMAN: No I wasn't working for BIA in '89, but I did
2 work for BIA for ten years. I am familiar with that
3 reorganization. This is really much different. And, you know,
4 sometimes people do things right by accident. That could be the
5 case here.

6 The Bureau -- this vision to restore public trust across
7 all of the agencies that work on offshore oil and gas is the
8 goal, the over arching goal. With respect to the Bureau of
9 Safety and Environmental Enforcement, we have recommended to the
10 people who have been assigned the primary duty to put together a
11 Bureau of Safety and Environmental Enforcement that part of
12 government that regulates the industry.

13 And we said, if you want to restore public trust this
14 Agency must be feared and respected by that industry. Feared
15 and respected. Now when I say feared, I don't mean feared as in
16 oh, we're afraid of them. They're coming, necessarily. They
17 fear and respect together in a way that we did in the Navy. In
18 the Navy Diving EOD Special Warfare communities, we were
19 inspected regularly. Those Inspectors -- inspections came, they
20 were thorough. And it forced you to maintain a very high
21 standard, as people, processes, equipment et cetera, policies,
22 everything.

23 At the same time that was in place, we knew that if there
24 was an accident where people were hurt or killed, they would
25 handpick from the Navy Safety Center the experts to inspect you

1 the most rigorously you could possibly imagine. And no matter
2 how good you were, how well your equipment was maintained, how
3 closely you followed the processes and procedures, you would
4 literally look, and you can get those safety reports online,
5 pull them right off the internet today. Shameful, because when
6 true experts come in and examine every aspect of everything, you
7 will never meet the requirements in full measure. And that's
8 the kind of regulatory agency that is feared and respected.

9 And when this industry, the offshore oil and gas industry,
10 fears and respects this new regulatory agency in that way, then
11 the public trust will be restored when there is someplace
12 towards endless demonstration of safety and environmental
13 responsibility.

14 The people who are in charge of this reorganization agree.
15 And they're working very hard on figuring out how to do that the
16 right way, that's the goal. I hope you share in our desire to
17 support an Agency like that. I think you do. But it's not
18 easy.

19 MR. SCHAEFER: There were statements made by the Secretary
20 of Interior, and others that work with him, indicating that
21 there were changes in the regulations in dealing with oil and
22 gas. I was wondering, was there any consultation with Tribes
23 regarding these changes and does the Native Village of Point
24 Hope know what these changes are? And how these changes
25 addressed in the Environmental Impact Statement and are they

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 applicable for that statement?

2 MR. LOMAN: They're not addressed in this Supplemental
3 Environmental Impact Statement. This Supplemental Environmental
4 Impact Statement -- there's really one reason why it exists
5 today in draft form. It came from the court remand. The court
6 said, you didn't address natural gas. You didn't appropriately
7 address all of those things in Exhibit 129 -- the missing
8 information et cetera and so forth. And so it supplements the
9 past EIS. Now with respect to changes in regulation that are
10 taking place, I think you're talking about recent notices to
11 leasees (sic), for example -- maybe proposed rule makings,
12 things that the Agency intends to place on industry, correct?

13 MR. SCHAEFER: Uh-huh (affirmative).

14 MR. LOMAN: Okay. No, we here at the Alaska Region -- we
15 haven't consulted with the Tribes that would be most affected.
16 But let me just state a little bit about the need to do that.
17 And I only say that because these are things that the Agency
18 intends to place on industry. There are some elements of Tribal
19 Corporations that are part of that industry, so I will get back
20 to you on that obligation. I'm not saying yes or no, that we
21 need to do it. We certainly are willing to share it with you as
22 you requested, to conduct government to government consultation
23 in compliance with Executive Order 13175. Maybe I'll get back
24 to you on that one.

25 MR. SCHAEFER: Categorical exclusions. That was a rate or

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 a procedure that was used to get around regulations and
2 requirements. And categorical exclusions has led to some
3 accidents such as the Santa Barbara accident that took place in
4 1969, where the company had requested for a categorical
5 exclusion so that it would only use one single pipe instead of a
6 double, triple, quadruple layered pipe which blew and tore the
7 ground up. And they were never ever able to seal that leak of
8 oil. What is being done with this categorical exclusion that
9 had somehow materialized and was taken advantage by the
10 industry? Does that still exist? Apparently this categorical
11 exclusion gets a 30-day period, and after that there's an
12 automatic approval or something of that nature. What's the
13 status of --.

14 MR. LOMAN: Non-exist --.

15 MR. SCHAEFER: That type of method that's been used in the
16 past?

17 MR. LOMAN: Well that particular categorical exclusion is
18 non-existent with respect to the Bureau of Ocean Energy
19 Management Regulation and Enforcement Alaska Region. And I
20 can't imagine that it will ever exist for any operations in the
21 Arctic.

22 MR. SCHAEFER: As far as I know, there have been
23 accusations that have been made by environmental groups
24 indicating that that categorical exclusions have not been
25 addressed to the public and what was going to done with that as

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 to whether there's going to be a complete termination of that or
2 what adjustment was going to be made? And so, you know, it's
3 hard for us to know who to believe. I mean, it's easy to
4 believe in an environmental group that has obtained all the fame
5 and stuff. But now we're asking, you know, the Federal
6 government as to where things are with that, because there were
7 categorical exclusions that were issued as a formality,
8 apparently, in the Gulf of Mexico which led to this accident --
9 human error.

10 And, you know, we feel the same in regards to that -- in
11 regards to -- you know the changes and regulations. And that
12 information should be, you know, made available before we even
13 discuss this Environmental Impact Statement, I believe.

14 Were you guys going to make comments? Burt?

15 MR. LOMAN: The categorical exclusion provisions in NEPA
16 are appropriate when the Federal agency has demonstrated and
17 supported administrative record that what they're proposing to
18 do, and do, can be done over and over again without any
19 significant harm to the human environment. Categorical
20 exclusions, to put in real simple form -- if you're going to go
21 around and change out an electrical component on an airport
22 runway. And that's a decision that's made by sometimes the
23 Federal Agency that oversees the maintenance and operations of
24 airport runways. So these kinds of activities are routine.
25 They're done. They don't get in the way of the Endangered

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Species Act or Federal Historic Preservation rules and all of
2 these regulatory things that govern actions. And the agency can
3 demonstrate that it's done safely without harm to the human
4 environment. And so they are categorically excluded from
5 further NEPA compliance.

6 Exploration in the Arctic will not be categorically
7 excluded by this Agency, ever. There's a number of reasons for
8 it. The Agency, from within itself, knows that it has to
9 analyze these activities at a minimum with an Environmental
10 Assessment because there are even subtle changes that can and
11 must be looked at, have the potential to get in the way of
12 subsistence activities et cetera, get in the way of sensitive
13 resources and so on and so forth. So that's not going to
14 happen. I can say that with great confidence even long after
15 I'm gone.

16 The other element is there's plenty of will to bring a
17 legal challenge. And I know this much about NEPA. If an Agency
18 tried to do a categorical exclusion for an exploratory drilling
19 operation in the Arctic, and they were challenged they would
20 lose. So there you go.

21 For anybody that joined us kind of mid-course, we are
22 taking comments on a draft Supplemental Environmental Statement
23 that we prepared for Chukchi Sea Sale 193 and the comment period
24 is still open. We're willing to take comments from anybody to
25 hear what you have to say.

1 MR. SCHAEFER: I have another question before I make a
2 comment. We had, more or less, looked at what is going on
3 around us, what is going on in Russia. What is going on in the
4 United States. What is going on in Canada. What is going on in
5 Greenland and those other countries in the Arctic.

6 And we talked with each other and we looked closely at
7 what is going on in Canada, because they're apparently trying to
8 go through the same path as what we are seeing that's going on
9 here. What I noticed that was somewhat different to a certain
10 point was that Canada had a different type of interpretation on
11 consultation with Tribes.

12 And so there was this court case that had materialized in
13 a ruling that was made by the Canadian Judicial and had
14 indicated that there is a little more -- there is more to a
15 government to government relationship than consultation. And
16 what was within that context was that that consultation was
17 talking with each other, trying to come to a solution.

18 There, the ruling that was made in that court case was
19 that they felt that this government to government relationship
20 was more than just consultation, more than just talking with
21 each other. And in the past, that was essentially what we were
22 doing. And it changed as the Administration changed from the
23 Bush Administration to this Obama Administration. But I really
24 feel that there is more than just talk with consultation. And
25 that there should be some different type of a phrase or language

1 or term used in dealing with our relationship with each other,
2 that goes beyond just the talk. That something should be done
3 in that regard and that I do expect that adjustment will be made
4 since both Canada and United States are playing this dare --
5 double dare game as to who's going to take that first step and
6 dealing with the risks. What is interesting between Canada and
7 the United States is the Inupiat (indiscernible) back there have
8 already got into an agreement with the industry where they have
9 somewhere along the line of 53 percent interest. More than half
10 of the proceeds from oil and gas will go to their people.

11 But they still have concerns with safety and risk and have
12 not moved forward. Us, we have no arrangement in regards to our
13 oil that is about to be exploited, our oil. Where we see
14 nothing in return other than maybe 40 job positions out of 400,
15 which is the norm of the ratio of hire. So, you know we are
16 looking at other areas and trying to figure out how we're going
17 to move forward, if we are going to move forward. But it is
18 noted that the Inupiat of Canada already have this arrangement.
19 that temptation, that proverbial apple in front of their eyes.
20 And they're not taking a bite out of it until they know for
21 sure. But they're still daring each other as to whether they're
22 going to move forward or not. They still live in that fear like
23 we do now, here.

24 But that is there. We don't have anything. We, as a
25 matter of fact, had to deal with the United Nations Human Rights

1 Division in 1989 regarding Prudhoe Bay, regarding discrimination
2 against indigenous peoples by transnational corporations,
3 British Petroleum, Atlantic Richfield. And so we've already
4 gone on record in regards to our concerns and how we're being
5 treated in the realm of Human Rights under the United Nations.
6 And that's still ongoing as to how this turns out, has yet to be
7 seen.

8 But you know we are indicating, you know, what we do know
9 which leads to, you know, the comments that we have made in the
10 past since 2007 of the hearings that have taken place and the
11 statements that have been made, the concerns that we have
12 expressed in regards to Federal employees that have their future
13 at risk because of what they were forced to do.

14 Where does that information start and your adjustment that
15 has been made regards to this Court Order that was done by the
16 judge in a remand? Does it start from the time that that
17 supervisor went to the employee and said, you must meet this red
18 face test? If it doesn't then, then you have to readjust your
19 results, your documentation. And we had no idea that any of
20 this was going on. It took them to blow their own whistle to
21 indicate that this was going on and that phrase was used. You
22 know it was really shocking to hear that kind of phrase. But
23 that happened.

24 So where are we on the Environmental, the remand as to
25 what stage is this addressing those concerns we're at, what

1 point? When we look at that Environmental Impact Statement we
2 see natural gas and then 143 pages of questions and answers as
3 to what type of species are -- you know what is significant and
4 what isn't. How does that play with this remand? They're just
5 going to look at it and hope that, you know, they meet this
6 requirement the way it is now or -- how far back do you go
7 before -- I mean when you go into the supplemental thing, do you
8 go that far back or did you completely skip the employees that
9 were involved and their supervisors? And whether that
10 information is, you know, accurate or not and what is that
11 looked at?

12 Did you go back into your files, your records? I don't
13 know. I don't know who to ask -- so I came in late so I don't
14 know who you are. I just --.

15 MR. LOMAN: I can answer some of that and then, you know
16 Jack, I'm a risk taker. So I'm going to do something you'll
17 never see at one of these meetings. With respect to dissent
18 amongst our people, here's what we believe. If you have an
19 Agency that encourages and fosters dissent -- people that say
20 look, Mr. Big Shot Jeff Loman, Manager guy, who wants to make
21 Headquarters deadlines to get these documents done. We don't
22 think we can do it because we need to know more or study this
23 longer or this wasn't analyzed correctly. That, in the end,
24 when people are right, when they're correct, ends to better
25 analysis and better decisions. It doesn't just work that way

1 with us. Dissent makes for better decisions in the context of
2 almost everything. So we say to our employees, we want dissent
3 to make better decisions.

4 Mike is a relatively new employee with us. I'm going to
5 let Mike tell you honestly and ask that he do so openly in his
6 analysis because he took -- he did some of this analysis. Was
7 he subjected to anything by management -- supervisors in the
8 organization that forced him to do things in a way he otherwise
9 wouldn't? He can tell you yes or no right in front of
10 everybody. And I hope that he does. So go ahead Mike.

11 MR. ROUTHIER: No, not at all -- and I worked with a lot
12 with the analysts and was busy. I'm more of a coordinator so
13 I'm trying to -- you know help the process and just facilitate
14 the process. Let our scientists give their information and then
15 -- as they call it. And I call the scientists in -- I'll say --
16 I don't think they -- none of them expressed that concern to me.
17 I can only speak from my own experience, though.

18 MR. SCHAEFER: Were you aware that that had happened down
19 there?

20 MR. ROUTHIER: I was -- yeah I was. I don't know many of
21 the details about it, but I understand that that has been a
22 concern in the office.

23 MR. SCHAEFER: And that it did happen, you were aware of
24 it?

25 MR. ROUTHIER: Yes.

1 MR. SCHAEFER: And that there was a law suit that was
2 filed in New York that addressed that and made it public?

3 MR. ROUTHIER: I wasn't aware of that. But, yeah.

4 MR. SCHAEFER: The Public Employees for Environmental
5 Responsibility was the group that did it. There was expressions
6 of concern by those employees to the environmental groups and to
7 us stakeholders through teleconferences. And we responded by
8 saying that you need to go to the Office of the Inspector
9 General and indicate that. They couldn't figure out how to do
10 that and so they used this organization to do it. And that's
11 essentially what had happened which led to my question.

12 How far back does the document go in regards to that
13 story? Was that looked at or was it completely ignored? I
14 wasn't talking about you know personal, you know, your
15 experience but the events and the facts that were provided. And
16 how far back did it go to review whether or not that information
17 is accurate or not? And, you know, because this all
18 materialized in a Freedom of Information Act request. And so
19 there were internal documents that were acquired through us by
20 direction of legal counsel to try and figure out what was going
21 on. And this essentially -- what materialized up to that court
22 decision. And how far back has the research gone as to, you
23 know, whether there was information that was overlooked or
24 ignored because of those chain of events?

25 Are -- you're not aware of it or the preparers weren't

1 aware of it or --?

2 MR. ROUTHIER: Well I can't offer that with the analysis
3 in this current Supplemental document is all fresh. We went
4 back to our analysts and asked them to provide their best
5 scientific judgment and opinions so all the analysis is fresh.
6 It is a Supplement to the existing EIS so it doesn't, you know,
7 fix any problems that -- you know it doesn't alter the text for
8 the conclusions of the original. We have new analysis to try to
9 supplement and that's fresh analysis from our analysts.

10 MR. LOMAN: In the end it's going to be up to the Federal
11 judge that has this case, Judge Beistline, to decide whether or
12 not the Agency appropriately addressed the remand. We think
13 that we have. But, you know, I have to tell you Jack that if he
14 would have said, you know, for the most part but anything in his
15 answer it's our job as a super -- it's a primary job of a
16 supervisor in the Federal government or everywhere else, that
17 people have the tools and the ability to do their job -- that's
18 my job. And it's my job to foster dissent and try to nurture
19 dissent. And where it doesn't meet the Agency's goals or even
20 the political goals of people, it's my job to stand up and tell
21 political appointees or anybody else in the organization that
22 their aspirations can't be met. And tell people what they might
23 not want to hear. I'm not afraid to do that.

24 Our people -- yes sometimes they are but you know -- let
25 me just say this. When you have 40 pages -- 40 pages of

1 excerpts from an Environmental Impact Statement that address
2 uncertainties -- lack of information et cetera, and practically
3 none of it has any context in the decision to be made, you have
4 to say to yourself why would an Agency do that? I'm not going
5 to go into that. But that's a fair question and I think that's
6 where you're going with this. And because I know you think
7 about these things really hard.

8 Was it a perfect Agency that produced the document? No.
9 And the Federal court -- the District Court in this case found
10 some deficiencies. We intend to address them to the
11 satisfaction of the court, and taking into concerns everything
12 we learn at these public meetings and the comments that we
13 receive.

14 MR. SCHAEFER: The only reason why I asked all these
15 questions was because, in our previous hearings we were told
16 that when you make your public comments you cannot ask any
17 questions. And so I figured I'd ask as many questions as I
18 could before we have this public hearing so that we can have a
19 little bit of an understanding as to what we're faced with and
20 what changes have taken place. And I apologize for, you know,
21 taking up so much of your time. With that knowledge that, you
22 know, that we can ask these questions when we make our comments
23 when we testify on this thing. I'm done. I'm ready to testify
24 but there's others that --.

25 MR. RONALD OVIOK: Thank you your honor. My name is

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Ronald Oviok, Senior. Thank you for your presentation and your
2 reports -- also from the people of Pt. Hope. And right now I'm
3 probably late for my traditional food gathering. That's
4 probably -- you'll probably be coming back sooner or later for
5 this -- reports. And to me, you know, I didn't know -- first
6 time I heard about this natural gas document report. Tell you,
7 it's about to be presented to the people and go forward and
8 please, notify you at Pt. Hope -- (indiscernible) already go on
9 further before people here present anything to the Department.
10 Thank you.

11 MR. LOMAN: Thank you very much sir.

12 MS. FRANKSON-HENRY: Aggie Frankson-Henry for the record.

13 MR. LOMAN: Thanks a lot.

14 MS. FRANKSON-HENRY: Last name F-R-A-N-K-S-O-N hyphen H-E-
15 N-R-Y. My question is, how can you clean all the oil on ice
16 scientifically, biologically? How can you clean all the oil on
17 ice? Do you have the expertise in this harsh environment?
18 That's my question.

19 My other question is, how can you make sure that trillions
20 of oil that may be leaked from a well be cleaned and managed in
21 a 40 to 90 mile hour gusting wind?

22 As we all know, us Inupiat people of the Arctic, we can't
23 even think of certain oceans because our life would be
24 endangered by the great seas. Those are my two questions in
25 life.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Environmental Impact Statement that I was going to
2 comment, but since I didn't know we could ask questions I'm
3 asking it now. And before we go on to any testimonies, are you
4 all done with your report to the community members here in Point
5 Hope before we go into a public hearing to inform, educate?

6 MR. LOMAN: We've presented all the information that we
7 came to present. We want to continue to ask questions and you
8 can ask questions while you're giving your testimony. I'll try
9 to answer them. What I try to avoid doing is getting into
10 debates with people, because I didn't come here to debate
11 anybody. I came here to listen.

12 Those questions that you asked are on the record, It's
13 now the Agency's obligation, under the National Environmental
14 Policy Act, to answer them. Answer them in writing and
15 memorialize that answer in a final Environmental Impact
16 Statement. I sort of answered your first question early on.

17 Can you clean up, effectively clean up a 100 percent of
18 oil on ice? I have not seen a 100 percent of oil in a major oil
19 spill be cleaned up in anywhere by anybody, anytime. So it's
20 safe to say that they will not clean up with all the technology
21 that's available today 100 percent of any oil in a major oil
22 spill that takes place on ice.

23 If you spill a gallon of oil on ice you can clean a 100
24 percent of it. In 90 knot winds you will not be able to clean a
25 100 percent of it because it will blow through the air all over

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 the place.

2 First time I came to Point Hope by airplane, I got off the
3 plane, I was wearing a ball cap. There were 45 knot winds which
4 is half of 90 knots and I swear to God my ball cap went to
5 Russia. It disappeared. And so it's safe to say that spilled
6 oil on the surface, in those kinds of winds, it's going to be
7 far from a 100 percent. Typically, and our documents reflect
8 it, the industry's able to clean up about 12 percent.

9 MS. FRANKSON-HENRY: That's all?

10 MR. LOMAN: About 12 percent. Much of the oil in typical
11 situations evaporates.

12 MS. FRANKSON-HENRY: So our -- all our migratory marine
13 mammals and birds will be affected by this development if it
14 occurs?

15 MR. LOMAN: In the event of a major oil spill?

16 MS. FRANKSON-HENRY: Will you be able to help them and get
17 another ocean for them?

18 MR. LOMAN: You certainly can't make an ocean -- not any
19 man that I know of or any industry. In the event of a major oil
20 spill in the Arctic under the activities that have been proposed
21 and are being proposed now, exploratory drilling. What industry
22 has put before the Agency for approval is a spill response
23 capability that is -- it's really almost to the point where if
24 you add more vessels or more capability, you could have a
25 negative impact from that magnitude of -- it takes boats and

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 people et cetera, in an area that's sensitive. I mean, we all
2 agree that the Arctic is a sensitive environment.

3 So you add more and that has more effects -- negative
4 effects on the sensitive resources. And it's now to the point
5 where it doesn't make any sense. One, given the chance of a
6 major oil spill is very, very negligible. It's not likely to
7 happen in the first place. Even in the Arctic conditions there
8 have been 83-84 exploratory wells drilled -- 30 in the Beaufort,
9 five in the Chukchi. There have been no major oil spills.
10 That's not a lot. Eighty-three in Alaska, most in the first
11 half of the Federal government's oversight for 17, 18 years.
12 Only three in the last half of our Agency's existence.

13 So, when we look at what industry says they intend to do
14 with respect to spill response we know this. It's not like Deep
15 water because the Deepwater Horizon incident, because it's about
16 150 feet. So in the event of that catastrophic release at the
17 ocean floor, that oil will arrive to the surface in seconds not
18 days in a place that's unknown like the Deepwater Horizon spill
19 occurred.

20 It arrives to the surface in seconds and in minutes
21 because their spill response capability is right there, right
22 there in place. That was not the case with the Deepwater
23 Horizon. Did they mobilize a lot right away? Yeah -- matter of
24 fact I'll reserve my opinion of what went on. But what's being
25 proposed now, it's at substantial capability and it's right

1 there. Will they clean up a 100 percent? Probably not. Will
2 they keep it from harming marine mammals? We hope so -- might
3 not.

4 Can you bring claims under the laws that exist today for
5 damages to natural resources? Definitely. What does that tell
6 industry? That tells industry -- industry is motivated by
7 money. There's no industry that's going to come up here and do
8 anything unless they think they can make money, period. They're
9 motivated by money. If they have a major oil spill it will be a
10 negative -- negative in a big way in the Arctic. So that's a
11 big motivator without any regulatory agency to keep them from
12 having a major oil spill.

13 That being said, I think we'll let us respond to you in
14 writing in the FEIS with respect to your questions. I know that
15 we can't satisfy anyone who's concerned about even the remotest
16 chance of hurting something that is so important to your culture
17 and to your children et cetera. And I understand that
18 completely.

19 MS. FRANKSON-HENRY: One more question. Aggie Frankson-
20 Henry, for the record, F-R-A-N-K-S-O-N hyphen H-E-N-R-Y. We
21 know that ice pressure ridges build up, our ice builds up. And
22 a wall -- the ice can be as tall as this building, once it goes
23 up because of the currents in our waters, in our oceans. We
24 know that will be very discouraging to industries to know that
25 their rig can just go in seconds. It can happen. And if

1 they're not careful it will happen because of our climate.

2 I believe climate change is not going to melt all the ice.
3 You never know -- it may be even just -- even get harder and
4 more frozen and compact, the Lord willing. I know for sure in
5 the Arctic, in the Beaufort Sea and straight down here in the
6 Chukchi Sea, our ice comes from afar. And it's a challenge. We
7 know we cannot go on the ice. We would no longer be alive if we
8 didn't know. If we didn't have no means of transportation, your
9 Coast Guard officials will be endangered if they were to try to
10 rescue the personnel working in the rigs, on the ships. Not
11 every ice breaker works.

12 With all the contaminants along with the vessels, with the
13 Clean Air Act regulate them -- enforce them. Put those -- get
14 those tax monies from them -- from those vessels to -- not only
15 from the amount of oil gushing out from a well. You have to see
16 these other impacts too that will affect our air and our water
17 and our land, our people.

18 We've been -- for so many years giving testimonies
19 regarding how affected we are not only from oil and gas but also
20 from Project Chariot, Cape Lisburne site. We don't know what
21 kind of chemicals they have, what they put into our lands, in
22 our air, and our sea.

23 We're affected -- the whole coastal communities along the
24 coast. We take it serious when we don't land a whale. Maybe
25 it's because of the seismic testing. Maybe that set the bowhead

1 whale from seismic testing has gotten them, you know, uneasy.
2 And the effects of seismic testing, too, needs to be informed to
3 the public of how our marine mammals and our people will be
4 affected. Once it bounces on the rocks to a person, to a
5 mammal, to a bird, to fish. Their ears are blown off. The
6 walruses, the seals, the stomachs of the bowhead whales and all
7 the other marine mammal species I care about, and love to eat.
8 Because if they're affected, I'm affected. Our eco-system even
9 through seismic testing, we did not have the voice to say no to
10 seismic testing other than coming here in these government to
11 government consultation meetings and then ask (indiscernible).
12 Thank you.

13 MR. LOMAN: Thank you.

14 MR. SCHAEFER: Can we testify now?

15 MR. LOMAN: You certainly can Jack.

16 MR. SCHAEFER: I'm not used to doing this right away but I
17 guess I can. Can you hear me okay? My name is Jack Schaefer.
18 I am the Council Member with a federally recognized Tribe known
19 as the Inupiat Community of the Arctic Slope. It is a Regional
20 Tribe for all the villages in the North Slope. It has the same
21 responsibility as any Federally recognized Tribe. And we have
22 expressed our concerns for quite some time. I am the grandson
23 of Timmy Kanooguk (ph). He caught 23 whales within his
24 lifetime. His last one was caught by his son in 1975 just
25 before they had this whale ban. So, you know, I grew up around

1 culture.
2 Concerns that I have in regards to these public hearings.
3 We have very little opportunity to express our concerns
4 regarding our government to government relationship and
5 obligations. And so, with that said, there's this government
6 report GAO Report 02357 which is a report that dealt with the
7 restoration of Prudhoe Bay. There were promises that were made
8 by the industry that they'll clean up Prudhoe Bay when they're
9 done. We expressed our concerns in the past in regards to the
10 migratory animals that are directly affected by development.
11 And the migration had been changed because of development that
12 had taken place in Prudhoe Bay, that from the view of a
13 satellite, looks like East L.A.
14 There's so many lights in Prudhoe Bay and the animals have
15 moved away from there. Now they promised that they would
16 restore this area. GAO did a report indicating that it wasn't
17 done and that companies had changed their name, walked away,
18 filed for bankruptcy, and still has not been cleaned up and the
19 impact is still there.
20 And the caribou are moving. The animals are moving
21 elsewhere. And development is moving closer and closer to Point
22 Hope, moving west, without that restoration. And we feel that
23 that restoration needs to take place so that these animals have
24 a place to go. We feel that development should take place on
25 land before you even go to the ocean.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 And it's interesting to see the changes in regards to --
2 what has been said in the past in dealing with the presence of
3 oil, evidence of oil, and circumstances. When there has been
4 offerings of incentives to do business and do development for
5 less -- industry goes that way. And so it seems and looks like
6 the temptation has been brought offshore and not onshore.
7 And that really has a direct impact in regards to benefits
8 of those stakeholders, when there's taxation that can take place
9 on land. When there are businesses such as ANSCA Corporations,
10 Land owners, municipalities, Tribal governments' ability to tax
11 onshore can be taken advantage of, can as an arrangement of
12 doing business. That looks like a very slim thing that's going
13 to happen now.
14 The Federal government has indicated through talking --
15 that two individuals that had to fight for land on the Trust,
16 known as a Native Allotments under 1906-1926, that their
17 allotments are very valuable in oil and gas. And that you need
18 to prove that they're not valuable in oil and gas and subject
19 to, you know, certain processes. Now that the push has gone for
20 offshore, those opportunities and those events will not -- and
21 shows that they will not take place.
22 The people that have Native Allotments, the businesses
23 that own property onshore will lose. Oil formations are, you
24 know, look like saucers filled with liquid, you know, those
25 round plates. And so when you go to the middle and use a straw

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 and you suck on it -- you know you get everything in that
2 saucer. But the edge of that saucer is right at Wainwright,
3 Point Hope, Point Lay, Barrow, Katovik. And there aren't
4 taxation by the State and others. So they go where there's
5 cheaper and that's what they were interpreting.
6 When we confront and indicate that is a concern that we
7 have they say, oh there's nothing. There's just little puddles
8 over here and we got no interest. Where's this government
9 documentation that indicates, you know, this? So we see this
10 development taking place offshore and, you know, we miss out as
11 a major stakeholder. And so onshore is something that should be
12 looked at and utilized to the maximum extent. And in the
13 meantime, you know, try to determine what type of infrastructure
14 that you will use to transport that oil.
15 We had said no to Alaska Native Claims Settlement Act. We
16 received only ten percent of the land that we have used, that we
17 own. We have not addressed the ownership of the ocean. We feel
18 we own the ocean. That is ours. The definition of Alaska we
19 feel it still needs to be interpreted and defined. Whether it
20 be something done by the Russian government, something done by
21 the Department of Defense through Public Landowner 92 or the
22 three mile Alaska boundary.
23 And so we've gone to court, saying the ocean is ours.
24 That belongs to us. You've got to deal with us. And there are
25 rulings that have been made over years, since the late 70s, have

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 been -- we don't have to address this. We don't have to give
2 you a decision now. We'll wait and decide on this from a
3 different case that has been addressed to us and brought to our
4 attention. And so that's been going on for years now.
5 So we feel we still have ownership of the ocean and still
6 have that claim and have the authority to regulate, the
7 authority to tax. And that hasn't taken place now. So this
8 human right is being violated as we speak, and we need to have
9 this addressed. As I had indicated earlier during our
10 discussions that we have dealt with the United Nation sector on
11 our Human Rights regarding Prudhoe Bay, the environmental
12 impacts, the economic impacts that have taken place. What was
13 taken from our oil away from us, the monetary value, being taxed
14 in regards to the reduction in animals. So that's one of the
15 things that we are, you know, about to address and are concerned
16 about.
17 The impacts from previous spills like the Exxon Valdez
18 still had -- really had a severe impact on the red fallrou (ph)
19 which is what we refer to as a south rook (ph), a little bird
20 that is about a little longer than this, that is red. It's a
21 sandpiper type of bird that when it swims in the water it goes
22 in circles. That used to be a bird that was -- that had one to
23 several hundred feet thick and 52 hundred feet in height running
24 miles along the beach, and the form of waves when they'd fly.
25 After that Exxon Valdez spill we never saw that again.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 There's very few of those birds around. And that used to be
2 something that we had to get for our grandmothers because it was
3 tender meat and they enjoyed that very much. So we took great
4 pride as little kids to gather those birds for our elders to
5 eat. And so there has been some impacts in regards to animals
6 that have taken place on these disasters in the past and we feel
7 that there hasn't been enough studies for the Chukchi Sea, the
8 Beaufort Sea. As to who exactly did all these technical reports
9 for the Beaufort Sea and the Chukchi Sea is still unclear and
10 as to whether they're reliable or not.

11 The ones that I noticed in regards to the Beaufort Sea
12 were done by an accounting company, KPMG, through a contract.
13 And so as to whether or not that information is accurate or not
14 is unclear. Furthermore, they're old and that has already been
15 admitted to the Environmental Impact Statements. Baselines
16 haven't been established.

17 There's no way that you can clean up an oil spill in ice.
18 The impacts are far too great. There are no revenue sharing
19 arrangements. There's no corporate social responsibility. We
20 have no control. Decisions are being made by the North Slope
21 Borough, by the State of Alaska, regardless of their
22 relationship between Federally recognized Tribes and Federal
23 agencies regarding the Coastal Zone Management Program and other
24 programs.

25 So all of this is very much premature. I don't know why

1 we're going beyond the basic concerns about cleaning up an oil
2 spill in the middle of winter and bad ice conditions. For ice
3 scourging is something that has been looked at thoroughly in the
4 80s where the ice rubs against the ocean floor and the patterns
5 shown what effects it has on wildlife refuges and those animals
6 that are protected within those, whether it be the muir (ph) or
7 something else.

8 The areas that has some concerns in regards to the whaling
9 ships that have sank off of the southern part of this lease sale
10 area. The water is very shallow. And when you look at flows of
11 anything, when something is wide, the flow is slow. When
12 something is sharp it's just like an -- shallow is just like an
13 hour glass. So everything moves real quick. And different
14 times of the year just by the, you know, the physics -- the
15 physical risks you know -- 100 feet times 75 feet versus one
16 mile deep. The patterns and the flows of that oil will hit --
17 portend and we might not see the real impacts, but our relatives
18 will, from Wainwright and the villages all the way to Canada
19 where it's shallow and then where it mixes into deeper water.
20 What agreements have been made and were they done with our
21 consent?

22 Are we going to welcome those whaling crews that will lose
23 their ability to whale when there's a spill and come over here
24 and compete with us through this term, good neighbor policies
25 that have been established since 2000, which has not been told

1 to anybody. Very little is known about it and what was done
2 with it and what the status is and whether something is still
3 there.

4 We would like to have existing EIS's and other reports
5 incorporated into this EIS such as for seismic. The
6 Environmental Assessments and the findings and no significant
7 impacts in regards to authorizations for taking of animals for
8 seismic purposes through the National Marine Fishery Service and
9 the U.S. Fish and Wildlife Service which has a different set of
10 regulations that have these methodical, categorical exclusions
11 involved where they don't involve legitimate addressing remedies
12 and correcting those findings that have been made in the form of
13 an Impact Statement.

14 And we have gone to court with that in the past and lost
15 several times because of those loopholes and the interpretations
16 that have been put into Federal Register that took away from
17 Federally recognized Tribes and renamed non-governing
18 organizations and municipalities as communities that has a
19 identical figure as Federally recognized Tribe and the
20 exploitation of those regulations that have gone and been
21 utilized up to this date.

22 As time went on, these adjustments have been made. We
23 haven't been consulted with that and haven't gone beyond a
24 consultation phase. And we do understand that we are having
25 this Trust relationship that we are trying to end and work with

1 each other and trying to move in a right path to ensure that we
2 benefit both ways in the future. And the technology doesn't
3 show that we have that there and taking those big risks offshore
4 at this time to the methods that are being proposed in the
5 Environmental Impact Statements that have been drawn up already.

6 And so, again, I do, encourage you -- you look offshore --
7 I mean onshore first -- look offshore when you have the
8 technology. But, as far as I can tell, that technology isn't
9 there. The response isn't there whether you can cap a well,
10 before it freezes too much is unclear. And to be going at it
11 again the following year when it melts off and there's open
12 water.

13 It's still too soon. And there are other arrangements
14 that can be made. And I feel that you need to honor and
15 implement your Federal regulations in regards to looking at
16 environmental concerns. Also the international flaws like the
17 Law of the Sea and whatever else is applicable. Again, with
18 migrating animals and such and I find it really surprising that
19 the Chukchi is being looked at when there are other locations
20 that could be taken advantage of, whether it be the Kotzebue
21 Sound or whatever.

22 So I am really, you know, confused as to the location
23 other than what we've been told that, you know, it's the largest
24 oil deposit in the world. And because of your responsibility as
25 the Federal government toward us indigenous peoples, starting

1 from the time the (indiscernible) filed lawsuits from the time
2 that Jacob Adamson filed his lawsuit back in 1977 in regards to
3 the banning of harvesting bowhead whales and to the decision
4 that was made, which was somewhat controversial because of the
5 decision was said that, because the International Weather
6 Commission is going to make a decision next year, we feel that
7 we will not take a position that there's a significant impact in
8 regards to oil and gas. And therefore, we'll dismiss this case
9 with the understanding that you'll be able to whale next year.

10 So, you know, all of these decisions that have been made
11 are really controversial. We are not the only village -- we're
12 not the only Tribe to have filed in the court in regards to the
13 ocean. ICAS Native Village of Gambell, Nome Eskimo Community,
14 Native Village of Akutan, Native Village of Eak (ph) have all
15 filed lawsuits and claim ownership to the ocean, in regards to
16 their subsistence activities and their way of life and the term
17 that they had used which was imminent threat and the Federal
18 government's interpretation in dealing with imminent threat
19 doesn't apply until you turn that stone on the ocean floor
20 versus what Bush Administration saw, term on how we use that
21 phrase.

22 So there are these things that we need to have addressed
23 and we need to be at the table. I am unaware of any
24 participation in dealing with the Endangered Species Act. Bruce
25 Babbitt had given an example on how the Endangered Species Act

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 worked where everybody comes to the table, draw the lines, where
2 development is going to take place. Where subsistence is going
3 to take place, where the animals are going to take place, how
4 it's going to impact and come out with a conclusion and a
5 process and after that's done, it's hard to come back to the
6 table. That was Bruce Babbitt's explanation of the Endangered
7 Species Act and how that process works. I am unaware of that
8 taking place, haven't heard of it taking place here in Point
9 Hope. I haven't heard of it taking place with the Inupiat
10 Community Arctic Slope. I feel that there has been things that
11 might have been done without our knowledge regarding the State
12 of Alaska and we need other non-governing organizations that
13 poses to have authority over us as Federally recognized Tribes.

14 And so we have Human Right issues. We are concerned about
15 our future. And you know it all falls back on, you know, can
16 you clean it up, it be capped and we shouldn't even bother with
17 it. We have wasted a lot of time talking about small portions
18 of the Environmental Impact Statement, different types of
19 animals, different types of things when we know that we can't
20 clean this up. That it can't be done safely. And we haven't
21 seen the regulations that have been announced and the
22 reassurances that have been given by the Department of Interior
23 indicating that these regulations have been changed. We haven't
24 seen that. So we haven't been able to give an opinion as to,
25 you know, what has changed if anything at all. And we really

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 can't afford to starve and that's what we have at risk.

2 The people in Cook Inlet, their herring has never
3 recovered. The subsistence hasn't really recovered. They have
4 had a real hard time. They've never been compensated for over
5 20 years adequately. We don't want that to happen to us.
6 There's too much of a risk. Exhaust what you have onshore
7 before you go offshore.

8 Re-look at how you're doing this and put these guys back
9 in their places because Edwards versus Morton, which was a case
10 that involved the trust relationship of the United States and us
11 regarding the impacts and the exploitation by transnational
12 corporations such as British Petroleum or Atlantic Richfield.
13 And the responsibility of the United States to protect us and
14 our interests have already been decided on through that case.
15 And we feel that still needs to be addressed. As far as I know
16 our legal representation has not addressed our trust
17 relationship in regards to indigenous peoples. The First People
18 versus the trust relationship with the general public. And
19 those are two different animals all together, still not real
20 clear understanding in regards to that but it has been asked on
21 Congressional record in regards to EPA and NOAA in their trust
22 relationship only toward the general public, not to our
23 Federally recognized Tribes.

24 Our legal representation, to our knowledge, has not
25 addressed this trust relationship yet. And I don't know when we

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 will, if we will. But we are working on a trust relationship
2 and we need to continue to do that. We do not like court cases.
3 We don't like going to court. It takes a lot of our energy and
4 a lot of our time. I could be watching my favorite TV show now.
5 And -- but no, we're talking about this and we don't have this
6 relationship. You know they have no -- companies haven't even
7 partnered with us fully. We don't have a royalty management
8 system in place. We haven't established our environmental
9 regulations. We feel the regulations that are being done by the
10 State under its Coastal Zone Management program and their own
11 regulations have a conflict of interest. And the State is not
12 fulfilling its obligation. And they won't, because they have
13 this constitutional thing that deals with equality. And they
14 don't respect the sovereignty of tribes and culture.

15 So I have more to say but I can't think of anything right
16 away. Again you know we didn't have much time to completely
17 review. It's hard to imagine who is delegated to gather the
18 birds, to gather the mammals, to get the walrus and clean it and
19 let it go. That portion of the Environmental Impact Statement
20 is very confusing. Some of it is semi-blank. They have certain
21 delegation. There's only two organizations that can deal with
22 birds, rescue the birds. I can't go out there and rescue a bird
23 if there's a seal. The same goes for mammals. There are
24 delegated groups assigned to do that. They don't have the
25 technology to deal with a 2,000 pound walrus which happens to

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 have 30 other friends with him and they're all real tight, just
2 like a gang, a family. And they're very aggressive when you
3 insult one of them. So there are, you know, concerns that we
4 have. And I hope we continue to move forward and try to come
5 out with a way that will work. But at this time it doesn't look
6 that way.

7 And I hope that all these other reports are incorporated
8 into and these concerns that are incorporated into this and that
9 they are responded. The Environmental Assessments that have
10 been made regarding seismic completely ignored Tribal concerns.
11 They only addressed and responded to non-governing organizations
12 such as the Alaska Wilderness League, The Center of
13 Biodiversity, the Natural Resource Defense Council. Those big
14 groups are the only ones that have been responded to by, you
15 know, governmental entities in these Environmental Impact
16 Statements. And Tribes need to be addressed too.

17 The North Slope Borough isn't the only authority to be
18 responded to. They have interests and they have conflicts of
19 interest also. And when the government tells them to do
20 something, they have to do it. And we had some very interesting
21 Governors in the past. They're not very trustworthy. And they
22 don't look out for our interests. They look out for Alaska as a
23 whole. And regardless of the impacts, and we seen that. Red
24 Dog has been the number one polluter in the United States for
25 six years straight. And it's going to take 40 years to clean up

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 that mine and ten years of follow-up. And there's a lot of
2 money involved with that. And they're expanding on that thing.

3 With that I thank you for allowing me to testify and
4 please keep this file open for additional comments and I really
5 look forward to mending our trust and our responsibilities. We
6 don't like to be adversaries in the world of -- world wrestling
7 and two cave men. And I want to be your wrestler. Thank you.

8 MR. LOMAN: Thank you very much sir -- appreciate it.

9 MS. FRANKSON-HENRY: Leaving? I agree with Mr. Schaefer.
10 This is Aggie Frankson-Henry, for the record. F-R-A-N-K-S-O-N
11 hyphen H-E-N-R-Y. I believe there should be an extension if
12 Environmental Impact Statements allow the coastal villages that
13 are impacted. As you know that -- there may be not very many
14 people that are educated with seismic testing in the Bassett
15 (ph) house -- to the people and the marine mammals. Is Albert
16 Barros still with --?

17 MR. LOMAN: Albert retired. He went back to the Nesperth
18 (ph) Reservation.

19 MS. FRANKSON-HENRY: Is there another person that has his
20 spot?

21 MR. LOMAN: Yes -- Michael Haller -- right there.

22 MS. FRANKSON-HENRY: Okay. For the record my
23 Environmental Impact Statement is dated November 2, 2010.
24 Bureau of Ocean Energy Management Regulation and Enforcement. I
25 had attentioned it to Albert Barros, Bureau of Ocean Energy

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Management Regulation and Enforcement Community Liaison, cc
2 Jeffery Loman, Deputy Director of Bureau Ocean Energy Management
3 Regulation and Enforcement. Is that your current title?

4 MR. LOMAN: Yes ma'am.

5 MS. FRANKSON-HENRY: This is regarding opposing the Arctic
6 Multi-Sale in the Beaufort Sea and Chukchi Sea planning areas
7 oil and gas lease sale 193, 209, 212, 217 and 221. For the
8 record, I'm Aggie Frankson-Henry, a Tribal Secretary and Tribal
9 member of the Native Village of Point Hope.

10 I am opposing the Bureau of Ocean Energy Management
11 Regulation and Enforcement decision on the proposed action for a
12 multiple sale EIS for the Chukchi Sea Sales 193, 212 and 221 and
13 Beaufort Sea's lease sale 209 and 217. And I support
14 Alternative One, Beaufort and Chukchi Sea, no lease sale.

15 I am an Inupiat mother, wife, daughter, aunt, Tribal
16 member of the Native Village of Point Hope, and most of all a
17 whaler and harvester dependent on the Chukchi Sea and Beaufort
18 Sea for means of survival.

19 Being Inupiat is an inherit freedom to hunt, harvest from
20 the vast frozen seas to nurture my family and extended families
21 across Alaska and Lower 48. The Chukchi and Beaufort Seas
22 provides nutritional food supply on my table without any after
23 taste of spilled debris from oil and gas. As stewards of the
24 ocean, I believe there is not enough traditional knowledge and
25 scientific studies to support the lease sales. With that said

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 please, no lease sales.

2 Tikigaqs, Point Hope, Alaska, oceans is a land of
3 opportunity to preserve my culture. Because of climate change,
4 this generation is faced with for a healthier ecosystem balance
5 for bowhead whales, walruses, polar bears, seals, ducks, fishes,
6 birds, crabs, plankton, oysters, clams, seaweed, worms, killer
7 whales, nor-whales, right whales, beluga whales, grey whales and
8 all the marine mammals of these two great oceans the Chukchi and
9 Beaufort that we the people of Point Hope are blessed with.

10 The Bureau of Ocean Energy Management Regulation and
11 Enforcement must conduct scientific studies before a lease sale
12 must be proposed for a lease sale. My question is, how can you
13 clean all the oil on ice? How can you make sure that trillions
14 of oil that may be leaked from a well be cleaned and managed in
15 a 40 to 90 mile hour gusting wind? As we all know, as Inupiat
16 people of the Arctic we cannot even think of surfing the oceans
17 because our lives would be endangered by the great seas. Based
18 on current agriculture in Valdez, Alaska, it is not my best
19 interest to harm this great State with offshore oil, gas
20 drilling around the Chukchi and Beaufort Seas.

21 And based on the facts of the current agriculture in the
22 Gulf of Mexico, the impacts and damages brought forth into the
23 United States of America from the Gulf of Mexico and Valdez oil
24 spills, it is not my interest to harm these oceans that this
25 great nation is dependent on. The natural resources that are

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 impacted by proposed spilled debris from oil, gas and toxic
2 chemicals in which is an imminent threat to our ecosystem and
3 marine life, as well as the people of this great State of Alaska
4 who are dependent on the two great pristine oceans, the Chukchi
5 and Beaufort Seas. I oppose the industrial development along
6 the Chukchi and Beaufort Seas.

7 I am voicing my right to life, liberty and equality. I
8 believe this great State, the Federal government agencies and
9 industrial servants can find other means of resources to benefit
10 the economy like wind and water generation to fuel the economy.

11 I am an Inupiat and I love to eat my traditional meals
12 that are delicious, healthy and nutritious in which are provided
13 naturally by the great seas along the Chukchi and Beaufort Seas.

14 I am an American who strives to survive in this harsh climate
15 through traditional knowledge and very dependent on the
16 resources along the seas. I oppose the industrial development
17 along the Chukchi and Beaufort Seas.

18 Once again I am opposing the Bureau of Ocean Energy
19 Management Regulation and Enforcement's decision on the proposed
20 actions for a multiple sale EIS for the Chukchi Sea Sales 193,
21 212 and 221 and Beaufort Sea Sales 209 and 217. And I support
22 Alternative One, Beaufort and Chukchi Sea, no lease sale. Thank
23 you for your time.

24 MR. LOMAN: Thank you very much. Anybody else that hasn't
25 testified like to make a comment before we close? I would like

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 to thank everybody for coming. We appreciate your time. We
2 know that there are other events and activities in the community
3 tonight. We apologize for having to hold this meeting during
4 those activities and we appreciate the time you sacrificed and
5 the comments you've made. And we hope that you've learned and
6 we've shared some information that was helpful to you. Thank
7 you very much. This hearing is closed.

PROCEEDINGS

(On record at 7:35 p.m.)

MR. LOMAN: Good evening everybody and thank you very much for taking time out of your lives to attend this meeting.

The purpose of this meeting -- my name is Jeffery Loman -- I am the Deputy Regional Director of the Bureau of Ocean Energy Management Regulation and Enforcement, formerly called MMS. Our Agency is going through a major reorganization. The reason that we're here tonight is to comply with a Court Order from the Alaska District Court that involves our environmental compliance with respect to the National Environmental Policy Act.

The National Environmental Policy Act is a law that was signed by President Nixon and it does several things. It is designed to be open and involve the public when a Federal Agency intends to take a major Federal action. A major Federal action could be building a bridge, building a road, relicensing a hydropower project, building a large facility of any kind. And the Federal government is funding or it involves a lease that the Federal government has to approve.

In this case, the major Federal action was a oil and gas lease sale in the Chukchi Sea. That sale took place after the Agency had completed an Environmental Impact Statement in February of 2008. And the government issued, after that lease sale, 465 leases for a total of about \$2.6 billion. Shell Oil was the largest winner of bids and is now the largest lease

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

holder with about a \$2.1 billion investment in leases in the Chukchi Sea.

Our approval of that lease sale was challenged, in part, on the grounds that we did not comply with the National Environmental Policy Act, and the case went before the Alaska District Court Judge Beistline. And the judge ruled in July of this year that the Agency had done an adequate job of most of the aspects, but did not appropriately analyze natural gas development. And there are incentives for national (sic) gas associated with these leases.

And the Agency needed to do what -- an analysis under section 1502.22 of the NEPA regulations, on about 40 pages of excerpts from the original -- original final EIS that talk about uncertainty, missing information to (indiscernible) gas, things of this nature.

That was put before the court in Plaintiff's Exhibit 129. And it has things -- for example, like there is -- it makes a statement. There is uncertainty associated with the population structure of the bowhead whale. And, in this case, because this written between 2004 and 2007 sometime, the International Whaling Scientific Committee was still debating whether or not there were multiple stocks like the Bering stock and the Beaufort stock or other stocks of bowhead whales. Since that time, the Scientific Committee for the IWC has concluded that there is one stock.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 So this 1502.22 analysis is kind of using a little bit of
2 logic here. What's the context of the uncertainty, assuming it
3 still existed? Does it have any implication to Inupiat hunters,
4 Inupiat whalers? We don't think so. Inupiat whalers have been
5 conducting those activities for a long, long, long time. And we
6 know of no reason why the Inupiat hunter would be concerned
7 about whether or not they were hunting a bowhead whale that was
8 a member of the Bering stock or a Beaufort stock if multiple
9 stocks existed.

10 Now the Scientific Committee has concluded there's one
11 stock. But more importantly is what's the context of it with
12 respect to making decisions about offshore oil and gas leasing,
13 exploration, seismic exploration, exploratory drilling and
14 things of that nature? We think there is no context there. It
15 wouldn't make any difference anyway.

16 But those kinds of statements existed in that document and
17 the court, we think correctly, said, you should explain whether
18 or not that information is necessary and has implications to a
19 decision on offshore oil and gas activities -- whether or not
20 it's obtainable, easily obtainable, and whether or not the costs
21 of obtaining it is exorbitant.

22 And -- so, how do we do that? Well we do that by doing
23 more NEPA. And these NEPA lawsuits involve -- if an Agency
24 loses you either, do NEPA where you didn't do NEPA, do more NEPA
25 or do NEPA right where you didn't do it right the first place.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 That's how the plaintiffs win in a NEPA lawsuit.

2 In this particular case, the court remanded us to conduct
3 these activities. And we're doing it by preparing -- starting
4 by preparing a draft Supplemental Environmental Impact Statement
5 which we have prepared and released and sent to various
6 stakeholders, individuals and organizations in the communities
7 throughout the Arctic in Alaska. And we have copies of that
8 document with us tonight, if you desire to take a copy and read
9 it. We're going to explain a little bit about it here in a
10 minute.

11 But before I go any further, just wanted to have the folks
12 that are with me introduce themselves starting with Mike and
13 then we'll go a little bit into the court remand, explain the
14 document and then take your testimony. Go ahead.

15 MR. ROUTHIER: Sure, hi -- my name is Mike Routhier and
16 I'm fairly new at the Agency, but I worked on these NEPA issues
17 so that means I basically help write the documents.

18 MR. PETERSON: My name is Bob Peterson. I'm Chief of
19 Resource Economic Analysis Section. I'm a Geologist. Most of
20 the people in my Section are geologists, geophysicists and
21 engineers. And we provide a lot of the information that -- Mike
22 would then build on for the impacts of the statement.

23 MR. LOMAN: And we'll go on with a little more detail on
24 that.

25 MR. PETERSON: Sure.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. HALLER: I'm Mike Haller and I'm the Community
2 Liaison. I'm new to the Agency, but not to Alaska.

3 MS. WARREN: I'm Sharon Warren, Program Analysis Officer
4 for the Bureau in Anchorage.

5 MS. CODY: Mary Cody -- I'm a Wildlife Biologist for the
6 Agency.

7 MR. CALLAHAN: My name's John Callahan and I'm the Public
8 Affairs Officer for the Alaska Region. And I'd like to take a
9 few photos tonight. Is that all right with everyone?

10 MR. LOMAN: We were watching Predator while we were eating
11 dinner at the Cully Cafe. So I want to flex my muscles if I
12 can. Let's -- and it's for Judy who is our Reporter -- we'd
13 like to have you introduce yourself and at least last night it
14 worked pretty good. One shot at introducing your name and the
15 spelling of your name. She may ask you again if you testify and
16 have questions, as well. Starting with you ma'am.

17 MS. ANNISKETT: My name is Lily Anniskett.

18 REPORTER: Could you speak up, please?

19 MS. ANNISKETT: My name is Lily Anniskett. If you want me
20 to speak up, I've got something on my lip. I've got a pus. My
21 name is Lily Anniskett from Point Lay, lifelong resident. I
22 went to boarding school and I love it at Point Lay and I'm going
23 to protect my land.

24 REPORTER: Okay, can you spell your last name for me?

25 MS. ANNISKETT: A-N-N-I-S-K-E-T -- my husband was from

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Metlakatla. Yes, that's the way it's --.

2 MR. LOMAN: Thank you.

3 MR. FERREIRA III: I'm Leo Ferreira the Third. I'm Native
4 Village Point Lay (indiscernible) President.

5 REPORTER: Would you spell your last name?

6 MR. FERREIRA III: F-E-R-R-E-I-R-A.

7 MR. LOMAN: Sir?

8 MR. TRACEY SR.: Bill Tracey Senior, T-R-A-C-E-Y. So now
9 you know there's no relation to Dick.

10 MR. LOMAN: Or John?

11 MR. TRACEY SR.: Or John. Thirty-eight year resident.

12 Presently Fire Chief, (indiscernible) Pusher, and a very
13 interested resident about all these offshore leases going on.

14 MR. LOMAN: Thank you. Sir.

15 MR. LISBOURNE: Robert Lisbourne, L-I-S-B-O-U-R-N-E.

16 Resident here at Point Lay -- (indiscernible). We do a lot of
17 hunting, whaling, fishing, subsistence hunter.

18 MR. PIKOK: Perry Pikok, P-I-K-O-K, (indiscernible)

19 fishing, longtime resident at Point Lay.

20 MR. HENRY: Jack Henry is my name.

21 REPORTER: I'm sorry, could you spell your last name?

22 MR. HENRY: H-E-N-R-Y.

23 REPORTER: Thank you.

24 MS. TRACEY: I'm Marie Tracey. I work on North Slope

25 Borough Village, Communications Liaison for our Mayor's Office.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 I'm a Volunteer Fire Fighter in which I am a Captain. I'm a
2 Volunteer EMS Captain, 24-hour Volunteer, Ambulance Co-member.
3 I'm a Volunteer Coordinator under our Volunteer Search and
4 Rescue. I'm an NASTEC Director for our Native Village of Point
5 Lay. I was born here in the old village. Thank you for coming.
6 And I would like you guys to spell your names, too.

7 MR. REXFORD: Hello, my name is Julius Rexford. I moved
8 here back in '94, '93. Came here, on and off since 1983,
9 chasing the job. I'm the Alaska Eskimo Whaling Commissioner for
10 Point Lay. I (indiscernible) workers in Point Lay and I also
11 sit on the Alaska (indiscernible) Whale Committee, as a member.
12 I'm the Search and Rescue President and Public Works Supervisor
13 for the North Slope Borough.

14 REPORTER: Could you spell your last name, please?

15 MR. REXFORD: R-E-X-F-O-R-D.

16 REPORTER: Thank you.

17 MS. NEAKOK: My name is Lucy Neakok, N-E-A-K-O-K. I'm a
18 ASRC Village Resource Representative. And I'm also the Native
19 Village Appointment (ph) Secretary.

20 MR. LOMAN: Thank you. Sharon can you tell us a little
21 bit about the decision out of the Alaska District Court on this
22 lawsuit, so folks understand why we're here a little bit better,
23 than I can explain.

24 MS. WARREN: Okay. I put on the table the two Court
25 Orders that came out concerning the case. Again, the case was

1 filed of January, 2008, before the lease sale was to be held in
2 February of 2008. So the Judge, when the lawsuit was filed,
3 there wasn't, like, an injunction filed with it to stop the
4 sale. So the sale went ahead and was held in February of 2008.

5 And, so the lawsuit was still at the District Court and
6 over time it stayed there. And part of the reason why we have a
7 decision that you may think of, you know, it's February 2008,
8 sale happened and we get a decision out of the court in July of
9 2010.

10 Why, you know, why did it take that long? The reason why
11 it took that long is because there was another case concerning
12 Sale 193 in the D.C. Circuit Court over the Secretary's five
13 year program. So the Secretary when we -- before we have a
14 lease sale, it's within the five year program. The Sale 193 --
15 Chukchi Sea Sale, was in that five year program. And the
16 Department was sued by the environmental organizations
17 concerning having that sale, as well as other sales in that five
18 year program.

19 And there was -- the Chukchi Sea Sale was in there, plus
20 two more sales in the Beaufort and two more sales in the Chukchi
21 Sea. So the Secretary was told in that lawsuit that he had to
22 look at the environmental sensitivity when they're looking at --
23 the (indiscernible) Lands Act requires looking at environmental
24 sensitivity. And that wasn't done to the Court's satisfaction.

25 So this District Court case for the sale -- this Judge

1 didn't make any decision on that. And because, if the Secretary
2 decided once he looked at the five year program again, not to
3 have that sale in there, then the Court wouldn't have to decide
4 on this one, because it was in another Court. So it's very --
5 in several Courts I mean that's how decisions of the sale that
6 was.

7 So when the Secretary of the Interior came out with his --
8 affirming his five year program again in March 31st of this year
9 2010, he did a preliminary revised program. It kept Sale 193
10 still there in that five year program. But he took off, out of
11 that five year program, the two Beaufort Sea Sales and the two
12 Chukchi Sea Sales. So the only sale that would be in the Arctic
13 would be the one that had already happened. The Department was
14 not looking at any more sales during this five year period of
15 2007 to 2012.

16 So once that was made, then the District Court knew that
17 the Secretary was going to leave the sale as is. And so that's
18 why the District Court now decided to take on back the, you
19 know, look at the case and look what we did with the
20 Environmental Impact Statement. And so in July 21st the District
21 Court first issued the decision, an Order saying, as Jeffery
22 said, that, for the most part, we, the Bureau, had met its
23 obligations under NEPA. And the only places that we did not
24 meet those obligations was that we didn't consider the natural
25 gas. And we didn't consider the missing information and the

1 cost to obtain that missing information.

2 So the Court told us, and that's why this EIS is a -- you
3 notice it's a supplement. And it's small because it's focused
4 on just what the Court has remanded. Because all the other
5 issues that was raised by the governmental organizations, the
6 Native Village of Point Hope, Brett (ph) Oil, Inupiat Village --
7 Community of the Arctic Slope, were also litigants, plaintiffs
8 in the lawsuit. The Court looked at all those arguments that
9 were made there. It said, the Federal government, you know,
10 prevailed on those issues. But you need to go back, the Federal
11 government, and take care of these others.

12 So that's why the Supplement was done and that's why it's
13 just focused on those areas. The original EIS that it
14 supplements is still there. So all the information and Mike
15 will go into more on how the Supplemental EIS is done.

16 What's going to happen is that once we have the draft
17 Supplement, take public hearing, and take comments on it, then
18 there'll be a final Supplemental EIS. And that will be filed
19 with the District Court. Because the judge still has the case.
20 So that'll be filed with the District Court. And the District
21 Court, in September of 2010, also set out what the schedule of
22 when he wanted us to reasonably meet that -- his Order and he
23 has a court date of January 21, 2011, six months from the first
24 decision Order to say, you know, -- six months you should be
25 able to reasonably, you know, meet this -- fix these

1 environmental compliance issues.
2 And so once it gets filed with the District Judge, the
3 parties that sued the Federal government, is going to be able to
4 see the document also the documents behind it that went into
5 preparing that document. The attorneys, the legal
6 representation will be filing briefs back and forth and why it
7 needs it, why it doesn't need it. And then the District Judge
8 will say whether or not it meets it. And so, I mean it's a long
9 court process that we've been in. But the District Court Judge
10 will hear it on the points filed.

11 MR. LOMAN: Any questions about the court case in this
12 litigation? Yes.

13 MR. REXFORD: When Point Hope filed their lawsuit and
14 (indiscernible) also filed an Injunction which would have
15 stopped the lease sale, that's what I assumed.

16 MS. WARREN: Right. There was a lawsuit -- to get an
17 Injunction there's criteria that has to be met. And there was
18 just a recent lawsuit that was filed with Sale 202 which was a
19 Beaufort Sea Sale. And they filed an Injunction on that one and
20 the Court didn't --.

21 MR. LOMAN: Grant it.

22 MS. WARREN: Didn't grant it. And so, I don't know --
23 that's a legal strategy move for that party. And why or why not
24 they decided, I don't have the answer. I mean, that would be
25 something that, you know, to ask them or their legal --.

1 MR. REXFORD: Just one quick add to that. If the
2 Injunction, was like (indiscernible) lawsuit was rejected, does
3 that reject the whole suit?

4 MS. WARREN: No, no, no, no, it doesn't. No it doesn't,
5 no, not at all.

6 MS. ANNISKETT: The one that the State allowed to drill,
7 is that Exxon, the one where it got (indiscernible) and all the
8 other ones were, like, rejected or (indiscernible)? Yeah, the
9 sale of Exxon Mobil, like \$8 billion?

10 MR. LOMAN: No.

11 MS. WARREN: No.

12 MS. ANNISKETT: Over on the Beaufort Sea?

13 MR. LOMAN: No, the Exxon Mobil is not drilling anywhere
14 in Alaska's Outer Continental Shelf.

15 MS. ANNISKETT: Is that option actual?

16 MR. LOMAN: Point Thompson.

17 MS. WARREN: Oh, Point Thompson, that's the State, that's
18 the State of Alaska. That's through the State of Alaska.

19 MS. ANNISKETT: Oh, okay. On land, you said?

20 MR. REXFORD: Well, it's inside of the Barrier Islands.

21 MS. WARREN: Yeah and that's the State. The Outer
22 Continental Shelf starts at three miles and goes to 200 miles.
23 So, from three miles to 200 miles. So the State of Alaska,
24 their jurisdiction is from shore to the three mile.

25 MR. REXFORD: Well, to the Barrier Islands then.

1 MS. WARREN: Right from Barrier Islands out is where it's
2 measured at. So that's all -- that's under State.

3 MS. ANNISKETT: So they could only drill from three miles
4 from shore to 200?

5 MS. WARREN: Yeah and it depends on the Barrier Islands.
6 It depends on how they do the boundary of bays and all that
7 other, where the measurement starts. But, yeah, but Point
8 Thompson where they're drilling is State of Alaska.

9 MS. ANNISKETT: Do you know where the leases are up there
10 like Shell Oil and maybe ConocoPhillips?

11 MS. WARREN: Uh-huh (affirmative).

12 MS. ANNISKETT: They've been here and now we have been
13 taking belugas here and now taking walrus and -- when we're
14 sent locations and, you know, where the tags, satellite tags go
15 like the beluga and the walrus -- and it shows that they would
16 go out there. That seems like that, around their feeding
17 ground, maybe, out there. And those are where those leases are.
18 Plus, right around the sand spit here, there are like, polar
19 bear dens. I know that my son had come across one and the mother
20 had charged at him. And he shot the mother bear through the eye
21 because it charged at him. And now the baby is now at the
22 Anchorage Zoo.

23 MR. REXFORD: San Diego one.

24 MS. ANNISKETT: Oh, San Diego?

25 MR. REXFORD: Yeah.

1 MS. ANNISKETT: Okay.

2 MR. REXFORD: To warmer climates.

3 MR. LOMAN: Mike could you talk a little about this
4 Supplemental Environment Impact Statement that had to be
5 prepared?

6 MR. ROUTHUR: Sure thing. So the Judge asked us to do
7 more with the analysis, those issues that Sharon talked about.
8 And so we started to prepare a Supplemental Environmental Impact
9 Statement which we feel is -- pretty in-depth analysis and the
10 process also allows us to come out to all the communities and
11 hold meetings like this. It's a pretty focused document in that
12 it just addresses the issues that the Judge told us to address.

13 The first one of those was providing analysis of the
14 environmental impacts of natural gas development and production.
15 We didn't do that in the original document. After the original
16 document was published, some circumstances changed. And by the
17 time the Judge looked at it a couple of years later, he said,
18 well, you know different circumstances now. You got to --
19 really need to do that.

20 So we set out to do that analysis. So, to understand the
21 environmental effects of natural gas development and production,
22 we needed to know what kind of -- what exactly the activities
23 would be. And so to get an understanding of a reasonable
24 scenario to give something to our scientists to analyze, we
25 talked with our geologists in the Resource and Economic Analysis

1 Section of our office. Bob, here, leads that Section. So I'll
2 turn it over to him then to give you some more background.
3 MR. PETERSON: So that's where I get to comment and
4 especially let our geologists, you know, with the basic starting
5 point is, okay, we've already analyzed the oil. Do we see a
6 potential for gas out in the Chukchi Sea? And, if indeed we do
7 -- so we have to build a reasonable model for Mike's group and
8 others to have something to study. And, indeed, you know, we're
9 able to say here's a reasonable area in the Chukchi where we
10 have large structures. We think there's a reasonable chance of
11 oil and gas being there. We've already studied the oil and the
12 question is, okay, if there's major gas accumulation there and
13 the reason we put them together is oil has much greater value.
14 We still don't believe that gas -- a gas deposit, on its own,
15 could make it economically. So we think it would be associated
16 with an oil deposit where you had the added value of the oil
17 that would pay for an awful lot of the infrastructure. And then
18 gas development would be economic, you know, sort of
19 piggybacking on top of this oil accumulation.
20 We picked somewhere reasonable in the Chukchi, you know,
21 60, 80, 90 miles offshore, provided that the amount of drilling
22 oil and gas wells now would -- could be investigated. Of course
23 we're now looking at not only an oil pipeline to shore, but we
24 would have a parallel gas pipeline that would come on at a later
25 date.

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 And let me -- I should make that point too. The most
2 reasonable development would be oil first and later gas. When
3 you develop a field that has both, you want to get the maximum
4 oil out so when the gas does come out of the ground, just like
5 at Prudhoe Bay. The gas has been pumped back into the
6 subsurface to keep the pressure high to get more oil out.
7 What happens then, of course, we hit the shoreline. And
8 the first thing we analyzed in the first Environmental Impact
9 Statement was the fact that you got to have a major shore base
10 and a major oil pipeline, several billion dollars worth of
11 infrastructure on shore. After a certain number of years,
12 around 15, your oil rates are beginning to climb. That's when
13 you begin to look at gas development. You would have additional
14 onshore infrastructure on the first line. You'd be, of course
15 prior to that, building a gas pipeline along the same right-of-
16 ways the oil pipeline. And the reasonable place for these to be
17 would be to tag -- to go across NPRA and hook into the current
18 infrastructure at Prudhoe Bay. The oil would, of course, hook
19 into the TransAlaskan Pipeline. The gas -- well, I don't know
20 yet -- Denali Line. All Alaskan Pipeline, who knows. But the
21 scenario would be a gas line hooking into that infrastructure.
22 Certainly a lot of environmental impacts were analyzed.
23 We also provide -- as I say -- I'm the Chief of Resource and
24 Economic Analysis. We also looked at some of the economic
25 aspects of this. And we would anticipate somewhere around a \$4

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 billion onshore investment infrastructure. Some would come
2 earlier with the oil and the oil pipeline. That would be taxed
3 at the similar level we anticipate to what's at Prudhoe Bay.
4 And supplying -- I think between \$2 and \$250 million a year in
5 tax revenue to the North Slope. And then, at a later date,
6 you'd see a second expenditure as the gas infrastructure came
7 on.
8 So that's the -- you know, a reasonable what we think
9 could be discovered -- how it would be developed and how that
10 accumulation, that field, you know, would flow into the current,
11 well, flow into the system. Now having done that, we can now
12 have something specific that Mike's group can go, okay, now we
13 have something specific to analyze and examine the effects of.
14 MR. ROUTHIER: Yeah, now our scientists know, basically,
15 what could be entailed with the natural gas development, where
16 we go forward. And so, basically, we handed off that scenario
17 to our scientists, our Oceanographers, our Marine Mammal
18 Biologists, our Economists, all those people. And ask each one
19 of those to give their forecasts of the type of environmental
20 impacts that could result as -- result of those activities. And
21 we documented all those forecasts in this document.
22 Basically, this document -- we summarized some of the
23 findings and some of the facts from the prior original document,
24 you know, because we're building off that document. We're
25 supplementing the document. So we summarize after context and

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 then we do specific analysis on that for gas development, you
2 know, installation of pipelines, things like that. And then
3 give the potential impacts of natural gas production, so its
4 normal operations through the years. And that process really
5 got at the first part of the Judge's brief.
6 The second part of the remand again was, the Judge found
7 that the Agency didn't do a sufficient job going through the
8 stipulated procedures for dealing with incomplete or missing
9 information. And basically he said, listen, just go back and
10 follow the procedures. All right, go through that exercise
11 again. Follow the procedures right, this time.
12 We had a pretty long list of these statements, these items
13 that implicated missing or incomplete information. That's the
14 exhibit that was alluded to before.
15 MR. REXFORD: Julius Rexford, for the record. Who did the
16 Environmental Impact Statement for the Chukchi Sea?
17 MR. ROUTHIER: That was our Agency in 2007.
18 MR. REXFORD: And, what -- what vessel did they use out in
19 the Chukchi Sea to do that Environmental?
20 MR. LOMAN: Vessel?
21 MR. REXFORD: Yes. Was there any ships or anything out
22 there to do studies?
23 MR. LOMAN: There have been ships and studies in the
24 Chukchi Sea.
25 MR. REXFORD: Which vessels were out there to do the

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 studies?

2 MR. LOMAN: MMS has a vessel. What the heck's the name of
3 that thing?

4 MS. CODY: Fairweather's out there now.

5 MR. LOMAN: Fairweather, that's not ours.

6 MS. CODY: That's not ours. (Indiscernible).

7 MR. LOMAN: We have one. I'll think of the name in a
8 minute. But others and there have been -- you know, people say
9 amazing -- they know more about Venus than the Chukchi Sea. And
10 then you take a certain type of fisheries, or a certain type of
11 fish. And then, you know, they don't enough or they don't know
12 anything about it. Then you start looking and some of the
13 information is dated, a little bit old. More recently, because
14 of Sale 193, MMS has focused their attention on a lot of studies
15 in the Chukchi, maybe more now than ever before. But it's not
16 some black hole where we know nothing about like you read in
17 some of the major media outlets.

18 We were just down, at the beginning of this trip, talking
19 to the Native Village of Kotzebue. They're involved in a ring
20 seal study, working with NOAA on it. They have no idea that that
21 money comes through our Agency. All told, MMS and now the
22 Bureau of Ocean Energy Management Regulation and Enforcement has
23 spent well over \$300 million and studied the Arctic environment.
24 But we're not the only Agency or organization or entity that has
25 studied the Arctic environment. There have been many others.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 The North Slope Borough's library -- we had a meeting the other
2 day. Half of that library -- just, you know, a casual look, is
3 literally those studies that we've produced and they don't have
4 anywhere near all of them.

5 There is a lot of information, an incredible amount of
6 information. Will we gather more? Yes. It's under way. More
7 yet, yes. But there have been many, many vessels that have been
8 involved in scientific studies in the Chukchi Sea since the
9 early '60s. or maybe even before.

10 MR. REXFORD: I mean the Japanese and the Chinese are in
11 our waters with American scientists. And this is what we're
12 finding out in our Alaska Small Whaling Commission meetings.
13 And they're letting the United States -- was the only one that
14 had one in Arctic waters. And they're saying it's going to be
15 another six years before we get a working ice breaker which --
16 this is a long ways away, six to ten years.

17 I just want to echo some -- one of our elders' comments,
18 that has passed on. This is Point Lay, S-09 Table (ph) 54,
19 public hearings leading to offshore development have taken place
20 in Point Lay between 1975 and 2009. These hearings include
21 traditional knowledge regarding the traditional migratory routes
22 of subsistence resources, statistical hurdle to, without fail,
23 response observed effects of noise pollution on marine mammals,
24 cumulative effects of oil and gas development and current ice
25 conditions.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 The importance of the annual beluga harvest, including
2 maintaining the ability to protect their seasonal moves is
3 evident from comments made at public testimonies from 1987 to
4 2007.

5 In response to exploratory seismic operations, Point Lay
6 residents have expressed their concerns regarding the
7 accumulation of subsea noise pollution, pipe for offshore oil
8 and gas development. For example, in 1987 Willie Tugarook (ph)
9 testified regarding this concern.

10 I've seen the same thing happening in Kotzebue. The
11 belugas hardly going to Kotzebue Sound anymore, where they used
12 to be numerous. It might be too drastic noise pollution, but I
13 think some kind of a study should be made and included in the
14 Draft Environmental Statement before this lease sale takes
15 place. Willie Tugarook (ph) 1987 Sale 109, Point Lay. Thank
16 you.

17 MR. LOMAN: Thank you.

18 MR. NEAKOK: Not only Kotzebue Sound but also -- but the
19 port studies there. Kivalina used to hunt belugas. And -- but
20 now, you know, they're having a tough time, last 10 years after
21 they extended the port -- that dredge out or even when they
22 built the port, or started to build the port they started losing
23 their belugas. Migration would change for them. And they would
24 have to go way out -- the belugas have to go way out just to get
25 away from the noise.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 And also, just like what's going on at Cook Inlet, you
2 know, they're almost gone right now. When I was a little boy I
3 used to go out to, you know, Ship Creek and watch all the
4 belugas. You know, there would be hundreds of them, thousands
5 of them. Today you can almost hardly see 50 because of what's
6 going on with the Cook Inlet, you know, and all the oil
7 platforms and everything, all the noise, all the ship traffic
8 that's going in and out of the Port of Anchorage. And now that
9 they're moving up, you know, that has to be a sound, with all
10 the ships. They're losing their belugas. They have to go way
11 out there.

12 Now Kivalina -- they're going half, you know -- they're
13 losing their subsistence food because of the noise from the Red
14 Dog Port. And now you want just to come up here and start
15 drilling and we know that can happen to same thing to us too.
16 We've been hunting belugas ever since, what 1979,
17 '78, '79, maybe even earlier. And I don't want to lose my
18 subsistent food just because, you know, western civilization
19 wants to have oil or gas.

20 I know there's still quite a bit here on land somewhere.
21 But going out there, you know, rerouting our belugas because of
22 -- you know, their migratory routes they have taken for
23 thousands of years. I don't want -- I just don't want to see
24 that happen to us. I've talked with people down there in Cook
25 Inlet area that hunts belugas, used to hunt, you know, without

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 getting a permit. Now they need a permit because they can't get
2 -- the belugas are endangered because, you know, all the oil and
3 gas, you know, noise that's going on down there.

4 You know I'd sure hate to have my grandkids or great-
5 grandkids start to have permits just to go hunt belugas because,
6 you know, they're so far and few in between if this thing
7 happens. You know we have a lifestyle here that we're adjusted
8 to. We live it every day. Global warming is right around the
9 corner, as we all know, because that ocean out there should have
10 had maybe one or two feet of ice already. You know, we still
11 have open water out there. And after that, you know, we're
12 going to have that -- maybe that Northwest Passage going to be
13 opening up. And that's really going affect our way of hunting,
14 our way of subsistence living, because of the oil. I mean, not
15 the oil exploration but, you know. ship traffic.

16 You know, and also you okay a pipeline that's going to be
17 going from the oil platform or whatever occurs, which I hope not
18 because. you know, I'm adamantly against, you know, offshore
19 drilling. You know, if it goes to that, you know, we got oil
20 pipelines going underneath, you know, the ocean bottom. Then
21 they come in on shore. Then we have, what, five, 600 miles of
22 pipeline. That's going to affect the migrational caribou. I'm
23 worried about the caribou, too.

24 Migratory birds, you know, they're going to have pump
25 stations in between. I know that, as they do with the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 TransAlaska Pipeline. But, you know, it's -- you know I've
2 started be a victim of what's happened -- been going on with
3 Cook Inlet, Kotzebue Sound and Kivalina.

4 You know, I don't want us to lose our way of life that
5 we've been living for thousands of years. And, that's just me
6 you know. I love this country. I love this State and I love
7 this nation, but you know.

8 And you can find an alternative ways of, you know, energy
9 -- there's quite a bit out there. We've got smart scientists
10 out there that can turn corn into fuel. You know, it's just --
11 it's just staying out of that and especially for this area here.
12 Especially when Beaufort Sea -- I'd sure hate to see them lose
13 their, you know, traditional way of whaling of bowhead, food
14 that we need, each and every year, to sustain us during the
15 winter.

16 As for us -- beluga, we harvest our beluga every year.
17 And we need that to sustain us, you know, during the winter. It
18 keeps us warm, fed, our families fed. You know, we just only
19 spend like \$20, \$30 on shells. But then when we try and buy
20 alternate food like steaks or hamburgers or french fries, you
21 know, they go over -- like five, six, \$700, maybe over \$1,000
22 every year. And here it only takes us \$20, \$30 worth of shells,
23 you know, to sustain us with beluga. Or even bombs that we need
24 to harvest bowheads with this, you know. You just don't want to
25 become a victim of western civilization because of oil

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 exploration and your drilling.

2 Because I'm sure I can see what's going to happen, you
3 know, like what happened in the Gulf of Mexico. And with the
4 Exxon Valdez, those people are losing a lot. Here we're going
5 to be losing everything. We live off the ocean. We live off
6 the land. And if an oil spill happens out there, we have no
7 more belugas. We have no more bowhead. We have no more seals.
8 We have no more fish. We have no more migratory birds. And
9 also, you know, if they say they're going to come through and
10 make barriers so the oil won't go into our lagoons, someday it
11 might be too late. Then we'll lose everything on land. I'd
12 just -- sure hate to see that in the future. That's just the
13 worst case scenario that I might be thinking of, or what we
14 should be thinking of. Because that -- that ocean currents out
15 there go all the way around Beaufort Sea, Arctic Ocean, Chukchi
16 Sea, Bering Sea. It goes all up and down this coast, west coast
17 of Alaska.

18 I know it might be small and I might be a small and
19 insignificant person talking. But, you know, I just don't see
20 what's going to happen, worst case scenario when you know it's
21 going to happen. Because this affects not only me, not only my
22 grandkids, but my great-grandkids, all our great-grandkids.
23 Because I want them to enjoy what I enjoy today. I love my
24 Native food. I love to fish, hunt. And I sure can't lose that
25 just because they, you know, haven't found ways of getting oil

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 and gas to the market. Like I say, I love this State. I love
2 this nation. but we're going to be the victims if something
3 happens like what happened in the Gulf of Mexico and, you know,
4 Prince William Sound. Thank you.

5 MR. LOMAN: Thank you. Did anybody have any questions
6 about the Draft Supplemental Environmental Impact Statement?

7 MS. TRACEY: If they don't give their testimony, do they
8 have another time to do that?

9 MR. LOMAN: Well we're taking comments.

10 MS. TRACEY: Tonight?

11 MR. LOMAN: Yes ma'am. We're taking comments until
12 November 29th.

13 MS. ANNISKETT: I'd ready to give mine. I'm a skin sewer.
14 I use the animals for fur. I make the (indiscernible) from
15 Point Lay, a long time resident. I've gone to boarding school.
16 I'm a Point Lay Corporation Shareholder, a Secretary. I'm a
17 North Slope Borough full Board Alternate. I'm a SAC, North
18 Slope Borough School District Member, a Native Village of Point
19 Lay member in the Council and a member of St. Elfin's Episcopal
20 Church.

21 And I don't know where to start. I feel like there's not
22 enough facts to approve sales for drilling. We have a whole --
23 again, I have -- repeat this about a hundred times -- migratory
24 area, the whole area -- animals, fowl, mammals, fish, walrus,
25 polar bears. And if they do have an oil spill, the winds -- the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 wind's going to play a big part of it -- the danger of inhaling
2 due to asthma residents. I feel like the Exxon was unfair to
3 fishermen, the money due to them. I don't think they were
4 adequately paid, if they were at all.

5 This would hurt the animals, the bird hunters and animals.
6 They use birds, seals, et cetera. I need to put my other
7 glasses on. My glasses are too weak. Okay, the animals that
8 were hurt with oil, which were badly covered with oil or they
9 were killed from the oil spill. We have tagging animals like
10 Marie said. These animals are all important to us.

11 This whole area is a feeding ground for the wild animals.
12 I love my land and want to protect it from harm. I feel it is
13 my responsibility as a subsistence hunter and user. I sew. I
14 use the fur for clothing, for example seal, polar bear,
15 wolverine skins. We use the wolf for mukluks and bottoms. And
16 we use the wolf skin, wolverines for trimming our parkas due to
17 the cold weather. We have caribou. We use the sinew to sew.
18 It's like the thread. And the caribou for the tops of the boats
19 and for parkas and skin socks. We use the fur of the caribou.
20 And we eat the meat of the caribou, due to our limited income in
21 our village. That really is -- they fix berries, cranberries,
22 blueberries, salmon berries -- the food we eat, beluga, duck,
23 seal. Seal we make for our oil, we take care of in the summer
24 for the whole winter. The beluga -- salmon -- we do have
25 fishing salmon. We do have whaling. We do have fresh water

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 grayling.

2 And, if there was ever an oil spill, it would really
3 damage our water area. I feel like our water, our water lake.
4 And from the caribou, we dry the meat for the winter and put it
5 away. So these are really important stuff. As a woman, we take
6 care of all these. And you have a hunter that goes out hunting.
7 The urooaguk (ph) we use for covering skin boats and the caribou
8 to sew -- the sinew.

9 Don't worry, I don't have lots, as much. And I want to
10 express our beluga annual hunting. It's a big thing for this
11 village. And we had just recently got a quota for whale. And
12 there is a procedure and a way that we do for beluga. We have a
13 meeting and we get all the captains and co-captains for each
14 boat. We sort of try to figure out how many boats we're going
15 to have and we all have -- we all elect. We have a meeting date
16 and a church blessing for our beluga hunt or walrus or bowhead.
17 And the Captain is picked by the residents. So it's very
18 important for us to listen to our Captain. We have to show
19 respect. We work with our Native Chief. We're informed --
20 someone's always watching out for the wild animals when they
21 come in. We collect gas for hunters. And there's a whole
22 procedure of how do we go out hunting. So it's not just what we
23 hunt out there. We try to show respect for our land. And we
24 have buoys with harpoons, which we have to take care of. And
25 the guns -- and there's rules of how we have to shoot and

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 harpoon the beluga.

2 And all this we teach our younger people and haul them
3 into the shallow water in the lagoon. There is a certain order
4 we give. And we listen to the Captain when he says to shoot.
5 And then we haul the belugas to cutting hill. Then, when it's
6 nighttime and they haven't slept for hours, they go home and go
7 to sleep. And then we have the youth, which watches out for
8 belugas across there. And then next day we start cutting.
9 Everyone is responsible to go and help. And with -- to cut up
10 with our ulus and knives. And we divide all the belugas to how
11 many house -- houses we have in the village. And this is all
12 the rules we have to follow. It's just not one big picnic.
13 It's a lot of hard work. You have to be permitted. And we
14 really respect this land. And we try to respect each other in
15 what we do.

16 I can't think of anything else. But I'm sure I'll think
17 about anything. But this sewing is really important to me
18 because I'm a skin sewer. And we do need all these warm parkas
19 when we go out whaling. Very important to us for the wolverine
20 and wolves, the animals and the seal to make mukluks and mittens
21 and parkas, jackets. And you have to know how to sew. Real
22 important where you don't have oneself or your family and you
23 have to pay someone to sew. So it's very important to know that
24 knowledge of how to make a boat, a skin boat and the outboard
25 and the gas and the ski-oods. And, everybody have their own

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 little part in whaling. So the Captain is always the head of
2 each whaling crew. And it's real important that people listen
3 to him and how to respect. We have Inupiat values which are
4 very important to us. Thank you.

5 MR. LOMAN: Thank you. Thank you and I have a question
6 Lily. You talked a lot about communication that takes place
7 between the people who are involved in subsistence activities.
8 And so I have to believe, but I would ask you. The terms in the
9 Inupiat language that are exclusive to those activities, if you
10 weren't conducting those activities, that part of the language
11 wouldn't be used right? You have no other reason to say some
12 certain words about certain actions?

13 MS. ANNISKETT: In everything we do we use Inupiat values.
14 We have some up there and my dad's -- one of them when he was
15 younger was charity. I won't say what (indiscernible) was
16 changed to certain thing. We used to worry, worry night, day.
17 Deal with life, serious situations. We have -- we were taught
18 to respect the elders, very important. And if you don't teach
19 that it's a shameful thing to see.

20 And we have men that teach our younger generation which we
21 do a lot of with the beluga and whaling. But I think that we
22 can do more in taking out the youth in caribou and showing them
23 how to cut the caribou and not waste. The elders always remind
24 you, do not waste. We had Charlie Tuckville (ph) who was always
25 taking a part to show people if he sees someone wasting

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 something that, you know, he scolded them on the CB or go to
2 them and tell them. Almost everything we do in life we have law
3 -- laws that we listen to under respect for the people.

4 UNIDENTIFIED MALE: There's over 100 words to explain
5 types of cheong (ph). Hundreds of good words in our language.

6 MS. ANNISKETT: It's easier for us to understand what is
7 happening in your family. It's more -- it's not -- the thing
8 is, you could only say certain words and it means just a little
9 handful of stuff. But Inupiat, it could mean a lot of stuff,
10 you know. All of our hunting we have back from generations to
11 generations and all sort of to take care of your neighbor, and
12 share.

13 MR. REXFORD: Ice conditions in the oceans there's
14 hundreds of terms to use in what type of ice conditions.
15 There's hundreds of terms for the ocean of ice. Just like the
16 snowing -- we have hundreds of ways to interpret what type of
17 snow and the condition at sea. And how it connects to the sea
18 ice when the snow falls onto it. There's terms that we use.

19 MR. LOMAN: But you mentioned that young people learn to
20 respect certain and have -- and develop values for things, not
21 waste things. In your experiences, anyone, did subsistence
22 activities teach you things like being patient?

23 MR. REXFORD: Yes.

24 MS. ANNISKETT: If you don't get a duck bird, I could be
25 vicious.

1 MR. REXFORD: When I first started hunting, I used to
2 (indiscernible) and the ducks would already have gone over.
3 But, then, later on I got more patient and, like duck hunting,
4 or waiting for caribou. There's certain places where we go and
5 just sit down and wait for caribou that -- they come around.
6 And, same with fish. We know the currents, certain winds that
7 the fish don't come in. They don't go in the current. They go
8 towards the current. Same with the beluga. When we drive them,
9 we have to know that the current is coming out of the lagoon not
10 going in. Otherwise, they will not follow the current into the
11 lagoon. And there's a -- it's all -- it came through
12 traditional knowledge. One year we had a strong current going
13 in south, southeast wind. There was -- we had hundreds of
14 belugas in front of us and they were not going. We tried
15 pushing them. They weren't going to go in. This traditional
16 knowledge of the currents, you need to know them in these areas.
17 I mean -- have you studied the currents in the Chukchi Sea yet?

18 MR. LOMAN: Very recently, through some pretty amazing
19 technology you can actually go online and get some data on
20 currents, real time now. And I have to believe that this is
21 going to advance -- you know the advances in IT technology are
22 increasing so fast, if you draw everything, all technology since
23 the beginning of man -- we don't know long ago that was, but
24 let's go back a 100,000 years. And we draw it on a graph -- if
25 we put it on a wide graph, it looks like everything happened

1 yesterday compared to all those tens of thousands of years
2 before we got to the telephone. And that would be the one that
3 you dial it, you know. And since then, all of these things that
4 we have in our pockets and our hands that we look for this
5 information, but all of those things don't, at least for me, do
6 much for my welfare. Don't teach me patience, probably the
7 opposite. Don't teach me manners. Teaches me bad manners.

8 But, you know, part of this law NEPA requires us to take
9 public comment and be open about what we're doing. We talked
10 earlier about 40 pages of scientific uncertainty that was listed
11 in the old document. I think we'll always be learning about
12 what subsistence activities mean to the people and to their
13 well-being. You can learn it but you can't really understand it
14 and it can't be in a meaningful way without really, you know,
15 really talking to people and seeing what it really means to them
16 like this opportunity here today.

17 That means a lot more if and when I'm back in Washington
18 D.C. or any of us and some decision maker wants to make a big
19 decision like they did on the Chukchi Sea Sale. They don't have
20 the opportunity like we do, forced by this law to come up and
21 talk to you. And the other thing that NEPA does, it requires
22 you to analyze the effects on human health. And human health
23 now, by the international term, and we believe that it's true --
24 means well-being.

25 So, you know, I talk to people and I don't know exactly,

1 because I didn't grow up in this community. I grew up in a
2 different reservation environment where some people practice
3 subsistence lifestyles but, you know, it's subsistence important
4 with respect to dealing with things like sadness, loneliness,
5 these kinds of mental health that involve our well-being. It
6 seems to me, when I talk to people, it does. People are much
7 more excited about hunting season, whaling. I've seen in Barrow
8 even older men, like my age, getting very excited like kids
9 about the possibility of spring whaling. And so those are the
10 kinds of things that we bring from these meetings that are most
11 important.

12 MS. ANNISKETT: You could feel it in the air when there's
13 nothing there and everybody's moving. Everybody's running.
14 Everybody's doing something. You could feel it, the excitement.
15 Everyone sees and there's a different climate.

16 MR. REXFORD: Anyway I'd like to --.

17 UNIDENTIFIED FEMALE: Did you make copies?

18 MR. REXFORD: Can I read these out, the ones I read
19 earlier in the prior meeting?

20 MR. LOMAN: You bet. Let's get them on the record.

21 MR. REXFORD: Yeah my name's Julius Rexford, for the
22 record. What are the areas where oil activities should be
23 excluded before and during beluga whaling and bowhead whaling?
24 Where's Lucy?

25 UNIDENTIFIED FEMALE: She's gone to make copies of -- she

1 go get the copies.
2 MR. REXFORD: Should she have my --
3 UNIDENTIFIED FEMALE: Originals?
4 MR. REXFORD: Yeah.
5 MR. LOMAN: She steal some pages?
6 MR. REXFORD: Well she took my -- the ones I had with the
7 answers. I had answered them on it.
8 MR. LOMAN: I remember the answers. You ask the
9 questions. I'll give you the answers because I remember it from
10 earlier. What areas? All the areas where those subsistence
11 activities are taking place with those research --
12 MR. REXFORD: I mean -- we can just sit down.
13 MR. LOMAN: Here she comes.
14 MR. REXFORD: Do you have a copy of my papers?
15 MR. LOMAN: We need the answers.
16 MR. REXFORD: Okay. What are the areas where oil
17 activities should be excluded before and during beluga whaling
18 and bowhead whaling? That answer is simple, stay out of the
19 ocean, the whole Arctic Ocean.
20 What are the time periods when oil activity should be
21 excluded? April, May, June and up to July 20. If companies
22 wanted to keep their vessels or drilling equipment in that area
23 during the exclusion periods, where should the equipment or
24 vessels go? One hundred miles out.
25 Is there a limit on the number of operations that should

1 be allowed before the exclusion period begins? One operation at
2 any time.
3 Are there any restrictions that need to be applied to
4 vessel transits? They should be monitored through COM Centers
5 in each Chukchi Sea Village, Point Hope, Point Lay, Wainwright,
6 Barrow, well before going into the Beaufort, to Barrow, Nuiqsut
7 and Kaktovik.
8 Are any other restrictions needed? Zero harpoon
9 discharged 100 mile buffer zone, very (indiscernible) activity
10 and quiet period from April, May, June, July and July 20. And
11 quite period in the fall, September 10, was the date we had
12 selected between Point Hope and Point Lay. But Wainwright was
13 different.
14 Okay, going down to Item E, Point Lay, at the completion
15 of the Point Lay beluga hunt, then seismic can begin. Hunt
16 Coordinator will make a call to operators about start
17 (indiscernible) into the Chukchi Sea after the hunt or until
18 July 20th, you know. The day of the hunt, beluga hunt day -- if
19 we're done with the beluga hunt before the July 20, we just make
20 a call to the operators, offshore operators, to say, we're done
21 with our beluga hunt.
22 And when we presented this July 20 date back in '09,
23 during the '09, to Shell Oil Company, they said they wouldn't
24 sign the CAA with that date. And that they -- they threatened
25 us with not opening our Town Center, which they didn't open it.

1 Nobody worked. We didn't mind. We didn't want their money
2 anyway. And it didn't happen. So, they went through with their
3 threat. They put -- three people were out of a job, so -- but
4 they were open -- they had their Council to open this year.
5 Okay Point -- it says same as Wainwright.
6 Point Hope -- stop whaling in end of May. If ships come
7 by around July 20, that would be fine with Point Hope. Support
8 other villages. Vessel should be required to transit well
9 offshore, yes, 30 to 50 miles offshore.
10 Monitoring Needs. Should the AEWG require monitoring of
11 additional subsistence resources? Yes. All of the other marine
12 mammals should be monitored. The bearded seal is used for the
13 skin of the umiaq. And the spotted seal blubber is used to oil
14 the umiaq frame.
15 Should the AEWG put the oil industry on notice that a
16 comprehensive baseline study program will be needed starting
17 next year? These were written up in, I believe, '09.
18 Kaktovik and Wainwright, Barrow, Boroughs to the northeast
19 of Barrow, September 10 to end up whaling season, same as
20 existing CAA, generally 30 miles away. Submit and follow a
21 schedule of operations with the AEWG.
22 Same as four. Ensure that no unmitigable adverse impacts
23 -- language be included. Also need the safe harbor language
24 from CAA. No Captain Hazelwoods.
25 And, I don't know if you are familiar with how the CAA

1 started with -- started back in, I don't know April
2 (indiscernible) I believe? And it was because of Nuiqsut and
3 Aktu (ph) were the most impacted communities at the time. And
4 CAA just -- it's been an agreement between the AWC and the oil
5 industry, basically to, you know, so that the whalers could have
6 a safe hunt. And bountiful hunt to that harvest of whale for
7 whales in the safe manner. And, in the past, in the Beaufort
8 Sea, there was drilling going on in Camden Bay. And my uncle
9 lives in Nuiqsut. His name is Archie Akiokmak (ph). He was
10 former Commissioner for Nuiqsut AWC (indiscernible). And
11 retired last year due to health problems. And he said, when
12 they were drilling in Camden Bay and seismic going on in that
13 area they were at, they took a whale. But they were 30 miles
14 out.
15 And then the big winds came and they had to cut their
16 lines and let the whale go -- to go, you know, for safety. For
17 safety -- life, health and safety is more important than the
18 whale.
19 And I've been in situations -- we're in fog whaling in
20 Barrow where 11 boats unhooked and we stayed hooked up on an 18
21 foot boat. And 11 boats -- I mean these were the big boats that
22 unhooked. Mr. Tom Brower, his whale we were towing and our boat
23 started unhooking and going around the point while we were still
24 towing. Seven boats were the only ones that towed the whale in.
25 But we got -- when we got there, it was breaking waves on the

1 beach and (indiscernible) I don't know how long to the beach.
2 We endured some, you know, it was the biggest year of the whale,
3 which we did. The whale was 52 feet and it was shared between
4 seven, eight, with the people that cut it up. So it was a
5 pretty good -- good sharing that day.

6 And I'm against offshore exploration and drilling, period.
7 I believe we have enough gas and oil on land to sustain our
8 needs and the United States for years to come. And that
9 drilling in our ocean is one of the biggest risks that the
10 United States is going to take.

11 And unknown conditions here can have hurricane force
12 winds. Some years we had winds up to 70, 75 miles an hour. And
13 these drill ships, they say they're going to jack them up sixty
14 feet above the water. But, can they sustain heavier waters --
15 heavier salt waters from the wave action? I mean you said the
16 salt salinity is higher above surface and in cold surface --
17 cold surface salt water and it's heavier. And with the wave
18 action, it can move anything. And someone else should come too.
19 Thank you.

20 MS. ANNISKETT: Lily Anniskett. There was a death in
21 Point Hope where else our -- the whaling Captain and his crew or
22 family would be here also. But they chartered -- elder that
23 passed away.

24 MR. LOMAN: I thank you.

25 MR. REXFORD: Thank you.

1 MS. TRACEY: These different oil companies that come to
2 our region, that come to the (indiscernible). They talk to us
3 about wanting to preserve our culture and preserve our
4 historical sites. And yet, at the same time, we believe that
5 the ocean is our culture and our historical sites.

6 For years now we come past -- we used to have our caribou
7 meat for our whole family, for our whole village -- feed the
8 village. That was our main meat dish. Now, with the scarcity
9 of the caribou not coming around to Point Lay, we depend heavily
10 on our sea mammals for food. And it scares us to death, almost
11 to death, that people that don't live around our area, want to
12 come up here and drill and make rules for us and say, okay,
13 we're going to drill in your ocean, whether you want us to or
14 not. And here we are we're talking and asking you not to do
15 this against our wishes. But you'll do it anyway.

16 We talk about wanting our grandkids and their kids to and
17 grandkids to hunt the meat, what we are presently eating. We
18 work hard for our food like my sister said. We dry meat during
19 the summer. We make oil during the summer. And every season
20 it's a different season of different types of food. And we
21 don't have gardens to grow anything. The ocean is our garden.
22 It provides us food. And recently, after 73 years, we had
23 gotten a whale. We praise the Lord for that. And that day was
24 a lot of food for the winter.

25 But without beluga hunt, when we herd the beluga with

1 boats, and the whole village participates. And this is how our
2 young ones learn from us that we learned from our elders. And
3 we continue to teach our young ones how we do things, how our
4 ancestors do things, that they had been doing for thousands of
5 years.

6 And now, with the scarcity of ice in our ocean, the
7 changing of our weather and the changing of tides, I guess the
8 whole world had heard about our walrus hollow. People were
9 calling here on the phones. Our phones were ringing. People
10 were calling and saying we want the truck -- we would like to
11 rent a truck when we get off the plane in Point Lay. And we
12 would like to rent a boat. And we would like to take these
13 people and go to the walrus.

14 We want to -- and we want to come and take out the
15 tourists and come and fly over the walrus so that they could
16 take pictures. We've had polar bears down there while the
17 walrus was here. They're stampeding, natural stampeding and we
18 don't need the two-legged race racing down there to take
19 pictures, just to show what we have here. We've been trying to
20 protect the walrus here and try to keep them from stampeding.
21 But then, at the same time, we can't keep the polar bears or
22 bears away from them. When the wind is right, we can smell
23 them. The stench is very strong. And if there is no ocean and
24 the wind is right you can smell them. If you can't hear them,
25 and you could smell them, then you know they're nearby.

1 MR. REXFORD: If you've been near a big farm, that's what
2 they smell like.

3 MS. TRACEY: Anyway, we've had pregnant women walking
4 outside, they're trying to vomit. That's how bad it was. But
5 then, at the same time, it was good to have them here. We could
6 hear them. When you're outside, they're loud. They're like a
7 real loud crescendo, you know, and then they don't have anybody
8 doing this for them, like the orchestra or the bands, you know.
9 I mean, they're like, wow. You know, and very harmony. I mean,
10 you know, each one of them wanted to be louder than the other.
11 But we go into our houses and we try to sleep, but we could hear
12 them.

13 It's a beautiful song. But then the scarcity of ice down
14 there, it kind of scares us. I mean they were like tens and
15 thousands and thousands of walrus down there on the beach.
16 And what they do, is that they crowd there next to each other.
17 And they're crowding out each other and the beach would get
18 full. The sandy beach would get full of walrus. And there
19 you could see walrus out there in the ocean. And they're
20 still coming up to the beach. And then once they're on the
21 beach, they're being pushed up to the grassy area. And then as
22 more come up to the beach, more walrus are getting pushed up
23 onto the grassy area. Boy, this is a sight to see.

24 It was beautiful. I -- you could see -- it's like you
25 know when you see the ocean, you could see brown -- brown spots,

1 brown lines in the ocean. Just -- it's all walrus. You know,
2 you could see their tusks when they come up and they're -- and
3 the ones nearest land they're big. I mean, they're huge. You
4 know, and they're moving and the ones that were tagged, the ones
5 that we have seen, that they have sent us the direction that
6 they would travel, we've seen them go to that same area where
7 there's lease sales out there. You know, like Shell Oil and
8 ConocoPhillips and the other industries. And it's probably the
9 only reason they go out there is probably to feed. And that's
10 around the area -- the beluga too. They take beluga.

11 And recently for three years and this was the last year
12 that the Loon Project was done by University of Alaska
13 Fairbanks. Vizo (ph) and his crew were here. Every summer for
14 three months they were coming here and camping out there and
15 taking pictures. You can see the one up there -- there's a new
16 picture over here. You know, they -- satellite based on them
17 and then they send us the migration or the -- it's amazing.
18 Some of these go to Malaysia, I mean. And then there's -- you
19 know, some of them go down south and (indiscernible). It's
20 amazing. I mean, I'm glad these people come and take the
21 walrus, the beluga, the loons, the seals, you know. What can
22 I say but say, thank you? I have a lot of information. But now
23 I'm kind of getting a little overwhelmed now.

24 But then all these things get passed down to us from our
25 ancestors. And we learn from them and then we teach the young

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 ones that they want to learn from us, you know. So we do our
2 best to try and teach them. And every season is a different
3 season for us. Different mammals, different animals, different
4 kinds of birds, but the ravens are always here.

5 But I would like to thank you, guys, for coming here to,
6 you know, get our input on our village, our village life and the
7 animals and mammals and fowls that we have here. I know this is
8 such a strange place for you guys to be. But I see bears
9 walking out there -- and the weather does get worse than this
10 so, you know. It's just our way of life and we love it here.

11 I was born in the old village down there. Yeah. And I,
12 as soon as I turned six I went to Wrangell to go to boarding
13 school. And then I graduated from eighth grade from there. And
14 then I went to Chimal (ph), Oregon for high school for four
15 years. So I was away from my hometown, my parents, for nine
16 months out of every year. So, that's the story of my life. But
17 I really missed my parents, you know. I recently lost my Dad --
18 simply become sick. And he did a lot of hard work for us. You
19 know, like hauling coal from up-river for our winter supply.
20 Getting ice from the pond, ice pond, and bringing it into the
21 ice cellar for the spring, for springtime during breakup. And
22 it's just, a lot of the stuff that happens here is very awesome.
23 You know, if you don't live in a small village. And in a small
24 village you have to help, you know, and that's just life here.
25 Thank you.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Well, thank you.

2 MS. ANNISKETT: Our father just went to -- fifth grade and
3 they thought it was very important for us to get educated so
4 they sent us out. We were poor and when we were young, when we
5 had dog teams, my Dad was able to find a job at the Dew Line.
6 Jobs were rare in the (indiscernible). That's part of the
7 situation people like to move out also. But we love to care.
8 Thank you.

9 MR. NEAKOK: You know we talk about traditional knowledge
10 and how you know you folk's western civilization. But we talk
11 about -- we tell you folks what we do -- how we live -- how we
12 live during each season. We pass it on to you yet when you go
13 back to Washington you know traditional knowledge couldn't
14 (indiscernible) anymore. That's how I see it because you know
15 (indiscernible) and that kind of (indiscernible). Nuiqsut they
16 have their traditional knowledge. They told me it's why it's
17 complicated -- this is where we get up -- this is where the
18 migration of the caribou come. This is where the bowhead
19 migrate to the ocean. These are where the ducks molt -- these
20 are where the fish you know come every summer -- every fall --
21 every winter yet when Washington hears about it you know it
22 seemed like you know kind of (indiscernible) our land. That's
23 how it is.

24 And here Nuiqsut you saw the (indiscernible) to what a
25 company. They lost their fishing for some of them. They lost

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 their caribou. They have to go out past the pipeline in order
2 to hunt. In the past before the oil companies came they were
3 able to go out there and shoot a caribou. Now they have rules --
4 - regulations. Traditional knowledge for them went out the
5 door. Why should (indiscernible) turn to hear about it. Or
6 think what they hear about it. Now they're surrounded by three
7 sides and now they want to close their backdoor to them -- threw
8 it out there in the ocean in the Beaufort Sea. I feel for those
9 people that hard to go and pay eight or nine dollars a gallon --
10 you know what (indiscernible) whaling have 2.52 gallon here
11 (indiscernible) -- even cheaper than they do in Fairbanks.

12 Again you know traditional knowledge seem like doesn't
13 matter in Washington. Yet it matters for us because we live it.
14 It was passed on from generation to generation. It's not even
15 written -- passed by word of mouth. That's how we survived up
16 here in the cold and the darkness with the bugs. All the
17 mosquitoes. They try to (indiscernible) use different stuff to
18 you know heal ourselves. The different plants that we need --
19 the different berries where to pick them. All passed down by
20 word of mouth. You know we just (indiscernible) maybe
21 Washington to see traditional knowledge in small letters.

22 You know I (indiscernible) just last month. It hasn't
23 really (indiscernible) on the North Slope to be subjected to
24 what's happening in (indiscernible) right now but now they want
25 to -- like I said earlier -- now they want to close them off

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 through the ocean. Just like the surrounded by western
2 civilization when they could be proud of Inupiat. You know they
3 got their dividends from the oil and gas land but
4 (indiscernible). You know their land that they lease every year
5 to the oil companies. Pretty hard to see that you know why
6 Inupiat values over there we talk to NOAA but yet they still
7 have it in their heart -- in their minds. This is how we do
8 things. This is how we seclude. They still have their hunting
9 -- their whaling -- their fishing yet they're limited because
10 why should they stay when they could go to a. The oil company
11 say zero tolerance on (indiscernible) yet in the newspaper we
12 hear Prudhoe Bay got oil spill -- explosions. You know people
13 give them (indiscernible) and yet they say zero tolerance when
14 they come to our village.

15 We will not have an oil spill (indiscernible) that paper.
16 Yet you know mechanical (indiscernible) you know it still
17 happening and yet they're still out there drilling. The people
18 let the oil companies go out there and drill and something like
19 that happens like I said earlier in the Gulf of Mexico and
20 Prince William sound. You know that's. You know they promised
21 us that there wouldn't be able to have an oil spill -- they
22 probably promised those people down there in Mexico too. We
23 will not have an oil spill but yet look what's happened. The
24 oil company weeks it took to cap that well. I was watching that
25 thing every day. Watching all that oil come up. Our people has

1 been affected by it and all the animals that are affected by it.
2 I don't want to see that up here or in Beaufort Sea.
3 Because all the coastal people live off the water. We
4 live off the land yet when you folks leave here and when
5 Washington hears about traditional knowledge it doesn't
6 necessarily. We might talk about it here but then when it
7 reaches Washington (indiscernible). That's why I'm so adamant
8 about you know finish what's on shore first -- drill wherever
9 and be but out in the ocean that's the place I want to see in my
10 lifetime especially out here in Chukchi and Beaufort.

11 Traditional knowledge -- our kids are learning that by
12 word of mouth as it has been gradually been passed on to us.
13 Now with my kids and with that kind of set on -- we learn from
14 everybody here. How we do things -- how we survive. You know
15 I'm on the Search and Rescue to and I (indiscernible) see
16 anybody stuck out there overnight especially this time of year.
17 While the summertime too. We're just like that and we're stuck
18 out there somewhere and yet something bad comes it happens to us
19 -- sort of like a worst case scenario (indiscernible). Pipeline
20 being filled all the way from -- maybe I should (indiscernible)
21 between Wainwright and (indiscernible) Trans Alaska Pipeline.

22 The Environmental Impact Statement on that
23 (indiscernible). I was just going to be -- maybe I ask pipeline
24 from platform to the shore how is that going to be
25 (indiscernible)? That's going to have to be a four or five or

1 six hundred pages long. Who has the time to read the EIS -- to
2 say yes, yes, yes -- looks good -- looks good. I know it would
3 probably take me a couple of years just to read the EIS form for
4 the whole packet.

5 People say EIS looks good. Somebody who's paid to have sit
6 down and read it. What (indiscernible) here trying to survive
7 in our small village. Every season -- fall -- (indiscernible)
8 and summer. Yet people come here and say yeah EIA good to go.
9 We're going to fax it out to Congress so they can pass it. So
10 go out there and do it. In that case you'll have -- you'll find
11 lines that you know even enough to where oh yeah we can do this
12 -- we can do that because it's already by Congress.

13 You know I sure hate to see my grandkids lose the food
14 that we harvest each and every year. Traditional knowledge that
15 we have -- that we hold onto dearly each and every day. Even
16 during daily life when we talk to each other we're passing on
17 traditional knowledge. I ask the people how's the ice -- how's
18 the seal -- how's the river -- still passes traditional
19 knowledge to me because I want to know and if somebody's wants
20 to know from me I pass it on to them. I don't go to dinner and
21 gladly tell them and say here. I pass it on by word of mouth.
22 Yet when it goes to Washington it disappears.

23 People come -- Shell -- Conoco -- they hear about it yet
24 when they leave so does the traditional knowledge that they hear
25 from one goes out the window. They talk about it maybe briefly

1 yet they're talking about the EIS what they going to do -- how
2 they going to do -- how can our (indiscernible) this state --
3 the nation? Yet our traditional knowledge is at the bottom of
4 the (indiscernible) board. I just hope that something comes out
5 of this to where you know we can stop the drilling that's
6 happening out there. I don't (indiscernible) Chukchi Sea
7 (indiscernible). Beaufort Sea and say there are a lot of people
8 in the North Slope that are agree with Conoco or Shell but yet
9 about 90 percent are saying no. I seen it coming. We live here
10 -- people that come here don't -- they don't change the way we
11 live. We don't see how they live yet we see it on TV -- how
12 they do things. How they tell us you know we won't do this but
13 yet it happens. We live here -- we love it here -- we care for
14 each other each and every day.

15 When somebody sees a brown bear or a polar bear or fox
16 they get on the vhf and say hey something's coming to our
17 village -- everybody's on high alert. Yet in Anchorage
18 (indiscernible) you know when something happens to somebody you
19 know -- if they're a friend of mine (indiscernible). Didn't
20 happen to me -- I'm okay but yet -- we have family here. We
21 have friends here that grew up -- we care for each other. We
22 care for our land to put meat -- we hope that you know that we
23 can pass it on to our kids and grandkids and beyond. Hope that
24 like I say something good will come out of this rather than an
25 oil spill out there in the ocean and affect our way of life --

1 our way of subsistence.
2 You haven't showed me how we going to clean up oil under
3 the ocean ice. It's the (indiscernible) we have out there. Or
4 in broken ice yet they have boats registered to go out there in
5 the summertime. They show us that they can burn the oil on the
6 ice. Creating another problem with pollution that's going out
7 to (indiscernible). That's why (indiscernible) ice up here on
8 the North Slope. There's a lot of the country you know don't
9 care whether they're polluting the air or not -- they're just
10 trying to get (indiscernible). (Indiscernible) expecting less.
11 Our Arctic -- deep arctic ice -- North Pole ice is shrinking
12 dramatically. Ice out there in the ocean is not as thick as it
13 used to be -- 15 years ago even maybe 10 years ago.
14 15 years ago the ice would be thicker than this
15 (indiscernible). Now it's only about only three feet thick in
16 the middle of winter. People don't see this yet we do -- we
17 live it. People say no scientists -- say it's not happening --
18 they believe that. Yet they don't come up here. We live it
19 every day. All the while it's affecting us each and every year.
20 Just (indiscernible). I pray that we're able to stop the
21 (indiscernible). I hope someday we can get our lifestyle back -
22 - get those 15 to 20 feet of ice back out there in the ocean.
23 Spring time I'm afraid to out there anymore. Hunt for
24 seals -- hunt for ducks -- hunt (indiscernible). I don't know
25 if I'm going to go through the ice yet in those (indiscernible)

KRON ASSOCIATES

1 what you look for out there. The thickness of the ice -- the
2 color of the ice -- the conditions of the ice. All passed on by
3 traditional knowledge. Thank you for listening to me and I hope
4 something good comes out of this. Thank you.
5 MS. ANNISKETT: Willard is our Reverend at the Episcopal
6 Church.
7 REX HENSON: Just wanted to make an observation with the
8 comments. I'm Rex Henson and I've just been around for about a
9 year here working in the community. What happens here affects
10 the whole world.
11 Shell this summer was her with meetings and in one meeting
12 that I took part of they said that through the new technologies
13 and safeguards that they've developed and plans to institute
14 since the Gulf oil spill which was still going on when they put
15 the -- as the meetings changes -- said that a large oil spill
16 would not happen up here. They might have been able to
17 (indiscernible) small oil spills and (indiscernible) back to
18 destroy the subsistence way of life on (indiscernible) slowly
19 leaching into the food chain (indiscernible) giant spill.
20 But they're claiming the technology and the safeguards
21 that are in place would prevent something like that happening
22 today. Valdez is 20-30 something years ago now that was the
23 worse (indiscernible) disaster history at that time. So 20
24 years have gone by and then this year now we have the Gulf
25 spill. Worst environmental history of damage in the history of

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 the United States. 20 years later -- 20 years more technology -
2 - 20 years not only that but right here on the North Slope on
3 the pipeline we had the worst or second or third worst spill in
4 the history of the pipeline. On the pipeline we had a worst
5 spill at one of the pump stations that you know. So these
6 things to be inevitable but they will happen whether it be on a
7 large scale or a small scale so it's hard for environmental
8 impact it's just what type of impact are people willing to
9 accept because it will be a large impact. Overall I mean
10 (indiscernible) it's going to happen -- there's no doubt about
11 it -- no way it'll stop this from happening everywhere that this
12 has ever been done -- that you had this (indiscernible).
13 I use a analogy talking about a friend of mine -- he says
14 well you know it's like -- I'm a cook so you got two
15 (indiscernible) cheeseburgers and you pour a quart of oil over
16 one of the cheeseburgers (indiscernible) obviously. All right
17 if I pour just a quarter teaspoon on your cheeseburger will you
18 eat that? No. Half a teaspoon -- you know what's the limit?
19 You know the damage will be done and their food as I use a
20 cheeseburger for an example like the whales -- will be affected
21 and it will be so important. But our (indiscernible) little by
22 little from the pollution from the entire world --
23 (indiscernible) how the industrial development from oil
24 companies (indiscernible) of the world but it's already affected
25 the local area from the impact of the entire world let alone

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 this happening right here in our backyard.
2 They sat it's not a matter of if it will happen -- it will
3 happen just whether the people of this area you know will accept
4 it. And that's it. Thank you.
5 MR. REXFORD: Spell your last name.
6 MR. HENSON: Henson -- H-E-N-S-O-N. I do admire and
7 respect the people of this village and throughout Alaska. I'm
8 not from her but I respect their (indiscernible) and concerns.
9 UNIDENTIFIED FEMALE: Having three boys ages under 10 --
10 they know about the traditional knowledge. They tell me even
11 though they probably never even caught a summer bird or a
12 squirrel yet but they did tell me -- mom I caught you a caribou
13 -- mom I caught you a polar bear. They know about the
14 traditional knowledge and I don't want that to be taken away
15 from them.
16 MR. TRACEY: I'm not going to repeat everything that's
17 been said tonight even though I know where it's coming from -- I
18 feel it -- I've been living it for the last 38 years. Really
19 close knit community here -- everybody depends on everybody else
20 here. We talk about patience -- let me just mention that a
21 little bit. I've learned patience here which take a lifetime to
22 learn and practice that patience.
23 And I appreciate you folks sitting here and listening to
24 us tonight that reflect on what you see and (indiscernible) or
25 talk shows or debates on TV. And nobody ever gets to finish a

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 statement. Someone's always cutting in and it becomes a I
2 commit. Nothing ever really gets said and then it's over.
3 It's different -- this happens here your timing is perfect
4 for us expressing our points of view and I really appreciate
5 that. And as Lily mentioned there's a whole group of values
6 that are lived by and practiced here every day. And as a group
7 can record all those values and insert those values into IEIS if
8 you will. And it may work a little better.
9 We're talking about team work -- if we could all work
10 together we might come up with a plan that will work. Happiness
11 -- caring -- all these different values should be incorporated
12 and I think and we should work on that. We talked a little bit
13 about scientific uncertainties and possibly some of them have
14 been overcome like the bowhead whales. Not so fast the world's
15 changing and we're witnessing it here on a fast track.
16 Willard mentioned the ice disappearing or getting thinner
17 -- it won't be long before -- you know might not be any ice at
18 all or what? Or is it going to get cold again. The world has
19 been going through phases and cycles for billions of years --
20 we're just a rock hurtling through space for billions of years.
21 Nothing is really certain -- we don't know what tomorrow is. We
22 don't know what's going to happen on December 21, 2012 either do
23 we. I want to talk about that.
24 With the walrus -- the last four years -- the walruses
25 have used the shores of the Chukchi Sea for refuge because there

1 was no ice for them to rest on -- for them to leave their
2 juveniles so they can off and forage food and bring it back so
3 they know where their juvenile is. If you leave your kids in
4 the ocean they're going to drift with the currents -- the
5 mother's not going to know where to come back to feed their
6 young so they're using our beaches.
7 The first year it was several miles north of us. We had
8 little to no really control over the situation. They year was a
9 little bit different. We came up with an official statement for
10 the world -- we live in it -- anybody making their way over
11 there we read them the riot act and the federal laws and the
12 state laws about going over there and disturbing them and that
13 seemed to work. We diverted aircraft so the aircraft wouldn't
14 fly right over them and disturb and cause a stampede. And like
15 we saw a couple of years ago where hundreds of juveniles and
16 female walruses were killed just from being crushed during
17 stampedes. That didn't happen this year because we had a little
18 bit of control -- we had a little bit of knowledge of what
19 they're doing -- why they're here and what they need to sustain
20 themselves and then move on.
21 So they had a good year here and the walruses moved --
22 they're probably several hundred miles offshore now on some of
23 the ice on Russian shores and down by the Nome areas. At least
24 they had the opportunity to move on (indiscernible) go down
25 there. So we've learned that and we learned it through some

1 mistakes because when they were stampeded a couple of years ago
2 it was really ugly. And we believe that stampede was caused by
3 polar bear activity. So not much we can do about that but there
4 was something we can do about our involvement with them.
5 Another unique thing about Point Lay is that -- Willard
6 talked about Nuiqsut. Nuiqsut -- half the village -- the native
7 village are kind of anti-industry but the corporation is pro-
8 industry and they've embraced -- they're making money with it
9 and so got kind of a battle there in a single community. But
10 here the native village and Cully Corporation seem to be working
11 together really well. You know Wainwright is starting -- the
12 Wainwright Corporation is starting industry and what I have to
13 think is that off shore drilling is probably going to happen
14 regardless of any opposition up here but let it happen on our
15 terms.
16 And I think that's how some of these village corporations
17 are looking at it. It's going to happen -- we're going to
18 profit from it but it's also going to happen on our terms. And
19 we're starting to hear some of our terms now and then this was
20 here before and we spoke. And I haven't myself read the whole
21 EIS -- boy I'm going to read more and more of these
22 (indiscernible).
23 We've had studies here and we've had studies with
24 helicopters and I don't believe the helicopter is through
25 studying caribou what do you get. You get a bunch of nervous

1 caribou -- you're not getting the real animal -- you're not
2 getting the real behavior. We've had non-invasive studies --
3 we've had UAF was up here Marie mentioned for three years in a
4 row studying Moose. Those folks were on foot -- they were in
5 (indiscernible) -- they studied the (indiscernible) -- the bird
6 was not nervous -- the bird was allowed to do it's every day
7 thing -- it was a beautiful study and I think that's what we
8 need to see more of.
9 We've got to stop using helicopters for everything. If
10 you want to study something that's distant go out there and
11 spend time out there -- don't go back and forth every day back
12 to your camp and then come back out. We saw caribou -- we
13 didn't have an honest caribou study here because the helicopter
14 would bring the folks and back and forth every day. We've had
15 fish studies and those are non-invasive -- go out in your boat
16 and net a bunch of fish and we get you know a true story there.
17 We've had local involvement with studies. If we went out
18 on a caribou hunt or a whale hunt or just out for a joyride --
19 we would come back and fill out a survey. And all that
20 information was pulled together and plugged in and no
21 helicopters. It was a really good study and the folks here
22 either made a little gas from it or a little bit of money. So
23 it worked out real nice.
24 You mentioned currents and yeah currents are being
25 studied. They've been studied for a couple of years in

1 Wainwright now and this year in Point Lay they just set up a
2 couple of antennas and they had the buoy going back and forth
3 out in our ocean and I'd seen some live up to date of pictures
4 of currents. Off shore Point Lay and it shows some things we've
5 learned from charts but the charts weren't complete but they're
6 shoals out there that kind of influence the currents. And
7 between the winds -- the shoals and the currents going by it
8 looks like if oil was spilled out here it's going to be a mess.
9 It's going to go out in multiple directions and also what I
10 learned from the currents is why and where the belugas are going
11 out there where the walrus are going out there because when
12 you're boating out there and all of a sudden come across a
13 current -- there's birds -- there's fish to seals -- there's the
14 (indiscernible). They're all there with these currents and
15 that's where our food is -- that's where the oil is going to be.
16 It would be a disaster.

17 So I mentioned that life begins here -- this is the top of
18 the world. We've got the polar bear here which is the top of
19 the food chain if you will. That's one piece where an animal is
20 -- and man is lesser than that animal there. A lot of respect
21 for every animal here and that's another one of the virtues that
22 attracts us up here. Even though you're hunting that animal and
23 living off that animal you're respecting that animal. I've
24 watched year after year after year and I've learned to do it
25 myself when belugas are hunted. The head is severed to release

1 the spirit so that the hunt will be good this year. Just shows
2 you the love for that animal and respect for that animal.

3 We've mentioned cumulative effects -- and that's not just
4 off shore affects. You've got to include everything. You've
5 got to include all your activity on land -- you've got the food
6 and environmental activities. Everything's got to be included
7 you can't just go like (indiscernible) with Prudhoe Bay -- the
8 accumulative effects of what's happening in that specific area.
9 But the same time there're studying this area now. We've had
10 cold studies -- we got Red Dog -- we got to pool all this
11 together and then of course what we're doing up here -- there's
12 more people living out (indiscernible) ever before. We're
13 really watching how many caribou are taken -- we need to
14 maintain that herd -- how many walrus are taken -- how many
15 whales are taken -- you have to. We're kind of self
16 (indiscernible) on our belugas right now. The weapon
17 (indiscernible) -- those belugas come back in numbers every year
18 because we're not wasting -- we're not over killing and that's
19 something that needs to be practiced everywhere. And in every
20 aspect.

21 Industry if there's enough oil on shore right now by golly
22 let's get the oil that's on shore and let's do it smart. Let's
23 let technology catch up with off shore stuff. Everybody's
24 talked about skills -- I'm not going to repeat it but we're not
25 ready for off shore. We proved it ourselves that we learn from

1 the states but it's too late if you make a mistake. We're 250
2 people here at best -- tonight we'll be a few more with you
3 folks here.

4 Sometimes we feel like it's 250 people versus everybody in
5 the lower 48. We don't have a loud voice but look at us as you
6 would say New York. New York is a community -- sure there's a
7 lot more people but it's a thriving community and they do things
8 their way and if they were asked to change by golly there's
9 going to be a lot of commotion. There's 250 people here that
10 makes this community -- that should be important. If you put
11 all of the people together that live on the slope and use the
12 slope and need the slope -- we don't equal the amount of people
13 you're going to find in a mall -- Merry Christmas -- a ninth --
14 a fraction of that many people. You got to respect the fact
15 that these are communities -- they're not big but they're
16 communities and they've been here longer than any community down
17 in the lower 48.

18 DOD has been up here. They made promises -- they set up
19 (indiscernible) lines (indiscernible). They had a treaty with
20 Point Lay -- the native village of Point Lay and when they were
21 done with that Air Force sight it would be given back to the
22 native village community. We're still waiting for that to happen
23 but since then that treaty's been kind of overwritten and now
24 instead of the Air Force land going back to the rightful owners
25 -- going back to a corporation that was with ANSCA. So ANSCA

1 deals with the state entities -- the native villages' boroughs -
2 - so when the Air Force is done with that property it goes to
3 BLM and BLM turns it over to Cully Corporation -- a state
4 entity.

5 Cully Corporation wasn't here in the 50s when the Air
6 Force made a deal with the native village of Point Lay. And I
7 think the point that I'm trying to make is that things are
8 forgotten -- things have changed -- promises are broken and
9 we've seen that throughout the history of the United States of
10 America. And it's still happening. We can't fool ourselves in
11 thinking it's not -- it's still happening. Changes are made and
12 not everybody is in agreement or even aware of the changes. I'm
13 not going to stop there because in our defense they polluted
14 these areas and yeah there's some cleanup going on now --
15 there's Operation Clean Sweep and other monies that are here. I
16 tell you though at one point when the war was at its peak over
17 in Iraq those (indiscernible).

18 There's still some monies to clean up these sights but if
19 you look where they are most of them are coastal if not all of
20 them.

21 On some form of water way and there dumps include pcb's
22 and other carcinogens that are affecting animals. And it's the
23 animals that we eat. An awful lot of cancer up here and there's
24 even atomic waster up here. Folks that got written about -- it
25 just goes on and on -- the pollutants are already here plus what

1 Rex mentioned the pollutants from the world come (indiscernible)
2 here. If you look at the way the magnetic spheres around the
3 earth it follows here at the top of the world and it funnels
4 into the bottom of the world. We're getting pollutants from all
5 of the world right here -- even space pollutants.

6 So it's not the clean pristine place that some people like
7 to think it is. Where it's a daily battle to try to maintain
8 with all this outside interference. We're talking about
9 billions of dollars of infrastructure the offshore goes into
10 effect. Does any of that take into consideration that people in
11 Point Lay -- Wainwright -- Point Hope -- Alaska are buying their
12 fuels from Seattle. The oil is coming from here and the natural
13 gas is going to be coming from here -- do we get to enjoy some
14 of that profit or are we still going to have to buy it? We're
15 at the mercy of the barge -- if the barge can't get in then we
16 have to fly our fuel in and the price elevates. It's already
17 ridiculous anyway for what it costs for a gallon of oil so that
18 might be something that we would bargain for. If it's going to
19 happen -- if off shore drilling is going to happen -- include
20 everything we're saying tonight and help us out with a small
21 piece of that gas pipeline.

22 And that was going to be my final statement is that if off
23 shore activities are in fact going to happen it looks like
24 they're going to happen all over the world -- the whole world
25 right now to us is the Arctic ocean. We've got Russian interest

1 out there -- we've got Canadian interest out there and USA of
2 course. We need to work together as a world and pool our
3 ingenuities and our technologies and do it right. Let's not
4 fight over all this -- let's do it right.

5 MS. ANNISKETT: Thank you Bill.

6 MR. TRACEY: Thank you.

7 MR. LOMAN: Thank you very much. We've been on the record
8 for well over two hours and I can move around better than the
9 court reporter can so I'm going to go on a five minute break
10 because I know we have a lot more testimony that people want to
11 give and we want to hear it. So five minute break and then
12 we'll take our seats and talk about this. Continue on.

13 (off the record: 9:50 p.m.)

14 The reporter said: 9:50 p.m.

15 (on the record 10:10 p.m.)

16 LEO FERREIRA, JR: What you hear (indiscernible) the
17 majority of the folks being in this village (indiscernible)
18 because we all say a part and we all have a part to say. Even
19 though there's different stories like it's suppose to be. Our
20 way of lifestyle are traditional -- Inupiat cultural
21 (indiscernible). For hundreds and thousands of years from
22 generations to generations taught to us through particular
23 cultural and dancing. A bit part of it is (indiscernible)
24 communities in our State of Alaska. We have to as natives we're
25 trying to learn how to balance out with western world past

1 (indiscernible) industrials. We feel like as natives up here we
2 feel like we're being held (indiscernible) pagan -- we're
3 depressed. Its decision makings are going on just a little too
4 fast and it's not -- we see it doesn't have a good decision and
5 these are people that are whether it's the federal government or
6 gas and oil industry. We feel that we're being pressured just a
7 little too fast and at the same time we have to think about our
8 cultural and our way of life. And we (indiscernible) no zero
9 tolerance of our Inupiat native way of life being affected
10 whatsoever by gas and oil period.

11 And yet we have to balance out to make some kind of
12 stipulations to what we have some kind of control over the gas
13 and oil activity up here. We have to have some kind of control
14 so we have a sense and a meaning -- and in fact that our
15 traditional life will not be affected in any way or form.
16 That's how we have it and that's how we -- all of us been taught
17 throughout the years from our grandparents -- our parents to us
18 and even -- everything has to be taken into effect either from
19 this community or the next community.

20 Every community is special in its own way. There's
21 different kind of things -- maybe one community has all whales
22 and others maybe they hunt more birds than others or they have
23 more seal hunters or how they be communities up here. Those are
24 my relations -- they need to be better -- they need to be paid
25 better to where it fits our lifestyles. It doesn't

1 (indiscernible) to take them away from us at all. And you hear
2 -- some people will say we don't know gas and oil -- some people
3 will say we got no choice -- some other people say it's going to
4 happen either way but we still have to balance out because we're
5 Alaska natives and the United States government -- we're
6 brothers-in-arms and we see that and so we have to balance out
7 but yet we have to protect our way of life period.

8 So you might (indiscernible) as a ways to be here through
9 the whole native community through the whole State of Alaska and
10 our coastal villages that we (indiscernible) harm to happen to
11 our ocean -- we already know our subsistence life when we take
12 (indiscernible) and that's our strongest hold we had -- is our
13 subsistence way of life. And you take that away from us -- it
14 will be taken away from us if we have an oil spill and the
15 magnitude is too great for us and scientist already tell us that
16 we can't clean up an oil spill and that's scary when you tell
17 and receive it and we hear stories about it.

18 Even people in our ICAS have to look (indiscernible)
19 documentation on it -- oil clean up here is method. What we
20 find is just a little bit and then there are small portions of a
21 real small oil spill but it's not you know things that are oil
22 spill.... If it's a big catastrophe like Hurricane Katrina in
23 the Gulf of Mexico during over there and look at that oil spill
24 and (indiscernible) happening up here. We don't see how could
25 the government say let's go open up oil without doing studies

1 and there's rules and regulations from (indiscernible). There
2 has to be some kind of (indiscernible) here. So our balance is
3 we feel like all the coastal villages -- our ambassadors -- our
4 animals -- every village (indiscernible) or supplement their
5 village with their animals and their subsistence way of life.

6 Every village in that manner is unique -- their cultural.
7 We all share the ocean and the land -- we're all the same
8 people. I'm sure and I'm not sure I know how the villages feel
9 the same way we do. Too many stories from the oil companies
10 promising -- they won't be (indiscernible).

11 MR. REXFORD: We see their catastrophes -- they had
12 (indiscernible) mess. (Indiscernible).

13 MR. FERREIRA: Going to our waters and Canada and the
14 United States and by promising you guys can clean it up. I
15 don't appreciate you clean it up -- we can't even fish there.
16 The oil leaves a type of covering in the Gulf of Mexico and
17 that's why a (indiscernible) despite (indiscernible) water.
18 They still have to send divers down there to fix it.
19 (Indiscernible). It's a different process where they say
20 they're going to use (indiscernible). (Indiscernible). Water
21 (indiscernible). Still when we think about oil spills and
22 (indiscernible) know and see what that (indiscernible).
23 Industrial can't even clean up oil spill. It seems to me like
24 there needs to be more study on our wildlife and the ocean and
25 needs to taken into account.

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 We have a community that thinks if we have an oil spill
2 that's going to kill our (indiscernible) -- our (indiscernible)
3 -- kill our whales (indiscernible) food chain. And
4 (indiscernible) our fish -- elk -- our seals -- our walrus --
5 our whole (indiscernible) going to get contaminated. And I
6 don't think anywhere in the world that the oil has been cleaned
7 up 100 percent. I don't think the disasters that happened were
8 the environmental (indiscernible) turn back to its normal
9 operation to the way it used to be before an oil spill. And
10 Exxon Valdez is a perfect example of the oil spill. I'm not
11 coming back that the environment restoring itself back to our
12 (indiscernible). Those people I feel -- I hurt for those people
13 even though when that spill happened I was a teenager and I
14 didn't understand the magnitude of an oil thing. How much the
15 oil runs the world -- at my age now and then I fully -- wouldn't
16 why I understand how oil affects the world -- how much it is a
17 part of our world. It has to be the United States but we still
18 have to protect our way of life period.

19 And we need to have some kind of word in some kind of city
20 -- some kind of law for us to govern our wildlife and govern oil
21 industrial and heed to their promises. They're not just
22 verbally promise but have it on black and white on paper
23 promises that in case of an oil spill (indiscernible). Take
24 full responsibility instead of pushing blame onto your
25 contractors. That's not right either to (indiscernible) our

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 (indiscernible) contractor that's working for the oil company.
2 Everybody should take the blame -- part of that (indiscernible)
3 to be done -- part of the industrial around them. Doesn't
4 matter if we -- shame on ourselves for letting this happen in
5 our own country. We've been told we have and been told that our
6 oil reserve -- that we have enough oil reserve in this country
7 to sustain us for another 200 hundred years and yet matter of
8 fact the government won't help us -- natives (indiscernible).

9 We feel like one (indiscernible) to take away our cultural
10 and given up on our cultural and our subsistence way of life --
11 our oil. We don't want to do that we want to hold onto to our
12 subsistence way of life and our cultural. And yet at the same
13 time US government tells us if you don't work with us then we're
14 going to (indiscernible). It didn't work and you have no say
15 so. You have to learn on the side of the (indiscernible) here.
16 Especially with our subsistence -- it means a lot to us -- the
17 State of Alaska -- our coastal communities. Thank you.

18 MS. ANNISKETT: And another thing we haven't tested is the
19 ice cellars. The ice cellars down there in the spits they're
20 all bloodied up so we can't use them any more so our whalers
21 have made their own ice cellars by their (indiscernible). We
22 had these ice cellars for tons of years and hundreds of years
23 and they got damaged due to the permafrost and bloodied so I
24 wish there's a way you can fix them. I don't know if we even
25 can but that would be a nice thing if we tried. Thank you.

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Thank you. And Mr. (indiscernible). I didn't
2 mention to you about the reorganization of what was called
3 Minerals Management Service. After the Deepwater Horizon spill
4 the President spoke to the country and the President said
5 basically that this agency known as MMS discharged its
6 regulatory authority with the state and we're showered by gifts
7 from oil executives and so they made the decision to reorganize
8 MMS. And what they have done so far is take one entity -- the
9 acronym is honored but these are the people that deal with
10 royalties and the money and they're reporting under another
11 assistant secretary now and everybody knows about some of their
12 issues long done by with the rest of us in MMS Alaska Bureau of
13 Ocean Energy Management Regulation and Enforcement. The plan is
14 not for long -- not for long -- because the vision for the
15 Secretary of the Interior is to very soon to create a Bureau of
16 Safety and Environmental Enforcement and they've got some point
17 people they've sent in from Washington D.C. but we really live
18 in Alaska here.

19 But these people and some are from -- just happen to be
20 from Alaska -- one of the gentleman that's a point person
21 working on this reorganization and a consultant firm called
22 McKenzie and we met with them. And so they said to us this new
23 agency -- this Bureau of Safety and Environmental Enforcement
24 will be the arm that regulates the industry and we want that new
25 organization -- we want to restore the public's trust in that

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 new organization and that's our goal -- restore public trust.
2 And we said that we think that you have to put together that
3 regulatory agency that will be both feared and respected by the
4 industry. Feared and respected and I don't mean feared in the
5 usual way. I mean these two words in my mind come together --
6 fear and respect. It can come together.

7 When I was in the Navy I feared and respected the
8 regulatory authority in diving and special warfare -- explosive
9 (indiscernible) disposal. Procedures and methods and the
10 equipment and the people and we were inspected on a routine
11 basis at a very high level and we maintained a very high level
12 of readiness and safety. If we didn't I wouldn't be here today.
13 But if you had an accident in any of these areas in the military
14 and people were killed or injured they would hand pick from the
15 Safety Center and send in the best in the world on those
16 particular things. Deep diving -- the best deep divers. If it
17 was explosives and diving so on and so forth.

18 And no matter how high your state of readiness was -- how
19 good your people were -- they came in with the experience and
20 knowledge and the expertise to basically end it for you. You
21 were going to survive that kind of rigorous analysis and so this
22 new agency that the President and the Secretary wants to develop
23 to restore public trust. What would it contain -- I said well
24 now our inspectors focus on drilling operations and we think it
25 should contain much more. It should contain all encompassing

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 worker safety -- environmental compliance -- all aspects of the
2 federal environmental regulatory framework.

3 Now you mentioned earlier that we as a government agency -
4 - a regulatory agency -- need to take into account the
5 protection of everything that's important to you -- the Inupiat
6 and the community -- the subsistence activity -- the cultural
7 redefining aspects of subsistence activity and so forth. So I
8 think now I forgot about something but that's okay because
9 they're still learning on reorganizing but maybe we can work
10 together to communicate the importance of including in this new
11 regulatory agency an element -- a person who might be whaling
12 captain -- might have been a MMO -- maybe an expert on the
13 cultural aspects of subsistence activities and other culturally
14 self defining activities.

15 And the heart of that regulatory team and make it even
16 more encompassing in the Gulf of Mexico -- wouldn't make any
17 sense but the Arctic it's certainly starting to think in my mind
18 to make sense. And so I would ask that you now continue to
19 think about your statement that the regulatory agency needs to
20 protect these activities and consider and think about what you
21 would recommend to us and you can do it me if you want and I'll
22 forward it to these people who ultimately will make the
23 recommendation to the Secretary of the Interior will make the
24 recommendation to the President on what this new regulatory
25 agency will look like.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 So I think we can agree that maybe that new regulatory arm
2 needs to contain that kind of expertise in the Arctic to protect
3 and the regulations are there under Marine Mammal Protection
4 Act. These activities cannot interfere with the subsistence
5 whaling. That's in the MMNPA -- that's part of National
6 Fisheries Services' discharge to ensure with their permitting
7 authority (indiscernible). But I'm glad you mentioned it
8 because I think with your help we can make a recommendation to
9 fully encompass in full measure the kind of regulatory agency
10 that would exist in Alaska to oversee industrial activities in
11 the OCS. Thank you very much. And I hope we can talk more
12 about that and not just with you Mr. President but with the rest
13 of the folks in the community because I know you will consult
14 with them too.

15 MS. TRACEY: You know what as subsistence hunters we are
16 now being forced to buy licenses to go hunting. We search
17 animals and.

18 MR. REXFORD: Jeffery right? And we have quarterly
19 meetings with Alaska's Eskimo Whaling Commission and time and
20 time we always ask the industry to bring your MMO's and give us
21 a recording. And they're all set to bring their MMO's -- any of
22 our (indiscernible) and they are not bringing the MMO's of
23 northern mammal observers -- they're not letting come for our
24 meetings when we ask them time and time again. Can these MMO's
25 do a report at an annual meeting like this one well have to our

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 next one will be in February for the Alaska Eskimo Whaling
2 Commission and we want to hear what the Marine Mammal Observers
3 have seen under ships and we've never heard any report. The
4 scientists made the reports for them but the people that are out
5 observing the animals are they allowed making reports? Are they
6 manipulating the reports? We don't know.

7 When it's dark at night along the ocean we can't see
8 nothing when they're at with a ship.

9 MR. LOMAN: Well I certainly would join you in supporting
10 the recommendation to the National Fisheries Service to make
11 that part of the agenda for the open water meeting. You need
12 those reports -- they have scientific nexus in my mind and
13 that's what that's about is they're required under the Marine
14 Mammal Protection Act to appear be of science. I mean it's a
15 regulatory thing but their observations are a part of science.
16 So I think it's important to ask them to put that on the agenda
17 and get those reports and review them and discuss them during
18 the open water meeting.

19 MR. REXFORD: I mean after the end of their season you
20 know at least have (indiscernible) their MMO's (indiscernible)
21 and that all these other commissions look up to Alaska Eskimo
22 Whaling Commission. When they have issues with the oil
23 industries like Willie the CAA under the beluga that's a whole
24 community at the high school or the school that first see the
25 (indiscernible) we had. I was President for the native village

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 of Point Lay at the time and I signed off on it and we had set
2 July 20 date.
3 All it was was a date that we signed off on -- that was
4 it. No to interfere with our beluga hunt. There was a one page
5 CAA and then we came on board to AWC in 2008 of February or was
6 it (indiscernible). And we came a long way (indiscernible) a
7 mad rush to we have no ice. We came home -- built our ice
8 cellars but we finished them in time before the hunt -- bowhead
9 whale hunt. And we didn't succeed the first year but the second
10 year we did succeed in that being a whale. You can see the
11 pictures up here and the celebration in June. On the Thursday I
12 caught -- we caught a whale -- the whole community. We came
13 together and cut it up and it took us some time to cut it up but
14 we did it.
15 I've done it time and time again. In Barrow I started out
16 (indiscernible) you know manning the hose to help them pull the
17 skin off the whale -- carve the meat and then I graduated to
18 butchering whales and that's how I learned how to know where the
19 (indiscernible) are is (indiscernible). Portraying the whale
20 and you look for the (indiscernible) where the kill spots are.
21 It took me about 15 years to become a harpoon from the start --
22 I mean you just can't go in there and say hey I'm a harpooner --
23 can you put me on a harpoon boat. That's not the way it goes --
24 you got to -- like in the military you've got to start from the
25 bottom and go up -- ranking. And that's all I have.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MS. ANNISKETT: That same thing goes for beluga -- we
2 would all (indiscernible) get the harvest but we keep going out
3 with the weather conditions and the captain and the people --
4 it's not always successful but we try our best.
5 MR. NEAKOK: You know we have commissions for the people
6 here in our village -- our commissioners that attend AWC. We
7 have people attending beluga -- we have people attending walrus
8 commission meeting -- polar bear -- you know seals. And you
9 know we report to them but we -- what we do in our village you
10 know. It's our responsibility to give rather than to take. You
11 know that way we can regulate our intake of what we subsist on.
12 And they report to us you know who puts portion of Alaska being
13 affected by certain things. You know and we pass it on to our
14 village council meetings. You know we don't -- especially for
15 our belugas you know we have beluga commission that reports to
16 the commission that -- you know does state or federal reports
17 you know how our population is whether they're down in port of
18 Anchorage or Kotzebue. The stock that we subsist off of here
19 you know like we said before we don't like to waste anything
20 especially our belugas and the walrus.
21 You know we heard testimony about us not you know going
22 mad dash going full bore (indiscernible) walrus. We care for
23 the animals that we subsist off of. We (indiscernible). The
24 (indiscernible) population wise and we you know have to report
25 to them whether we might see you know certain things what kind

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 of caribou -- we see certain things you know out of the
2 ordinary. We might see a cyst or a boil or something that we
3 know that's not suppose to be there and we report it.
4 We have scientist coming down from Barrow even way over to
5 Connecticut that comes every end of June to take samples --
6 tissue samples -- bird samples that they take back and report to
7 us you know how our stock is. Butchering after we've done
8 butchering you know we allow them to take samples. You know we
9 communicate with them -- they communicate with us. We help them
10 you know take belugas and we help you know take some of the
11 tissue samples that we have from us. You know after our hunts
12 and it works both ways when we cooperate.
13 And you know that's what we -- you know like I said every
14 year we have commissioners on different wildlife here. And
15 might be able to get some information from those commissions to
16 hopefully get -- you know regulate more and/or stop any you know
17 oil drilling out there in the Chukchi and Beaufort sea. Because
18 each of our (indiscernible) have commissioners that attend these
19 meetings. You know that might be a helpful thing to maybe
20 attend to where you know we can learn something you know
21 provided that (indiscernible). I don't know if they will or not
22 but you know no harm in asking. Probably an open public meeting
23 anyway.
24 You know we go there you know certain months of the year
25 to give our report. As for myself I have to go to Anchorage

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 next month and do a report on the walrus (indiscernible) that we
2 have had here. How many animals that we're you know crushed
3 during or stampede. You know I have to give a full report --
4 I've even helped the State of Alaska to -- you know go out there
5 and take measurements of the walrus that were stampeded dead on
6 the beach. After see you know the size and general condition of
7 the walrus and I have to give that (indiscernible) in which you
8 know the state that turns around and gives a report to our
9 village on how you know and why it happened. You know even
10 (indiscernible) doing this too -- he goes to his quarterly
11 meeting -- he lets us know what's going on -- how many
12 (indiscernible) we can get -- how many (indiscernible) you know
13 the AWC can get for the whole year.
14 But if that's another option and maybe we can use to
15 hopefully stop or slow down exploration -- drilling -- pipeline
16 that if we can put in the EIS that we -- use a tool. And the
17 tools that we use going to these meetings -- you know benefit us
18 -- benefit all seven villages. We let them know you know like
19 the beluga commissioner report on the belugas we got this year --
20 -- last year -- year before. And just like walrus too -- just
21 like bowhead -- migratory birds you know we (indiscernible).
22 We're deep into this like Marie said you know now we've been
23 hunting without permits or licenses for thousands of years now
24 people are coming in and saying you need a license to hunt this.
25 We've never had that before.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MS. ANNISKETT: Treat us like criminals.
2 MR. NEAKOK: You know we've been doing this for thousands
3 of years and we only taken what we eat to sustain us during that
4 time. And now they want to regulate our intake of certain foods
5 and that's why we need people. That's why we have commissions
6 that (indiscernible) -- (indiscernible) sustain the population
7 of whatever marine mammal -- land or air -- the birds that we
8 harvest. You know those protection (indiscernible). Get a
9 license from the Fish and Game Department just to hunt ducks.
10 You know we need to do that (indiscernible). Pretty soon they
11 might come under and we're going to have buy you know trailer
12 boat permits. (Indiscernible) in Minilchik you know. You know
13 permits -- lotteries -- thank you. You know we don't need that.
14 We take what we need -- we eat what we eat -- we don't
15 waste anything. And I hope you know that hopefully we can you
16 know use these commissions to help our fight against you know
17 drilling -- purposed to be happening here in the Chukchi and the
18 Beaufort sea. Thank you.
19 MR. TRACEY: We take pride in the fact that most of the
20 knowledge gained -- face that knowledge gained about belugas is
21 common here. And we've invited the scientists to work with us
22 during the hunt and after the hunt and during the butchering.
23 Like they always take their samples but here in (indiscernible)
24 belugas prior to us inviting the scientific world here and I
25 thought that was pretty neat.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 On the theme of commissions earlier I mentioned cumulative
2 affects shouldn't be all inclusive. Sure we're talking about
3 off shore drilling but all the other activities need to be
4 considered. I sit on the Planning Commission -- Willard is the
5 alternate and (indiscernible) this year but regardless 99
6 percent of the permits that are being applied for are -- I
7 almost want to say after thoughts. The original permit you know
8 brought industry in and they did their drilling -- okay they got
9 their role established. Then their permit for a pipeline and
10 permit for a road and permit for an ice road then a permit for a
11 pad. I think we need to include a 20 year projection of what
12 off shore we can expect from off shore (indiscernible).
13 If we knew that it'd be easier today to decide you know
14 how to go about some of these points that they have. I'm sure a
15 company that's spending billions of dollars pretty much knows
16 what's going to happen in the next five -- 15 -- 20 years.
17 They've got to know otherwise they wouldn't be doing business so
18 I would think it would be relatively easy to include a future
19 projection in what industry's activities are going to be let's
20 say applied for drilling activities. Thank you.
21 MR. LOMAN: I'm not so sure that they know for sure what's
22 going to happen but you'd think that we in considering
23 accumulative affects. Part of that effort is to develop detail
24 in so much as you can a reasonable scenario for development
25 (indiscernible) colleagues do that. There's models in Arctic

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 waters or near Arctic waters -- a few anyway to look at.
2 (Indiscernible) concepts that are in place there. What's a
3 project that is no good (indiscernible)? If it was a sampling
4 of a heavily subsidized project that reduces the footprint and
5 popular -- there are not ways that you can get those who have
6 many of the typical concerns of off shore oil and gas and the
7 impacts.
8 But you know there's I think -- industry has an obligation
9 certainly when going into produce and development to do that.
10 At this point in time we're (indiscernible) down. We've got
11 companies with billions of dollars of leases they don't exactly
12 where the oil is whether or not it is really there. It's only
13 through exploration that they really know.
14 And as we've seen over the recent years -- four years now
15 -- in efforts to explore -- these huge, huge hurdles of
16 regulatory political hurdles -- economic in that hundreds of
17 millions dollars are spent and still no exploration. So if we
18 (indiscernible) forget the legal. I forget pretty easily --
19 it's just like breathing almost right. But I agree that
20 certainly it would be easier for the communities in the Arctic
21 to envision what the risk if they knew what was really going to
22 take place -- how it will in great detail hopefully that will
23 come.
24 MR. PETERSON: Mike (indiscernible) point out but we're
25 going to hear (indiscernible) envisioning what the impact of the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 success would have and that's what we're concerned about. It's
2 kind of worth noting that the history of Arctic off shore
3 exploration has been negative and industry deciding not to
4 proceed at this point. Not to proceed to go ahead but getting
5 close. Exploratory wells and I think (indiscernible) basing and
6 some (indiscernible) basin.
7 The drilling there is very disappointing and industries
8 have essentially abandoned areas and you know they're
9 (indiscernible) no more anticipated activity in those areas so
10 we're concerned with successes in exploration and the impacts
11 they may have. History so far off shore is said to be produce
12 (indiscernible) exploratory drilling. Sort of condemn the areas
13 and ended to keep track (indiscernible).
14 Now I mean minimize what you know could happen but it's
15 worth keeping in mind that may be the end result that
16 exploratory drilling is bad news everybody packs up and goes
17 home and then look somewhere else.
18 MR. LOMAN: It's almost unfathomable for people in the
19 communities like some here that have been attending these
20 meetings for almost 30 years and maybe 30 years now concerned
21 about off shore oil and gas development in the Arctic. I can
22 imagine that that would be a possibility that they could drill a
23 couple dozen more exploration wells in addition to the ones that
24 have already been drilled and have no further interests and walk
25 away from the Arctic with nothing in the OCS. It's possible.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 And hard to believe for us that are in this everyday but it is
2 possible.

3 MR. REXFORD: One comment that was made at our third
4 quarterly meetings and this is just the beginning. Wait till
5 they find the oil. I mean you're going to have hundreds of
6 ships coming into the Arctic. After the whales is found then
7 the (indiscernible). I mean the Murray Pilots Association came
8 to one of our meetings and said -- hey (indiscernible). Every
9 owner of a tug -- barge -- we want to give a contract to
10 (indiscernible) and bring it in and we're dead in the water
11 there's no one to help us.

12 I mean is ever been a moratorium on barges coming into our
13 waters. I mean revelations and this (indiscernible) sea were
14 what these Murray Pilots Association was talking about and one
15 of our commissioners said gone to the (indiscernible) in Dutch
16 Harbor and now he's no longer a commissioner. We don't have
17 anyone that frequents to these meetings anymore and our children
18 from AWC mentioned that you know (indiscernible) problem. The
19 seismic and drilling is nothing compared to what's going to
20 happen -- what's going to follow after the oil is
21 (indiscernible). I (indiscernible) here.

22 Like Bill said you know it is going to go in stages. So I
23 mean it's going to go on for what 20 years maybe more. But if a
24 pipeline fails -- the well fails -- we got (indiscernible). And
25 we don't know.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MS. TRACY: Certainly we found gold in areas but
2 (indiscernible) came out black (indiscernible) so
3 (indiscernible) will be coming up this way and we wouldn't be
4 able to accommodate them. (Indiscernible) their ocean it's going
5 to be -- it's going ruin ours. Or mammal life up there.

6 MR. REXFORD: Anyway I think I'm done.

7 MR. LOMAN: How many people have been to the open water?
8 I'm sorry I know you're.

9 MR. PIKOK: You know I'm not (indiscernible) for this off
10 shore drilling. I'm against it. We live off of our ocean --
11 this is our garden. You take that one animal away all that
12 animal (indiscernible) it's going to go. I mean I'm not
13 (indiscernible) on orders off shore you know. I'm against it.
14 We live off our ocean -- you take that one mammal away the rest
15 of them are going to follow it like a chain reaction. That
16 happens you know. We follow (indiscernible).

17 That's our garden out there. You know that'll hurt us.
18 We live on (indiscernible) if we have an oil spill out there.

19 MR. LOMAN: How many people have been to the open water
20 (indiscernible) that no one (indiscernible).

21 MR. TRACEY: We had a form of that (indiscernible) here.
22 Right. No one was (indiscernible).

23 MR. LOMAN: And the Coast Guard comes out here?

24 MR. TRACEY: No.

25 MR. LOMAN: I've been to three now and last year there

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 were a number of seismic companies coming in to talk about what
2 they intended to do. And it was very interesting that one in
3 particular -- quite frankly I even remember the name of that
4 company -- but their representative was presenting what they
5 intended to do.

6 MR. REXFORD: (Indiscernible)?

7 MR. LOMAN: No. This was one of the speculators that the
8 company had actually conducts seismic but many of my colleagues
9 remember was (indiscernible). But the representative is
10 presenting information what they intend to do and how they
11 intend to do it and starts being questioned by whaling captains.
12 So our regulatory agencies and literally within an hour you
13 could see and I turned to (indiscernible) was sitting next to me
14 at the time and I said.

15 MS. ANNISKETT: He's too young to remember.

16 MR. LOMAN: I said they're not ready for prime time. And
17 it became more and more obvious and so you know people from the
18 Marine Association or can come from outside and say oh watch out
19 there's going to be a flood of activity once they do this kind
20 of or the other thing. No doing business in the Arctic is not
21 going to be some cake walk for anybody just because they find
22 oil. No it's not going to happen.

23 MS. ANNISKETT: You don't know that.

24 MR. LOMAN: That's not -- I mean if there's one thing I
25 know ma'am I do know that. Because there are a host of federal

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 laws that they -- we'll make the difference.

2 MS. ANNISKETT: The last oil company say.

3 MR. LOMAN: I don't work for the oil company. I don't
4 work for an oil company and I never work for an oil company. I
5 owe oil companies nothing.

6 MS. ANNISKETT: You sure sound like it.

7 MR. LOMAN: And I'm not here to talk anybody into
8 anything.

9 MS. ANNISKETT: You won't (indiscernible).

10 MR. LOMAN: Yeah I don't work for oil companies.

11 MS. ANNISKETT: That's why we're fighting....

12 MR. LOMAN: I understand that -- I'm sharing with you what
13 I've seen and what I've learned in the time that I've seen it.
14 There are and I think everybody could agree that oil companies
15 (indiscernible) the Chukchi sea in 2008 and sent billions of
16 dollars and have moved to explore. Hundreds of millions of
17 dollars have been sent and have not accomplished any
18 exploration.

19 MS. ANNISKETT: And yet that's their change to them.

20 MR. LOMAN: I'm not going to discount that -- that they
21 have a lot of money (indiscernible). The alarmist things that
22 we hear and this is just my point not to talk you into not being
23 concerned. Believe me I know enough about people in the
24 communities -- everyone here included -- that that's ridiculous.
25 I'm not going to talk you into agreeing to that. But the law --

KRON ASSOCIATES

Anchorage, Alaska 99503
(907) 276-3554

1 the federal regulatory framework -- the agencies that are in
2 place and enforce them -- the litigation when they don't enforce
3 it appropriate is a very compelling hurt. For those kinds of
4 activities to take what in every aspect should be -- seismic --
5 drilling is all regulated. Discharges to the air -- to the
6 water -- so on and so forth.

7 And you know my only desire is that the regulatory
8 agencies get stronger not weaker. Stronger than the audience.
9 That's all I'll say. I'm sorry that anybody thinks that I work
10 for an oil company. I don't work for an oil company. I owe the
11 oil companies no more than I already (indiscernible) or anybody
12 else in America.

13 MR. REXFORD: So in light of environmental justice is
14 finally here?

15 MR. LOMAN: I hope it's here to stay. One thing I will
16 say about the administrations I've seen since I've worked for
17 the federal government whether it was Republican Administration
18 or Democratic Administration -- the political appointees that
19 I've seen and come into contact with and gotten to know a little
20 bit -- want to treat native people like a national treasure.
21 Not the poster child for the national trashcan (indiscernible).
22 They really do.

23 They really want to do it. The problem is America is a
24 huge country with a huge, huge demand for oil. There is a lot
25 of things that (indiscernible). But they -- I can see the

1 desire in these people to treat native people like a national
2 treasure. And then that's something I can (indiscernible).
3 It's certainly is better than the opposite.

4 MS. TRACEY: You know when the walrus was here we're
5 getting called the people that are (indiscernible). Or we're
6 getting rich. If we could get rich we could have tourist
7 industry. Even now then everything come and take pictures and
8 all that. If you guys could get rich -- we don't care about
9 getting rich -- we (indiscernible) how to protect our
10 subsistence way of life you know. If (indiscernible) really
11 look around this -- kids play here but you know we could use
12 some money but we don't want to trade our subsistence way of
13 life for billions like you know Nuiqsut.

14 MR. LOMAN: I don't really (indiscernible) rich doing it
15 anyway.

16 MS. TRACEY: Well no I mean you know (indiscernible) rich
17 anyway.

18 MR. TRACEY: Let's here from Robert.

19 MR. LISBOURNE: I am also against off shore drilling.
20 It's just (indiscernible) hunter -- whalers -- beluga hunters
21 and Inupiat way of life is mainly hunting and subsistence
22 (indiscernible). We just don't go out there and do it for fun
23 you know. We build in knowledge -- we build in the heart -- we
24 do it together and we share by (indiscernible). Dad caught the
25 whale (indiscernible) had the celebration. It's mainly because

1 we share. If you could see those pictures over there and see
2 how happy everybody is -- celebrating.

3 And Inupiat people who are on the slope it takes
4 (indiscernible) it takes -- you know take the whole community to
5 raise one. It's because the knowledge is all being passed on
6 and some opportunities pass on. All this subsistence we hunt
7 throughout the year plus Inupiat people are different from like
8 the people (indiscernible) in Alaska but I call Thanksgiving and
9 Christmas -- we all gather and have a big piece in all the food
10 we catch. Just all gathered up and there are people out there
11 (indiscernible) you know and just happy to see people that go
12 there and take food. That's an old fashioned (indiscernible) --
13 keep the herds in homes giving food if they're too far
14 (indiscernible) like (indiscernible) jobs you know and for our
15 native communities.

16 So I love doing what I do (indiscernible) divide and not
17 only that with the subsistence (indiscernible) we have Inupiat
18 values. And there is somewhat (indiscernible).

19 MS. TRACEY: I think if we stay any longer we're going to
20 get more cranky people. Because I think it's (indiscernible).

21 MR. LOMAN: Yeah they did lock the lodge an hour ago
22 but....

23 MS. TRACEY: Do you know how many cranky....

24 MR. LOMAN: There is a dynamic if you keep it on and then
25 you start being Inupiat crank and you fight and then you get

1 past that and then something good is suppose to happen.

2 MS. TRACEY: Good night.

3 MR. LOMAN: And we'll go off record and conclude that if
4 no one else has anything else to say. I'd just like to say
5 thank you for taking all this time to have this discussion. We
6 certainly learned a lot from everybody that said here.
7 Hopefully you've learned a little bit about what we're doing. I
8 know it's (indiscernible) but it works with government -- a
9 whole lot of sense that anybody -- we try to make sense to
10 ourselves and barely do it. But thank you very much and we
11 appreciate it and look forward to working with you in the
12 future.

PROCEEDINGS

(On record at 7:20 p.m.)

MR. LOMAN: My name is Jeffery Loman, J-E-F-F-E-R-Y L-O-M-A-N. I'm the Deputy Regional Director with the Bureau of Ocean Energy Management Regulation and Enforcement, formerly MMS, in the Alaska Region. Thank you very much for coming. The reason I spelled my first and last name is we have a Court Reporter. Judy is going to be recording this.

This is a public hearing. It's a public hearing for the purpose of complying with the National Environmental Policy Act or NEPA. I'll -- we use that acronym NEPA frequently. National Environmental Policy Act, Federal environmental law signed into law by President Nixon requires a few things. Requires that the Federal Agency analyze a major federal action to see if it has the potential to affect the human environment. The major federal action in the case of tonight was the Chukchi Sea Sale 193 that took place in February of 2008. An EIS, Environmental Impact Statement, was prepared. And the Agency was -- decided to hold the oil and gas lease sale.

The Agency was sued, sued by ICAS, Native Village of Pont Hope, and a number of environmental advocacy groups. The case went to Federal court in the Alaska District. It was stalled for a while because there's another lawsuit in the courts in Washington D.C. I won't go into that very -- in detail, but the Alaska District Court withheld their decision until that case

was resolved, so that the Court could decide. And they did decide. And, for the most part, they decided that our Agency complied with NEPA. But there were a few things the Court found that the Agency needed to address. And we'll talk about that. But before I go any further, other than to say thank you for taking the time tonight to come here. We want to hear what your comments on the draft EIS, Supplemental EIS, if you have any comments about it. Want to hear your comments about offshore oil and gas in any context, as well, just because we want to communicate with you. And we want to become a better Agency and learn from your comments and ideas and concerns about offshore oil and gas.

Real quick, starting with Tim who's -- we are now calling Flying Tim -- we're going to introduce ourselves. And then we'll have you introduce yourselves. And we'll all spell our names for Judy the Court Reporter. Tim.

MR. HOLDER: Yeah, I'm Tim Holder, H-O-L-D-E-R. And I'm with BOEMRE in our Washington D.C. offices, opposed to everybody else who's in the Anchorage office. And I keep track of what's going on with the affairs of the Alaska office.

MR. ROUTHIER: My name is Mike Routhier, that's R-O-U-T-H-I-E-R. And I'm a NEPA Coordinator for the Agency, which means I work on these National Environmental Policy Act documents.

MS. CODY: Mary Cody, C-O-D-Y and I'm a Wildlife Biologist with the Anchorage office.

1 UNIDENTIFIED MALE: You're a what?
2 MS. CODY: A Wildlife Biologist with the Anchorage office.
3 UNIDENTIFIED MALE: Okay.
4 MS. WARREN: Sharon Warren, W-A-R-R-E-N. I'm the Program
5 Analysis Officer for the Agency in the Region.
6 MR. PETERSON: I'm Bob Peterson. I'm a Geologist and
7 Chief of the Resource and Economic Analysis Section. And that's
8 P-E-T-E-R-S-O-N.
9 MR. CALLAHAN: My name is John Callahan, C-A-L-L-A-H-A-N.
10 I'm the Public Affairs Officer for the Alaska Region. And I'm
11 taking a few photos tonight, if that's okay with you guys.
12 UNIDENTIFIED MALE: There's a \$4,000 donation that needs
13 to come to each of our pockets.
14 MR. CALLAHAN: Sure.
15 UNIDENTIFIED MALE: I'm kidding.
16 UNIDENTIFIED MALE: From you to him.
17 MR. LOMAN: We are the Bureau of Ocean Energy Management
18 Regulation and Enforcement. And we will no longer be showered
19 with any gifts. If we ever were.
20 UNIDENTIFIED MALE: They turned off the spigot.
21 MR. LOMAN: So we want to meet you folks.
22 UNIDENTIFIED FEMALE: Mike -- Jeffery.
23 UNIDENTIFIED MALE: Who's this?
24 UNIDENTIFIED MALE: Mike the Senior.
25 MR. LOMAN: Would you like to sit down?

1 MR. LOMAN: Herbert?
2 MR. WAINWRIGHT: H-E-R-B-E-R-T.
3 REPORTER: Can you speak up?
4 MR. LOMAN: Wainwright, Herbert.
5 REPORTER: Herbert, no last name?
6 MR. LOMAN: I'm sorry?
7 MR. TAGAROOK: T-A-G-A-R-O-O-K.
8 MR. LOMAN: K-A?
9 MR. TAGAROOK: T-A-G-A-R-O-O-K
10 MS. AKPIK: This is Clyde Akpik, A-K-P-I-K, his last name.
11 And my name is Cora Akpik, from Wainwright.
12 MR. LOMAN: Thank you for coming.
13 MR. AKPIK SR.: Max Akpik, Senior.
14 REPORTER: I'm sorry, I couldn't hear.
15 MR. HOPSON: Max Akpik, A-K-P-I-K, Senior.
16 MR. MICHAEL TAGAROOK: Michael Tagorook, T-A-G-A-R-O-O-K.
17 REPORTER: Everybody's going to need to speak up. I can't
18 hear.
19 MR. LOMAN: Yeah, well it's hard hearing if you're back
20 there. Yeah, if you can, really shout it out.
21 UNIDENTIFIED MALE: Like Bing, I think.
22 MR. LOMAN: Yes sir, way in the back.
23 MR. PATKOTAK: Who me?
24 MR. LOMAN: Yes sir.
25 MR. BLAIR PATKOTAK: Blair Patkotak, P-A-T-A-O-T-A-K.

1 MR. LOMAN: Thank you.
2 MR. NEGOVANNA: Raymond Negovanna, N-E-G-O-V-A-N-N-A.
3 MR. TERRY TAGAROOK: Terry Tagarook, T-A-G-A-R-O-O-K.
4 MR. HOWARD PATKOGAK: Howard Patkogak, P-A-T-K-O-G-A-K.
5 MR. OKTOLLIK: Enoch Oktollik, E-N-O-C-H O-K-T-O-L-L-I-K.
6 MS. MAYER: Lucille Mayer, M-A-Y-E-R.
7 MS. NASHOOKPUK: Isabel Nashookpuk, N-A-S-H-O-O-K-P-U-K.
8 MR. LOMAN: Thank you.
9 MR. AGNASAGGA: Ransom Agnasagga.
10 MR. LOMAN: Spell your last name please.
11 MR. AGNASAGGA: A-G-N-A-S-A-G-G-A.
12 MR. LOMAN: Thank you. Thank you very much.
13 UNIDENTIFIED FEMALE: Steve?
14 MR. SEGEVAN: And I'm Steve Segevan, S-E-G-E-V-A-N.
15 REPORTER: I'm sorry, could you say that again?
16 MR. SEGEVAN: Segevan, S-E-G-E-V-A-N.
17 MR. LOMAN: Are there any other participants we may have
18 missed? Yes sir.
19 UNIDENTIFIED MALE: Could you repeat what you said
20 earlier, to the people that just came?
21 MR. LOMAN: For the new people? Sure, you bet. I'm
22 Jeffery Loman. I'm the Deputy Regional Director of the Bureau
23 of Ocean Energy Management Regulation and Enforcement, formerly
24 known as the Minerals Management Service or MMS. And the reason
25 that we're here tonight is to hold a public hearing, because the

1 Agency has prepared a Supplemental, a draft Supplemental
2 Environmental Impact Statement, which is required under a Court
3 remand in a lawsuit, challenging the Agency's actions when it
4 did an Environmental Impact Statement for Chukchi Sea Sale 193,
5 that took place in February of 2008.
6 The Agency held that sale in 2008, issued 487 leases for a
7 total of about \$2.6 billion, with Shell Oil Company obtaining
8 \$2.1 billion of those leases. And the Agency was sued, sued by
9 the North -- the Native Village of Point Hope, ICAS, and a
10 number of environmental advocacy groups. And they challenged
11 the Agency's compliance with the Federal law called the National
12 Environmental Policy Act, or NEPA, asserting that we didn't
13 comply with NEPA.
14 The Court found that the Agency complied with NEPA, for
15 the most part. But there were a couple of provisions that the
16 Court found the Agency fell short. And those provisions are the
17 failure to analyze the effects of natural gas, and the
18 requirement to explain or analyze, evaluate under a Section of
19 NEPA called 1502, Section 1502.22, do an analysis under that
20 Section of about 40 pages of statements in the original EIS of
21 uncertainty or lacks of information.
22 For example, there's a statement in the original EIS that
23 says, there's uncertainty, scientific uncertainty concerning the
24 population structure of the bowhead whale. At that time, the
25 IWC, International Whaling Commission Scientific Committee, was

1 debating whether or not there were multiple populations,
2 multiple stocks, of the bowhead whale, like a Beaufort stock or
3 Bering stock. The IWC has since concluded that there is only
4 one stock.

5 So our job in that -- using that example, is to determine
6 whether or not there's any significance. Is there significance
7 to the Bowhead Whaler, which many of you are. Does it make a
8 difference if there's one or two or more stocks when you're
9 subsistence whaling? We think not. Whaling has taken place for
10 a long, long time, a lot longer than our Agency has existed, a
11 lot longer than, even than the use of oil and gas.

12 And the uncertainty regarding the stock, the population
13 structure has made little or no difference to the hunter. And
14 it makes little or no difference, we think, to the decision
15 maker who's got to decide on how to approve or not approve or
16 regulate offshore oil and gas activities. So, that's an
17 example, one example of the exercise that we have to go to --
18 through in this draft Supplemental Environmental Impact
19 Statement. And we think we have.

20 We're going to talk a little bit more about that, and
21 explain the legal action that took place. Explain a little bit
22 more about the document. And then we'll go to the important
23 part of this meeting. And that's to hear from you. And take
24 your comments on this draft document and talk together about
25 your concerns, ideas, comments that you may have about any

1 offshore oil and gas activity.

2 Because our Agency, as you know, is going through a
3 reorganization. And these are challenging times for us. And we
4 feel that we share the same challenges as the people in the
5 community of Wainwright.

6 Our work is as important to you as it is to us, really.
7 So we are facing together these uncertain times. And we need to
8 work together and communicate and talk and put our thinking caps
9 on and resolve conflicts and competing interests. And we look
10 forward to this conversation tonight. Sharon is going to talk a
11 little bit about this Court case before the Alaska District
12 Court. Sharon, you really will have to come over here unless
13 you can scream.

14 MR. OKTOLLIK: Before you go on, I didn't bring a pen.

15 MR. LOMAN: Need a pen? You probably need a book to write
16 on, too. But we have to return it. That paper's got my name
17 and phone number on it, in case you don't like what I say
18 tonight.

19 MR. OKTOLLIK: All right.

20 MR. LOMAN: Thank you Sharon.

21 MS. WARREN: Okay, thank you. As you know, what Jeffery
22 said, was that it went to the District Court in January of 2008.
23 And the sale was held in February of 2008. Also, the fact that
24 we have lease sales, based on a five year program. And the Sale
25 193 was in the five year program for 2007 through 2012. That

1 five year program was sued by the environmental organizations in
2 the D.C. Circuit Court. And so, that is why that this case just
3 kind of sat there in the District Court waiting to find out what
4 was going to happen with the D.C. Court. Because the D.C. Court
5 remanded back to the Secretary, his decision, on whether or not
6 to keep the Arctic Sales in that five year program.

7 So that was going back and forth with the D.C. Court. And
8 the Secretary had to do the Environmental Sensitivity Analysis,
9 is what it was called, part of the OCS Lands Act, the Outer
10 Continental Shelf Lands Act. So they had to meet that
11 requirement of the law. The Court, in that situation said,
12 Secretary, you didn't meet the requirement of the law. You need
13 to go back and meet the requirement of the law. So, that's what
14 happened to the sale. The sale was sitting in the District
15 Court because we had the lease sale.

16 So we had the five year program in the D.C. Circuit Court.
17 We had the lease sale in the District Court. A lot of
18 litigation going on during that time. So the D.C. -- so the
19 Secretary -- they finally decided, you know, we're making
20 progress on this. And let's start briefing again on this
21 District Court case on Sale 193. As you know, the Secretary
22 came out with a preliminary Advice (ph) Program in March 31st to
23 keep Sale 193 in the five year program. But did not keep the
24 remaining Arctic sales in the five year program. So there was
25 two Beaufort Sea Sales planned and two of the Chukchi Sea Sales

1 planned. And those were removed from the five year program. So
2 we only have one Arctic Sale that was held in this five year
3 program.

4 So the District Court began looking at all the briefs that
5 were filed. And there was a lot of allegations by the
6 Plaintiffs saying how we didn't follow NEPA. You know, we
7 failed to look at all these things that we should have been
8 looking at. So when the District Court Judge, Beistline, issued
9 his decision in July 21st of this summer, he said, I've looked at
10 all this. And I've looked at everything that you've alleged
11 that the Agency hasn't done. And for the most part, the Agency
12 did take a hard look. They looked at all these things. But you
13 need to go back, and like Jeffery had said earlier in his
14 opening, is you need to look at these three things. And these
15 were the only three concerns that the Judge had.

16 And that's why the document you'll see tonight, and Mike
17 will explain further about it, is focused because it's based on
18 the Court remand, because everything else in that litigation has
19 been decided by the Judge. So we're just left with these
20 concerns that the Judge had on the environmental impacts
21 concerning the natural gas and then the missing information and
22 the cost to get that missing information. We need to look at
23 that, as well.

24 What's going to happen next is that once the comment
25 period is closed, the comments are taken, the public hearings

1 held, we'll be doing a final Environmental Impact Statement.
2 And that final Impact Statement, after it's completed, will go
3 to the Court, because the Judge has kept the case before him.
4 So he'll look at our final Impact Statement. He'll also look at
5 the documents and any other documentation that we use to make
6 that decision on the final EIS. That will be filed with the
7 court. The Plaintiffs who sued us will also have that before
8 them. And there'll be briefs between the legal representation.
9 Then the Judge will decide whether or not that we will --
10 whether or not we met our NEPA obligations in this court case.

11 The Judge also later issued an Order and set a timetable
12 of what he thought would be the time sufficient to do this. And
13 he gave a timeframe, six months from July 21st. So January 21st
14 of 2011 he thought that would be a reasonable time for the
15 government to make a reasonable effort to comply with his Order.
16 And so that's why you see what we have today, the focus of the
17 document and then the timeline that we're working from is from
18 what the Court has said in his order.

19 MR. LOMAN: Sharon, we have till January 21st to submit a
20 final EIS before this Court. How long do these folks have to
21 make comments on this draft?

22 MS. WARREN: You have until November 29th. There's a 45
23 day comment period. So your comments is -- it's open until the
24 29th of November.

25 MR. LOMAN: How can they submit comments?

1 MS. WARREN: You can submit comments by -- in the EIS,
2 hopefully you have a copy, if not. But you can submit comments
3 to our Department by mail. You didn't get in --.

4 UNIDENTIFIED MALE: (Indiscernible) Supplemental EIS?

5 MS. WARREN: Yeah it's the Supplemental EIS. And in the
6 beginning of the document it says precisely how you need to
7 submit the comments. What it needs to say on the comments so
8 that we know when we get it in there. And I think it's the
9 first page. So -- I don't have one in front of me. But,
10 there's a email address that you can use. There's a specific
11 email address to use to submit your comments. You can mail them
12 in, as well. So if you don't have the EIS here, even though
13 they were FedExed here. But apparently FedEx doesn't deliver
14 next day service, it looks like.

15 MR. LOMAN: Has anybody spotted it in the library here,
16 because we did spot them in the library at Point Hope.

17 UNIDENTIFIED MALE: (Indiscernible).

18 MR. LOMAN: Somebody's got one.

19 MS. WARREN: You've got one?

20 UNIDENTIFIED MALE: I called the State and I got it
21 through the computers.

22 MR. LOMAN: Yeah, you can get it online.

23 MS. WARREN: Yes you can get it online. Our website has it
24 online so it's a -- you know -- you can read it online as well.

25 MR. LOMAN: Does anybody have an extra copy that they

1 brought to give away tonight?

2 MR. HALLER: Yeah.

3 MR. LOMAN: Mike did, so --.

4 MS. WARREN: Okay we have another -- an extra one.

5 MR. LOMAN: We'll hold a (indiscernible).

6 MS. WARREN: Yeah.

7 MR. CALLAHAN: I think I have two back at our hotel room.

8 MS. WARREN: Okay.

9 MR. LOMAN: Yeah we don't need to take any to Barrow. We
10 know they arrived in Barrow in large numbers.

11 MS. WARREN: Okay.

12 MR. CALLAHAN: If you want one of mine, please see me
13 afterwards.

14 MS. WARREN: Is there any other questions?

15 MR. HOPSON: Your State, right, State of Alaska Court
16 you're talking about?

17 MS. WARREN: No, Federal.

18 MR. HOPSON: Oh, Federal.

19 MS. WARREN: United States District Court for the District
20 of Alaska, Federal.

21 MR. HOPSON: Oh -- okay.

22 MS. WARREN: We're in the Federal. Yeah, this is the
23 Federal. Yeah, the State has a lot of stuff going on as well.
24 But, no, we're the Federal and so it goes to Federal Court.

25 MR. LOMAN: Thank you Sharon. Any questions about this

1 litigation?

2 UNIDENTIFIED MALE: Yeah, you stated earlier that the
3 Secretary of Interior or somebody (indiscernible) in the five
4 year program. And right now it's fit right into the five year
5 program?

6 MS. WARREN: Yeah, this is an interesting situation
7 because the five year program -- there was a preliminary revised
8 five year program that was done. That was out on the 31st of
9 March and then public comments were taken, okay. There is not
10 yet a final revised program, okay. So the Secretary still needs
11 to make a decision on that five year program, in addition to
12 doing this as well. So if the Secretary, you know, he's got to
13 decide that Sale 193 will be kept in the five year program. He
14 decided, at least at the preliminary stage, it would be. But
15 now they're reviewing those comments. And so he has to make a
16 decision, after reviewing those comments, whether or not it will
17 stay in the final five year program.

18 If it doesn't stay in the final five year program, then
19 this case is going to be -- not relevant anymore. Because it --
20 he removed it from the five year program, so --. So there's
21 several things that need to happen by the Secretary.

22 MR. LOMAN: Thank you Sharon. Any other questions for
23 Sharon? Mike can you come up and talk a little bit about the
24 preparation of this document? Mike was probably the principal
25 person that worked on this draft Supplemental Environmental

1 Impact Statement. And he can tell you what he did to try to
2 address this Court remand. Mike.

3 MR. ROUTHIER: Sure. I was actually on my third day of
4 work with the Agency that we got the remand so --.

5 MR. LOMAN: We put him right to work on this.

6 MR. ROUTHIER: Yeah. So it was pretty interesting, but
7 yeah. So we got the Judge's remand. He was pretty specific
8 about what he wanted. He didn't give us very specific
9 directions on how to do it, but we went with was a Supplemental
10 EIS. It's a pretty intensive amount of analysis. And it also
11 allows us the opportunity to have public comments and to go out
12 and meet the people that are going to be concerned about it. So
13 we're pretty happy with that process.

14 As to the analysis itself, as you probably remember, the
15 first bit of that remand, the Judge told us to do analysis of
16 the environmental impacts of natural gas development and
17 production. So we needed -- our Environmental Analysis Section
18 needed, like a scenario to analyze. We needed an idea of what
19 the natural gas development and production could entail, what
20 kind of development, what kind of production. So, for guidance
21 on those issues, we consulted with our Resource and Economic
22 Analysis Section. And Bob here leads that Section. So he can
23 fill you in a little bit on how they developed this scenario.

24 MR. PETERSON: So, we do the Resource and Economic
25 Analysis. So Mike's group, they needed something concrete to

KRON ASSOCIATES

Anchorage, Alaska 99503
(907) 276-3554

1 analyze -- to study the effects of. My group is Geologists and
2 Engineers primarily. We had already, under the original
3 document, looked at the oil potential, came up with an oil
4 scenario that, one, given a successful case, would expect in the
5 Chukchi Sea.

6 The Judge also wanted to see a gas case. Part of our
7 determination was, yes, there were large quantities of gas
8 potential in the Chukchi. And one of those is that the gas was
9 going to be associated with the oil. Oil, really, is where the
10 big value is. You just didn't see a case where you're just
11 going to have a gas field on its own. So it's going to be an
12 oil field with gas, and this really drove our scenario. So we
13 were going to have, given a discovery, an oilfield with
14 development off shore, the drilling of the oil, a pipeline to
15 the shore, a shore base developed somewhere along the Chukchi
16 coast. And then an oil pipeline that would go across the NPRA
17 and hook into the existing TransAlaskan Pipeline.

18 The oil would be paying for a lot of the infrastructure.
19 After we had a reasonable estimate of about 10 years, we could
20 begin to see gas development. This would be from the same
21 offshore facility. There would be a second pipeline to shore,
22 more onshore infrastructure development at the coast, a second
23 gas -- a second pipeline built, this time a gas pipeline. And
24 it would run along the same right-of-way, both offshore and
25 onshore, across NPRA.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 And this is a little leap of faith. But we had to assume
2 that either the Denali Pipeline or AIGA Pipeline or some gas
3 pipeline is going to be built from the North Slope. And this
4 gas pipeline from the Chukchi would hook into that somewhere in
5 the Prudhoe Bay area and take the gas somewhere south, wherever
6 that may be. So now, Mike's group would have a scenario of oil
7 development to begin with, that oil infrastructure built and
8 then a second pulse of activity which would be the gas
9 development.

10 We also looked at some of the economics. As you know, the
11 North Slope Borough gets almost \$240, \$250 million a year from
12 the property tax of onshore facilities around the Prudhoe Bay
13 area. We estimated that there could be \$2 to \$2.5 billion worth
14 of onshore development that would be taxable, property taxable,
15 due to the onshore landing, oil infrastructure, pipeline, roads,
16 oil compressors.

17 There would be, at a delayed time, because you're going to
18 produce the oil first and then later the gas. At a later time,
19 you would then produce or have to build the gas facilities
20 onshore and a gas pipeline. And that could be worth another
21 \$1.5 billion investment onshore for the gas facilities. You
22 might also think -- like to mention that this all is going to
23 take time.

24 First oil production could be 12 to 15 years in the
25 future. Of course nobody's drilled the first well yet or made

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 first discovery. But, from that date, you could expect 12 to 15
2 years before the first oil production. You could then, very
3 easily, look at another 10 years before the first gas production
4 came. So you'd have 10 years of oil production, roughly another
5 10 years of both oil and gas production with the oil production
6 headed down. And then the oil production would halt. And then
7 there'd be another period of time where you would only have gas
8 production.

9 So that was pretty much the scenario and the timeline that
10 we left Mike with. And, again, we looked at some of the
11 economic infrastructure that would be built onshore and realized
12 there would be the pulse of spending for oil. And then a second
13 pulse later on, spending for the gas facilities.

14 Any questions on how we envision this working? Sir.

15 UNIDENTIFIED MALE: On this lots of oil and gas you're
16 seeing out there, you're talking about 20 years. And yet I
17 can't follow you here because alternative energy there's -- our
18 world is coming where they look at the alternative energy.

19 MR. PETERSON: Yes.

20 UNIDENTIFIED MALE: Do you feel that we just get to rely
21 on oil and gas up here, all of us here or whatever,
22 (indiscernible) stuff like that? What will become of it -- if
23 it's not utilized and you find other source of alternative
24 energy.

25 MR. LOMAN: I think it's safe to say that with the most

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 heightened vision of the alternative energy development, given
2 the use and demand for energy, if Bob's scenario played out and
3 you started in on a production that soon, you would be looking
4 at taking all of the resources that we think may be, even at the
5 highest estimation out of the Arctic. That being said, we go
6 back to what the first Chairman of OPEC said, who was a sheik
7 from Saudi Arabia, when they asked him back in the 60s, I think
8 it was the 60s, how long he thought oil and gas would support
9 these countries in OPEC. And he said, the Stone Age didn't end
10 because they ran out of stones. And I think it's probably the
11 same thing in the case of oil and gas. There'll still be oil
12 and gas. When we move to other sources of energy -- going to
13 the last drop of oil and the last bit of gas before we really
14 move to other alternative energy is kind of a scary thought.

15 But we think that -- we think -- we don't know and won't
16 know until exploration occurs and confirms or negates what we
17 think, that the oil and gas resources in the Arctic could be
18 larger than the largest oilfield on earth. So it is a
19 substantial amount. But the demand is huge and the United
20 States is getting most of their oil and gas, by far, from abroad
21 now. Not at necessarily the right price, and not from people
22 who we're in love with. Or, they're not in love with us. We
23 have lots of love.

24 MR. PETERSON: Alternative energy, I think, has some
25 interesting, you know, additions to the whole nation's energy

1 needs. And yet, at the same time, you know, the companies and
2 its -- money that they're investing, are continuing to believe
3 that we are going to need more oil and gas and more coal. So I
4 don't think 15 or 20 years from now there's going to be any
5 reduced demand for oil and gas. And I guess, again, the only
6 support of that is, that many people are still very willing to
7 spend the amount of money it takes to find additional quantities
8 of oil and gas anywhere in the world and, certainly in the
9 Arctic.

10 UNIDENTIFIED MALE: Some of us, (indiscernible) would
11 probably be (indiscernible). I know they have done studies of
12 exploration of oil and gas probably. I didn't know what date
13 you all would go back. But, they have done studies before and
14 probably around the Bering Sea and along through the Chukchi Sea
15 and the Beaufort Sea. And I always want to try to see the broad
16 picture because most of our bodies of waters are the Outer
17 Continental Shelf, also?

18 MR. PETERSON: Yes.

19 UNIDENTIFIED MALE: How far has that research gone with
20 the whole Bering Sea, the Chukchi Sea and the Sea -- how much is
21 that potential of oil and gas?

22 MR. PETERSON: That's a very interesting -- intriguing
23 question. There's been a lot of work at different levels.
24 Currently, as we speak, every 10 years -- I'm sorry -- yeah
25 about every 10 years we do an updated oil and gas assessment for

1 the offshore. And in our case, for all of Alaska's offshore.
2 Some areas we know a little bit more about, because we have
3 seismic and -- two primary things -- are seismic and wells.

4 In the Arctic we have 35 wells, 30 offshore in the
5 Beaufort or the Beaufort Sea and five in the Chukchi. That's
6 not very many at all. So we have seismic where we can identify
7 tracts. And we have a few wells that say the key components for
8 oil and gas is there. That's what we base our estimate on.

9 Something we haven't, or I haven't mentioned yet today,
10 we're assuming in our scenario a success. We have basins like
11 St. George and Norton Sound where we have gone out -- or
12 companies have gone out and drilled where we had some very
13 optimistic estimates of oil and gas. They drilled them and
14 found nothing and the geology was bad. Reservoirs were missing
15 or there was no indication that oil was in the system at all.
16 So the result could be that after companies go out and drill
17 some wells, they'll all be negative. And they'll decide there
18 is no potential in Alaska.

19 So that's also, you know, a possibility. But the impacts
20 of that, of course, are very minimal. And we're looking for the
21 large impacts that could occur, or any impacts that could occur
22 given a successful case where you go to development. Did I sort
23 of answer your question?

24 UNIDENTIFIED MALE: Didn't our (indiscernible) you say
25 estimates? When you say estimates you do -- we don't really

1 know what's out there even from past oil and gas tests?

2 MR. PETERSON: I can tell you a little more in detail how
3 we do our estimates. We have seismic data. I don't know how
4 familiar you are with seismic data. But it allows us to map the
5 subsurface, what the surface of the earth looks like 5,000,
6 10,000, 15,000 feet deep.

7 We know to have an oilfield you have to have three things.
8 You have to have oil that's generated in the area. You have to
9 have a reservoir rock. Prudhoe Bay is the (indiscernible)
10 sandstone so you have to have a rock where the oil can be stored
11 and you have to have a trap. Oil is lighter than water. So if
12 you can see a -- those structures in the earth, oil could
13 potentially be trapped there. To have an oilfield you have to
14 have all three at the same place. You have to have a trap. You
15 have to have oil generated. And you have to have the reservoir.

16 We don't really know what we don't know. One of the
17 elements we do know is the trap. When the companies go out and
18 shoot the seismic data, they're now able to map traps in the
19 subsea and they've mapped many traps in the Chukchi Sea. So
20 that's very -- that's one good potential that they have. The
21 five wells that they have drilled say that there are sandstone
22 reservoirs there. So they know those, at least, exist out
23 there. And a number of them have oil and gas in them, not
24 enough to be economic but it indicates that there is oil and gas
25 in the area. That's what we base our estimates on.

1 We can look at the number of traps and we can kind of just
2 add them up and, you know, in some areas maybe we see 10 traps
3 every few hundred square miles. And we can assume it's like
4 that in places where we don't know as much. That's an estimate
5 of that potential. We can then say, well, we think the sands
6 will be there. It's a risk that they're there, but we think
7 maybe two out of 10 will have the sands there. And that's how
8 we kind of filled up our estimates. They're based on knowledge,
9 you know, the baseline knowledge that we know. And then we
10 estimate, you know, further up the lines to try and think how
11 much oil and gas is reasonable to be there.

12 We also make estimates of most optimistic, the most
13 pessimistic, to give our -- an idea of how big a range that our
14 estimates are. But we kind of work in the middle that we think
15 it's the most likely. Again, has that addressed?

16 UNIDENTIFIED MALE: Yeah, I think, yes.

17 MR. HOLDER: Another way to answer your question is that
18 in the '75 to '85 period in the last OCS, industry spent about
19 \$11 billion in the winning of bids. And, after that, in '86 the
20 price of oil crashed. And so, just about everybody went away
21 and the amount that industry spent on leases subsequently was
22 much smaller. It was like in the \$100 or \$200 million. And
23 they backed away.

24 MMS has a process where industry can express interest in
25 lease sales in any of the Outer Continental Shelf. And until

1 2005, industry -- well Shell had been interested in about 1990
2 and did some exploration. They backed away till 2005. They
3 said they're interested. And then, as Jeff pointed out, in 2008
4 there was about \$2.6 billion put down on those leases. So
5 that's kind of in a snapshot of -- they have been full of
6 industry interest.

7 UNIDENTIFIED MALE: Maybe I might ask you a question, all
8 right (indiscernible). They stated that Shell Oil spent \$2.1
9 billion?

10 MR. HOLDER: Yes. Right.

11 UNIDENTIFIED MALE: On a (indiscernible) of sea shelf?
12 And there's some \$2.7 billion from -- a lot of lease sales? To
13 myself -- maybe the others would know -- how is this money
14 spent? I mean, where does it go?

15 MR. LOMAN: To the Treasury, to the U.S. Treasury.

16 UNIDENTIFIED MALE: U.S. Treasury?

17 MR. LOMAN: Yes.

18 MR. HALLER: We don't get any of it.

19 MR. LOMAN: Yeah, you could say, I guess, because it
20 influenced the Coastal Impact Assessment Program funding about
21 \$35 million. In the Chukchi Sea Sale increased the amount of
22 Coastal Impact Assessment Program funding that went to Alaska,
23 \$35 million after that Chukchi Sea Sale. But right to the U.S.
24 Treasury it goes.

25 It's a federal resource. The Agency is second only to the

1 IRS in collecting money, money from lease sales, money from
2 royalties from oil and gas.

3 MR. PETERSON: I'll just finish up saying we do have these
4 estimates. But they remain estimates. That's why you now --
5 someone needs to prove it up. And that's why you drill the
6 well. It will always remain an estimate until someone actually
7 drills the structure out there, penetrates it and finds out
8 what's actually there.

9 UNIDENTIFIED MALE: And we -- if we find out the major
10 players, all the major players, if they all come out together we
11 will find out also that something's out there, have a large
12 amount?

13 MR. PETERSON: Well just the players that are out there.
14 And, you know, at this point there's really just a handful of
15 players out there. But, there are not a lot of people that can
16 spend that kind of money. So it's a pretty exclusive group of
17 companies. But, they would be the ones to go out and drill
18 those exploratory wells.

19 MR. LOMAN: Thank you Bob. Now, Mike is going to finish
20 up talking about the draft Supplemental Environmental Impact
21 Statement. Mike, Bob and his staff gave you this scenario. And
22 I read the document. Some of these folks might have too, or
23 they will. So, if you could answer the question, this scenario,
24 natural gas scenario, how much different is it, really, from the
25 effects of the oil production scenario? And how much more

1 analysis needed to be done? Kind of start there and then
2 continue on.

3 MR. ROUTHIER: Sure. It's -- the effects are pretty
4 similar. In fact, but, in a way they are a little bit less. In
5 fact, you might be able to view as a subset.

6 One important point was that no additional exploration
7 would be needed to find the gas. Because, if the gas is going
8 to piggyback off the existing oil infrastructure -- well, all
9 the stuffs already there. We don't need to go exploring for
10 more. We've already got the wells in here. We're getting into
11 the oil. We're using the gas to keep the pressure up. So, I
12 mean, we know where the gas is. We don't need to explore. So
13 all those impacts are not going to be duplicated.

14 What impacts there will be are basically from development
15 of an offshore pipeline. You know, we're not going to have a
16 pipeline in place to get the gas from the platform to shore. So
17 we'll need a gas pipeline. But we could use the same corridor
18 that the oil pipeline is currently using.

19 We need an onshore facility to help process the gas. And
20 then we'll need an overland pipeline. But, again, use the same
21 corridor that the pre-existing oil pipeline could, at that point
22 in time, be in. So, the effects were pretty similar to the
23 effects that we had already analyzed for the oil. And we tried
24 to organize it pretty logically in the document where we first
25 summarized the impacts from the oil. And then we summarized the

1 projected impacts from the gas development. And then summarized
2 the projected impacts from the gas production. So we tried to
3 organize it pretty logically in that manner.

4 And that was about it. We had our whole team of analysts
5 working on it, scientists like Mary here. A variety of
6 disciplines looked at Bob's scenario and gave their analysis on
7 it. So, and that takes care of that first part, the Judge's
8 remand.

9 The second and third concerns of the Judge's remand, both
10 pertain to that 1502.22 regulatory process. Basically, there's
11 provisions in the Federal regulations that say, when you have
12 incomplete or missing information in a NEPA document like this,
13 there's a certain process that you have to follow. And the
14 Judge found that the Agency did not do a good enough job the
15 first time around. He said, do it again. So we did it again.

16 We developed a more logical and sequential process to keep
17 everything objective and keep our analysis focused on the right
18 things. And we ran it through our analysts. They came out with
19 their conclusions. And we memorialized the conclusions for
20 every item of missing or incomplete information in Appendix A
21 here.

22 Basically, the Plaintiffs in the lawsuit we talked about
23 before submitted a large exhibit that included a variety of
24 statements pulled from our documents where it referred to
25 information that was incomplete or missing, stuff like that. A

1 lot of it was background information. So we catalogued all
2 those, plus we went back, reviewed our own documents, and just
3 to try to ensure that we had captured all the references that
4 the Plaintiffs may have missed some. So we reviewed it again
5 ourselves and tried to look for more. We found a few more,
6 maybe like 30. And we included those in this analysis, where a
7 few of our analysts used a sequential process and memorialized
8 all the analysis from Appendix A, which is there for your review
9 in this document. And that was it.

10 MR. LOMAN: Any questions about the draft Supplemental
11 Environmental Impact Statement?

12 UNIDENTIFIED MALE: I have a question. You said that a
13 lot of people had filed on (indiscernible) 2008 and the court
14 (indiscernible) the Court doesn't need to address three
15 concerns, right?

16 MR. LOMAN: Uh-huh (affirmative).

17 UNIDENTIFIED MALE: How close are you in addressing those
18 concerns before the Ninth Circuit Court can accept your EIS?

19 MR. LOMAN: Well, we're not in the Ninth Circuit Court
20 yet. We're still in the -- before the Alaska District Court.

21 UNIDENTIFIED MALE: Okay.

22 MR. LOMAN: We've got the draft Supplemental Environmental
23 Impact Statement. We're using the standard, pretty much
24 standard, NEPA guidelines to move that document along. Taking
25 public comments now. That will end on November 29th. Then we'll

1 move to address those comments, which is required under NEPA and
2 answer them, answer questions, explain things. Finalize the
3 draft Supplemental EIS, after taking these comments into
4 consideration. And then the next step is, file it with the
5 court and look for a record of decision.

6 Record of decision could be, reaffirm the sale. And the
7 Secretary would reaffirm the sale. Or the Secretary would not
8 reaffirm the sale. Given the draft Supplemental Environmental
9 Impact Statement, the document we have today, we're talking
10 about today, my recommendation to the Secretary of the Interior
11 would be to reaffirm the sale.

12 This exercise of analyzing natural gas, was it necessary
13 under NEPA? Yeah. And like Mike just explained, no extra
14 seismic activity, none -- no exploration activity. These are
15 all the activities that are right before us. And the
16 development activities, the effects from development are many,
17 many years away. In fact the effects of development of natural
18 gas are so far off into the future, this young man may be in
19 charge of that. I'll be dead, that's how long. I will be. I'm
20 going to be dead. I don't mean to be morbid. We're talking
21 many, many, many years down the road.

22 And so, not that, you know, we didn't have a requirement
23 to do it under NEPA, and now we have. And the 1502.22 analysis
24 speaks for itself. The methodical evaluation of each and every
25 one of those items has been done. So, given that, I'm ready to

1 say right now, not that I can't be, you know, persuaded that we
2 need to do additional things, during the middle of a public
3 comment period. We certainly can. We're hearing lots of good
4 ideas. And we're only about half way through our meeting with
5 the communities and the government to government consultations.
6 But none of them pertain to this particular issue, necessarily.

7 But we could do more. But right now -- if the Secretary
8 of the Interior walked through that door and said, where are we
9 headed with this, I would say reaffirm the sale. Don't think
10 that will change, but that's just a guesstimate at this point in
11 time.

12 By January 21st which is in our time lifeline, extremely
13 fast, because it's just right around the corner, the Secretary
14 will have some decisions to make.

15 UNIDENTIFIED MALE: Now, you made a good point of that.
16 You're going to be dead when this all takes, you know, in the
17 future too. You know we got our grandkids that's going to grow
18 up, up here. I don't know where your family's from but, you
19 know, that's -- that's our backyard. Do not act dumb, but we
20 just ask, like you say. The future is going to be affected.

21 MR. LOMAN: I don't have any children. I don't have any
22 grandchildren so I have to worry about yours, I guess.

23 UNIDENTIFIED MALE: Well I do, you know.

24 MR. LOMAN: Yeah and that's part of our job. That's part
25 of our job is to worry about you, your children and your

1 grandchildren and so on.

2 UNIDENTIFIED MALE: And, in my opinion, as well, it's the
3 part of our job, like he said, to look after our children and
4 grandchildren. Well, I've got to also think about how are they
5 going to make a living, you know. The population's getting
6 bigger but the job status is that it's status quo. We don't
7 have jobs to provide our young people. They're going to have to
8 get up and leave town. That boy right there is going to have to
9 go to college and not come back because there'll be no jobs
10 here.

11 We have to be able to develop our community in a safe,
12 sound manner so that we -- our families can come back and work
13 and be at home. That's another aspect of looking at the
14 livelihood of our families. There's not enough jobs. There's
15 five of us in here who have had jobs the whole summer because of
16 oil and gas, right now, because of oil and gas. There was none
17 when we had these jobs. Thank you.

18 UNIDENTIFIED MALE: Another point I wanted to make. You
19 know, like you said, the Borough only tax, what \$250, how many
20 millions, last year -- \$250 million, right? What was the
21 profits of Shell last year? You know, there's a big difference
22 in the world. We're running this Borough, on not very much,
23 compared to the profits that you guys are making.

24 MR. LOMAN: Last night at the meeting, a lady said I
25 worked for the oil and gas company.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 UNIDENTIFIED MALE: You guys say, yeah, we get the taxes.

2 MR. LOMAN: I don't work for the oil and gas company. I
3 work for the government. I serve you.

4 UNIDENTIFIED MALE: Yeah.

5 MR. LOMAN: But do the oil and gas companies -- and I
6 think your point sir, is well taken. The oil and gas companies
7 make a lot of money, a lot of money, a lot of money. That's
8 your point.

9 UNIDENTIFIED MALE: The market is shot.

10 MR. LOMAN: Go ahead. I'm sorry, I didn't mean to
11 interrupt.

12 UNIDENTIFIED MALE: But we're expected to take care of our
13 -- with that \$250 million, run everything up here with the costs
14 so high. And on top of that, try to create jobs and everything.
15 It's -- I don't know what it's like in the Borough but it's got
16 to be hard.

17 Just like with the federal government, you know. You're
18 running our government, leaving it without any money. That's
19 the truth, leaving a deficit. No China money you know -- we're
20 a slave to China for real.

21 UNIDENTIFIED MALE: The North Slope Borough gets its money
22 from tax and property tax and that is declining because of the
23 aging infrastructure. And creating a pipeline and creating
24 onshore infrastructure, the property tax will increase. And the
25 North Slope Borough will have more money to sustain itself. The

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Borough is not running on a deficit. It's running at a break
2 even, with some funds being put away for future use. Not like
3 the Federal government, where there is so many trillion in the
4 hole and who knows what will happen.

5 UNIDENTIFIED MALE: The Federal government is the one that
6 (indiscernible), you know. Would it (indiscernible).

7 UNIDENTIFIED MALE: I don't know it's a lot deeper.

8 MR. LOMAN: What is your biggest concern? If there is one
9 thing that is -- bothers you the most with respect to offshore
10 oil and gas?

11 UNIDENTIFIED MALE: I notice (indiscernible) done correct.

12 MR. LOMAN: Safety?

13 UNIDENTIFIED MALE: If there is a correct way.

14 MR. BLAIR PAKTAOTAK: I feel like, I guess, for the
15 welfare and well being of our community like, no discussion of
16 natural gas heating their homes and there's a -- lot cheaper
17 than transporting diesel, what they're doing right now to heat
18 our homes. Our businesses are burned by diesel. And it's
19 transported to the barge. I read somewhere that -- looking to
20 the gas, analyze the gas, whatever to -- see if it's feasible,
21 for Wainwright to get that. You guys have no -- anything to do
22 with that except the oil companies who drill for that, right?

23 MR. LOMAN: You're talking about Alpine and the natural
24 gas?

25 MR. HOPSON: You're right, Blair. That gas issue in the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 book that you're reading, would be between Wainwright and the
2 producer. It wouldn't -- the Federal government couldn't
3 mandate the oil companies to give us free gas or flat gas, or
4 whatever it would be, between the community and the development
5 -- the developer.

6 MR. BLAIR PAKTAOTAK: We'd have to talk to them too, to
7 see if we can go about that, getting heat to producing oil and
8 gas, right?

9 MR. LOMAN: That's -- it's a business deal where an
10 arrangement, a legal agreement or agreement between the
11 community, and the case in Nuiqsut, and the producer, yes. I
12 think what you're talking about, and John is certainly right --
13 we can't make a company give a community gas or anything else,
14 really.

15 Even the Conflict Avoidance Agreement in a recent court
16 decision which kind of exemplifies what I learned after working
17 for the Bureau of Indian Affairs for 10 years, a lot of times
18 you sue and you win, but you lose. And the lawsuit involving
19 the conflict avoidance -- it was actually challenging
20 exploration. But the issue of the Conflict Avoidance Agreement
21 -- the court found that neither than MMS, our Agency, or
22 National Marine Fisheries Service, is a party to the Conflict
23 Avoidance Agreement -- couldn't do anything to force anybody to
24 come to it if it wasn't reached. Couldn't do anything if it was
25 breached by either party. And so, in other words, the Federal

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 government, just two Agencies standing on the sidelines puffing
2 up their chest and walking around powerlessly.

3 And so that essentially means the Court found, and that
4 was the Ninth Circuit, that this agreement is between the Alaska
5 Eskimo Whaling Commission and the industry alone. Last night,
6 however, when we were talking about -- a little bit about the
7 reorganization of our Agency, I mentioned earlier. Everybody
8 may not have been here then. We're not done reorganizing.

9 We're going to change our name again. The Regulation and
10 Enforcement will go to a new Agency that's about to be created
11 called the Bureau of Safety and Environmental Enforcement. Our
12 inspection arm of the Agency will become a stand alone Agency.

13 The Bureau of Ocean Energy Management will move forward
14 and do environmental reviews, interface with the public.
15 Probably do everything but those enforcement activities. And
16 they don't know exactly, yet, because they're working on how to
17 create an Agency that regulates the industry that will do first,
18 one thing. You might be the most interested in this, since your
19 concern is safety -- most interested.

20 UNIDENTIFIED MALE: Thank you. (indiscernible) you're
21 already talking, the government's trying to expand, you know.

22 MR. LOMAN: Not necessarily expand, do something right for
23 a change. They want to create an Agency that restores public
24 trust, restores public trust.

25 UNIDENTIFIED MALE: Another thing I wanted -- just ask

1 before you going any further. You know, if Obama doesn't get
2 re-elected in 2012, is all this going to just keep going on the
3 way it started out? Like MMS spinning into these different
4 fields or is that going to -- is it go back to what it was
5 before?

6 MR. LOMAN: Well, look at history. MMS was, at one time -
7 - the activities that MMS did were done by BLM employees and
8 USGS employees. And then they created MMS. And that was -- I
9 don't remember, because I wasn't working for them at the time.
10 But there was either a Republican or a Democrat as President,
11 whoever it was, they were. And then they went to another one
12 and then they went -- so it continued on. Government continues
13 on. I'm not a political appointee. I'm not, one, an employee
14 of an oil company. I am not an employee of an oil company.

15 UNIDENTIFIED MALE: You thinking, like I was jacking you.

16 MR. LOMAN: I am not an employee of an oil company. You
17 can attack me all you want but you're attacking somebody that
18 serves you. I serve you.

19 UNIDENTIFIED MALE: Look and see what I'm feeling.

20 MR. LOMAN: I know how you feel. I know how you feel and
21 you know that's why --.

22 UNIDENTIFIED MALE: Want to see just --.

23 MR. LOMAN: That's why --.

24 UNIDENTIFIED MALE: Feel very, very bottom, zero, zero,
25 zero, zero, zero, whatever percent I'm (indiscernible).

1 MR. LOMAN: Well when I see somebody that thinks that, you
2 know, that I don't serve you. I'll come back pretty strong and
3 say, I serve you. I serve you just as much as I serve any oil
4 company. I serve them too, a part of my job.

5 But -- so this new Agency that they're going to create,
6 that they want to restore the public's trust, including yours --
7 they've asked for recommendations from us. And we've said,
8 well, we think you need to create an Agency that is feared and
9 respected by the industry. Feared and respected by the
10 industry. That doesn't mean the industry is afraid of them like
11 in the context. Feared because of their capability to regulate
12 them -- their respect and fear together that industry, in a real
13 strong way.

14 Last night, with the leaders in Point Lay, it was brought
15 up that the Agency's regulatory arm needs to have a component
16 that protects the Inupiat culture, protects subsistence whaling.
17 Protects other subsistence activities. Protects the culture,
18 the Inupiat culture, from all kinds of other activities that be
19 -- come from integration into the community, et cetera, et
20 cetera, insomuch as the law allows.

21 And I had recommended, already, a much broader set of
22 expertise than just drilling operations. And so, I'm going to
23 recommend, and I think other leaders from communities in the
24 Arctic will also recommend, that the Agency include a component
25 that has a person. It'll be a person, probably a person who has

1 experience like all leadership comes here -- comes first from
2 whaling. I have to believe it'll be leaders here, our leaders
3 in the whaling context first. Whaling first, and possibly
4 somebody who was also an MMO, worked in the industry, the oil
5 and gas industry. Regulated the oil and gas industry for the
6 Borough, or some other massive expertise that adds to this new
7 regulatory component that will restore public trust.

8 Restoring public trust in the Arctic is going to mean
9 doing those kinds of things that I can't do. I didn't grow up
10 here. I don't know about whaling. I can read about it. I can
11 talk to you about it. But I've never done it and I won't do it.
12 You do it. I'm not allowed. So it will have to be somebody
13 with that kind of expertise. And that might restore public
14 trust. Who knows, it might even restore your trust, I don't
15 know. We can hope. I can recommend, hard, as hard as I can to
16 these people who are in Washington D.C. Their lawyers, they
17 know nothing about this. So they'll listen to us. And a lot of
18 what I have to say comes from people in meetings like this. The
19 Lord knows all of my good ideas just get me out of the good
20 schools.

21 So that's where we're going as an Agency. And I think
22 this new regulatory Agency will be created as soon as -- just in
23 a few months, there'll be an announcement of a new Bureau of
24 Safety and Environmental Enforcement.

25 We want to take public comments this evening, comments

1 primarily on the draft Supplemental EIS prepared to address the
2 Court remand. John do you have comments?
3 MR. HOPSON: No.
4 MR. LOMAN: No -- thank you.
5 MR. HOPSON: Not yet.
6 MR. LOMAN: Okay. Let me know when you're ready. So I'm
7 going to turn it over to you all, and hear what you have to say.
8 Hear what's on your mind. Also, we have coffee and cookies,
9 quite a few cookies, so please feel free to help yourself.
10 UNIDENTIFIED MALE: So who's here representing the State -
11 - nobody? It's all feds here? All feds, huh?
12 MR. LOMAN: All from the three mile limit out to the 200
13 mile limit. But we do work with the State. Matter of fact,
14 we're working with the State collectively on developing a
15 process to do health impact assessments in conjunction with our
16 NEPA evaluations.
17 UNIDENTIFIED MALE: You need to ask them to step up there
18 so the Reporter --.
19 MR. LOMAN: Well it would be ideal.
20 REPORTER: If they're going to talk, they need to tell me
21 their name and spell it.
22 UNIDENTIFIED MALE: Do I need to come say what I said
23 earlier in the comments?
24 MR. LOMAN: No, no, no. If you've said it already, we have
25 it down. If there's additional -- people don't like to talk so

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 you have to encourage. Help me with this if you can. Encourage
2 people to come forward and say what's on their mind.
3 UNIDENTIFIED MALE: I don't even know the times that we
4 got.
5 MR. LOMAN: The draft Supplemental EIS? Well given all of
6 our environmental documents that we've produced, it's two
7 things. Easy to read because it's written in plain English.
8 And it's short, probably the smallest environmental document
9 we've produce just about, you know. Yes sir?
10 UNIDENTIFIED MALE: Are those the three, there's only 40
11 max (indiscernible), I believe in your EIS?
12 REPORTER: Can we get his name?
13 MR. LOMAN: I'm sorry?
14 UNIDENTIFIED MALE: The three concerns the Court gave you
15 -- are those the only three that you're looking at?
16 MR. LOMAN: Yes.
17 UNIDENTIFIED MALE: To fulfill your EIS?
18 MR. LOMAN: Yes. The impetus for preparing this
19 Supplemental Environmental Impact Statement is the Court remand,
20 and those three things that the Court said we needed to address.
21 UNIDENTIFIED MALE: Okay, (indiscernible).
22 MR. LOMAN: Hasn't been -- hasn't been submitted to the
23 court yet. Because the National Environmental Policy Act, in
24 addition to saying you must address the affects to the human
25 environment when you're taking a major Federal action like in

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 oil and gas lease sale, like we did in 193. Its other component
2 is to be transparent, open. It's a Sunshine Law, let the public
3 know. And then the other thing is, let the public and other
4 stakeholders, government Agencies that are interested, et
5 cetera, provide input to us, the Agency that's doing it. That's
6 why we're here tonight.
7 MR. PETERSON: But I think your question was, the Judge
8 read the original and --.
9 UNIDENTIFIED MALE: Yeah.
10 MR. PETERSON: -- and accepted everything in the original,
11 except these three issues.
12 UNIDENTIFIED MALE: Yeah.
13 MR. PETERSON: So he did. He found the other ones treated
14 the requirements thoroughly. So it's just these three that he
15 had an issue with.
16 UNIDENTIFIED MALE: Thank you.
17 MR. LOMAN: Yes sir? Our reporter will want to know who
18 you are.
19 MR. HOWARD PATKOGAK: I'm Howard Patkogak with the Hoonah
20 Corporation.
21 MR. LOMAN: Howard.
22 MR. PATKOGAK: I have a question on page 10 -- in this --
23 explain fourth paragraph. I need an explanation about that
24 first sentence with BOEM. What do you call a reasoned --
25 reasoned choice -- explain that.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: A reasoned choice? That it's reasonable.
2 Reasonable is something that is not far-fetched. It's
3 obtainable. It's possible. It's likely to happen.
4 MR. PATKOGAK: Thank you.
5 MR. ROUTHIER: And that that language is taken from that
6 Federal regulation that we discussed before, that 1502.22.
7 That's directly taken from the regulation.
8 UNIDENTIFIED MALE: You had a comment? You got a
9 microphone on?
10 MR. LOMAN: We have a microphone right in that thing right
11 there.
12 REPORTER: Could you state your name, please?
13 MR. OKTOLLIK: Thank you very much. My name is Sean (ph)
14 Enoch Oktollik, City Mayor of Wainwright. And my comment for
15 tonight is November 4, 2010 to the Regional Director Alaska OES
16 (sic) Bureau -- Bureau of Ocean Energy Management Regulation and
17 Enforcement. And your address. Wainwright, Alaska Public
18 Hearing today -- Chukchi Sea Draft SEIS, Lease Sale 193.
19 Today's date, November 4, 2010.
20 The Director: As Mayor of Wainwright, I would like to
21 thank you for this opportunity to give our thoughts about
22 oil and gas activities in the Chukchi Sea. As the community
23 that stands to be impacted the most by activities in the Region,
24 we are paying close attention to a wide range of economic and
25 environmental issues. I had the pleasure of sharing these

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 issues with the Director Michael Bromwich, Tom Beaudreau and
2 John Groll here in Wainwright on October 27th. At that time, I
3 told him that the City supports a balanced approach of
4 exploration in the Chukchi Sea. That support is shown in a
5 Resolution we passed, adopted this year. I have a copy of the
6 Resolution for you that we would like put into the record.

7 By a balanced approach, we mean one that provides jobs and
8 business opportunities, but does not impact our subsistence
9 lifestyle. This balance is important to us because, while much
10 of our traditional food comes for the sea. In today's economy
11 we must also rely on jobs to pay the bills for the modern
12 services we have here.

13 One of those modern services is electric power. Today our
14 electricity is provided by diesel generators. The potential of
15 natural gas from our own backyard to power these generators
16 would be beneficial to us in two ways. It would provide us with
17 a consistent and less costly fuel. And it would help reduce the
18 greenhouse emissions burning diesel fuel products. This is an
19 advantage our neighbors in the village of Nuiqsut enjoys, thanks
20 to gas produced in the Alpine Oil Fields.

21 In a remote village like Wainwright, the number of jobs is
22 limited. This is why we support careful exploration in the
23 Chukchi. Because our community is so close to the exploration
24 area, we have an opportunity to create long-term jobs. That is
25 why we join the Olgoonik Corporation in support of exploration.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 As the primary landowner and for profit organization in it will
2 be through their efforts that development will take place. That
3 is why we have identified Olgoonik Corporation as the point of
4 contact for local hire and their subsidiaries as preferred
5 contractors for operations on property owned or controlled by
6 the Corporation.

7 For Wainwright, to take advantage of this economic
8 benefits of oil and gas development in the Chukchi Sea, we urge
9 that exploration activity be approved and not delayed any
10 further. Thank you for this opportunity to provide you with our
11 comments.

12 Respectfully, Enoch Oktollik, Mayor of City of Wainwright.
13 I don't have Resolution right now, but I'll give it to you guys.
14 How long will you be here?

15 MR. LOMAN: Well we're going to Barrow tomorrow morning.
16 But we actually, I believe, have the resolution already.

17 MR. OKTOLLIK: All right.

18 MR. LOMAN: If you -- and we will submit as part of the
19 record. We will take comments until November the 29th if you
20 want to be double sure you can always just email them. Email
21 the resolution to us.

22 MR. OKTOLLIK: All right.

23 MR. LOMAN: And we will submit it, as part of the record.
24 We will take comments until November 29th, if you want to be
25 double sure, you can always just email them. Email the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Resolution to us. And we'll make it part of the record.

2 MR. OKTOLLIK: All right. And, I'll leave you a copy in
3 here and I never write a cc copy to the City of Wainwright.
4 Maybe I could write it down first before I turn it over to you?

5 MR. LOMAN: Sure.

6 MR. OKTOLLIK: We got the copy in Wainwright.

7 MR. LOMAN: Thank you very much for your comments and the
8 Resolution Mr. Mayor. We appreciate that.

9 MR. OKTOLLIK: Thank you for the opportunity to testify
10 tonight.

11 MR. LOMAN: Thank you Mr. Mayor. We need that note for
12 the record.

13 MS. MAYER: Good evening. For the record, Lucille Mayer.
14 Thank you for coming to Wainwright to hear our testimonies this
15 evening. And I'm sure there'll be others that will submit
16 testimonies or their comments to you by the 27th of this month.

17 My name is Lucille Mayer. I am a member of the Board of
18 Directors of Olgoonik Corporation, the Village Corporation of
19 Wainwright, Alaska. The Olgoonik Corporation was formed in 1973
20 by the Alaska Native Claims Settlement Act. In 1999 we formed
21 Olgoonik Development to create and manage for profit,
22 subsidiaries in government contracting.

23 During the past nine years, Olgoonik Development and its
24 growing number of successful subsidiaries have assembled a
25 record of proven performance in the area of construction

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 management, facility operation support services, design/build
2 services, logistics support, environmental remediation services
3 and technical security. While this growth has brought financial
4 and educational benefits to the community, the great majority of
5 the jobs created are outside of Alaska.

6 However, the Federal government's focus on reducing
7 reliance on contractors makes it necessary for the Olgoonik
8 Corporation to seek opportunities outside of the Federal market
9 place. For that reason, we made the strategic decision several
10 years ago to diversify into commercial operations. One of our
11 key business targets was the oil industry in Alaska. In advance
12 of potential exploration in the Chukchi Sea, we began investing
13 in the infrastructure and technology needed to support oil
14 company operations on the North Slope.

15 Our working relationship with the industry in the Chukchi
16 started in 2007. This was the year we began providing Marine
17 Mammal Observers, as well as crew change and supply support for
18 companies conducting science studies in the Region. This
19 support has grown over the past two seasons and made it
20 possible, train and hire local residents for several seasonal
21 jobs. During the past four years Olgoonik has invested in
22 excess of \$5.5 million developing and upgrading infrastructure -
23 - purchasing equipment and preparing residents for working with
24 the oil industry.

25 We have built good relationships with the companies who

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 have leases in the Chukchi. We have worked together to develop
2 the groundwork for important economic growth. In the forefront
3 of these efforts is our focus on what Mayor Oktollik described
4 as balanced growth between economic and subsistence issues. The
5 jobs and economic development that will come from exploration in
6 the Chukchi Sea is important to the Olgoonik Corporation and the
7 people of Wainwright. We are confident that exploration can be
8 done in a manner that protects our subsistence traditions. Our
9 Board has passed a resolution in this regard. And we present a
10 copy for inclusion in the public record. Thank you for your
11 time. And I will be happy to answer any questions you may have.

12 MR. LOMAN: Thank you very much.

13 MS. MAYER: Un-huh (affirmative).

14 MR. TERRY TAGAROOK: Good evening. And before I start, my
15 cell phone accidentally pressed a number. And do you know who
16 that person was?

17 UNIDENTIFIED MALE: Your mom?

18 MR. TAGAROOK: No, Marie Tracey. And she send her
19 greetings to all of you. I know she -- you met with them
20 yesterday. Anyway, I'm glad you guys are here and speaking to
21 us about this, even though it might be on a short notice.

22 My name is Terry Tagarook. I am speaking today as a
23 member of the Wainwright Tribal Council. The Council also
24 believes we can achieve a balanced approach between our
25 traditional subsistence lifestyle. This is important because we

1 no longer function in an isolated barter economy or rely totally
2 on subsistence as our ancestors did.

3 But subsistence remains an important part of our way of
4 life. The Arctic Ocean subsistence resources not only feed us,
5 but are fundamental to our identities as Native Alaskans. While
6 these waters provide many of our basic food, it is important to
7 consider the fact that we also must rely on local jobs in
8 addition to subsistence.

9 Our households are caught in a changing world. We hold
10 strongly to traditional Inupiaq values, but must also adapt to
11 the reality of living in a cash based society. The limited
12 number of jobs available in the Village is found in public
13 services provided by the North Slope Borough, the City and the
14 Olgoonik Corporation. In the past, this has meant that many of
15 our young people have had to leave the Village to find work.

16 For that reason, we see oil operations in the Arctic Ocean
17 as one of the most important opportunities we have for
18 developing a local economy that could grow and support future
19 generations. We understand that exploration and development
20 activities in the area will bring challenges. By speaking with
21 us about our concerns and taking advantage of our traditional
22 knowledge, these challenges can be overcome.

23 We believe that our traditional way of life can be
24 balanced with responsible and environmentally safe oil and gas
25 development. We urge you to move forward with approval for

1 drilling in the Chukchi.

2 Like the City of Wainwright and the Olgoonik Corporation,
3 the Council has passed a Resolution supporting exploration in
4 the Chukchi. And I request that this document be added to the
5 record of this public hearing. Respectfully, Terry Tagarook,
6 Tribal Council, Wainwright, Alaska.

7 And I believe you have that copy of the Resolution.

8 MR. LOMAN: Thank you.

9 MR. TAGAROOK: Thank you.

10 MR. HOPSON: My turn?

11 MR. LOMAN: Always.

12 MR. HOPSON: Always, huh? John Hopson, for the record.
13 Good evening. I'm going to speak on behalf of the Whaling
14 Captains because our President is not here today.

15 My name is John Hopson, Jr. As one of the Whaling
16 Captains in Wainwright, I would like to thank your Agency for
17 this opportunity for us to express our opinion regarding oil and
18 gas in the Chukchi Sea.

19 Every whaler in our group is committed to support the
20 subsistence lifestyle in Wainwright. That is why we have paid
21 close attention the plans to explore for oil off our coast. We
22 understand that these activities can bring new jobs to
23 Wainwright. Those jobs are important, because every Captain
24 knows that it takes money to support subsistence whaling. We
25 need to pay for gas, supplies and equipment. That money comes

1 from local jobs.

2 For some time now, the Whaling Captains have supported
3 Olgoonik Corporation's effort in the oil industry. They have
4 been active in making certain the oil industry understands the
5 importance of whaling and other subsistence hunts. They have
6 led the discussion of what can be done to balance exploration
7 with our traditional lifestyles, our concern for the environment
8 and our need for local jobs.

9 As an example of this effort, Olgoonik runs a
10 Communication Center during the summer season to make certain
11 offshore science operations do not interfere with whaling. The
12 company also operates a small boat that supports the Science
13 Program. This fall they've used that vessel to help tow in that
14 whale, which was Wainwright's first fall whale.

15 We appreciate this leadership and join the Olgoonik
16 Corporation, the City of Wainwright and the Tribal Council in
17 their support for the Chukchi oil exploration that is done in a
18 safe and respectful manner. Thank you.

19 I've also got a copy of a letter dated January 7, 2010,
20 addressed to June Childress, our President of Olgoonik
21 Corporation from Walter Nayakik, Jr. our president of the
22 Wainwright Whaling Captains.

23 MR. LOMAN: Thank you very much.

24 MR. HOPSON: Thank you. I just want to ask this question.
25 It's probably the only community that has statements of this

1 sort, that pretty much supports the working relationship with
2 oil companies and the Federal government. One, because we
3 understand whether we fight you or not, oil exploration will
4 continue. So we've taken a proactive stance to work with the
5 industry and the Federal government to help balance the issues
6 and not fight in court.

7 What questions does the Federal government have of us in
8 that sort, or the State government for that matter?

9 MR. LOMAN: Well I don't know if I can speak for all of
10 the Federal government, but you are correct that -- and there is
11 a subtle difference. Wainwright and the statements that are
12 being presented tonight aren't the only statements that are
13 supportive of responsible exploration and subsequent
14 development. There's a fear. And it's understandable to me,
15 and I think to everyone in the Federal government, of a major
16 oil spill.

17 This spill that occurred in the Gulf of Mexico on April
18 20th -- because I work in Alaska. I've never worked in the Gulf
19 region. I've only worked for this Agency in Alaska. I will
20 only work for this Agency in Alaska. I came to this Agency
21 because, one, I wanted to live in Alaska first. And, so I said
22 to myself, what would I do and what would my colleagues do had
23 that occurred in the Arctic? But for that spill, Shell may have
24 conducted exploration activities in the Arctic. It was likely
25 that they would have. And I think that -- I know I would be

1 devastated, personal responsibility. I would take personal
2 responsibility for it because I am part of the senior leadership
3 in our organization. And I work closely with the managers that
4 would be overseeing the regulatory aspect of any drilling
5 operations. Ours would be -- our inspector, at least one, would
6 be there 24 hours a day during that exploration. But that's,
7 you know, what didn't happen.

8 What did happen is, this week we took statements and
9 listened to comments starting in Kotzebue, Point Hope, Point Lay
10 and now here. And then we continue to Barrow and then
11 Anchorage. And people say -- say this -- almost everywhere more
12 and more in the communities, that exploration and development is
13 inevitable. So if it's going to happen, then we demand certain
14 things. What is being demanded is pretty consistent, probably
15 consistent with your expectations. I think you have
16 expectations that's different than demands. But what gets done
17 is the same, stay out of the way of whaling. Don't interfere
18 with whaling and disrupt it like Shell did, by their own
19 admission, in 1985.

20 Shell admits to that. One time one of their leaders said
21 they were going to apologize for it. I hope they did. But it's
22 not my job to make people apologize. It's my job to regulate
23 that industry in a way so that they never have to apologize.
24 Because in our mind, this is not an experiment with respect to
25 regulating industry so they don't disrupt subsistence activities

1 and other culturally self-defining activities. It has to be
2 done and it can be done. We know it can be done. The Deepwater
3 Horizon spill, Exxon Valdez -- those are incidents that didn't
4 have to happen. They shouldn't have happened. And they didn't
5 have to happen.

6 One man could have made a turn and avoided, on time or
7 even close to on time, and avoided the Exxon-Valdez spill. One
8 turn, one course change, and it didn't happen. That's how
9 simple it is to avoid it. Given that, I say it doesn't have to
10 happen. The reason it happens, in my mind, and this is just me,
11 it's not about the Federal government, my Agency. It's because
12 people get too comfortable, so comfortable they don't get enough
13 sleep or don't stay awake when you have to. That comfort comes
14 through a lot of things. It comes through an industry that
15 says, we've got a wonderful safety record. It comes from a
16 regulatory Agency that says, we've got a wonderful safety
17 record. And they pat themselves on the back. And they get more
18 comfortable. Pretty soon they're asleep when they need to turn.

19 Safety environmental responsibility is accomplished
20 through endless demonstration. You don't need to talk about it
21 and brag about it. And, hopefully, the industry -- hopefully
22 the industry will start realizing that. In the frontier areas,
23 they won't make a dime unless they realize it. Despite what
24 they write in the magazines and say on TV, and even our highest
25 elected official and the person I ultimately serve, say -- we

1 have told industry that loud and clear. We had a conference in
2 March, oil platforms on photos that the Coast Guard put up.
3 Great, clear, sunny days and they're on fire and toppling over
4 in calm waters. And we've said, this industry has to avoid that
5 or you will never have a production platform in these frontier
6 areas like the Arctic.

7 And the room gets silent. I don't mean to rain on
8 people's parade. If there wasn't any exploration after the
9 Deepwater Horizon incident, and it's not going to make it any
10 easier. One thing it will do, is it will make it safer because
11 the regulatory Agency will do a better job. And hopefully
12 industry will at least get one huge giant step forward to
13 endless demonstration of safety and environmental
14 responsibility. It can be done safely. It can be done
15 responsibly. And it can be done in a way that treats what every
16 political appointee and elected official that I've seen in my
17 entire Federal service wants. They want to treat Native people
18 like our national treasure instead of the poster child for the
19 National Trash Campaign. They want to do it. And that's a good
20 starting point, because when you really want to do it, you'll
21 probably do the right thing. Probably. I'm with them on that.

22 MR. AGNASAGGA: For the record, Ransom Agnasagga,
23 Alternate Commissioner Alaska Eskimo Whaling Commission. Yeah,
24 I was not made aware of this meeting, you know, and I'm on the
25 AWC. I'm an Alternate Commissioner. I don't see Roscoe in

1 here, you know, he's our Commissioner, you know. I don't know
2 what kind of information he's got, if he's even seen this, you
3 know, because I haven't seen it, you know.
4 Just listening to what everybody said, our Directors, you
5 know -- our guess our corporate leaders, you know, they said it
6 all. You know, even in the Bible it says all traditions will
7 come to pass, you know. Eventually everything that we do now,
8 you know, it's not going to be done 30 years from now, 40 years
9 from now. We understand that. And I guess not even really
10 reading it, I'm going to have to stand behind them too and
11 support it. But I was not made aware of this meeting until I
12 saw it on the billboards around town. And I didn't know what to
13 expect, you know. But I'm glad John stood up for the Wainwright
14 Whaling Captains Association, you know, and I hope that the OC
15 will continue to support -- I hope, you know, this fall whaling
16 season.
17 I mean when I was for a discount on gas, you know, because
18 I didn't want to be considered a special interest group, you
19 know. What I heard from one of the meetings -- that kind of
20 hurt, you know, so that just shows where our traditions are
21 going, you know. It's corporate -- it's all about money.
22 I just want to make the comment that I hope it's done like
23 they say, responsibly, safely and with the future in mind, you
24 know. Because when the oil and gas is gone, there goes the
25 money with it. And what's left is what we're going to leave our

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 grandchildren, you know. And I just hope that it's done
2 responsibly and safely. I guess I have to stand behind
3 everybody else here in Wainwright or else I'll be the black
4 sheep. Go do it.
5 MR. LOMAN: Thank you.
6 MR. AGNASAGGA: I wasn't able to draft a letter to, you
7 know. I wasn't made aware of it until --.
8 UNIDENTIFIED MALE: You still got time.
9 MR. LOMAN: Thank you.
10 MR. HOWARD PATKOGAK: For the record, I'm Howard Patkogak.
11 I'm the Cully Corporation Chairman. To me, as a whole, I've got
12 to think about not just me, not just my neighbor, but the whole
13 community. You know, I grew up watching our traditional whaling
14 subsistence, before all the electric stuff came around. You
15 know, I got to see part of that. I share Ransom's uncertainty
16 of these fears.
17 I have the same fears, you know, but I go out hunting out
18 there too. At the same time, you know, we're all dependent on
19 the oil that directly benefiting us for the past -- since the
20 70s, right?
21 MR. AGNASAGGA: (Indiscernible) They ain't going to come
22 out.
23 MR. PATKOGAK: Yeah, I share your fears. At the same time
24 I don't believe in living in fear. We as Native people, we're
25 strong willed. But at the same time, we have to deal with

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 what's going on around us. We can't stick our heads in the
2 sand. It benefits us. At the same time, I'd like to ask a
3 careful, balanced approach. And I'm in agreement with the City
4 and the Tribal. That's what I wanted to say. I don't have
5 anything else besides that. Thank you.
6 MR. LOMAN: Thank you very much sir.
7 MR. HOPSON: It got quiet.
8 MR. LOMAN: John I guess I would ask -- you asked it
9 earlier -- you had a question. Does your vision see a way to
10 explore, produce if there is an economically viable resource
11 benefit in a way that's positive through jobs and economics and
12 maintain the culturally self-defining part of the people of
13 these communities?
14 MR. HOPSON: I knew that was coming.
15 MR. LOMAN: Way down the road?
16 MR. HOPSON: Again, for the record, this is John Hopson.
17 You can hear me okay. Okay. Yes. If we -- when we listen to
18 the Native Village of Point Hope and ICAS and AWC when they file
19 for these lawsuits or join in each other's lawsuits, they talk
20 about the potential for losing our culture, our traditions and
21 our subsistence.
22 I imagine that we will lose them faster if we don't
23 develop our communities in a positive manner, by creating jobs.
24 I've never been in a skin boat. My parents have. I've never
25 driven a dog team. My parents have. At the time I was born and

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 raised, we had snow machines, aluminum boats and outboards. So
2 I could not tell anybody here how to do it. I don't know how.
3 I need to learn how. But because of the way I was brought up, I
4 need money to buy a new outboard. I need money to buy gas. I
5 need money to buy food for these trips that we take.
6 I believe we will lose our subsistence way of life faster
7 if we don't find a way to supply jobs. Because these kids had
8 not -- did a skin boat or drive a dog team nor -- it will be
9 pretty hard to learn how, with the mindset we have today. So I
10 need the money to continue this. I could not go whaling if I
11 didn't have money. I spent a lot of time up the river in the
12 summertime. And I couldn't do it without money, because I have
13 to buy gas and diesel to heat my cabin, to drive my boat. I
14 have to buy guns. I have to buy bullets to shoot these animals.
15 The Native village of Point Hope, ICAS or AWC is not
16 willing to buy me any of those items. Nor can they afford it
17 for every hunter on the Slope for their actions that they're
18 dealing with. They are stopping us from developing these
19 opportunities for the people today. More and more kids are
20 graduating from high school, but where do they go? They go to
21 college and they can't come back because there's no jobs. They
22 go to training. They can't come back. There's no jobs. So
23 they go live in a city. Then they lose their culture and their
24 traditions and their subsistence if they don't get the chance to
25 come back.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 That's where I see this helping us in a positive manner.
2 The potential for an oil spill, I believe, and I'm not an
3 expert, is low. Based on the knowledge we've learned, and the
4 education we've gotten from the industry over the past five
5 years. I was probably the most vocal person against oil and gas
6 when Shell first came up here again in '05 to tell us they were
7 going to go develop. But because of the education that I've
8 received from them and the trips that I've taken around the
9 world -- polluting Norway and seeing operations of not just
10 Shell but Conoco and Standard Oil, made me believe we can do
11 this.

12 Our oceans are no more than 170 feet deep where they plan
13 on developing or exploring. The Deepwater Horizon was in a mile
14 of water, 5,000 feet of water, which is very hard to get to when
15 there's a catastrophe below. Ours is just a matter of hours
16 before we can get to it, not days or weeks or months like they
17 had. So I think we can get this done in a positive manner. But
18 that fear of an oil spill is still there.

19 But I have to find a way to buy these items so I can
20 continue our subsistence. We take kids out to our cabin that
21 when -- some kids that don't have family that goes up the river
22 -- we get to expose them to our traditions over a time period.
23 So I get that opportunity because of the job that I have. Now
24 it provides me money to buy this stuff. So it's a positive move
25 forward if we can get them to explore and develop.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Our schools are top notch. Our water and sewer is top
2 notch. Our Fire Departments are top notch. Our Public Works is
3 becoming top notch because the North Slope Borough has the
4 taxing authority to provide that. But because of the aging
5 facilities in Prudhoe, the money is at a status quo practically,
6 the taxation. So we can't build any more than what we already
7 have.

8 Yet our populations throughout the North Slope is growing.
9 It's not declining. So we got to think where are we going to
10 build our next school when we become over-populated? Where are
11 we going to build our next hospitable if we need one in a larger
12 community? We're going to need more fire trucks. We're going
13 to need another ambulance. We're going to need more police
14 departments. We're going to need more teachers. But the way
15 that the taxing is going, the properties at -- decline the
16 property tax by the status quo.

17 So we can't provide that unless we create more
18 infrastructure, building a pipeline, building infrastructure,
19 hotels. You know, support facilities for offshore oil. Is our
20 -- basically our only hope for the next 20 to 30 years when you
21 look at what is going to happen to us, if everybody just walks
22 away and does nothing. If the oil companies decide not to
23 develop, we have nothing. We're going to be stuck with what we
24 have today and try to come up with new ideas on how the world
25 will be able to provide the services that it's mandated.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 So it is a positive move forward. You know I just -- I've
2 said this in numerous meetings. And you've heard me over and
3 over. We need this to happen because of this reason. ICAS,
4 Native Village of Point Hope, AWC executives, don't come to our
5 communities and tell us why they're doing this or when they're
6 going to do their lawsuits. You know, they don't get our
7 blessings. We may have members in some of those organizations,
8 but it's just a one member on a Board. And they don't come down
9 here and ask us for our opinions as to whether we want to do
10 this or not, whether we should get into a lawsuit or not over
11 oil and gas.

12 So they're not really representing, like ICAS says -- they
13 represent all of the Inupiat. I don't see that happening. I
14 don't see it working. It's an organization that just has a
15 mindset of no oil and gas whatsoever. And we have a problem
16 with that. I have a personal problem with that. And I've
17 expressed my concerns to George Edwardson. He is the President
18 of ICAS. But he won't listen to me. He won't even look at me
19 when I want to talk about oil and gas with him. He's a -- in my
20 opinion, a one eyed jerk. He's my uncle, for crying out loud,
21 but I have to call him that because he won't listen to me. He
22 won't reason with me. He just does not want to reason. And
23 he's the Executive CEO of ICAS. Yet he's supposed to represent
24 us all, 10,000 people. But he won't. Thank you.

25 MR. LOMAN: Thank you. It's the other question I have.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Oh, go ahead sir.

2 MR. AGNASAGGA: For the record, Ransom Agnasagga. I just
3 wanted to comment (indiscernible) ICAS, AWC. The reason AWC is
4 included in the lawsuit is because it was formed under ICAS and
5 that's what I -- if I remember right, we were the leading
6 support of trying to get behind that lawsuit during the meetings
7 in February.

8 MR. LOMAN: The other question I have for everybody here
9 is -- at least inasmuch as what has happened, and these are
10 offshore activities -- offshore activities that we are
11 responsible for overseeing, facilitating, not promoting,
12 facilitating. Here in Wainwright, there's been some activities
13 that demonstrate that maybe there's the desire for integration
14 of the industry -- outside workers.

15 Prudhoe Bay has segregation. Is integration of outside
16 workers a concern for people in Wainwright?

17 UNIDENTIFIED MALE: I don't know, look at me.

18 MR. HOPSON: I think in my opinion we -- if I have local
19 trained people to do the job safely, ready to go, which we don't
20 have, because we haven't really gotten the population out there.
21 But if I had it in my hands here, saying we have these people
22 that can do the jobs, and the oil companies are not hiring us,
23 then we have a problem. But the way things are going, I think
24 integration is happening and I think it's working well, in my
25 opinion.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Mr. Mayor.
2 MR. OKTOLLIK: Enoch Oktollik again, for the record. Oil
3 and gas development in the Chukchi and the Beaufort Sea I see
4 that a place that we could benefit ourselves in our community.
5 So I heard it along the lines that, from reading history books
6 and whatnot of our United States and our Federal government,
7 about mistakes in there when it could benefit the Federal, when
8 it could benefit the State, when it could benefit private
9 sectors and benefit most everybody, when it's essential.
10 That is, where ever the impact is, it could benefit us
11 here in this small community in Wainwright. I believe it could
12 be beneficial to us all -- of what is this happening now in --
13 close to Wainwright. These are by the ocean or by the land, we
14 are getting to be impacted. And we haven't seen the full impact
15 of it yet.
16 We're going to be impacted whether into the future as
17 probably Northwest Fisheries Service will probably come to the
18 Arctic. And we'll probably see the northwest manifestation of
19 routes opening to the future in offshore tourism. We can see
20 this as a little, even though it's oil and gas -- pocket.
21 There's other things that we going to see that will impact our
22 Arctic Ocean.
23 We're going to see -- we haven't seen the impacts of
24 what's going to be happening through the Bering Sea and through
25 the Chukchi Sea of ship trafficking. How are we going -- how

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 are we going to regulate trafficking from the Bering Sea, Bering
2 Straits into the Chukchi Sea? And how -- anyway when I heard
3 this gentleman here, I can't remember his name, they say this
4 essential way of running a pipeline and where it will be. And
5 through all those scenarios offshore, when development happens,
6 oil spill is essential.
7 Haven't seen where we could find funding -- relief funding
8 -- there are relief fundings -- what about in this Environmental
9 Impact Statement or the (indiscernible) that are impacted? I
10 would like to see these set in place. We have work -- we are
11 good with the NPRA from the City of Wainwright where we provide
12 almost over two jobs. And could we be able to work with the oil
13 companies and the Federal government in this State in providing
14 more programs like this?
15 Like I'll give you example how we get our NPRA funding and
16 what we provide -- we provide Boys and Girls Clubs. We provide
17 Elder programs. And also we operate our government of
18 operations and our recreations and others that we don't see
19 (indiscernible) funded to the North Slope Borough -- and
20 whatnot.
21 If we could set up a program of some sort with the oil
22 companies -- Outer Continental Shelf development of this
23 program, 30 years looks like a long ways and we could see for
24 probably -- like more jobs in our community.
25 But on the most strongest point I would probably see is

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 some way for our own community, us over here and try to develop
2 relief -- oil spill relief fund from the oil company before it
3 starts its production. I think it would be essential, even
4 though the Eskimo Whaling Commission -- I've heard they asked
5 for \$20 million aside for our subsistence way of living or what
6 you call it (indiscernible) village, kind of a funding. We need
7 that kind of funding for our own community. Wainwright would be
8 very impacted and most of our, probably 30 percent of our
9 community relies of subsistence food. Some rely on store bought
10 food. Thank you very much.
11 MR. LOMAN: Thank you.
12 MR. AGNASAGGA: I just want to say, Ranson Agnasagga, was
13 saying something like mitigation matters for the -- mainly the
14 Wainwright community. I don't know what we can do for that -- a
15 band-aid over it, but you said you can't tell them what to do.
16 That's kind of like what I understand.
17 MR. LOMAN: Well there is a huge issue of -- it's one of
18 Mayor Itta's -- a Ocean Claims Initiatives and it involves
19 revenue sharing rather than sharing to the local level. That
20 can mean different things to different people. The biggest to
21 the local level to the ground zero level. Certainly Wainwright
22 community and The Native Village of Wainwright are at ground
23 zero. Ground zero, as in one of the communities that would be
24 most affected because of the proximity to the Chukchi Sea.
25 Revenue sharing is a very difficult one for us bureaucrats

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 that work for a Federal agency. Because it's going to require
2 legislation. We don't have the authority to mandate it. But it
3 does exist in the Gulf of Mexico.
4 MR. HOPSON: You say that in a manner like, my opinion,
5 the Federal government doesn't want to deal with revenue sharing
6 yet. The amount of money and royalties that the Federal
7 government gets from the leases, the amount of money that the
8 Federal government will get from the sales and royalties, why
9 can't that be used as a part of the revenue sharing for the
10 impacted communities? I mean, you know, it's just common sense,
11 that's where it should come from. We all know the oil companies
12 are in it for the money. The Federal government is in it for
13 the money, as well. But if we -- it would make more sense if
14 the revenue sharing came from the Federal government's part of
15 its royalties. Or the State of Alaska, for that matter, when it
16 gets its royalties, you know. That might be the route to debate
17 rather than trying to find a way to make the oil companies come
18 up with a revenue sharing plan, which you can't even recommend.
19 MR. LOMAN: Well, in the case of the States in the Gulf of
20 Mexico it's the law and it goes to the State level. Senator
21 Begich has introduced some legislation. I know there's been
22 other legislation introduced that has gone nowhere.
23 MR. HOPSON: Because it was a bogus legislation.
24 MR. LOMAN: Well there's -- there are other people in
25 bodies such as the Senate, Senators. And their position is, the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 royalties from these resources should go to all the people
2 because they belong to all the people. So the other counter
3 argument is, is all the people don't suffer the kinds of
4 affects.
5 I come from the Upper Peninsula of Michigan on Lake
6 Superior. It's pretty safe to say that my culturally self-
7 defining practices on the Lonts (ph) Indian Reservation will not
8 be affected by offshore oil and gas activities in the Arctic.
9 So it's easy for me to understand why communities in the Arctic
10 are most affected and others are not. So he logic is easy.
11 As far as an Agency goes, we can give administrative
12 support to certain legislation. We can say certain things. It
13 would be pretty safe to say that the Administration, no matter
14 which Administration, can support that kind of legislation,
15 revenue sharing, because it will resolve conflicts and competing
16 interests that are stumbling blocks to getting anything done so
17 that the nation can sell and benefit from its resources. It's a
18 stumbling block.
19 And we'll see what happens there. It's going to require
20 legislation to get any kind of thing that resembles revenue
21 sharing over and above the Coastal Impact Assistance program
22 funding. Yes sir.
23 MR. PATKOTAK: I am Blair Patkotak for the record. Do I
24 have to go up there to the mic to speak?
25 MR. LOMAN: It's easier for the Reporter to hear you.

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 REPORTER: There's a hum.
2 MR. LOMAN: There's a hum and there's a vent and it blocks
3 the sound.
4 MR. HOPSON: Next time you come you'll have the recorder
5 sitting in the audience so that the reporter can hear.
6 MR. PATKOTAK: For the record, my name is Blair Patkotak
7 and I'd like to say something from my heart. Because it's what
8 my dad wished. You know, that he wanted development to help our
9 people. So, from his heart to my heart, I'm happy for him to
10 say that. And thank you very much for coming. And my question
11 to you is, you said that you are in a reorganization -- you're
12 planning a reorg right? And there's another organization?
13 MR. LOMAN: They're planning it for us.
14 MR. PATKOTAK: Yeah. And you said that there is an
15 organization that's going to regulate the oil companies, right?
16 Would you pass that information on to them that, when you have
17 that reorg and that organization is set up, to please come into
18 the villages so that they can train us how to do what you guys
19 do. So that maybe we might even be able do what you guys do.
20 And thank you very much for coming down. And may God bless you.
21 My dad was -- considered a religious man but he had a
22 faith in the Lord Jesus Christ. So those that do pray, we need
23 to pray not just, you know, live in fear like my brother says --
24 he walked out the door. To live in fear is not what the word
25 says. I mean, what you speak can come to pass. You know, you

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 afraid of oil spill, will come to pass. You will always have
2 oil spills, plane crashes, car crashes, what kind of disasters
3 that are out there. But we can minimize that. We are learning
4 right? But I'm sure that if we do our part in lifting them up,
5 it can be done successfully. And I hope that our grandchildren
6 will reap the benefits.
7 Hopefully, if I ever get married and have kids, then
8 become a grandfather. But I'd to say thank you very much and
9 may God bless you and all those that came and attended. I speak
10 this from my dad's heart. From a couple of years ago, I heard a
11 lot of no, no, no development and whatnot. To come to a meeting
12 like this is kind of -- brings to mind my dad what he wanted in
13 a way. And I thank you very much for taking the time to come
14 here and come back again.
15 MR. LOMAN: Thank you very much.
16 MR. PATKOTAK: Thank you.
17 MR. LOMAN: We appreciate it. I think. Yes sir.
18 MR. AGNASAGGA: One more comment, Ramsom Agnasagga. This
19 is just like the -- there ain't going to be no socio-economic,
20 what you call it?
21 MR. LOMAN: Socio-economic study?
22 MR. AGNASAGGA: Yeah, like impact like that?
23 MR. LOMAN: We have socio-economic studies specific to the
24 Chukchi Sea under way.
25 MR. AGNASAGGA: You do?

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Yeah. Sharon has a list of our environmental
2 studies that --.
3 MR. AGNASAGGA: I was one of the people in the past, that
4 it said there's no baseline, you know. That's why they started
5 all that stuff, you know. Just wondering about that, too.
6 Because, the socio-economics of the North Slope and the people
7 in the villages, how it's going to impact, you know?
8 MR. HALLER: Right. In the EIS, the original EIS --
9 there's a socio-economic impact analysis and I know -- I used to
10 do some of that so I kind of know about that piece of it. And
11 it gets into the socio-cultural, the subsistence and then with
12 jobs.
13 MR. AGNASAGGA: And like I said, I haven't had a chance to
14 see that.
15 MR. HALLER: Yeah, well that --.
16 MR. AGNASAGGA: I wish I would have.
17 MR. HALLER: Right. The Chukchi EIS is a much bigger one
18 but the socio-economic, subsistence. But you always have to
19 keep up with the current, you know, because society is
20 constantly changing. And so we always having to revise them.
21 MR. HOPSON: We're hearing different leaders who have come
22 in and different opinions will come out.
23 MR. HALLER: The pendulum swings.
24 MR. OKTOLLIK: Enoch Oktollik. Did you -- I know that we
25 saw the bottom core studies -- on the Beaufort Sea from a

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 company that did the bottom floor study. But, yet, we haven't
2 the baseline studies in our bottom sea studies in the --.
3 MR. HALLER: Right. Yeah, those are -- I'm not sure of
4 the exact status of those, but I know those are --.
5 MR. OKTOLLIK: And how could we get those studies?
6 MR. HALLER: Well Sharon --.
7 MR. HOPSON: We were a part of that. Our company was a
8 part of that study.
9 MR. HALLER: Yeah -- Sharon has a list of the studies and
10 then there's -- we have a website that has studies that are on-
11 going, as well as completed studies. And then, if you want more
12 information there's about eight or, what, ten people in our
13 Study Section. Hugh Williams is the Chief it. You know, if you
14 need more.
15 MR. HOPSON: Would these studies --.
16 MR. OKTOLLIK: Got a lot of group of them -- many of them
17 like Shell and them. Shell, Conoco and those others that's been
18 leading them -- studying on them.
19 MR. HALLER: Yes and this --
20 UNIDENTIFIED MALE: Their focus would be the bowhead whale
21 and it's slowly starting to go out into, like, other animals.
22 MR. HOPSON: We have copies of the studies. And they talk
23 about walrus and whale and seal and fish and krill, plankton,
24 the bottom, the shrimp, worms. We have all of that. They're
25 just trying to make it in plain English because about 80 percent

1 of the book I cannot understand and read it.
2 MR. HALLER: Yeah, way to -- .
3 MR. HOPSON: So I read it based on the pictures until we
4 get the down to earth type -- summary out of it. And that's
5 what we're waiting for. But we do have this -- the book is
6 about yea thick just on one season's project.
7 MR. HALLER: Yeah one.
8 MR. LOMAN: Mr. Mayor our new Community Liaison, Michael,
9 will be coming to the community soon. And, in addition to
10 working with the school, to kind of have some interaction
11 between our scientists and the students, expose them to some
12 outside -- positive outside influence that is part and parcel to
13 their environment here.
14 Our environmental studies people can come with that effort
15 and present information, especially those studies in the Chukchi
16 Sea that are being finalized or where data's coming up, and
17 provide information to you by talking, oral communication, in
18 some pretty substantial detail. It is not true when you read
19 that the government knows more about the planet Venus than the
20 Chukchi Sea, no matter how many times they say it
21 MR. OKTOLLIK: What about the sea collection data from the
22 bottom floor and the offshore studies of the bottom sediments of
23 the (indiscernible).
24 MR. LOMAN: What we do know is that the Arctic Ocean, and
25 the Chukchi Sea certainly included, has a breathtaking amount of

1 diverse living organisms that support a complex ecosystem that
2 is beyond the imagination of most. From one respect, I know
3 that every whaler knows it, because it's the same ocean that
4 supports those whales, an extremely complex and sophisticated
5 animal, some of which were swimming -- or are swimming out there
6 now and were swimming when Abraham Lincoln was President.
7 MR. OKTOLLIK: Most of us were (indiscernible) many has
8 two, North Slope Borough, Fish and Wildlife. How many members?
9 MR. AGNASAGGA: No, I don't.
10 MR. OKTOLLIK: Offshore, Walrus becomes a member and
11 Whaling Commission and certain, the Borough Commission. And
12 sometimes, when you understand it in the Arctic Ocean, we've got
13 so many endangered species. There would be a number of
14 endangered species out there. As we're talking right now, how
15 many -- some of them need to be added on to the Endangered
16 Species list into the Arctic.
17 What, versus Endangered Species and the ones that are
18 coming into the listing, versus oil industry -- what does it
19 mean? Maybe somebody --.
20 MR. LOMAN: Mary can answer that question better than I
21 can.
22 MS. CODY: Once they're listed under the Endangered
23 Species Act, any action that the oil company wants to take, they
24 have to consult with the Agency that's responsible for that
25 species. So, like for the polar bear, that's Fish & Wildlife

1 Service. And when they give us a plan for what they plan on
2 doing, the oil companies also have to give that plan to Fish &
3 Wildlife Service. And Fish & Wildlife Service reviews it. And
4 for bowhead it's NIMS (ph).
5 And if there are things in that plan that Fish & Wildlife
6 Service or NIMS (ph) think are incompatible with maintaining
7 these species, they have the option to just say, no you can't do
8 it. You can do it this way instead. Usually it's an iterative
9 (ph) process that goes back and forth, sometimes for months.
10 And companies having a specific plan and the Agency that's
11 responsible for that species, helping them come up with a plan
12 that they can do what it is they want to do without additional
13 harm to a species that may already be in decline. It's a very
14 strong law.
15 MR. HOPSON: Leads to another question and it's going to
16 affect oil and gas. Why is it that the Federal government
17 doesn't go consult with the people who live with these animals
18 before they're listed? We don't see our comments in -- when
19 they say they come and they say they're going to consider our
20 comments and concerns and list them, we don't see those in the
21 Register. We don't see our comments.
22 We all opposed the Federal government in listing the polar
23 bears as a threatened species. But nobody took that serious
24 consideration. And it was a move to screw up oil and gas, in my
25 opinion by the Democratic people of America. No right

1 Republican in their right mind would do that thing. We're not
2 that dumb. But the Federal government never did come and
3 seriously take our consideration and why we were telling them,
4 it's not a threatened species. We've seen these animals die of
5 drowning. We've seen these animals die from themselves. When
6 they fight each other, they kill each other. They eat each
7 other. The only reason that it became a national political
8 issue is because Shell was out there exploring, doing seismic
9 activity and some guy took one picture of a dead polar bear and
10 we see it every year all the time.

11 Take for instance, the walrus, the last year's instance
12 where the Federal government said we had four hundred dead
13 walrus on our beach. And there was only ten. And they blamed
14 the oil companies. The oil companies are 70 miles offshore and
15 these walruses died on the beaches. They come here and Icy
16 Cape. You know, it's crazy. Now they want to list -- now
17 they're thinking of listing the walrus as a threatened or
18 Endangered Species because there's no ice, you know.

19 The animals move. Go to the Russian side and count them.
20 They're thousands of them, you know. Watch their pictures.
21 It's just crazy that the Federal government can come here and
22 tell us, this is going to happen whether you like it or not.
23 And then come back to us and say, oh we made a mistake. We're
24 sorry. It's not right, you know. It's just not right. And our
25 taxpayers pay for that, you know.

1 And it affects oil and gas in a big, big way when it comes
2 to threatened or Endangered Species. When the Marine Mammal
3 Protection Act was created, they said the bowhead was going to
4 be listed as Endangered until its population reached 10,000 or
5 more. Well it reached that population number, about four years,
6 five years ago. And we're still on the Endangered Species list.
7 Nobody's listening to us.

8 IWC knows our numbers. They take our numbers and they're
9 credible. But our own Federal government won't take it. You
10 know, it's crazy. And it affects oil and gas and what they want
11 to do, when they can do it, and when they can't do it, you know.

12 The only thing that should determine what the oil and gas
13 can do and can't do is the ice movement. That's what should
14 dictate what they can and can't do. So that they can do it in a
15 safe, sound manner. Animals get deflected. They will. We
16 deflect them ourselves, you know. We can deflect a herd of
17 10,000 caribou in a heartbeat. We don't do it because we won't.
18 We know how not to.

19 If you listen to us, we can teach you. But you have to be
20 willing to listen to us. Both the State and Federal government,
21 they have to be willing to listen to us. We've listened to you.
22 We've lived by the laws of the Federal and the State government.
23 But why not take our advice as we've been doing this for
24 thousands of years?

25 I cannot go down to California and tell you how to hunt

1 those crazy animals, you know. Because I don't know how. But I
2 can teach you to hunt our animals. I can show you how we hunt
3 our animals. Just got to be willing to listen to us. Thank
4 you.

5 MR. TAGAROOK: Before I go, one last comment, I want to
6 make it. I'm Terry Tagarook, for the record. You know, we have
7 to listen to the pros and cons of all -- what is happening with
8 the Federal, the oil company and our people. To our people
9 before White man came, we were taught to respect our elders, our
10 land, our sea, ourselves. Respect other people's property. And
11 we didn't have no police doing that, going after people that
12 were doing something wrong. That was up to the Council and the
13 Council had that power. But in the long run, the respect is
14 what we have always been shown to do to our environment, the
15 land, the sea, our animals.

16 If the government will listen to us, then please learn to
17 show respect to our environment. In this Arctic, animals, the
18 mammals we depended on before oil companies came up. We showed
19 -- they showed us respect, to show respect to our animals. It
20 took government and the oil companies and whoever it is, to show
21 respect to our environment. Things will go smoothly.

22 And that is one thing that everybody's got to learn,
23 respect. Trust and show others what is right and what is wrong.
24 I know that I was raised to show respect. And I'm looking at
25 the kids that are running around in the library. We weren't

1 even allowed to run around in a meeting or at the church, and
2 that's respect. And all the parents would reprimand us and we'd
3 quiet down and settle down. It's something that has changed.
4 And we know that change is coming. We cannot stop it. Progress
5 -- that's what's happening. And whether we like it or not, it's
6 going to happen. No matter what the outcome will be at the end.
7 But in the end, we'll be impacted. Thank you.

8 MR. OKTOLLIK: Terry, before you go, you addressed one
9 race and it was a White person. I would be happy if you say
10 that immigrants' children's, children's, children. Probably be
11 the proper words to say -- and you not put him into one category
12 when it's around 300 and some nationality.

13 MR. TAGAROOK: Whatever we do, I want Eskimo support on
14 the North Slope.

15 MR. AGNASAGGA: Hagar (ph) said we are the Endangered
16 Species.

17 MR. HOPSON: Yeah we will be.

18 MR. LOMAN: Well, I thank you for sharing everything with
19 us tonight. And we learned a lot. Hopefully, you learned a
20 little bit from us. And we appreciate your comments and your
21 time and effort and look forward to meeting you again soon to
22 provide information and to provide assistance.

23 So, barring any other comments, we'll close this record
24 and say a quick prayer for some good weather tomorrow so we can
25 go to Barrow and continue on with this mission. Thank you again

1 very much.

PROCEEDINGS

(On record at 7:10 p.m.)

JEFFERY LOMAN: My name is Jeffery Loman. I'm the Deputy Regional Director of the Bureau of Ocean Energy Management Regulation and Enforcement, formerly the Minerals Management Service, probably more commonly known as MMS. They changed our name. And they are going through a major ongoing reorganization of the Agency with the goal to restore the public's trust. So that's who I am. We've got some other members of our team, some folks that have come to Barrow for the -- in the communities that we've traveled in for the first time, so I'm going to let them introduce themselves starting with Mike.

MR. ROUTHIER: Okay -- hi my name is Mike Routhier. I've worked on National Environmental Policy Act documents for the Agency.

MR. HALLER: I'm Mike Haller. And I'm the Community Liaison for the Bureau.

MS. CODY: Mary Cody, and I'm a Wildlife Biologist with the Agency.

MR. HOLDER: Tim Holder. I'm with the Agency and I'm based in Washington and (indiscernible). Based in Washington D. C. and I keep track of the Agency's activities are (indiscernible).

MR. LOMAN: Thank you. And thank you again for taking the time out of your Friday evening to attend this public hearing.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

The purpose of this hearing is born out of a couple of things. First, I guess, the National Environmental Policy Act or a law called NEPA, Federal environmental law that the Agency must comply with when it intends to take a major Federal action. In this case we have prepared a Supplemental Environmental Impact Statement to address concerns that came out of a Court remand.

In between 2004 and 2007, the Agency had planned, first, a sale in the Chukchi Sea, an oil and gas lease sale. Prepared an Environmental Impact Statement. Finalized that and issued a Notice of Sale. And then held the sale in the Chukchi Sea in February of 2008. From that sale, the Federal government issued 487 leases in the Chukchi Sea for a total of \$2.6 billion with Shell Oil Company being the largest leaseholder, holding a total of about \$2.1 billion in leases in the Chukchi Sea.

The Agency was challenged through litigation. Litigation filed in Federal court in a case that went before the Alaska District Federal Court, Judge Beistline. And the Court decided, in short, this, that, for the most part, the Agency complied with the provisions of NEPA. But the Court found that the Agency had not, and should have, analyzed the effects of any natural gas development and production that might occur. And, in these leases there were incentives for natural gas associated and connected with those leases.

The Court also said that the Agency must address. from

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Section 1502.22 of NEPA, an evaluation analysis of what the Plan
2 tiffs had submitted in their Exhibit 129, about 40 pages of
3 excerpts from their -- from the Agency's final Environmental
4 Impact Statement, statements regarding uncertainty or missing or
5 lack of information or data. And so that was the remand to the
6 Agency. And when litigation is filed in a NEPA lawsuit,
7 typically when the Agency doesn't fully comply with those
8 provisions in the National Environmental Policy Act, the Agency
9 is compelled to do NEPA where it didn't do NEPA, do more NEPA,
10 do NEPA right. Follow the provisions in full measure.

11 So to do that, and address this Court's remand we've
12 prepared a draft Supplemental Environmental Impact Statement.
13 Hopefully, you've had a chance to take a look at it. If not, we
14 have some copies here. It's available online. It's in the
15 libraries in all of the communities from Barrow, all the way
16 through to Kotzebue. And it's probably going to be one of the
17 shortest, if not the shortest environmental document, that this
18 Agency produces. Usually our Environmental Impact Statements
19 are much larger and onerous and complex. This document is
20 shorter and very straightforward.

21 So, we're here to take comments that you may have about
22 this draft Supplemental Environmental Impact Statement. But we
23 can talk about anything else. Talk about anything else you want
24 to talk about. But especially, we're interested in talking
25 about your concerns about our Agency. An Agency that is going

1 through a major reorganization with the President of the United
2 States' goal to create several Agencies, actually that will
3 restore the public's trust. And I think for us, at least for
4 me, being part of the Senior Management Team in Alaska, the
5 public trust in the communities of the Arctic are the most
6 important to us. They come first, that portion of the public.
7 And I would submit that, if we can restore the trust of the
8 communities in the Arctic, the rest of the United States will
9 follow.

10 So we probably have a lot to talk about. And we'll start,
11 I think, with just those who have comments that they came
12 prepared to present tonight. We have a Court Reporter. She
13 knows how to spell my name because she's been doing this and
14 listening to me for days and days now. But she doesn't know how
15 to spell your name. And so, if you would, if you have comments
16 to present, you can present them from the chair. You can come
17 up and use the podium. You can kick me out from in front of the
18 podium. And I'll sit down and let you stand wherever you want.

19 But she needs to hear you and she needs to know how to
20 spell your name. So we typically start with -- I like to start
21 with elders. Barring no comments from elders, I usually go to
22 Whaling Captains. And so, in that order, I would like to hear
23 your comments or anything else that you have to say. I bet
24 Harry has a comment.

25 UNIDENTIFIED MALE: I'll make it so the elders can get a

1 person to come (indiscernible).

2 MR. LOMAN: Okay. It's an open floor -- open to anyone
3 that would like to provide comments. Does anybody have any
4 questions while we build up a little courage -- questions about
5 the National Environmental Policy Act? Questions about the
6 Bureau of Ocean Energy Management Regulation and Enforcement?

7 UNIDENTIFIED MALE: I have one right now -- just for my --
8 in terms, I guess in terms of just getting to learn and time,
9 not hearing a timeframe in terms of when you started your
10 Supplemental and when do you -- are what timeframe are thinking
11 to end the comment period?

12 MR. LOMAN: That's a good question. When did we start the
13 Supplemental? Well this is a little inside view to how
14 government works. The Court issued their decision July 21st. We
15 read the decision that same day, at least I know I did. And I
16 read the decision and I said, we've got to prepare a
17 Supplemental Environmental Impact Statement to address this
18 remand.

19 Well then the Agency consulted with its colleagues at
20 headquarters and its attorneys. And a whole week or a week and
21 a half went by before they decided that we have to prepare a
22 Supplemental Environmental Impact Statement so I would say by
23 that time we were into August. And we probably -- I didn't let
24 the people like Mike know that they had to take the working over
25 until mid-August or maybe even late August. Something like

1 that?

2 MR. ROUTHIER: Yeah.

3 MR. LOMAN: Yeah. So mid to late August is when we
4 started -- and a couple of important dates. The first, I guess,
5 and most important date for those that want to comment to the
6 Agency on this particular document, is the deadline for taking
7 comments which is November the 29th. So there's still quite a
8 bit of time, but not a lot of time left to take your written
9 comments. You can send them by email, regular mail or hand
10 write them tonight if you would like, and we'll carry them back
11 with us.

12 UNIDENTIFIED FEMALE: I have a quick point on that.
13 Something I saw that were sent out by the Agency saying November
14 30th including the one that was sent to the Borough, the Mayor's
15 office, along with the draft of the Supplemental.

16 MR. LOMAN: I'll make a command decision and move that
17 comment date to November 30th. And I don't doubt for a minute
18 that there was some confusion there. The EPA announced -- they
19 set the comment date and deadline date automatically. And
20 theirs was the 29th, but we'll go right into the 30th, no problem.
21 And, from a practical standpoint, we take them until we really,
22 you know, have to get things moving.

23 But, yeah, the 30th could have been put out. People count
24 how many days -- I mean count -- the EPA counts one way,
25 somebody else counts another. So that's an important date.

1 The other important date, which is more important for us,
2 is the Court said, when some of the parties in this litigation
3 said to the Court, this shouldn't take a long time. The Agency
4 can do this in about 60 days or less. That was Shell. Shell,
5 as you can well imagine, after spending over \$2 billion on
6 leases has an interest in this case. And the Court said, well
7 six months from my initial ruling, January 21st, the Agency
8 should have that done.

9 It's unknown what the Court really means, by done, because
10 the way NEPA works, in addition to requiring the Agency to
11 analyze the effects of a major Federal action, in addition to
12 being a Sunshine Law and have everything that we do, like this
13 draft document -- this draft document, open and available for
14 your review to take your comments. Hold public hearings like
15 this one, answer those comments, try to address any concerns
16 that come out in these public hearings. NEPA requires that we
17 issue a final EIS -- allow for review before a record of
18 decision comes. There's a time period there. Remember, it's 45
19 days.

20 And then, issue a Record of Decision. In this case, the
21 Record of Decision is probably going to be pretty simple in that
22 the Secretary can either reaffirm the Sale, let the Sale stand
23 as it is, or not. Not would be some work for us because we took
24 \$2.6 billion into the U.S. Treasury from these companies and
25 issued these leases. So we would have to back away from our end

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 of the bargain, or the United States end of the bargain. Pay
2 some money back and deal with the leaseholders.

3 We think, after giving some thought about the draft
4 Supplemental that we have before us, that the Secretary can
5 reaffirm the Sale. But we're not there yet. And we haven't
6 finished listening to comments, reading comments and addressing
7 comments that we receive. So we really don't know yet.

8 MS. LEAVITT: For the record, I'm Roberta Leavitt, L-E-A-
9 V-I-T-T.

10 MR. LOMAN: Thank you.

11 MS. LEAVITT: I think to a few of these MMS -- I'm sorry I
12 can't remember what your Agency --.

13 MR. LOMAN: Bureau of Ocean Energy Management.

14 MS. LEAVITT: Maybe you should write it as I'll remember.
15 But --.

16 MR. LOMAN: It doesn't make any difference.

17 MS. LEAVITT: I signed my name in and I was requesting for
18 copies. I got one. But then, now you're saying another one is
19 out. How do we get on the email list? Or is it only a one time
20 email that you get information for? I mean like how are we
21 going to know what you're asking questions about, but we still
22 have concerns about what's going on. And maybe you should have
23 had copies out, ready for us, to -- try and look at it at least.

24 MR. LOMAN: Did you get a copy of this document?

25 MS. LEAVITT: No.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: No, okay.

2 MS. LEAVITT: The one I got was four volumes.

3 UNIDENTIFIED FEMALE: You have any more of those?

4 MR. LOMAN: I think we have a few more here. They're
5 available online.

6 MS. LEAVITT: And how are we supposed to know when they're
7 available online when, you know, we're not bigwigs. But I
8 consider myself a bigwig being a Captain's wife.

9 MR. LOMAN: Un-huh (affirmative).

10 MS. LEAVITT: You know this stuff is important to me,
11 along with my family and what we do. And I want to know about
12 what this stuff is doing too, you know. Because I'm the one
13 hunting and I go hunting with my husband. I butcher his
14 catches. And I've got words to say too, but I can't say them if
15 I don't know what you already -- it's like you already got all
16 these things figured out. And you haven't even heard me.

17 MR. LOMAN: Un-huh (affirmative).

18 MS. LEAVITT: I'm like, this is your first meeting here
19 under a new name, but I know I've seen you before.

20 MR. LOMAN: I remember you.

21 MS. LEAVITT: So you see what I mean? How do I know?

22 MR. LOMAN: Well --.

23 MS. LEAVITT: I'm not in a position -- I'm not in a
24 Director's position. You know, I have internet on my own -- at
25 my own home.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Un-huh (affirmative).

2 MS. LEAVITT: I only saw this meeting posting a week ago.

3 MR. LOMAN: Un-huh (affirmative).

4 MS. LEAVITT: Like, where am I supposed -- it didn't even
5 say where I could get this kind of information.

6 MR. LOMAN: Well --.

7 MS. LEAVITT: It was -- it should be on the TV or around
8 me --. It should be on the radio. I know there was -- it's in
9 the paper. But then that, you know, that -- I didn't see that
10 until way later.

11 MR. LOMAN: Okay -- let me just say this. We can put you
12 on our list and send you everything we send to everybody, bigwig
13 or not. You'll be as big a wig as you can get. And we're happy
14 to do that. We have a list -- it's a long list. And we can
15 send you all of environmental documents. You may or may not
16 want that. But you can always tell us to stop. So that's a
17 start.

18 The other thing that's easy to do is just go to our web
19 page, which is not too hard to navigate, the Alaska Bureau of
20 Ocean Energy Management Regulation and Enforcement, used to be
21 MMS, web page. And you can check on us daily or weekly and see
22 what we have going on. We have a lot going on. But it's not so
23 much that once a week a concerned person, like yourself, could
24 check and see what we're up to. And then you can call 907-334-
25 5200 and ask for me. And I'll give you an update on the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 telephone every day if you want. That's easy to do. And I talk
2 to a lot of people. And I talk to a lot more people that are
3 just like you and me than I talk to bigwigs, that's for sure.
4 And I'm glad to do that.
5 MS. LEAVITT: Can you say that number again?
6 MR. LOMAN: 907-334-5200. And if you get a recording
7 because it's after hours or they're tied up and they can't get
8 to the call, the urgency number is my cell phone number that I
9 carry 24 hours a day. And now, thanks to improvements, it works
10 in all the communities in the Arctic, as it's worked all week
11 this week traveling through Kotzebue, Point Hope, Point Lay and
12 Wainwright and here. So, you can get a hold of me 24/7.
13 Yeah, and we'd be happy to put you on that list. Mike,
14 you can make a note and get her on that list that you guys
15 maintain. Don't blame me though, when they bury you in
16 paperwork.
17 MS. LEAVITT: It's important. You know even just an email
18 --.
19 MR. LOMAN: Sure.
20 MS. LEAVITT: -- to say there's an update or, you know. I
21 know how much it is to send this out, especially the one I got
22 before, four volumes.
23 MR. LOMAN: We have to FedEx it to get it to people quick
24 enough to --.
25 MS. LEAVITT: Right, so even just an email might even be

1 cheaper for you. But still having that Notice sent to other
2 people that are in big positions you know. I'm sorry, but I do
3 consider myself in a big position.
4 MR. LOMAN: I do too.
5 UNIDENTIFIED MALE: I feel the same way as her. I just
6 got that little piece of paper that was a notification about the
7 meeting. And I don't know how you guys send them out. It takes
8 -- you said something about Fairbanks. It used to take about
9 two weeks to get it.
10 MR. LOMAN: Anchorage.
11 UNIDENTIFIED MALE: And so we have this by-pass mail that
12 takes forever to reach up here. So, this notification -- my
13 daughter's at home. My daughter reminded me that there's a lot
14 of vehicles over here, so I came over here. There's no
15 notification at all.
16 MR. LOMAN: Uh-huh (affirmative). Okay -- noted on there.
17 Somebody in the back?
18 MR. SAM: My name is Sam (ph). I was just going to
19 suggest for these important documents, your meeting is right
20 next door to the library. And it might be worth talking to a
21 Library Director and seeing if he would receive a set for the
22 community.
23 MR. LOMAN: Yeah, they're sent -- the libraries are sent
24 automatically. And there's a copy over there. Yeah, that's
25 another source is the local library. I don't know -- we

1 physically looked and found them in the, even in like Point
2 Hope, Kotzebue, the libraries. We had our meetings in some of
3 the libraries in the villages and they did arrive there. But,
4 you know, a library puts them on the shelf and doesn't put a
5 blinking light on them. Yes sir.
6 MR. OLSON: My name is Donald Olson. I'm the State
7 Senator from the area and one of the -- I'm not that familiar
8 with the new NEPA. I know that's what you're trying to do is
9 get comments on it. But the concern that we have in the last
10 six months is that a lot has happened as far as dealing with
11 offshore drilling and those kind of things.
12 Obviously, in April, we had the blowout down in Gulf of
13 Mexico. In June you had the Beistline -- Judge Beistline's
14 decision related to that. Then you had the moratorium put on.
15 And a number of developments have happened. And with President
16 Obama in place and his mental framework, and then now we've just
17 gone through an election where it looks like the Republicans
18 have taken over control of, at least, one of the bodies. And
19 we're going into this time now and it's all over-shadowed by the
20 fact that, during the last session down in Juneau for the State
21 Legislative session, we couldn't get a Coastal Zone Management
22 Plan through, that MMS always is very familiar with.
23 With that in mind, how is this new NEPA law going to
24 protect the people that are along the coast, if you're
25 prioritizing against something that may -- we'll have disasters

1 (indiscernible) declares another mishap, especially if ice is in
2 place. And, what kind of protection can you assure the
3 constituents, myself included, that we'll have something to hang
4 our hat on?
5 MR. LOMAN: NEPA isn't new. Signed into law by President
6 Nixon. It's probably one of the premiere Federal environmental
7 laws. It's definitely the most litigated Federal environmental
8 law (indiscernible). And the -- in the beginning Federal
9 agencies were slow to comply. And people who challenged Federal
10 agencies prevailed, in the beginning. That changed as the
11 Federal government, all these different Agencies taking every
12 kind of Federal action imaginable.
13 Just to let you know, I've worked for -- on NEPA projects,
14 starting with Hazardous Waste Facility, when I worked for the
15 Navy, the EIS for that. I've worked on NEPA projects that
16 involved large hog farms, hydropower re-licensing. So there's
17 just a huge variation of things that the Federal government
18 might have to comply with NEPA on. But it's a planning
19 document. And it's designed to inform the public, get public
20 participation. And then inform the ultimate decision maker of
21 the effects to the human environment.
22 And when you do an Environmental Impact Statement, there
23 may be negative effects. And there may be significant risks to
24 the human environment. And then it's going to be up to the
25 Secretary of Interior, or whomever he or she delegates, to make

1 a decision whether or not that risk is acceptable.
2 And in the case of the Chukchi Sea Sale 193, I had just
3 come to work for, then, MMS. Happened to be in Washington D.C.
4 for some meetings when they briefed the Assistant Secretary of
5 Land and Minerals Management on this upcoming lease sale. It
6 was his decision, Steve Allred (ph) was his name. I actually
7 knew him when he was a State -- the State head of Idaho's DEC.
8 I was a Federal employee. He was running the State of Idaho's
9 Department of Environmental Conservation. Now he's the
10 Assistant Secretary of Land and Minerals. He's delegated the
11 Secretary's authority to make the decision to go ahead with the
12 Chukchi Sea Sale or not.
13 He asked the question -- he said, there's a roomful of
14 people. I'm just a little guy sitting there from Alaska. And
15 he said, well now that the Secretary's been up there on the
16 North Slope and talked to those folks, are they still worried
17 that the oil companies can't clean up a major oil spill? Oh,
18 oh, you know, that's one of those questions where they're asking
19 and the real answer is something they might not want to hear.
20 So there's dead silence in the room. And I had just been up at
21 these communities managing, scoping meetings for the Arctic
22 multi-sale EIS that we were working on. And so, I knew, no,
23 people were not confident in industry's ability to clean up a
24 major oil spill. And I said, no, they're not. They don't
25 believe it.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 And so his next question was, well, can they? And I said,
2 in the worst weather day in the Arctic, they'd be lucky just to
3 stay alive, much less clean anything up. So, you know, I bet my
4 money on prevention -- better not have a major oil spill. And,
5 you know, he thought about it for a minute and he said, what
6 does it say in our documents? I said, there's a risk but the
7 risk is remote. And that, if there's a major spill, that they
8 might clean up a 12 percent of what's spilled.
9 MS. LEAVITT: Now when you say remote, though, whose
10 decision is that?
11 MR. LOMAN: Well, remote --.
12 MS. LEAVITT: Remote on their end -- it's real high on our
13 end.
14 MR. LOMAN: Statistically -- I'm using remote from a
15 statistical percent. Is one in ten thousand or greater?
16 Somebody might say that's remote. You might say it's not remote
17 enough, you know. That's -- and I -- that's totally acceptable.
18 But he said, I'm going to go ahead and approve it anyway. But I
19 want the lawyers to look at it. He looked around the room and
20 said, you guys aren't like BLM. You don't bring your lawyers
21 here for this. And let the (indiscernible) guys look at it --
22 he made the decision (indiscernible) have to say. So there, now
23 you've got the inside look at how it works. Because that's
24 exactly what happened.
25 But at least he asked the question. At least he asked the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 question, how do the people feel? What can industry do?
2 And, quite frankly when you have -- like -- it's the
3 documents you receive, the big stack of documents. Those people
4 in that position, they cannot possibly have the time to read, in
5 entirety, all of the environmental documents that come before
6 them. But the bottom line decision, the risks that are out
7 there, how people feel, he can ask the question or he can read
8 the Executive Summary. The choice is his. And we serve the
9 Administration, their political appointees. And our job is to
10 tell the truth.
11 UNIDENTIFIED FEMALE: What is the plan, God forbid,
12 there's a spill? What is the plan?
13 MR. LOMAN: If there's a spill? Well, right now we have
14 an updated, for example, we have an updated exploration plan
15 that was submitted to us by Shell. In addition to their past
16 exploration plan that they submitted for what would have been
17 this past open water season, which did not take place because of
18 the Deepwater Horizon spill, they have added a few more things,
19 in addition to what they intend to do.
20 And what they intend to do is to put enough on site 24/7,
21 right there on the spot, spill response capability to clean up a
22 worst case discharge. Now we all saw the Deepwater Horizon.
23 There was straight uncertainty about a number of things. How
24 much is coming up of this thing? The rig catches on fire. It
25 topples over. And now there's a massive release, uncontrolled

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 release of oil coming up.
2 In the Deepwater Horizon case, it's coming up a mile deep,
3 a mile deep. So, no, there's a scale like this. That's -- on
4 our scale it would be a mile deep. And this oil is coming out
5 and moving to the ocean. They don't know where it's going to
6 surface. And we all know, from watching the news, didn't know
7 exactly how much. Well, as it turned out, when they really got
8 a good calculation of how much was coming up, and it was a lot,
9 it was very close to the worst case discharge analysis that was
10 done, very, very close.
11 So Shell is prepared to deal with an uncontrolled release
12 of the worst case discharge estimate right there on site. Now,
13 does that mean that the worse weather days won't disrupt with --
14 they're prepared to do? No. On the worse weather days in the
15 Arctic, real bad luck weather days, in addition to the bad luck
16 oil spill that shouldn't happen in the first place, I start --
17 I start to lose some confidence then. But they've added some
18 more -- a second drill rig to drill a relief well will be there
19 right in the region, ready to go to work in the event that they
20 need to do that. That's another thing. Remember the Deepwater
21 Horizon, it was -- I don't remember exactly now -- you try to
22 forget it, it's such a -- I don't know, you forget pain, I
23 guess. But it took days, weeks before the relief well started
24 to drill.
25 You remember the containment dome that they built while

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 the uncontrolled release was occurring. Shell now intends to
2 have a containment dome right there on site. But instead of the
3 mile depth, Shell's is 150 feet deep. The oil will come, in the
4 event of an uncontrolled release, will come to the surface in
5 seconds, not days. The oil will come to the surface right
6 there. It won't travel, because it doesn't have to travel far -
7 - 150 feet has a pressure of -- do the math now, three, four,
8 five, about five times the pressure we're under now. We're
9 under atmospheric pressure of 14.7 pounds per square inch. The
10 pressure at a mile depth is over 200 and, about 2,300 pounds per
11 square inch. It's like being -- it would be like being inside
12 of a scuba bottle fully charged, tremendous pressure and
13 tremendous depth. That's not the case in the Arctic.

14 So, Shell's proposed response is about at the place where,
15 if you start adding more, just to be sure, then more means more
16 impacts. The more ships, the more chance for bird strikes into
17 ships, more chance for ships to run over marine mammals, the
18 more chance of more ships disrupting activities, other
19 activities, including some subsistence activities, in my mind.

20 UNIDENTIFIED FEMALE: I guess my biggest worry is the ice.
21 What if there's a leak under the ice?

22 MR. LOMAN: Well, under the ice -- and ice comes in, as
23 the Whaling Captains, that are in the room, know ice a lot
24 better than I do. But ice comes in different forms. Right now,
25 I think we're looking at -- out here now what is typically

1 called young ice. That's ice that can be managed, moved around.
2 Thicker ice, and very thick ice that can't be managed, then you
3 have oil under ice.

4 What will they do? They're going to have to continue --
5 they have to continue and their plan calls for them to continue
6 to go after that oil that's been spilled in an uncontrolled
7 release. How do they do it? They've got to get through the ice
8 and get at it.

9 UNIDENTIFIED FEMALE: How -- yeah -- how?

10 MR. LOMAN: How to get through ice? Drill through it, cut
11 through it, move through it through -- move it out of the way
12 with giant ice breakers.

13 UNIDENTIFIED FEMALE: We don't want you to do that.

14 MR. LOMAN: I understand. No one wants -- the first,
15 before that starts, you don't want the uncontrolled release.
16 You don't want the spill. Deepwater Horizon didn't have to
17 happen. It didn't have to happen.

18 The Exxon Valdez didn't have to happen. The Exxon Valdez
19 happened because somebody was too tired to make a turn. One man
20 was too tired to make a turn. If he would have made the turn,
21 the Exxon Valdez wouldn't have happened.

22 UNIDENTIFIED FEMALE: But you have new voices here --.

23 MR. HARCHAREK: -- that community -- are still affected by
24 it today. Everybody, not just the Native community that, you
25 know, wasn't properly taken care of. But everybody is still

1 affected -- 20 years later.

2 MR. LOMAN: I know. I'm sorry -- we have a Court Reporter
3 -- I'm bad at this -- Judy just remind me.

4 MS. LEAVITT: Where's the microphone.

5 MR. LOMAN: She would like --,

6 MS. LEAVITT: They can hear people in the back.

7 MR. LOMAN: Can you tell us your name and spell your last
8 name for the Reporter?

9 MR. HARCHAREK: Hi, I'm Art Harcharek. Last name is H-A-
10 R-C-H-A-R-E-K.

11 MR. LOMAN: Thank you. Yes?

12 MR. HARCHAREK: Twenty years later, the people of that
13 area are still affected by Exxon Valdez. They say you don't
14 have to dig very deep into the soil and oil still comes to the
15 surface. To put all that on one person's judgment, whether he's
16 tired? I mean, that had a whole community, a whole population's
17 risks. I don't, you know, see how anybody has the power to even
18 make that decision. Thank you.

19 MR. LOMAN: Thank you. So -- for some folks that came in
20 after we started, we're taking comments on a draft Supplemental
21 Environmental Impact Statement. But we're also talking about
22 many other offshore oil and gas activities, issues, concerns.
23 And including the organization we are with, the Bureau of Ocean
24 Energy Management Regulation and Enforcement, formerly MMS. An
25 organization that is going through a major restructure and

1 reorganization -- so.

2 UNIDENTIFIED FEMALE: You guys are going through a major
3 restructure organization right now?

4 MR. LOMAN: Yes.

5 UNIDENTIFIED FEMALE: Okay. So you we're supposed to
6 depend on a corporation that's -- doesn't have a very good past
7 history of oil spills. And then you guys are restructuring the
8 plans and --?

9 MR. LOMAN: The reorganization is the impetus for it. The
10 reason that the President has directed it is because the public,
11 including you obviously, they lost confidence in the Agency's
12 ability to regulate. And to quote the President, what the
13 President said was, it's an Agency who discharged their
14 regulatory authority with disdain. We're showered with gifts
15 from big oil executives. That's the Agency that I work for. I
16 worked for it then. I've worked for this Agency for over three
17 years.

18 I can tell you this. I don't work for oil companies. I
19 don't take any gifts from oil companies or anybody else. I
20 serve the Administration with pride, without prejudice. And I
21 serve the people of the United States. Shell Oil Company is no
22 important -- more important to me than you are, or anybody else.
23 And the goal is to create -- and it will be announced, we think,
24 in a few more months, a new Agency that's the part of our
25 current Agency, our Inspectors, the regulatory arm. And the new

1 name for that Agency will be the Bureau of Safety and
2 Environmental Enforcement. And that Agency, the goal is to
3 restore the public's trust.
4 Some people in Washington D.C. have been given the charge
5 to put that together, that new Agency, new name. And design it
6 in a way that will restore the public's trust. They've talked
7 to us. They said, what's your recommendations? Our
8 recommendations are, in short, the Agency must be feared and
9 respected by industry. Feared and respected by industry. And
10 so, how do you do that? Well, it should be very experienced in
11 the full spectrum of regulatory activities, all the Federal
12 environmental regulatory framework, every environmental law.
13 This new regulatory Agency should be able to enforce. Worker
14 safety, so the inspectors would have experience as industrial
15 hygienists, or safety -- workplace safety expertise.
16 In Point Hope the other night, talking to the President of
17 the Native Village of Point Hope, the President, said we think
18 that your Agency should start to regulate industry to prevent
19 disruptions to subsistence activities. Which, I went, you're
20 right. In the Arctic, this new Agency should have an expertise
21 that would come from being an MMO, Marine Mammal Observer.
22 Being a Whaling Captain, or at least a whaling -- a
23 seasoned whaling crew member. An expert on all of those things
24 of the Inupiat culture that are self-defining practices. All of
25 the subsistence activities and other activities. Part of a

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 regulatory team that can prevent disruption, erosion or
2 otherwise harm the culture of the communities in the Arctic.
3 We're going to make that recommendation. And we think, because
4 we've had conversations with a number of leaders in Native
5 Villages and leaders in other organizations, that they will
6 support that.
7 UNIDENTIFIED FEMALE: It's hard to be respected here when
8 you look at Valdez -- that these people 20 years later -- they -
9 - all this was tied up in court and they're just now getting
10 restitution checks for \$1,200.00 or something crazy like that.
11 Anybody else know anything about that? You know, when accidents
12 do happen, the people are not helped at all. The oil's not
13 cleaned up and the community's (indiscernible). So, until I see
14 an action to fix that, what's the use?
15 MR. LOMAN: The Exxon Valdez was the impetus for a number
16 of very powerful Federal laws. The Oil Prevention Act of 1990
17 came about because of the Exxon Valdez spill. I encourage
18 people to pay attention to, his name is Kenneth Finegold (ph),
19 who is administering the fund that has been created. This is
20 funds, money, that BP agreed to put into an account. There were
21 175,000 claims that sits before this administration -- this
22 group under Mr. Finegold (ph) -- is charged with administering.
23 I listened to him night before last. According to him, 110,000
24 claims have zero evidence to support them. Now that doesn't
25 mean they just threw them in the wastepaper basket. They're

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 working with those people to help them put those claims
2 together.
3 The difference, I think, between what's happening now to
4 address the harm, the injury, the damages to natural resources,
5 the lost use of resources, caused by this disaster that BP and
6 others possibly are responsible for in the Gulf of Mexico,
7 should set a distinct difference between what we know, and you
8 correctly articulated to be the case of the Exxon Valdez. We
9 all live in and under and subject to laws. And the Exxon Valdez
10 created some powerful new laws. And, so, companies have to
11 behave differently because of it. And funds were created that
12 are managed by the Coast Guard and so on and so forth.
13 It's not a perfect world. And I understand the
14 frustration and fear that people feel because of the misgivings
15 of shortfalls of government Agencies and the laws of the past.
16 I feel the same way.
17 MR. BROWER: In common (indiscernible). Harry Brower, for
18 the record. (indiscernible) In regard to this discussion here
19 in terms of the oil pollution happening in 1980. That Act is
20 subject to address -- to compensate the commercial enterprises.
21 And it doesn't so much address the subsistence -- to -- how do
22 you compensate for the loss of subsistence resources? It
23 doesn't identify anything of that sort of thing, in that Act.
24 I've asked and tried to look with folks that were working on
25 that Act before. There's different Agencies in there, between

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 the Coast Guard that worked on the oil pollution at Valdez. And
2 they say, they've been trying to define or putting the means for
3 compensating the loss of subsistence resources. And, it's not
4 been addressed to date. And somebody should have. You all have
5 been involved what the pollution Act is structured. It needs to
6 be very well understood in terms of how it's supposed to be
7 compensating commercial uses. The losses (indiscernible). If
8 you have (indiscernible) comes (indiscernible) compensated for
9 (indiscernible).
10 MS. WILLIAMS: I am Vera Williams, for the record. I want
11 to comment on NEPA. You mentioned Shell Oil and about their
12 prevention program. If the drill rig was to be that close to
13 collect all that oil, where were they going to take it? Are
14 they going to take on land? You know, what's the options? And
15 I, you know, if there's stipulations there, what are they going
16 to be stipulating -- do with all that oil that's coming out? Or
17 to take it to somewhere -- what, they going to dispose of it or
18 put it down the pipeline that is going down from Prudhoe or --
19 what's the big plan for that, if that was to ever occur? I
20 mean, I haven't heard. What would happen once they collected
21 all the oil at their spill?
22 And, another thing also about a compensation for the
23 subsistence families. I just (indiscernible) about 20, 25 years
24 ago. Or are you guys going to compensate the Native people? I
25 know beef doesn't go a long way for us because, we don't eat

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 beef. We eat seals. We eat whales. And one cow will last me a
2 month. Will I be compensated a cow for the year? That wouldn't
3 go for us around here. We are Arctic people that need our seal
4 oil to eat with our food. Those are the types of things that we
5 could be, you know, thought about when your structure and your
6 stipulations and your compensation plan for -- for the Natives
7 that live up here.

8 MR. LOMAN: Thank you.

9 MR. JEFFERY: Hi, my name is Mike Jeffery, J-E-F-F-E-R-Y.
10 I've lived in Barrow for 33 years. Question is this, you're
11 saying that this meeting is to comment on the Environmental
12 Impact Statement. I would like to see -- because I'm not going
13 to raise my hand because I haven't seen it. Has anybody here
14 seen it? That we're supposed to comment on?

15 UNIDENTIFIED FEMALE: I've seen it, just now.

16 MR. JEFFERY: Well where is it?

17 UNIDENTIFIED MALE: In the computer.

18 MR. JEFFERY: One copy -- couple of copies?

19 UNIDENTIFIED FEMALE: Because I haven't seen it until
20 tonight.

21 MR. JEFFERY: Well, I mean, it's not a very meaningful --
22 if none of us knows exactly what the -- what the recommendations
23 are. I mean, sometimes when -- I mean it's great that you guys
24 are making the effort to do outreach to the various villages and
25 come to Barrow. But, you know, in different hearings there's at

1 least (indiscernible) like, at the beginning. You know here's a
2 summary. Here's our main (indiscernible). Here's a handout.
3 And we're all sitting here kind of in the dark except a few
4 people who made a copy. But they seem to have gotten some
5 summary of it but. And so I just -- it just needs to be -- we --
6 -- as we're sitting here, we can't really comment on this because
7 we don't know what you guys are saying in your recommendations
8 and stuff like that.

9 Well, you'll certainly be getting some wonderful comments
10 on the whole idea of offshore oil drilling. That as a
11 meaningful exercise and comments from this community on a
12 document that, you know, we haven't seen -- is not meaningful at
13 all. So, I just think that needs to be kind of registered.

14 And then the other thing is, you know, you've talked about
15 how much easier it is up here if there was an oil spill compared
16 to the Deepwater Horizon. But another way of looking at it is
17 the Gulf of Mexico is a piece of cake compared to the Arctic. I
18 mean, just think of the ice and the wind. And, you know, these
19 -- all these people are coming forward to say, oh, well, it'll
20 be so easy up here because it's so shallow. Well my goodness --
21 yes it is. But, look at all these other factors that need to be
22 contended with. So, I mean, these very heartfelt comments here
23 about well, how are you going to deal with it? Where are you
24 going to put the oil? I don't get it. What about the ice?
25 This is all really important stuff. And, somebody focusing on

1 this is easier than the Deepwater Horizon doesn't cut it here.
2 This -- the environment here is much more difficult. So, that's
3 my two cents.

4 MR. LOMAN: Let me just respond to that quickly. I hope --
5 -- sometimes it may sound that way. The people think that my job
6 is to come here and talk somebody into something. That my job
7 is to put those kinds of fears to rest. That it's my job to say
8 it's so much easier. We talked about ice management problems
9 and the Assistant Secretary -- I don't know if he had arrived
10 yet. The Secretary of Land and Minerals Management, when he
11 asked if people thought industry could clean up a significant
12 spill before he made the decision to go ahead with the Chukchi
13 Sea Sale, the answer from me was no. People aren't confident in
14 it. And his next question was, can industry do it? And I said,
15 quote, myself -- I remember it very well. On the worst weather
16 day in the Arctic, they'd be lucky to stay alive much less clean
17 anything up. And that's part of this NEPA process is to do
18 analysis. Inform the decision maker and tell the truth. Not
19 always say what people want you to hear. Some Administrations
20 might want to promote development. Some Administrations might
21 not.

22 One thing about all Administrations, they want to do this.
23 They want this activity, when it does occur, it occurs safely.
24 And they want this industry to act within an environmentally
25 responsible manner. That's done through endless demonstration,

1 not a bunch of slapping on the back and talking about what a
2 great record we have. Like they and my Agency has done in the
3 past. It's done through endless demonstration. So, please
4 don't think that I'm trying to talk somebody or alleviate fears.
5 I share your fears. We're well aware of the hazards of these
6 kinds of activities in the Arctic. And it's our job to make
7 sure that, if industry does it, they're fully prepared to deal
8 with the Arctic environment insomuch as you can be.

9 And then in the end, the decision maker hopefully, is
10 dutifully informed and makes the right decision. So, to set
11 that record straight. And, yes sir, you had a comment.

12 MR. NINGEOK: Yeah, Robert Ningeok, for the record. You
13 guys tell the same people the same thing before you guys --
14 these spill down there -- down in the states? You guys tell
15 them the same thing, you telling us?

16 MR. LOMAN: To tell people --?

17 MR. NINGEOK: You told them the oilfield would be safe?
18 It would be easy for you guys to clean up a spill down there?

19 MR. LOMAN: No.

20 MR. NINGEOK: It's different here. I know the ice flow
21 and the oil well can drill through the ice and go in the water.
22 You know, we have strong currents. If that oil spill out of the
23 pipes, it'll just soak right through. It's going to be
24 impossible, you know. I worked on the Valdez oil spill. I saw
25 what you did. We have strong currents -- I go (indiscernible).

1 We'll lose our lives, subsistence -- all our fish
2 (indiscernible). I was there. I saw it all.
3 MR. JUBA (ph): My name is Patrick Juba (ph). And you
4 guys talk about the Exxon Valdez and the rig that blew up.
5 Valdez had just had the oil in it. But the rig that blew up had
6 chemicals on that platform. And the same things going to be
7 around those platforms on -- if they start drilling out here.
8 And don't know how much of that chemical -- it's dangerous for
9 the animals or even for humans. So, and they say it's a lot
10 safer. And it'd be a lot easier because it's not as deep.
11 But the shallower it gets, the waves get closer to each
12 other and it's going to be hard trying to keep them boats in the
13 water. Because the waves are closer to each other than --
14 anyplace where it's deep.
15 MR. LOMAN: Thanks.
16 MS. HEPA: My name is Tagulik Hepa, H-E-P-A. I just
17 wanted to make one comment here about -- seeing like you're --
18 I've been attending these meetings. This is my 19th year. And I
19 just want to say that, in the 90s, when I came to these
20 meetings, there would be a roomful of Whaling Captains
21 (indiscernible). I just want to thank all the people for coming
22 today to speak on the issue.
23 But you are correct that there is a lack of trust with
24 your old organization and your reorganization of your new --
25 your new BOEMRE -- I think that's the name on it. That it's

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 going to take a lot of work because you need to come to the
2 community not to talk about a Supplemental EIS, but to talk to
3 the people of the North Slope how you can regain our trust.
4 Because we've been coming to these meetings for over 25
5 years. You've heard our hunters, our whalers say the same
6 things over and over. We are very concerned about OCS
7 activities. We've always been strongly opposed to it. We
8 understand that we can't stop it. So the people of the North
9 Slope need to have a meaningful role. And we need to have that
10 type of open dialogue and how can we be at the table to make
11 sure that the right decisions are going to be made to protect
12 the interests of the North Slope, the interests of our people?
13 And, so regaining the trust, you know, is going to be a
14 lot of work. So please come back. Meet with the whalers
15 because I want to see more Whaling Captains come back to these
16 meetings. There's too much going on. I think people are tired
17 of talking about the same things over and over. And as the
18 other gentleman had said here, and Michael, that I don't have
19 faith that it's going to be easier to clean up an oil spill in
20 ice conditions. You know, the weather factor today, if there
21 was an oil spill eight miles out where the lease sales are -- I
22 have very little confidence that you'd even be able to get out
23 there to evaluate the situation. I don't think no helicopters
24 could go out there. I don't think that a big ship could go out
25 there, you know, to go see what's going on. It's just way too

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 dangerous. The conditions are very extreme. We have a lot of
2 respect for the ice and the oceans out there. And we understand
3 the force that they have. Thank you.
4 MR. LOMAN: Thank you.
5 MS. LEAVITT: Roberta Leavitt again. I got two questions.
6 One goes towards the production for what Vera was saying. When
7 you have the production flowing, what is the process? Like she
8 was asking, is it going to go through Prudhoe Bay? And we all
9 know that Prudhoe Bay was only lifetime expectancy was going to
10 be 25 years. And it's already starting to break down. There's
11 even been people who are supposed to be Inspectors or even
12 qualified to be Inspectors. And we can't -- we don't, you know
13 -- how can it be stronger so that the Natives even have a word -
14 - a say in those inspections? You know, you didn't even hear us
15 when we were telling you that the whales go through that
16 migration route is right there where the sales happened.
17 And we say -- we say -- we say and still it's not being
18 heard. We're gonna still come and say, you know, that's because
19 our trust is still not there. I read about it. I heard through
20 PBS that Shell, not Shell but BP's had all these other extra
21 problems on land. Now you harvested in the water bringing to
22 land -- where is it going to go? Is it going down that same
23 pipeline that's deteriorating? Are they going to make a new
24 one? Have they even decided any of that yet?
25 We see all of that because it's a long term thing for us

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 up here, with our subsistence. I get sick animals from the
2 ocean and I know that they don't smoke. I have seals that come
3 back with cancer. And we still can't -- how are they getting
4 it? You know we weren't getting any answers of how it's getting
5 into the ocean. But we tell them and tell them and tell them
6 over and over again that we're harvesting sick animals. I get
7 at least three, two, maybe three a year that I cannot use or
8 eat.
9 And it's not what we're doing. You know, that's our
10 respect for the land, our respect for the water. And we still
11 have to voice it, because people that do not live here are
12 making decisions of our lives, what we live off of. And there's
13 -- how many times of patients now. You know, how do you know
14 that they're not getting it from what they're eating?
15 UNIDENTIFIED MALE: (Indiscernible).
16 MR. LOMAN: People start off -- it happens all the time --
17 they start off I've got a couple of questions but.
18 UNIDENTIFIED FEMALE: Can you answer the question on how
19 it's going to land or where it's going?
20 MR. LOMAN: Contaminants? Or --
21 UNIDENTIFIED FEMALE: No -- is there going to be a
22 pipeline?
23 MR. LOMAN: Yeah, that. I'm glad you said that because
24 that is relevant to the Supplemental EIS, sort of. I mentioned
25 earlier that the Court said, analyze the effects of natural gas

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 because the leases have incentives connected with natural gas in
2 them. Chukchi is thought to believe to contain a vast amount of
3 natural gas. So natural gas analysis by the Agency in this
4 draft Supplemental EIS occurred this way.

5 Our resource evaluation people came up with a reasonable
6 scenario. The reasonable scenario has a couple of basic
7 components to it. First, it's not going to happen for a long
8 time. Gas is maintained in these wells because gas has -- the
9 gas is the pressure that buoys the oil to the surface. Oil is
10 more valuable than gas, so it's going to be somewhere between 15
11 and 30 years before gas would be ready to go to market. And
12 that's if they explored next year and they found a viable
13 resource.

14 I would just point out, in Alaska's OCS, it's most likely,
15 or it has been the case, that they would explore in the Chukchi
16 and they would explore in the Beaufort. And like the rest of
17 Alaska's OCS, they found no viable -- economically viable
18 resources and they walk away. And all of these meetings and all
19 this fear and all of this discussion would really be for
20 nothing, in that case.

21 The natural gas then, in 15 to 30 years, if it went to
22 market would be pipelined to shore, cross NPRA, connect to a
23 pipeline. And we don't exactly whether it would be the AGIA
24 version or some kind of natural gas pipeline that we think would
25 travel in the same direction, at least initially, as TAPS. And

1 then what happens to it after that, we just don't know. These
2 are things that are 10s, 10, 20, 30 years away.

3 So we've analyzed a reasonable scenario in this draft
4 document. And, it's important to realize that natural gas
5 doesn't need any more seismic activity than what was analyzed
6 originally. Because it doesn't take any more seismic activity.
7 None. It doesn't need any more exploratory drilling than what
8 was analyzed and what they would conduct to find oil. None.

9 Doesn't come -- the effects don't come until they're ready
10 to start building the infrastructure that it takes to move gas
11 from a deposit to the market. Yes sir.

12 UNIDENTIFIED MALE: You mentioned that seismic activity
13 out there. I know there's been some seismic activity. You've
14 seen all that pressurized equipment out there, and they say it
15 works pretty good. But have they checked the aftermath of what
16 happens to the wildlife that is on the bottom of the ocean after
17 they go through with the seismic?

18 MR. LOMAN: They do have a monitoring plan. They've got
19 ongoing monitoring -- don't know if any of us has a list of our
20 ongoing environmental studies. But they do do some monitoring
21 to see what the impacts are. Stat oil this past summer
22 conducted seismic activities in the Chukchi Sea. It was a
23 successful seismic data gathering operation. And there was some
24 monitoring activity that's associated with that. The -- every
25 year the National Marine Fishery Service, with our assistance,

1 has an Open Water meeting where the science that is in place to
2 monitor seismic activities and other activities is discussed.
3 These meetings are open to the public. Harry has attended more
4 than I have. And so have a lot of representatives from the
5 North Slope Borough. And they're heavily involved in the peer
6 review of that scientific monitoring and data gathering work.

7 And so the answer is yes. Some parties think that more
8 should be done. Some parties think that enough is being done.
9 So there's some debate that these ongoing involving that
10 activity, but it does occur.

11 MS. AHSOAK: I'd like to say about the seismic -- the
12 seismic (indiscernible). This is Heidi AHSOAK, A-H-S-O-A-K. I
13 was working for Top of the World at the time, two years ago that
14 they were doing testing. B -- employees from BP were staying
15 next door to some of the Mammal Observers. Some of the Mammal
16 Observers told the housekeepers that BP was trying to pay those
17 people to count more than what they were counting. Do you guys
18 have anybody regulating, you know -- do not how to say it.
19 There were people paying other people to say there's more
20 mammals out there than there actually are.

21 MR. LOMAN: Paying people to lie?

22 MS. AHSOAK: Paying people to lie.

23 MR. LOMAN: Paying people to not to tell the truth and --.

24 MS. AHSOAK: Correct.

25 MR. LOMAN: First I've heard that. Have you heard it

1 before? No.

2 MS. AHSOAK: And also --.

3 MR. LOMAN: But, yes, there's a written --.

4 MS. AHSOAK: And, also I don't work --.

5 MR. LOMAN: There are regulatory Agencies that are
6 interested in -- keep my phone number handy because, at least as
7 long as I work for the government, you know, I mean, you know
8 how the law works. That's kind of hearsay and whatnot, but
9 these things are best, always best, investigated right away.

10 MS. AHSOAK: Another suggestion is maybe -- keep the oil
11 companies (indiscernible) at hotels than the people counting.
12 That's one suggestion from me.

13 MR. LOMAN: Well--.

14 MS. AHSOAK: Another comment that I do have is, you know,
15 if you guys could publicize these meetings more. Because I
16 don't work -- I don't get emails from, you know, the North Slope
17 Borough, saying there is a meeting. You know, I found out
18 through Facebook.

19 MR. LOMAN: Facebook?

20 MS. AHSOAK: I found out through Facebook.

21 MR. LOMAN: You mean a friend's page?

22 MS. AHSOAK: No, I found out from -- people had
23 publicized. People had got emails about it. And I found out
24 about it and was letting everybody else know.

25 MR. LOMAN: But one of your Facebook friends?

1 MS. AHSOAK: Yes. But I shouldn't find out from Facebook.
2 I should find out from the news. I should find out from KBRW.
3 I should find out from the (indiscernible). I should not be
4 finding out -- you know, people should be finding out from, you
5 know, a valid --.

6 MR. LOMAN: We did use KBRW -- did use the Arctic Sounder,
7 we did use some obviously --.

8 MS. AHSOAK: I mean, obviously, I mean not many people
9 heard about it. Because I was telling people about it all week.
10 I just found out -- what's today Friday, I found out Wednesday.

11 MR. LOMAN: There's a phenomenon here and it happens all
12 the time, no matter what the subject is. And not just in the
13 Arctic, everywhere that at every meeting that I've ever managed.
14 That's always a complaint, and you can never do enough. People
15 are at the meeting but didn't know about it. There's a conflict
16 that's inherent there. We're going to do more. But we know,
17 even no matter how much we do, it's still not going to be
18 enough. I guess, you know, just in addition to collecting email
19 addresses on sign-in sheets at these meetings, and then
20 continually informing people of meetings in the future, which
21 we're trying to do, incorporate that, keep sending the
22 information until people say, I'm not interested anymore.

23 MS. AHSOAK: Yeah, I'd like to be on the email list.

24 MR. LOMAN: Yeah. If you give us your email address. And
25 everyone who gives us their email address will get on our list

1 and be notified as soon as we make a decision. Which still, and
2 I apologize for this because even though I'm a Manager in
3 government, I still can't control all of it. I get very
4 frustrated with how the government works too. It's never fast
5 enough for me. The only difference between you and me is,
6 government has to deal with me and my, you know, running around
7 being a 200 pound pit-bull saying hurry up, get it out. But I
8 understand that frustration. And we will do more. And I
9 apologize because I know, ahead of time, that we'll never do
10 enough.

11 MS. AHSOAK: And, also, if you could let the Captains --
12 the Whaling Captains know. You know, get all of their phone
13 numbers and, you know, all of their emails and let them all
14 know. Because I know my husband didn't know.

15 MR. LOMAN: Yes.

16 MS. STEIN: My name is Dorcas Stein, S-T-E-I-N. I didn't
17 even know what to say the only thing I can say is, when it
18 comes to you people coming up here and talking about offshore
19 and oil and gas development and stuff, that my heart begins to
20 ache. You know, from the human side of it as an Inupiat people
21 who subsist off the ocean and whale, with the walrus and
22 eating seals and fish. And we're so dependent on the ice and
23 trying to keep it clean, not broken up, not touched. It's
24 almost like you're coming in our backyard, okay, to me. And it
25 becomes very personal. Now my heart begins to hurt because of

1 the big possibilities and the great danger of what you're doing
2 way out there where our livelihood just roams.

3 Do you know, I worked briefly for Alaska's Bowhead Whaling
4 Commission when they first started to take the bowhead whales.
5 And it was just amazing, the traffic of those whales right there
6 where you're going to be. And I can almost cry just to think
7 that they're going to be bumping across aliens, you know, on
8 their turf. And, you know, we really respect the animals there.
9 I want you to know that even my heart hurts to even think of
10 something like this happening, which causes me to go to this one
11 other area of getting away from fossil fuels and stuff.

12 I really wish the government would just spend a great
13 amount to get some wind power, solar power and all this to heat
14 our homes, you know, other than using oil and gas. I don't see
15 any big efforts happening and I wish somebody would do so.

16 The other thing is, I don't know if you can talk about it,
17 but I'm sort of curious on our brothers and sisters over in
18 Point Hope and what came up from your meetings with them,
19 because they're the ones that are really going to be touched the
20 most, being right there at the Chukchi when, you know -- where
21 it's right there with Chukchi and Beaufort. Thank you.

22 MR. LOMAN: I sure can talk about what happened in Point
23 Hope, because I was there just the other day. And here's my
24 short assessment.

25 The people continue to share the same fears that you have

1 about activities that may take place. The Native Village of
2 Point Hope was a litigant in the case that is the impetus for
3 this draft Supplemental Environmental Impact Statement. And I
4 guess you could take the position that they sued along with
5 others. The Court found at least some of their assertions to be
6 correct. And so they made the Federal Agency, my Agency, behave
7 according to the Court's directions. So I guess maybe you might
8 want to congratulate those folks in Point Hope. I did, because
9 I work for a government Agency, it's not my job to get ornery
10 because people sue us. It's my job to do -- to obey the Federal
11 environmental laws appropriately.

12 And so they share concerns related to uncontrolled
13 releases of oil, like the Deepwater Horizon. They share the
14 same concerns about the industry's ability to clean up oil in
15 the event of a spill, manage ice, the horrendous weather
16 conditions of the Arctic. That was discussed. Some folks that
17 had received and read the document and talked about it -- it was
18 evident to me that they understood the document pretty well.
19 Jack Schaefer -- I think people know Jack. Jack had read it and
20 he understood the exercise of analyzing the statements of
21 missing information. He expressed concern about the fact that
22 it was limited to just those activities that the Court had
23 mentioned in their remand.

24 And then we talked about other things that kind of related
25 to what we talked about -- that I mentioned earlier with respect

1 to the reorganization of our Agency. And the creation of a new
2 Agency that will be respected by the public. There were 20
3 people in attendance at Point Hope. And there were other things
4 happening simultaneous to the meeting. For example, it was
5 Election Day. I voted in Point Hope. In the Community Center
6 they were taking in big thousand pound pieces of oil for a
7 ceremony that was starting at 8:00 that night, so people
8 sacrificed not being able to participate in the beginning of
9 that ceremony to talk with us. It was fair, frank,
10 understandable, open communication and valuable, I think, for
11 both sides, for the government officials, us, me, and for them
12 to some extent.

13 But, you know, you mentioned, how you feel when you said
14 you people come. I understand that. I come from an Indian
15 reservation in the Upper Peninsula of Michigan. And I realize
16 what it's like to have your community invaded by, in my case,
17 mining activity and other activities that have a horrendous
18 effect on the environment. But, like I mentioned earlier, my
19 job is to serve you -- serve the Administration, no matter what
20 administration it is, and try to obey Federal environmental law.
21 To be honest about informing the decision maker, no matter what.
22 I think I've done that job and I'll continue to do it until I
23 step down, which won't be that much longer, and retire and go
24 back to the Reservation where I came from, after 35 years of
25 Federal service and 20 years of military service. And I'm just

1 as proud to serve you in this capacity, as I was when I had a
2 gun in my hand and served you in combat with the military.

3 UNIDENTIFIED FEMALE: Thank you.

4 MR. BROWER: (Indiscernible) And if there are no other
5 questions coming from the audience. I was going to sit here and
6 read a statement about the Environmental Statement
7 (indiscernible).

8 MR. LOMAN: I'm going to get coffee, but I will listen.

9 MR. BROWER: First of all, my name is Harry Brower, Jr.
10 I'm Chairman of the Alaska Eskimo Whaling Commission. It's my
11 privilege to give -- provide -- to comment on this Supplemental
12 Environmental Impact Statement during this public hearing
13 tonight. I'm not sure, if this mic is on? How's that
14 (indiscernible).

15 Anyway, again my name is Harry Brower, Jr., Chairman of
16 the Alaska Eskimo Whaling Commission. I've lived here in Barrow
17 all my life, a hunter, registered Whaling Captain to the Alaska
18 Eskimo Whaling Commission -- Barrow Whaling Captains
19 Association. Anyway, this evening I'd like to read some of
20 these comments. They are not generated on my own. I've worked
21 with my staff and others and our legal counsel in generating
22 these comments.

23 This Lease Sale 193 Supplemental Environmental Impact
24 Statement is typical of what we see in the Alaska Region in
25 every environmental review. Green light to the industry, don't

1 worry about subsistence. The decisions have already been made.
2 This is just an exercise.

3 You talk about all of the industrial activities that are
4 coming and all of the impacts that are going to be happening -
5 to happen out in the ocean in the migratory paths of resources
6 that we depend on. on onshore and in our communities. And then
7 you say that there is no need for concern because of impacts --
8 will be mitigated. But you never say how they will be
9 mitigated. In the alternative, you say that none of the impacts
10 will be significant. But you never say why the impacts won't be
11 significant. I guess because the impacts won't happen to you.
12 They'll happen to us.

13 The reasons behind this Supplemental Environmental Impact
14 Statement is the Court telling the Department of Interior that
15 you left out a lot of important scientific information when you
16 did the first EIS. So you were supposed to go back and identify
17 that important information and decide how to use it before you
18 reach your final conclusions on the EIS. But you don't actually
19 consider any new information in this Supplemental EIS. You just
20 say that you have already considered all of the important
21 information and that anything else is not important.

22 Basically, you conclude, that you don't need to worry
23 about what the Court told you to do. You are trying to just
24 cover it all over the words. You say there is no important --
25 no information for how most -- all of our subsistence species

1 use the lease sale area. But then you say that information is
2 not important. No need to worry.

3 You try to get around the Court Order by saying that there
4 will be -- that adverse impacts no matter what the development
5 scenario is and no matter what the scientific information is.
6 But that doesn't work.

7 Federal regulations require you to prepare an
8 Environmental Impact Statement that is supported by evidence
9 that you have made the necessary environmental analysis. And
10 there's a quote in here in regard to this 40 CFR 1500.2. This
11 document does not meet the requirement. You are supposed to
12 provide full and fair discussions of significant environmental
13 impacts. And inform decision makers and the public of the
14 reasonable alternatives, which would avoid or minimize adverse
15 impacts or enhance the quality of the human environment. Again,
16 40 CFR 1502.1. This document does not meet the requirement
17 either.

18 There are going to be lots of adverse impacts from the
19 proposed development. You give long lists of impacts, but you
20 conclude that there is no need to worry. What do you base your
21 conclusions on? Where is your analysis? There isn't any. Just
22 like always, from your shop.

23 In terms of what your alternatives, given the many
24 unknowns and the heavy reliance of our villages on marine
25 mammals resources, it would make sense to go with alternative

1 three. This would give us a greater buffer between the
2 industrial operations and our hunting areas. This makes a lot
3 more sense than the proposed action, because you have no idea of
4 what all of the impacts are going to be, since you don't even
5 know how the resources use the habitat. On top of that, you
6 have no clear means of mitigating the impacts that do occur.

7 So it makes sense to put as much distance as possible
8 between the industrial activities and our hunting areas. You
9 need to provide a good justification for not to do that.

10 You don't tell anyone how you are going to gather the
11 baseline data you need and you ignore the data that you have.
12 Federal law requires you to use the best available information.
13 In July NMFS put out a new biological opinion for oil and gas
14 activities in the Beaufort and Chukchi Seas. You don't even
15 make a reference to that. In July you published the final
16 report for satellite tracking on the Western Arctic bowhead
17 whales for 2005 through 2009. The study shows that the whales
18 all migrating through the lease sale area. This tagging study
19 is funded by the Alaska Region published on your website, and
20 you don't even mention it.

21 You also have the report of the 2010 Tagging Study also
22 funded by the Regional Office and you don't even mention that.
23 The Chukchi Sea development will disrupt our marine mammal
24 species and their prey species. And you talk about onshore
25 infrastructure disrupting the rest of the hunting opportunities

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 for those villages. But then you say, the impacts don't, won't
2 matter. You talk about a gas pipeline coming onshore, probably
3 at Wainwright. This will require high resolution seismic plus
4 site clearance, plus dredging and other trenching right through
5 the migratory areas. But you say there's no need to worry about
6 the impacts to the whales. What is your basis for saying that?
7 Where is your analysis?

8 You say that our villages might have to go without whales
9 and other subsistence resources. But then you conclude that the
10 impact to our people will not be significant. You continue your
11 practice of deciding that we can go without important food
12 resources for up to two years without suffering any significant
13 impacts.

14 Our bowhead whale villages have a documented need for 61
15 landed bowhead whales per year. That is food we need to
16 survive. One season without whales is very significant for us.
17 Yet, you say we can go up to two years, four seasons, without
18 this resource. You can go for two years without your major food
19 resources? At one point, in this document, you speculate that
20 we might be able to start buying western food to replace our
21 subsistence food. I'm not even going to talk about the social
22 and health impact that would go along with that. My question
23 is, where is the money going to come from? How does the family
24 in Wainwright afford \$5 for a gallon of milk, \$15 for a pound of
25 beef? How do parents in Wainwright feed their children if they

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 can't get their subsistence resources?

2 Shell likes to come to our villages and tell everyone
3 about the jobs that are going to be accompanying all of this
4 development. Jobs for whom? Jobs for people whose main skill
5 is as a subsistence hunter? I don't think so. I think the jobs
6 they are talking about are going to go to union workers in the
7 Lower 48. That is what I see happening already.

8 When the development drives our subsistence resources away
9 and the jobs that pay enough for people to live on are all taken
10 by shift workers from the Lower 48, how do we survive? Where is
11 your analysis of that? What is your mitigation for that?

12 You are supposed to provide a cumulative effects analysis.
13 Instead you just conclude, without any support, that oil and gas
14 can be developed in the Chukchi Sea without any cumulative
15 impacts to the whales and other animals. But in your cumulative
16 impact discussions, you don't even mention the development work
17 in the Beaufort Sea, ship traffic, all of the research work
18 going on, or fishing in the Bering Sea. All of these things are
19 already affecting our migratory species. And they need to be
20 part of your cumulative effects analysis.

21 You say that there is no need to worry about impacts,
22 because they will be mitigated by National Marine Fishery
23 Service or by another Agency. But you don't say how that will
24 work. I pulled out a couple of quotes. "While the complexity
25 of how marine mammal species react to underwater and above water

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 sound renders an exact determination of potential adverse
2 impacts difficult, abundant regulatory review and careful design
3 of mitigation measures are expected to preclude instances of
4 level A or harm take of a marine mammal and to reduce the
5 potential for level B or harassment take." Really? How is that
6 going to happen? We don't know because you don't say how.

7 Another quote is -- "No population-level impacts are
8 anticipated as a result from natural gas development and/or
9 production." Again, all I can say, really? There is nothing in
10 this document that tells me how you reach that conclusion.

11 My family depends on these animals for food. How am I
12 supposed to sleep at night knowing that you are going to get
13 ready to permit all these activities without any actual
14 mitigation in place and without any actual understanding of what
15 potential consequences of your actions? Would you be able to
16 sleep at night if it was your family's food supply that we were
17 talking about?

18 You also say impacts will be mitigated by conflict
19 avoidance mechanisms. But Shell and Conoco are not signing the
20 CAA and you are providing no support to help us get them to
21 sign. Instead, they are using their so-called Plan of
22 Cooperation. But those FOCs are nothing but a slide show and a
23 bunch of sign-up sheets. That is not mitigation.

24 Federal law requires you to provide an Environmental
25 Justice Analysis. In this part of the document you say that we

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 will suffer a lot of health impacts, including loss of food,
2 degraded air and water quality, stress and increases in negative
3 social impacts. But then you say that there are no
4 environmental justice problems because you have decided that
5 none of these impacts are important. That is not an
6 Environmental Justice Analysis. That's just you telling the
7 decision makers in our Federal government that we don't matter.

8 I think the main take-home message from your Supplemental
9 EIS is that it doesn't matter to your Office what the impacts
10 are to our subsistence resources or to our families or our
11 communities. You have already decided to give the companies a
12 green light. To you that's all that matters.

13 These are comments that were generated through the Alaska
14 Eskimo Whaling staff and working through the reading of the
15 document and learning of what went on, needs to occur. These
16 are very serious matters to us. I hope you learn and take these
17 comments seriously. Thank you.

18 Jeff I'm going to give this to you.

19 MR. LOMAN: Thank you. Do we have another commenter?

20 UNIDENTIFIED FEMALE: Sir, I have one more please.

21 MR. LOMAN: Yes ma'am.

22 UNIDENTIFIED FEMALE: Maybe I'm loud enough.

23 MR. LOMAN: I hear you loud and clear. Judy do you hear?

24 UNIDENTIFIED FEMALE: Thank you.

25 MR. LOMAN: Thank you.

1 UNIDENTIFIED FEMALE: In light of what our Chairman of the
2 Alaska Eskimo Whaling Commission said that maybe it doesn't
3 matter because the government has already started and said we're
4 going to do it, you know. And I thought of saying it earlier
5 but I didn't because I didn't want to say it. I remember saying
6 it, how many years ago, at a meeting. But when it comes to the
7 Inupiat people up here, I think that the government needs to
8 have more respect and listen to them. I mean, you've said you
9 will be listening to us. But in the same manner, when you look
10 at the big picture of what the imperialistic attitude of the U.
11 S. Government has been in the past of taking, taking, taking in
12 land and resources. Here this whole Arctic Ocean is wide open
13 right now. And I hate to see our government have that kind of
14 mentality as they did to the Lower 48 Indians, and you know
15 about it. I think you are part Indian, you say. And, when it
16 comes to our people up here, I hope the government has more
17 sensitivity this time to our people. As few as we may be, just
18 in the thousands, compared to millions in the Lower 48, that I
19 think the moral point of it is respect for our culture, you
20 know.

21 That, I know that the government has learned a lot the
22 past many years, especially after the MMS was sued and they lost
23 and lawsuits coming in and so forth, that they're taking better
24 care. But I just don't want to see them coming in like a
25 bulldozer, no matter what people say. They're still going to

1 cut down trees and you know, drill and so forth.

2 If you can just spend more time with our people, your
3 Agency can spend more time with our people and build a
4 partnership, you know, like I know some people say maybe we
5 can't do without it -- it's got to happen. But if it's going to
6 happen, then extend your hand more to our people and say, okay,
7 what can we do? Can we work together, you know, more and
8 communicate better with us? Maybe there needs to be a Regional
9 or an offshore -- this offshore drilling and exploration. But,
10 so far it's very scattered. Our lands are vast, you know, and
11 it's scattered. But, we just want you to respect us a little
12 more. Thank you.

13 MR. LOMAN: Thank you. We are trying to extend our
14 actions to form partnerships. For example, I think probably
15 everybody knows Mayor Itta developed eight Ocean Claims
16 Initiatives. And I sure don't mean to speak for the Mayor, but
17 I have read and heard Mayor Itta speak on a number of occasions.
18 And, essentially, his position is, is that although we are
19 against offshore development, if it's inevitable, we think that
20 the government should do these eight things, Eight Ocean Claims
21 Initiatives. So, we drafted a informal Partnership Agreement
22 and we're working, or going to be working with the Borough to
23 try to enter into that Agreement and it's an Agreement just to
24 basically set some, you know, guidelines, some actions on how we
25 are going to communicate to try to address these Eight

1 Initiatives. We talked about it today. Ben and I talked about
2 it and others at a meeting today. Harry was there. The
3 progress is pretty slow. I wish I could wave a magic wand and
4 address some of these communication problems. And respect comes
5 from, at least for me, and I don't think I'm too much different.
6 You get respect when you deserve it, you know, through your
7 actions, through what you say and then, you know, how it turns
8 out in the end.

9 Harry, for example, got up and said that we failed
10 miserably to address the Court remand. We're going to see about
11 that because the Judge is going to decide. Now you heard what
12 Harry said. So it should be pretty simple. If Harry's right,
13 that Judge will kick us to the curb. I'm using terms that I
14 think everybody can understand that aren't legal terms, because
15 I'm not a lawyer. But we'll see, you know, we'll see.

16 I said earlier that, at least the draft Supplemental
17 Environmental Impact Statement, we think is a good step forward
18 at addressing the remand, although we've got comments to
19 address. And there have been some suggestions that I think will
20 add to the document. And then we go before this Judge and he
21 makes a decision.

22 So you gain respect by that proof that's in the pudding.
23 And it comes slow, and it takes patience. I know Inupiat people
24 learn patience through the subsistence activities that are
25 culturally self-defining. We had that conversation in all of

1 the villages. What does subsistence activities do besides put
2 food to the people? It teaches you how to be patient. It
3 teaches you how to deal with loneliness, sadness, and on and on
4 and on. Those are really important things to people on a very
5 personal and individual basis. And I understand that, and
6 appreciate it. Part of my job is to make people who can't
7 easily understand those things, understand them.

8 UNIDENTIFIED FEMALE: Who chose this time and location
9 advertised for this meeting? I heard about it in Facebook
10 through one person. I didn't see flyers up. I didn't see
11 anything. While the oil companies tried to butter up our
12 community through pancakes and door prizes, but when it comes to
13 the actual impact, the environmental impact on land, where's the
14 flyer? Why is there no advertisement like I had -- there's --
15 if people knew about it, more people would be here. This is not
16 a reflection of how the town feels, with the dozen people that
17 are here. If more people knew about it, they would be here.
18 Only one person at Kotzebue showed up, I heard. In fact -- I
19 mean -- talk about lack of respect and you want to know -- for
20 me it looks like the bank taking your house, and then three
21 weeks later they're going, well, how do you feel about that?
22 You guys already did it so --.

23 MR. LOMAN: Yeah, the announcement for the meeting was
24 announced on KBRW, for example. It was put in the Arctic
25 Sounder, and other media. We notified organizations, agencies,

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 stakeholders. And we maintain an email list like -- that's why
2 we ask for emails when people sign in, and notify people that
3 way. There is another person that learned about it through
4 Facebook. I guess through your Facebook friends, who told you
5 about it as well. The Secretary of Interior has a Facebook
6 page. Maybe we should put it on there too. If you like him,
7 then you can get his notices.

8 But, I said this earlier, and I'll just say it again.
9 We'll keep doing more. But trust me, if you're at these
10 meetings with me we'll never do enough to satisfy everybody in
11 that regard. But we will do more.

12 MS. LEAVITT: I kind of got a question about -- the
13 history of Prudhoe Bay has done real well on land. Why is it
14 that we can't do more on-land stuff? And why is it that your --
15 not you -- I know you're in a position, but why is that people
16 cannot hear that it's a whole lot safer to do this exploration
17 on the land compared to in the ocean? In the wintertime,
18 cleaning up a spill during the winter time it still can be done.
19 But there is no proof -- what proof do you have that will
20 satisfy our hearts, saying that our food will not be destroyed?

21 There's been studies out there that say that our Native
22 food is considerably more healthier than the store bought foods
23 because of their preservatives that are added into the food,
24 the sugars that are added, the diabetic part of it? You know,
25 long ago we didn't have diabetes because of those carbohydrates

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 and high blood pressure, with the food that we harvested from
2 the land. And here it's been proven that you have drilling on
3 land that is manageable.

4 I know there's people out there from the Lower 48 say that
5 we've got all this oil underground. That we're only a speck on
6 the map. And, you know, we voice and voice -- even I was here
7 in the 70s, and we had over 100 people here compared to what's
8 here now. And we didn't have the media the way we have -- the
9 way we have now. We had no internet back then. We had no
10 Facebook back then. We had barely KBRW. The North Slope
11 Borough didn't have all those internet capabilities, but the
12 word still got out.

13 I know that's a sore subject. But still, I can remember
14 when we did have over 100 people here testifying. And they had
15 to close it down because they got tired of repetitious things.
16 Now it's our turn to be repetitious, and still say the same
17 things, and still say the same things, and yet our voices are
18 still lowered. I feel that they're lowered. Because it's still
19 going to happen.

20 People are saying that there is less oil in Prudhoe Bay,
21 so they got to look elsewhere, and they're going into a place
22 where I eat from. And you're not going into the store to get
23 oil. You're going into my refrigerator, my garden where I eat.
24 Where my muktuk -- we had no muktuk -- what are you going to do?
25 You know that warms our bodies in the cold, that -- the blubber.

1 The seal, that means a lot, with that we had with the caribou.
2 There's so many things that we get from the ocean that
3 supplement our food.

4 And I have to agree with what Harry said about it not
5 addressing of any of those things in this. Plus, with Harry
6 saying that who's going to get the jobs. I totally agree with
7 what he said. We're not qualified as MMO. You have to go to a
8 certain kind of college and get a degree to get even put into
9 those positions. You have to know certain things. We're not
10 going to be the ones getting the jobs. Yeah, you may have 900
11 jobs on the line, but it's not going to be us. We're not that
12 qualified because we're subsistence hunters. Plus, where's the
13 subsistence mitigation?

14 You know you got to re-look at what it says about it going
15 to commercial people. We're not commercial. We're subsistence.
16 So I just want to voice that. And I'm Roberta by the way --
17 Roberta Leavitt, L-E-A-V-I-T-T. Thank you.

18 MR. LOMAN: Thanks.

19 MS. DE SOUSSA: I'm Leandra De Sossa, D-E S-O-S-S-A.
20 Just wanted to mention very little actually.

21 UNIDEFINED MALE: Could we have a microphone. We can't
22 hear you.

23 MS. DE SOUSSA: Oh, sorry. I didn't have as much time to
24 read the whole document, but the Mayor of the Council of
25 (indiscernible) mentioned that there were no -- that there was a

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 revision of the -- additionally it required by the courts, but
2 there were no impacts. And that's repeated over and over again
3 as Harry mentioned it. There is no transparency on how they got
4 to those conclusions. And I'm not sure what this is on the
5 legal matter -- how transparent those needs have to be.

6 But, there should be the data there saying, well, this is
7 what we have (indiscernible) these are how many cases and this
8 is what we are basing our conclusions on. And, that information
9 doesn't seem to be there, so if that information would be
10 included it is a (indiscernible). That should be in the
11 document to explain officially to the community and to the other
12 people who what -- what this will be mainly based on.

13 It's not transparent. It makes it very difficult because
14 we have to believe to have faith on what you're hearing. And I
15 can see that being a problem. Do you see what I mean?

16 MR. LOMAN: Yeah, like I said earlier, I know that people
17 would like to debate with me, but I'm not here to debate you.
18 With respect to --.

19 MS. DE SOUSSA: I'm not debating -- I'm just --.

20 MR. LOMAN: With respect to the issue that you brought up,
21 let me give you an example. In that document it says one of
22 these excerpts of missing information or uncertainty. There's a
23 statement in the original final EIS for Chukchi Sea Sale and it
24 says this. I can almost quote it verbatim, pretty close, close
25 enough. There is uncertainty concerning the structure of the

1 bowhead whale population, uncertainty about the structure of the
2 bowhead whale population. At that time, the time that statement
3 was made somewhere between 2004 and 2007, the Scientific
4 Committee for the International Whaling Commission was debating
5 whether or not there were multiple stocks of bowhead, Bering
6 stock, the Chukchi stock, the Beaufort stock, the Chukchi stock,
7 the Bering stock or other stocks. They since concluded, I think
8 in 2007, they concluded that there's one stock. Okay, that's
9 good, that's fine.

10 But from a decision maker point of view, an analysis of
11 the impacts we can almost talk about this in layman's terms.
12 What difference would that make to the bowhead whaler whose been
13 taking whales for thousands of years, whether it was a whale
14 that came from a -- and was a Beaufort stock or Bering stock?
15 The answer is none. It makes no difference. That's the most
16 important thing with respect to making decisions to offshore oil
17 and gas activities. If it means nothing to the people that
18 subsist from whaling, then what would it mean to the decision
19 maker to regulate, for example, an exploratory drilling project?
20 Again, none, it's meaningless. That's an example.

21 MS. DE SOUSSA: So, what's your point?

22 MR. LOMAN: I guess you can't follow it. The document
23 said, made a statement in the document. There is uncertainty
24 with respect to the population structure of the bowhead whale.
25 And the Judge said, oh well, there and 40 other pages of -- 40

1 pages of statements like that, you have to address that. What
2 does it mean? What's the context of it, et cetera? I'm not
3 going to start a debate about that particular issue. I see
4 hands going up and I don't want to debate the science.

5 MS. DE SOUSSA: That's not what I -- I just said that it
6 was not clear. And there are other Sections -- there's vast
7 information on bowhead whales, thank goodness. But there are
8 even some Sections about fish and the geography of their -- and
9 they're very limited -- they're very similar. And there is no --
10 - there's very little agreement from the scientific community
11 about how currents interact and how animals go through their
12 life cycle. And all of that is very debated for many years and
13 people try to, you know, (indiscernible) theories or those
14 processes. So how can just one environmental, this Supplement,
15 say that, well, this is all understood and there will be no
16 impact when even the process, itself, is not very well
17 understood. And it's not even explained or debated how it's
18 shown in the document. That's all I meant. But thank you.

19 MR. LOMAN: Okay, thank you. And I really -- I'm sorry I
20 probably shouldn't be upset, because I'll just get into a debate
21 and I'm not going to do it.

22 MS. WILLIAMS: This is Vera Williams again, for the
23 record. You mentioned earlier about when I talked about a
24 partnership -- a draft partnership (indiscernible) driving the
25 North Slope Borough. Will you be including a Federally

1 recognized Tribe from the North Slope, with ICAS and the Native
2 Village of Barrow and all the other Tribes within the North
3 Slope area, would this partnership -- will to be formulated?

4 MR. LOMAN: I'd like to think that we already have through
5 the mandate Executive Order 13175 that requires government to
6 government consultation. As you know, better than anybody else,
7 we had a meeting today. So that requires us to communicate.
8 But we'd like to do more so the answer is, yes. If we need to
9 include others in that agreement, or have separate agreements
10 with Federally recognized Tribes that want to establish a
11 partnership to address things and it's productive, the Federal
12 government likes to use the terms effective and efficient. If
13 it effective and efficient, we certainly are going to do that,
14 and partner with effective Federally recognized Tribes.

15 UNIDENTIFIED MALE: Could you tell me what kind of impact
16 has it had on the wildlife in Valdez ever since the oil spill?

17 MR. LOMAN: On the Exxon Valdez?

18 UNIDENTIFIED MALE: Yes, what impact has it had on the
19 wildlife?

20 MR. LOMAN: I really -- I'm not qualified to discuss it.
21 It's not relevant to this meeting other than that was an oil
22 spill.

23 UNIDENTIFIED MALE: It certainly was an oil spill. It's
24 relevant.

25 MR. LOMAN: Yeah, and you know I would just mention that

1 the Exxon Valdez didn't have to happen. It was one person who,
2 for whatever reason, didn't make a turn.
3 UNIDENTIFIED MALE: I want to know what kind of impact did
4 it have on the wildlife down there after the oil spill?
5 UNIDENTIFIED FEMALE: Is Shell going to have, make sure
6 everybody get (indiscernible) on the see, tonight.
7 MR. LOMAN: There's an abundant amount of information
8 that's been collected through the Natural Resource Damage
9 Assessment activities that all of the Trustee Agencies have
10 collected on that spill and the damages that have occurred and
11 are ongoing. And, if you leave your email address or contact
12 information, will help the people that are responsible for
13 serving you along those lines, give you that information.
14 PATRICK SUVLU: I've got one. My name is Patrick Suvlu,
15 that's S-U-V-L-U. On the purchase of Alaska, how many acres did
16 the United States buy from the Russians for purchase of Alaska?
17 MR. LOMAN: Yeah -- it's not --.
18 MR. SUVLU: And have they done any survey of natural
19 acreage of what they bought for -- is the United States
20 trespassing -- what if they didn't pay for? Are we included in
21 that acreage when they bought?
22 MR. LOMAN: I have no comment about that subject sir.
23 MR. SUVLU: Maybe that's what they need to find out.
24 MR. LOMAN: Yes sir.
25 MR. SUVLU: If the United States own the North Slope.

1 MR. LOMAN: Yes sir.
2 UNIDENTIFIED FEMALE: Yeah, that's a good one.
3 MR. LOMAN: Yes sir in the back. Yes sir?
4 MR. BROWER: You know, my name is Charlie Brower, for the
5 record. I'm kind of all -- through the magnitude of the
6 materials, you don't have available for maps and stuff where
7 that's (indiscernible) on. Your product of presentations to
8 elaborate on the subject. But the matter is, you're on --
9 waters that are in the jurisdiction that are not within the
10 State boundary. And the only people that you would have to deal
11 with on that is with the Inupiat community of the Arctic Slope.
12 Your Act in Congress did not pronounce lying into this kind of
13 Tribe for nothing. So you've got to learn to deal and accept
14 the fact that these people are Inupiat people and they're not
15 Indians and you're not -- can treat them like Indians or copycat
16 or imitate the treatment of Indians to us Inupiat.
17 When the Federal (indiscernible) collects taxes, they
18 collect that but then they have to use it for a purpose. You
19 got to get into the Federally recognized Tribes jurisdiction.
20 Our ancestral grounds from 12,000 years back, plus, you'll have
21 to learn to pay the 28, 27 percent Federal government fee to the
22 Inupiat people.
23 The Russians sold something that they thought it was here
24 when their (indiscernible) depleted they sold -- they sold for
25 quick cash revenue. The only thing they sold was the

1 jurisdiction domain where the (indiscernible) are.
2 And they never been north of St. Michaels at the time of
3 the sale. So let's get real. Don't play games with us. This
4 is a real life thing. Said there a while ago, you mentioned
5 elaborating IWC about the populations of the bowhead whale. IWC
6 came up here with the Scientific Committee in 1977 and said
7 they're there was only 947 whales. That was the first time they
8 ever been to the North Slope region.
9 On a hearsay basis, they got people to talk about it and
10 then a bullshit Scientific Study Agreement, worthless to avoid
11 where you're going (indiscernible) and then kick them out if
12 necessary. Just to prove a point. You going to put out
13 something to my people and my Tribe. You're not going to
14 respect and honor what's given to them. Some of the stuff I
15 look at here -- I want to see some results from the scientific
16 exploration that were being conducted out there. You have a
17 mediocre -- what kind of impact they did to the crustaceans from
18 the surface of the water to the sea floor?
19 And you know where to fight. Would you like to go out
20 there and swim and have to be blasted with 297 decibels of
21 noise? When a 47 decibel at 17 mile range, disrupt the bowhead
22 whale and cause him to pop up, straight up and down. Instead of
23 like this. Forty-seven decibels is -- in the water it doesn't
24 subside to 46 or 45 decibels at 200 yards. When you shooting
25 290 plus decibels in the water. they don't subside down to 245

1 unless it's past out there to ten miles or so.
2 So let's get real. You want to destroy and damage
3 everything that we stood for, based on our way of life and the
4 way we use animals in the sea, that is our garden and resource
5 for livelihood. Long before anyone even noticed there was a
6 North American continent. Some of these Indian Tribes down in
7 the Lower 48 where Asianic League or Indians at the time when
8 they first crossed, 12,835 years ago. Now you call them
9 American Indians. You forgot the government gave them the
10 recognition and productive life to them. The fact is, you doing
11 all these things to get into an area to do seismic exploration
12 and after that, the informations you gather, okay. Maybe right
13 there back where that chair is sitting is a good spot. We'll
14 drill there. And a lot of people buy stocks from that company
15 that's drilling.
16 Or let's say 20 or 30 separate families own 75 million
17 shares and they get (indiscernible) and much richer over what
18 they done. And they strike oil. We haven't Senators -- or you
19 only have one with the United States but they trample on us,
20 worse than cockroaches in some sense. A way of respecting a
21 human, you're supposed to honor people for who they are and what
22 they are. For what country you are -- we understand and know
23 that. But what country of people we are, you got to learn to
24 understand and deal with that. That -- face reality, instead of
25 living in mental insanity 99503 (indiscernible).

1 Just how badly are you willing to go for, to the people
2 that push you into these things, to conduct meetings? When
3 you're doing Environmental Impact Statements, we donate a lot of
4 information and stuff and have it printed. But it just gets
5 stored in catalogue and never been used. Nobody uses it for
6 testimony in Congress or one State, another don't even bother to
7 look at it.

8 So people who are indigenous by themselves at the rate human
9 in the culture. Disrupted, toyed with, and forced to change
10 their ways of the way they're living 99 different ways. How
11 many more ways are you going to expect us to (indiscernible) and
12 deal with something that we don't want to see, for no
13 (indiscernible). What's going to happen if that 75 reversing
14 and then we start changing you people 99 different ways? Do you
15 know the magnitude of (indiscernible) reality? That the bumpus
16 (ph) is forcing you people to do, to erase Korean (ph) culture
17 in the Arctic? Or is it that it's so many of the people that
18 have migrated from the European side, they want more of this,
19 they want more of that. And they don't care who they destroy
20 and hurt just so they could get to that resource? Is it said
21 that (indiscernible) got the United States government and
22 (indiscernible) life into a Tribe? That's being blamed by the
23 United States Department of Defense against the Indians?

24 At the same time there wasn't an Indian, you know, we
25 existed up here at the time when they thought. Alaska. You got

1 to learn to face reality and understand them and learn to deal
2 with and cope with -- how you treat things and make things for
3 the way people have to live, the life they have to live. At
4 such a magnitude of a change that they can't let -- alter it
5 anymore. When it says, when is this going to become, I thought
6 we heard reality.

7 I enjoy my life. I enjoy being an Inupiat person. I enjoy
8 my Native language. I enjoy my culture, my music and dances and
9 my Native food. You are -- you are do that -- you going destroy
10 a lot of -- of who I am and what I am and how I live and what I
11 used to live with. Do you have something out -- do you have
12 some alternate replacement for that? Because you better learn
13 to prepare on how to make the alternative preparations on, if
14 you damage too much. And I, for one -- if women pick up their
15 own arms and have to start doing things to you people just to
16 make you understand who and where they come from, and they start
17 telling you our men have died for this and died for that and
18 they weren't even Americans. But they still -- you treat us
19 worse than dogs in some sense. Let's get real.

20 When the United States government pronounces life into a
21 Tribe it's not just a word that you can toy with and play with.
22 And if you have to face that United States Congress to make them
23 understand that, it's time to learn to understand whether you're
24 truly under mental insanity from 9305 classroom practice. Thank
25 you.

1 MR. LOMAN: Thank you sir. Do we -- have about 12 minutes
2 for anybody else that would like to provide testimony before we
3 close the meeting at 9:30. Rosemary did you have testimony?

4 MS. AKTUANGARUAK: Yes. BOEMRE needs to obtain additional
5 baseline data to meaningfully analyzing environmental impacts of
6 Lease Sale 193. An Agency cannot comply with NEPA when data on
7 baseline conditions is so lacking, that it cannot adequately
8 determine what the environmental impacts will be. As Alaska
9 Natives and others have continually pointed out, there is a lack
10 of baseline data related to subsistence impacts, marine mammal
11 populations data, air quality, water quality, health impacts and
12 climate change impacts. The Agency must obtain additional
13 baseline data to properly analyze the environmental impacts of
14 Lease Sale 193.

15 BOEMRE cannot simply presume that adverse impacts will
16 occur under all circumstances for which information is missing.
17 The Agency is avoiding its duty to obtain missing information by
18 presuming the adverse impacts will occur for the circumstances
19 from which information is missing. But the commonality and
20 severity of the adverse impacts may vary between alternatives.
21 So the missing information is needed to make an informed
22 comparison of alternatives. For example, the Proposed Action
23 and Alternative III provides significant different sized buffer
24 zones. So the Agency must obtain missing information about the
25 impacts of an oil spill or the location of bowhead whales in the

1 buffer zones, because it is essential to make an informed and
2 reasoned choice between these alternatives. Furthermore, it is
3 true that the impacts are all the same with all alternatives
4 then the range of alternatives is inadequate.

5 BOEMRE must rely on updated scientific information on
6 bowhead whales. An Agency may not rely on outdated scientific
7 information when analyzing environmental impacts under NEPA.
8 Here, updated information about bowhead whales is now available
9 from three new sources. One, NMFS's July 2010 Biological
10 Opinion for Oil and Gas Activities in the Beaufort and Chukchi
11 Seas. Number two, MMS's final report for Satellite Tracking of
12 the Western Arctic Bowhead Whales. And three, Quakenbush's 2010
13 study of bowhead whale movement.

14 The Agency must conduct separate SEIS to analyze the
15 impacts of the entire Lease Sale 193 on bowhead whales now that
16 additional information is known about the species.

17 BOEMRE cannot rely on compliance with additional
18 environmental laws or future NEPA analysis to avoid its duty to
19 obtain missing information.

20 To make a reasoned decision between alternatives of this
21 Lease Sale, the Agency must have sufficient information about
22 the differences in environmental impacts of each alternative
23 before it is irretrievably committed to resources -- commitment
24 to resources. The Agency cannot substitute further compliance
25 with the environmental laws or later NEPA analysis for its duty

1 to obtain the missing information to make a reasoned decision
2 now.
3 BOEMRE must analyze the new information related to the
4 Deepwater Horizon spill. Under NEPA, Agencies have an ongoing
5 duty to supplement Environmental Impact Statements whenever new
6 information renders the original Statement inadequate. The
7 Deepwater Horizon spill has rendered inadequate the Agency's,
8 one, oil spill analysis, two, conclusions that an exploratory
9 drilling oil spill is unlikely and, three, the requirements for
10 a oil spill response plan. Thus, the Agency must conduct a new
11 oil spill analysis in a separate EIS. On behalf of the Inupiat
12 Community Arctic Slope.

13 MR. LOMAN: Thank you Rosemary. Rosemary, could you let
14 me have that written comment?

15 MS. AKTUANGARUAK: I can get it with the statement of the
16 original county (ph) of ICAS and that's what they usually like
17 it handled, so I'd have it ready.

18 MR. LOMAN: Okay sure. Thank you very much.

19 MS. AKTUANGARUAK: I'd like to give a statement now on
20 behalf of myself.

21 MR. LOMAN: Okay.

22 MS. AKTUANGARUAK: We've commented for decades in these
23 processes. We've brought out decades of concerns. Our
24 grandparents started these processes. They worked with us in
25 trying to build ways that we might (indiscernible) some these

1 impacts. We worked for many processes with the Agency before
2 you changed your name, to try to build ways that might limit
3 some of these actions. But the enforcement of any our efforts
4 never (indiscernible) out. The impacts were left upon us.

5 I had to spend another day working with Tribal governments
6 from Louisiana because they wanted to learn what they can do to
7 help their area. We've gone through impacts to subsistence. As
8 you say, we can survive that. Families can survive loss of
9 subsistence what that would cost. The cost is tremendous when
10 you build social impacts that -- that's generations, in their
11 health, in their wellness, in their social ability to address
12 these problems, in their willingness to continue to participate
13 in these processes.

14 When grandparents had gone to their grave, and the
15 concerns that we have promoted for generations have never been
16 enforced -- have never been built into the process to give us
17 the hopes that our traditional and cultural (indiscernible) in
18 areas that are going to be changed by oil and gas, will still be
19 there. When you cause disruptions of multiple species to
20 communities, you just dropped generations of families, working
21 and living in these areas. When you don't have the species to
22 teach your children how to cut up these items, it's difficult to
23 do so when you have to use only pictures. It's very difficult
24 to tell the stories of our land usage when the changes to the
25 areas that are being discussed or changed, and the animals don't

1 use them the same ways. So our families don't hunt in these
2 same areas the way the stories were told for generations,
3 disrupts the learning curve for the future generations.
4 It affects our lives. It affects our whole beings. And
5 we continue to share these things. But we have cultures that
6 were never recognized in the Gulf area. Tribes that were never
7 recognized, and yet their livelihoods have changed forever.
8 Watching those people down there pulling out boats in the
9 opening of fishing season because they knew there was not going
10 to be something to harvest. Having the Tribal members say that
11 the government has said their food is safe, when they take the
12 shrimp from the water and they break the head off and there's
13 oil inside of it. And they can wipe it on a tissue to show.
14 And yet our government is saying that food is safe.

15 They did the same thing in our State with the previous
16 spill. The learning curve was not there. And you talked
17 earlier about how the Exxon Valdez created that law. But you
18 forgot there were two other devastations that occurred with
19 that. With the (indiscernible) event in India with their
20 chemical spill, there were three devastating events. Before, we
21 learned from that process. We didn't learn from Exxon. We'd
22 better learn from the Deepwater Horizon.

23 And don't get out here and try again because, just in a
24 short period of time, we had the GS2 spill and you said to us --
25 not one drop would be spilled in Exxon. And yet, 200,000

1 gallons still was spilled. And then at Prudhoe Bay, with alarms
2 going off for four days that were ignored.

3 That's not reassuring to us that anything you have put in
4 your documents has any cretisan (ph) of being implemented.
5 Then we had the fire in our own refinery in Fairbanks. And you
6 had still the explosion in Texas and still the Deep Horizon.

7 There is many changes that must occur. You still have
8 many of these same people authorizing documents in these
9 processes that were authorizing these same processes that led to
10 the devastations that happened to those loss of lives. We still
11 have many, many problems. You don't have the personnel to
12 enforce existing regulations. And you have exemptions to air
13 and water quality standards in our States still occurring as
14 part of the continued comments of health impacts affecting the
15 breathing of people. Twenty babies being Medi-vac'd out, ten of
16 them put on ventilators was not enough. A cost for our Village
17 but yet we endured that cost. We still have a better job there.

18 That's not acceptable to take and promote development at
19 the cost of tradition and culture and the health of our people.
20 These are not acceptable. They won't be tolerated. We have
21 many more cultures that are going through the devastation and
22 are asking for our help in Alaska because we have learned some
23 things. And they have so much more to learn in their process.

24 Having to tell people how to try and heal their
25 communities because they're going through loss that they were

1 told would never happen. And yet, every day of their
2 traditional and cultural lives or not to be seen for decades to
3 come and generations to become. In these spill plans, they say
4 in (indiscernible) burnings. But, yet when they burned in our
5 State they didn't even inform the nearest community. And all of
6 the people got sick. And you put regulations to limit some of
7 these things out there, but it's different in our environment.

8 These emissions in these air, in our environment, in our
9 times, when we're breathing them, with our cold environment, the
10 impacts are much more damaging to us. When you study this
11 impacts at 70 degrees, we don't have any days at 70 degrees.
12 You need to study it at our impacts, at our temperatures, at our
13 currents. They studied air quality currents with a goal. But,
14 yet still, the concerns from the communities down there were
15 still expressing. There's real concern here, the odor is really
16 strong, people are getting sick. And yet, the effort of our
17 government to monitor this process was not adequate to get the
18 notification in the documentation to prevent the worst
19 exposures.

20 Where's the respite for their pregnant women and children?
21 They're continually being exposed to the generations of growth
22 that is being affected. How can we help them in this process
23 because they have continued exposures? Using the dispersants to
24 put peoples into a toxic chemical spill at the benefit of
25 industry, reduce the way that those communities could observe

1 and try to build protections, to put the booms out in areas.
2 Because when you mix the oil into the water column, you can't
3 see it coming in with the tide. And the waves come in it's
4 below a few feet of levels and the oil is still coming ashore.
5 There's no protection. There was no enforcement to maintaining
6 boom that was laid out. There was no real good way of looking
7 at how the boom was being placed.

8 You could tell that some areas had good support to get
9 boom placed. Other areas had absolutely no support to get any
10 boom placed. But there wasn't even maintaining up there. Boom
11 that was placed was just free flowing. You're not doing any
12 protection. That important critical habitats site for the
13 pelicans, there was boom out there, but the same issue, no
14 maintain, no protections. The adequacy of that boom placing was
15 non-existent. Those pelicans still got impacted with the oil
16 from that.

17 We watched the dolphins come up through the sheen, the
18 birds diving into the oily water, fish jumping out gasping for
19 air. We can't watch that happen down there and take these
20 discussions up here. That's so devastating for us to be damaged
21 from the efforts from the Exxon Valdez to have it re -- happen
22 with it and there's more information with the Korean spill.
23 They studied health impacts from day one. Where's our studies
24 from all these different things? We don't have that data.
25 Nothing was done to help us get some of these health impacts.

1 If anything, it helped to hide what the health effects
2 were from that spill. All those workers that went out there to
3 respond. All those workers that got so sick from working the
4 dispersants. They died so fast and are no longer here to
5 comment, but their children are. The children watched their
6 health deteriorate until they were no longer able to be active
7 in their (indiscernible) lives. Those children grew up with
8 that loss, not only of just their family, but of their
9 traditions, their culture and the knowledge of what's normal.
10 We can't let that happen here. There is too much at risk.

11 We're a whaling culture. We're important to live in the
12 water and do the life of the lifestyle there. We need it for
13 our bodies. We need it for the health and longevity of our
14 communities and our region as a whole. That's what we -- what
15 we are. Dollars per barrels are not worth those costs.

16 MR. LOMAN: Thank you Rosemary. Yes.

17 MS. ITTA: I have a few comments. My name is Natasha
18 Itta, I-T-T-A. My question is, if we went into your home, you
19 drank a certain kind of coffee or you drank a specific soda and
20 that's all you drank. If there was a specific food, if you're a
21 vegetarian, if you had any allergies. You couldn't eat gluten.
22 You couldn't eat sugar. You needed something for you to sustain
23 yourself due to the life. If someone went into your house and
24 took that and told you that you could never have it again, what
25 would you do? You would fight the fight until you were not able

1 to fight anymore, so that you can have what it takes to survive.

2 If I went into your house and told you, that cup of
3 coffee, you were never allowed to have it. You will never have
4 a cup of coffee ever again and if anybody else around you sees
5 you having that, they'll take it away. That affects your day-
6 to-day life. If that's how you survive, with that cup of coffee
7 or that caffeine or whatever, if someone eliminated that from
8 your way of life, you would die.

9 Seriously, if someone said, you can't have water. That's
10 how we are. This is our place where we survive. We go out. It
11 not only affects the ocean, it affects the land. The land -- we
12 get snow. We get rain that feeds the berries, the caribou, the
13 ducks, the geese, everything. So if you're saying that we can't
14 hunt, and you're going to exploit oil in our waters, that
15 affects the way of life and the way we live. And for you to
16 say, you can't go out and go hunting whales, but I could still
17 have my cup of coffee every day, I don't think so. That's not
18 acceptable.

19 That's not something that I would -- I just had a son --
20 he may never get to go whaling because you might affect the
21 water that he's going to be able to go whaling in. That's
22 craziness. I want to know that my children are going to grow up
23 in a community where they can go out and do the things that
24 their ancestors did from day to day. I grew up -- I got
25 relatives that -- I for one go whaling. I don't go out in the

1 water, but I go out and I help harvest the whale. I cook it.
2 I cut it. I disperse to everybody that comes and wants some.
3 And for you to tell me that you are going out into the water and
4 tell me that you're going to go drilling, and go exploring and
5 all of this, but you can sit in your lofty offices with your
6 \$600 chairs, your \$5,000 computers and taking your private jets
7 and chartering planes to the little villages that you never tell
8 anybody that you're meeting with, and telling them they're not
9 going to be able to do that? That's not acceptable. That is
10 not something that I want to see. I want to know that, from
11 this generation to the next to the next, that we will still be
12 the people that our people were before us, hunting, camping,
13 boating, fishing every day.

14 If there's a spill, tell me that someone is not going to
15 go out in the dead of February when it's 50 below where there's
16 85 miles an hour winds and the wind chill is a 100 below and
17 you're going to tell me that someone is going out and go scoop
18 this oil up? We live in this weather. There's some days we
19 avoid this weather. We sit inside and pray that it gets nice
20 the next day. But for you to reassure us and tell us that
21 someone's going to go outside in this weather. This is how
22 bright it gets in December. And if you're telling me that
23 someone is standing outside watching the oil and telling me that
24 someone is going to be there to capture it, to fill it all up
25 and put it somewhere -- put it somewhere in a container and ship

1 it off after it's touched the oceans? That's not something I
2 want to hear.

3 I want to hear that you're going to do whatever it takes
4 to keep this from happening. Because I've seen many, many
5 impacts, not on just America, but of other countries too. And
6 so I want to know that this needs to be -- all of this
7 information needs to be shared. And I had no idea about this
8 meeting. So I want to know that you guys are going to do
9 whatever it takes to make sure that everybody's aware of what's
10 going on. You can't just say, oh well I can't comment on that.
11 I don't comment on that. That's not acceptable. We're asking
12 you questions and you answer it. Thank you.

13 MR. LOMAN: Thank you. We're past 9:30. Anybody who
14 hasn't spoke that would like to speak? Otherwise, sir we're
15 going to give you the last word.

16 MR. BROWER: For the record, Charlie Brower
17 (indiscernible) again. A lot of the money that's appropriated
18 and approved for spending by the United States Congress has
19 affected us up here in our country since they first started
20 drilling in 1944, in the early 40s at Umiat. And from those
21 drilling activity days, we are still seeing clean-up of
22 contaminant in volumes that are mind boggling today. And I'm
23 for one, I'm not doing -- what with -- when they're drilling up
24 there, the air -- they haven't been there and they left the
25 drilling. They stopped drilling in Umiat in the 50s.

1 And we're still getting money appropriated for clean-up in
2 Umiat for something that was once (indiscernible) like anti-
3 corrosion. But the United States Congress passed a law in 1970
4 declaring transform fluid very caustic to human health. Just
5 last May a DEC report that they found open containers up here
6 PCB and 12 (indiscernible) by six inch. And some of those
7 containers leaked out into a slough, a lagoon that drains into
8 the Koval (ph) River drainage. And they uncovered and removed
9 another 32 containers of the same thing that had been sitting
10 there for a very, very, long, long time. Considering what the
11 United Congress does in 1970, thinking it as a very caustic to
12 human health. And they're taking their time removing or
13 locating dangerous carcinogenic chemicals that they had left up
14 here.

15 And it gives my mind, the impression that we are offshore
16 drilling and they suddenly start to look like cities out there.
17 There's no telling how much contaminant you're going to leave
18 out there and say we depleted the oil. Hell with all the oil
19 rigs that are sitting out on the water. In the late 70s and
20 early 80s there were some caribous that were tagged for
21 satellite tracking. The next number of them would break the
22 caribous and much -- many of them were not very far from the
23 Alaska Pipeline. The pregnant caribous would not get - they
24 would stay over a mile away from the pipeline. The corrosion
25 inhibitor that they using to prevent rust and corrosion inside

1 the pipeline was so carcinogenic to human health that an animal
2 can detect it by smelling it over a mile away from the pipeline.
3 And the pipeline is from all the way from Prudhoe Bay to Valdez
4 and that's a big coating with corrosion inhibitor material.

5 And the only way you can remove that carcinogenic
6 corrosion inhibitor -- that pasting into the inside wall of the
7 pipeline needs to be removed section by section and replace it
8 with a new one. And then use an alternative corrosion inhibitor
9 that's not carcinogenic to human health. But the oil companies
10 don't keep us in the inside stories. They keep it to
11 themselves.

12 The reason why the gentleman asked about the Valdez oil
13 spill, because all the oil comes from the North Slope. And we
14 want to know if that oil that was that was in a danger had
15 certain percentage of that carcinogenic material. That would be
16 one of the main reasons for asking a question on how did it
17 affect. What kind of impact did it have to that oil and the
18 substance that they used for corrosion inhibitor? Those things
19 -- those two separate things are not talked about or mentioned
20 by either -- all parties. I worked in Prudhoe Bay. I've done a
21 lot of oil injections. I have to know how to approach an
22 inhibitor injections from the wellhead to the gathering place
23 and then it flows from gathering place to a pump house.

24 Pump station number one, pump station number two, pump
25 station number two, pump station number three until it reaches

1 Valdez. And they are allowed to pump x number of fluids with
2 corrosion inhibitors. And that's something that oil companies
3 got to do with that. And that raises a big question on the back
4 of mind. If they had a large volume container stored in that
5 platform that blew up in the Gulf of Mexico district, what
6 happened to all that corrosion inhibitor material that was
7 there? That they reduced to prevent rust from the pipelines
8 that they used to pour it into if they're going to be pumping
9 into an oil saver.

10 So, we ask questions because it affects people in the way
11 they live. And if they're harvesting food from the ocean, they
12 want to know what goes into the water. The same way we would
13 not rather see that kind of stuff up here. Thank you.

14 MR. LOMAN: Thank you sir. Thank you very much for coming
15 this evening. We appreciate your comments. And if you leave
16 your email or mailing address, we will include you to the list
17 to get you information about this project and any other project
18 that we have authority or responsibility over in Alaska's OCS.

19 Again, thank you for taking your time on a Friday night
20 and providing comments. And have a good weekend. Bye-bye.

21 UNIDENTIFIED FEMALE: Thank you for coming and hearing our
22 voices. But still come again, but we'd like to see you more.

23 (off record 9:30 p.m.)

PROCEEDINGS

(On record at 7:06 p.m.)

MR. LOMAN: My good friend from Point Hope has entered the room, so we can get started. Hi, Earl.

Good evening and thank you very much for taking your time to come attend this Public Hearing. This is the sixth and final Public Hearing that we've held.

My name is Jeffery Loman. I am the Deputy Regional Director for the Bureau of Ocean Energy Management Regulation and Enforcement, formerly known as MMS.

The purpose of this hearing is pretty straightforward. As most of you know, our Agency prepared an Environmental Impact Statement back in 2007. And the purpose of this Environmental Impact Statement was to analyze the effects to the human environment under the National Environmental Policy Act for an oil and gas lease sale in the Chukchi Sea, Sale 193. This map describes the results of that sale, because the Agency held that sale in February of 2008. And a total of 487 leases were issued for almost \$2.7 billion. Can you hear me back there? Okay, good. Somebody was trying to send me a message.

We were challenged by a number of parties. And the case went to the Alaska District Court. And the Court, in July of this year, issued an Order and remanded the Agency to do a couple of things. Analyze the effects of natural gas production, because the Agency did not do that. And these

1 leases have incentives associated with natural gas.
2 The other thing the Court wanted us to do was to address
3 about 40 pages, in the Plaintiffs' Exhibit 129, of missing
4 information or uncertainty, try to address the context of that
5 information in the context of informing the decision maker, the
6 decision to hold this oil and gas Lease Sale. This missing
7 information is something the Court said, find out if it's
8 obtainable and if the cost of obtaining it is exorbitant.
9 And, so, when we got that remand, like any National
10 Environmental Policy Act litigation, a court will say, do your
11 environmental assessment right, or do more. And we prepared a
12 Supplemental Environmental Impact Statement to address this
13 court remand.
14 And the purpose of this hearing is driven by this Federal
15 law called NEPA, is the acronym, and it's a Sunshine Law. It
16 requires us to do everything out in the open to produce a draft
17 document, which is here tonight, if you haven't seen it. We
18 still have copies available.
19 By the standing room only attendance, and I apologize for
20 that, we weren't expecting to have standing room only attendance
21 tonight. We're not so sure what drove that, but it doesn't make
22 any difference, we're delighted and inspired that you've taken
23 an interest and, obviously, share our passion for protecting the
24 ocean and enhancing our country's energy. It is a extremely
25 important aspect of Alaska's economy. And it's an extremely

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 important issue to the Alaska Natives who live in the Arctic.
2 We were there all week last week, starting in Kotzebue,
3 continuing on to Point Hope, Point Lay, Wainwright and Barrow.
4 And we met with folks in each one of those communities at public
5 hearings. And we held government to government consultation
6 meetings, as well. So, I have pretty much explained what the
7 Court asked us to do. Sharon, do you have anything to add to
8 that?
9 MS. WARREN: Just that the timeframe, as Jeffery said,
10 what the Court asked us to do. There's also -- copies out
11 there. There's a September 2nd Order from the Court outlining
12 the deadline. And the District Court Judge thought it would be
13 reasonable for us to make the effort to have this final EIS
14 completed by January 21, 2011. And, after that date, it would
15 be filed with the Court. The Administrative Record would be
16 filed with the Court on that date. The Plaintiffs will have an
17 opportunity to review the final EIS, as well as the
18 Administrative Record and file briefs with the U.S. District
19 Court on March 21, 2011. So far, that is the schedule that was
20 outlined in the September 2nd Court Order by Judge Beistline.
21 So, that's all.
22 MR. LOMAN: Thank you Sharon. Mike Routhier is our
23 colleague who worked extensively on the draft Supplemental
24 Environmental Impact Statement. Mike, could you tell our
25 attendees about that document?

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. ROUTHIER: Sure thing. The Judge's remand was
2 specific in what he wanted us to do, a little bit of more NEPA.
3 UNIDENTIFIED MALE: Could you speak a little bit louder?
4 MR. ROUTHIER: Oh, I'm sorry. The Judge's remand was
5 fairly specific in what he wanted us to do. He wanted a little
6 bit more NEPA and there were bits that he wanted done correctly.
7 He found deficiencies in some of the parts. In order to
8 accomplish what the remand required, we elected to do a
9 Supplemental Environmental Impact Statement, which allowed us to
10 do a pretty thorough analysis of the issues. And, also
11 incorporate some public process. It let us go out to visit the
12 communities on the North Slope. It let us have this meeting
13 here tonight.
14 As Jeffery stated, there were a couple different
15 components of the Judge's remand. The first component was the
16 requirement to analyze the potential environmental impacts of
17 natural gas development and production.
18 Now, in asking the analysts who work with us, the
19 scientists who do our analysis, we couldn't just ask them to
20 analyze development and production generally, we needed some
21 more specific information from them to analyze. What we needed
22 was a feasible scenario, a reasonable scenario that talked about
23 what kinds of developments would be necessary. How things would
24 actually work. So, to get guidance on what the natural gas
25 development and production would entail, we consulted with our

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Resource and Economic Analysis Section. These are Geologists
2 and experts in the oil and gas field. And they helped us --
3 they provided us with a scenario that the analysts could then
4 take and analyze. And I'm going to introduce Bob here, from
5 that Section, to speak a little bit more on that.
6 MR. PETERSON: Thanks. Hi, I'm Bob Peterson, Chief of the
7 Resource and Economic Analysis Section. As Mike pointed out,
8 one of the key things that their group needed was something
9 specific -- can you hear me okay?
10 AUDIENCE: No.
11 MR. PETERSON: What they needed was something specific to
12 analyze. And, again, when the Judge came back, he said, we
13 hadn't analyzed. But keep in mind, this was put together in
14 2006-2007. At that time, we didn't see gas as reasonably
15 foreseeable. But in our leasing instrument, we did give an
16 incentive in barrels of oil equivalent, which could be either
17 oil or gas. And so the Judge wanted to see an analysis of gas.
18 In our final Environmental Impact Statement that we had
19 completed, we looked at a scenario of an oilfield of
20 approximately a billion barrels in size. Well, what we did is,
21 added to that accumulation, we certainly see possibilities of
22 this in the Chukchi Sea of a billion barrels of oil and an
23 associated accumulation with that of two and one-half trillion
24 cubic feet of gas.
25 We thought this was the most reasonable scenario to begin

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 our development. Oil is a much more valuable commodity than
2 gas. We did not feel it was reasonable for a gas only
3 accumulation to be economically viable. But in the case where
4 you had oil that could be developed, and that provide a lot of
5 the infrastructure in place then for then a gas development, we
6 thought that was the most reasonable scenario to have both -- to
7 analyze both an oil and a gas case on the environment.

8 So the first stage in our first EIS, we looked at an oil
9 development of a billion barrels in the Chukchi Sea, a bottom
10 grounded -- sea floor grounded structure, a oil pipeline to the
11 shore. From that point at the shore, taking off across NPRA on
12 an onshore oil pipeline to the Trans-Alaska Pipeline over near
13 Prudhoe Bay.

14 It's important to note that this oil would probably begin
15 about 12 to 15 years from today, assuming drilling would take
16 place tomorrow. This would be, still, a number of years out
17 before oil production began. Sometime during that period of
18 time, the infrastructure for gas production would begin to be
19 developed. And that would include the gas pipeline to the
20 shore, gas facilities at the shoreline. And then along the same
21 right-of-ways as the oil pipeline, a parallel gas pipeline
22 across NPRA that then would connect to, well, maybe Denali,
23 maybe AGIA. We don't really know. But it would be something
24 coming from the Prudhoe Bay area to the south. This would take
25 place after about 15 years of oil development. So there would

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 be a transition stage where we had both oil and gas, with ever
2 decreasing oil. And then for the last 10 years of the field
3 development, you would have only gas coming off of this offshore
4 Chukchi Sea development. And you could be looking at a project
5 that would have, maybe, a 35 year lifetime.

6 It is important to, I think, mention, of course, the
7 offshore oil and gas pays royalties to the U.S. Government. But
8 also, a lot of the -- in fact, all of the onshore facilities
9 could be \$4 billion worth of onshore infrastructure would be
10 taxable by the State. with a percentage of that going to the
11 North Slope Borough in property tax. And this does add up.
12 Currently the North Slope Borough's getting about \$250 million a
13 year in property tax income from existing infrastructure in the
14 Prudhoe Bay area. So we did now have a concrete scenario that
15 could be analyzed by the people up in the Environmental Group
16 and the staff that Mike was working with.

17 MR. ROUTHIER: Yeah, that's correct. So, basically, we
18 passed around a scenario that Bob's office provided us with.
19 And this was reviewed by BOEMRE's team of scientists and
20 analysts. Scientists included Marine Biologists, Economists,
21 Cultural Anthropologists, a variety of disciplines. And each
22 analyzed the potential impacts of the natural gas development
23 and production to those various resources. And that's contained
24 in the heart of the document.

25 Basically, you break it down into -- well, first we

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 summarized what the original EIS said about the oil development
2 and production, just to give people context. Then we
3 specifically addressed the natural gas development, so
4 installation of pipelines and things of that nature. And then
5 in a separate section we had analysis of production activities.
6 And we just organized that for clarity, basically. But that
7 basically took care of the first item of the Judge's remand.

8 And that brings us to the second and third concerns in the
9 remand which, both, basically pertained to his holding that we
10 were deficient in our dealing with incomplete information.

11 Within NEPA and its implementing regulations, there's
12 certain protocol that Agencies must follow if incomplete
13 information exists or is identified. We didn't do a good enough
14 job of that the first time. So, we do it again and we try to do
15 it the right way. To ensure that we did it the right way, we
16 developed a pretty systematic logically progressing analytical
17 tool that, basically focused our analysis on the precise words
18 of the regulations.

19 For instance, the first step was asked whether the missing
20 -- or the incomplete information was relevant to reasonably
21 foreseeable significant adverse affects on human environment.
22 So, we worked with our analysts to determine what was relevant
23 to these types of impacts. If a particular item identified in
24 the Plaintiffs' exhibit or during our subsequent review,
25 indicated that an item was not relevant to that type of impacts.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 we simply noted that and moved on to the next item. If we found
2 that the item was relevant to that specific type of impacts,
3 then we'd progress through the next step in the analysis. That
4 asked whether the incomplete information is, quote, essential to
5 a reasoned choice among alternatives. And, basically, our
6 scientists and our management got together and we tried to hash
7 out what was really essential and what wasn't.

8 All the findings are memorialized in Appendix A of the
9 Supplemental EIS. And that's the type of thing that we
10 appreciate your comments on, whether we did a sufficient job of
11 doing that analysis.

12 MR. LOMAN: Thank you, Mike. In our meetings with the
13 communities along the Arctic Coast and in Kotzebue, we did get
14 some good constructive comments that will help us put together a
15 better, final Supplemental Environmental Impact Statement. We
16 also got some good suggestions from Tribal Leaders, leaders of
17 the Native villages on how to improve our Agency. Because we
18 are in the process of going through a major reorganization,
19 which is the impetus for the name change. And we expect to have
20 yet another Agency created here in the next couple of months,
21 the Bureau of Safety and Environmental Enforcement, with the
22 goal -- to the primary over-arching goal to restore the public's
23 trust in what we do.

24 So, are there any questions about anything we've talked
25 about, the reason we're here tonight about this environmental

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 law or any kind of question that I can answer before we get to
2 the public comment period? Yes sir.
3 TOM: Who are the Plaintiffs?
4 MR. LOMAN: The Plaintiffs are the Native Village of Point
5 Hope, the Inupiat Community of the Arctic Slope, and a number of
6 environmental advocacy groups. Sharon has, I believe, an Order
7 that lists all the Plaintiffs. Can you give it?
8 MS. WARREN: Yes. The Plaintiffs in the case, Native
9 Village of Point Hope, the City of Point Hope, the Inupiat of
10 Arctic Slope, Red Oil, Alaska Wilderness League, Center for
11 Biological Diversity, National Audubon Society, Natural
12 Resources Defense Council, Northern Alaska Environmental Center,
13 Oceania, Pacific Environment, Sierra Club and the Wilderness
14 Society.
15 And the Defendants in this case is the Bureau of Ocean
16 Energy Management Regulation and Enforcement, previously
17 Minerals Management Service, the Secretary of the Interior. And
18 the U.S. Fish and Wildlife Service was sued concerning the
19 Dangerous Species Act, but that claim, through the Court, was
20 moot, because the Fish and Wildlife Service redid -- updated the
21 biological opinion was a subject to the litigation, so that --.
22 The Interveners in the case is Shell Gulf of Mexico,
23 Incorporated, Conoco Phillips Company and the State of Alaska.
24 MR. LOMAN: Any other questions? Tom?
25 TOM: Yeah, did you try and incorporate any of the lessons

1 learned or was this -- from the Gulf spill? Or, was this just
2 strictly addressing court actions?
3 MR. LOMAN: It sets out to address the remand, court
4 actions.
5 TOM: So is there going to be any subsequent change to the
6 analysis regarding, you know, the ability to mitigate -- as we
7 saw, with such a miserable failure in the Gulf?
8 MR. LOMAN: Well, here's the beauty of our system. It is
9 multi-step, multi-phased. And the environmental analysis, in
10 this case, was to hold an oil and gas lease sale. And some of
11 the things that would happen after a lease sale are seismic
12 exploration. That requires additional environmental analysis or
13 exploratory drilling. More environmental analysis if a viable,
14 economically and recoverable resource was found. And they went
15 into a development scenario and production scenario, more
16 environmental analysis would be required for each and every step
17 of the process.
18 There are long lists of things that have already taken
19 place. Some of these things are voluntary. Industry has made
20 changes on their own, because of the Deepwater Horizon spill.
21 And some things are being mandated by other authorities that the
22 Department of Interior has. So, the long and short of it is --.
23 TOM: There will be a whole new set of EISs required down
24 the road.
25 MR. LOMAN: More environmental assessments, or

1 Environmental Impact Statements and other authorities that, in
2 the addition to, the creation of a stand-alone, regulatory
3 Agency to oversee industry's activities that we have been
4 involved with making recommendations we believe will be
5 successful in full measure at restoring the trust of the
6 American people in what we do. Any other questions? Yes,
7 Michael.
8 MICHAEL: You said that, in your documentation, that
9 nearly \$140 million has been spent on pre-leasing studies. Do
10 you have a handle on how much money in total has been spent to
11 this point on studying?
12 MR. LOMAN: Environmental studies in the Arctic is
13 probably approaching about \$400 million by our Agency alone.
14 Industry spends tens of millions of dollars, just in the short
15 time that I've been with the Agency, to do their own science in
16 developing baseline information and monitoring of what
17 activities have taken place.
18 Most recently, Shell and the North Slope Borough entered
19 into an agreement by which they will work collectively to do
20 even more baseline science. And, the posters on the wall, with
21 the little chart on an easel back there -- when the meeting is
22 over, I invite anyone who's intellectually curious about the
23 amount of scientific information that we base our decisions on,
24 to take a look at this list of environmental studies that have
25 been conducted and that are currently being worked on. So there

1 is a substantial amount of information, scientific information
2 to base these kinds of decisions on. And, I can tell you very
3 briefly that in the case of the decision to hold a sale in the
4 Chukchi Sea, the decision maker did ask some hard questions.
5 The decision maker wanted to know if the people in the
6 communities along the Arctic were confident in industry's
7 ability to clean up an oil spill. And whether or not industry
8 could clean up an oil spill. These are questions that are a
9 little different than the norm, inside the Beltway. They
10 require answers that someone might not like. But, this process
11 under the National Environmental Policy Act and this meeting
12 that we're having right now are all part of informing the
13 decision maker. And, so, when and if the decision maker asks
14 how people view certain things, it's our job, as employees of
15 this Agency, to tell them the truth. And so that's our job, and
16 we're proud to do it. Tom.
17 TOM: Jeffery, can you comment on whether, and if so, when
18 the Agency would submit to the State of Alaska revised Coastal
19 Consistency Determination, under the State's Coastal Management
20 Program?
21 MR. LOMAN: For this particular Supplemental Environmental
22 Impact Statement?
23 TOM: Right.
24 MR. LOMAN: We talked about that this past week. We have
25 not, because we just got back.

1 UNIDENTIFIED MALE: What's the question?
2 MR. LOMAN: Question is, whether or not we will consult
3 with the State, under the Coastal Zone Management Act and get,
4 would essentially be, a confirmation or re-confirmation of
5 consistency. We have not had the chance to hold those
6 discussions with the State because we just got on the ground the
7 other day. And, we had to prepare for this meeting. But we
8 will. And we will get back to the North Slope Borough with
9 that. Yes, ma'am.
10 UNIDENTIFIED FEMALE: How long will public comments be
11 accepted for the EIS statement?
12 MR. LOMAN: November the 30th. Apparently, it was --
13 November 29th is the date. But somebody sent somebody something
14 that said, it was November the 30th, so, with the great powers
15 bestowed on me, I have extended the comment date one whole day.
16 And hopefully that will work for you. This is a
17 straightforward, easy to comprehend document and matter. And
18 that should do it. Jeff, yes.
19 JEFF: You mentioned several times the decision maker.
20 Who's going to be the decision maker on this, on this EIS?
21 MR. LOMAN: Well, you know, that -- it's the Secretary's
22 shot to call. And the Secretary has he ability to delegate
23 down. I can tell you this, since the Deepwater Horizon
24 incident, decisions on doing things in the Arctic with respect
25 to oil and gas exploration, seem to be of great interest to the

1 Secretary, and even the President, as one could easily
2 understand. So, at a minimum, it will be made by the Secretary
3 of Interior unless he decides to delegate it to the Assistant
4 Secretary of Land and Minerals Management. Yes.
5 MR. HARBOUR: Question on process. It looks like we may
6 have several score of people here interested in testifying.
7 What are your rules? Are we going to have a certain time limit?
8 And how long are you going to allocate? Or are we going to stay
9 here as long as it takes for everybody to be heard? Or are you
10 going to put a limit on tonight?
11 MR. LOMAN: He's moving me along. Yeah, let's get into
12 that. Because we do have a long list. Thank you sir. A long
13 list of people that do want to testify. And so, I counted that
14 list and did the math. We have 'til 10 p.m. and that gives the
15 78 people about two minutes each. I know how these work,
16 because I do this for a living. Some people will change their
17 mind because somebody's already said something that they said.
18 And that's okay.
19 What I'm going to do is, I'm going to call the names in
20 the order of the sign-in sheet. Just to let you know, so you
21 can get in the batter's box, we're going to start with Mr. Taft,
22 and on deck will be Mr. Gilbert. So, if you could move that
23 way, we can get started straight away.
24 And then I would ask that everyone, insomuch as possible,
25 that you summarize what you want to say. And if you have it in

1 writing, I will take it from you and make it part of the record.
2 The only real rules that we have is that we respect each other
3 and be courteous. We talk just loud enough for our Court
4 Reporter, Judy, to understand you. There's no sense to let our
5 emotions get the best of us.
6 So, without further ado, I know we have more questions,
7 but I'm not going to take them because we do have to get into
8 the testimony. I'd be happy to answer any questions, burning
9 questions that you have, after the hearing is closed. Mr. Taft,
10 you have the floor.
11 MR. TAFT: Thank you sir. Thanks to you and your
12 organization for all the hard and good work that you do for this
13 State
14 UNIDENTIFIED MALE: Can't hear back here.
15 MR. TAFT: Is that okay?
16 MR. LOMAN: That will be picked up by the Court Reporter,
17 loud and clear. You may not be able to hear the person.
18 MR. TAFT: I'll do my best.
19 MR. LOMAN: Okay, do your best.
20 MR. TAFT: Yeah, --
21 REPORTER: Could I just ask that you tell me your name so
22 I can put it on the record?
23 MR. TAFT: Yeah, that's my first line. My name is Maynard
24 Taft. I'm a Partner in a small business, Hawk Consultants. We
25 provide supplemental personnel to the oil and gas industry here

1 in Alaska. We're an Alaskan company, founded here in 1985.
2 Last year we lost 50 employees due to the state of the oil
3 industry at this time. We also are a member of the Alaska
4 Support Industry Alliance, which is an organization representing
5 500 member companies, and their 35,000 employees.
6 We believe the OCS should be made available for oil and
7 gas exploration and development for these following reasons.
8 The United States is in a vulnerable position related to oil
9 energy consumption. Oil imports have risen about 20 percent in
10 the last few years and the U.S. local production has declined by
11 14 to 16 percent. We import over 59 percent of our energy as
12 reflected in oil. Where and what is our energy policy?
13 Opposition to oil and gas exploration and production here in
14 Alaska impacts here in Alaska, the Lower 48 and is a threat to
15 nation's security.
16 Even if we were to get approved tomorrow, OCS production
17 may not be available for some 6 to 10 years, when you consider
18 the permitting and contingency plans and different
19 (indiscernible). Can we accept a vulnerable and subservient
20 position relative to our energy needs? Do you think that the
21 American people will accept a damaged economy, stand by while
22 their elders freeze up in New England? Wars have started over
23 problems less than this. We must be always in a position of
24 strength, energy independence, flexibility, sustainability, when
25 it comes to our national security. Energy is the foundation of

1 our independence and the strength of the world.
2 Seventy percent of Alaskans, including the Alaskan Native
3 community, support environmentally, responsible development.
4 Shell is working closely with the local community in Barrow and
5 understands -- and incorporates concerns of the Indigenous
6 Alaskan people. We are citizens of this State, all of us in the
7 oil industry. We care deeply about the environment and its
8 citizens. Remember, even oil companies are made up of people.

9 I recall an experience when I was working in Barrow in
10 1972 to '74. We were doing a cleanup project at Umiat. And
11 workers came back and said, they expressed their amazement at
12 the amount of oil seeping out, just naturally seeping out under
13 the tundra, up there. And I commented to them, the oil
14 companies have a more stringent oil policy than Mother Nature.
15 Alaska needs the jobs, revenues and oil production. And the
16 U.S. needs its energy sources for our nation's security.
17 Exploration and production is a win, win, win -- revenues for
18 the government, energy independence for the nation and jobs for
19 a stagnant economy. Thank you.

20 MR. LOMAN: Thank you Mr. Taft. I have your written
21 statement. I appreciate your comments. Mr. Gilbert you're up
22 next. And, for the Mayor of Anchorage, Ms. Schubert, I hope
23 you're still here? Yes. Ms. Schubert -- Stacey, you're on
24 deck. Mr. Gilbert, you have the floor.

25 MR. GILBERT: My name is James Gilbert. I'm the President

1 of Udelhoven Oilfield Systems Services. We're a 40 year Alaskan
2 company.

3 The goal of Lease Sale 193 was to produce oil from the
4 Alaska OCS and boost domestic production from potential world-
5 class energy deposits. OCS production has the potential to
6 refill the Alaska pipeline which is now operating at one-third
7 of its 1988 peak flow.

8 Oil and gas production resulting from Sale 193 will occur
9 under the world's highest safety and environmental standards.
10 Activities will be governed by stringent lease stipulations
11 identified in the environmental impact studies. Numerous
12 mitigation measures, including seasonal operating restrictions,
13 will minimize potential impacts. There has never been a blowout
14 in the Alaskan or Canadian Arctic that resulted in a oil spill.
15 Thirty wells have been drilled in the Beaufort and five in the
16 Chukchi, all without incident. And these wells were drilled
17 utilizing 1980s technology, which is far behind what's used
18 today.

19 According to a University of Alaska study, new OCS
20 production in Alaska would provide an annual average of 35,000
21 jobs in Alaska, with a total payroll of more than \$72 billion
22 over 50 years. And that's over \$18 billion in income tax
23 dollars, alone.

24 Demand for energy is continuing to rise and the U.S.
25 requires continued development of America's oil and gas

1 resources, as the nation transitions to new energy sources for
2 the future.

3 I urge you to move forward with development of the 193
4 lease area. Our nation needs it. Alaska needs it. And we, as
5 Americans, need it also. Thank you very much.

6 MR. LOMAN: Thank you Mr. Gilbert. I have had a couple of
7 requests here to -- thank you -- ask that the speakers face,
8 stand and face the audience. And I think our Recorder will be
9 able to hear.

10 UNIDENTIFIED MALE: Can they sit and turn around?

11 MR. LOMAN: If you really want to hear, they have to stand.
12 Do you mind?

13 UNIDENTIFIED FEMALE: No.

14 MR. LOMAN: Thank you. Thank you Stacey.

15 MS. SCHUBERT: Good evening, and thank you for allowing me
16 the opportunity to testify. For the record, my name is Stacey
17 Shubert. And I am the Inter-governmental Affairs Director for
18 Anchorage Mayor Dan Sullivan. He asked me to apologize that
19 he's not with you tonight in person. But it's because he's
20 currently occupied at our Assembly Meeting where our lawmakers
21 are addressing the 2011 City budget. As Mayor Sullivan's
22 jurisdiction spans nearly 2,000 square miles and almost 300,000
23 people. I am testifying on his behalf to oppose any further
24 delay of development of Alaska's offshore oil and gas resources,
25 and to encourage you to affirm expeditiously, Lease Sale 193, as

1 held by the U.S. District Court for Alaska in 2008.

2 The economic security of our nation is in peril,
3 jeopardized further by the potential significant loss of jobs
4 and local, State and Federal revenues that the de-facto Arctic
5 offshore moratorium is imposing.

6 Your Agency has estimated that Alaska's OCS has up to 29
7 billion barrels of oil, compared to the 16 billion barrels of
8 oil already produced on the North Slope since 1977. The Trans-
9 Alaska Pipeline system has the capacity to ship more oil to the
10 domestic market. It is currently operating at only one-third of
11 its peak flow. And Alaskans need the jobs that will be created
12 by the development of offshore oil and gas. Further, Alaska's
13 OCS may hold 209 trillion cubic feet of natural gas, further
14 positioning, both our State and this nation for reduction in
15 internationally imported supplies of these resources.

16 As an Alaskan who understands the Arctic's extreme
17 temperatures and remoteness, and the importance of this industry
18 to our State, Mayor Sullivan has personally met with Shell
19 Alaska Vice President, Pete Slayby (ph). The Mayor appreciates
20 the company's need for a decision by your Agency in the next few
21 weeks to move forward with its 2011 plans that involve moving a
22 drilling ship and other infrastructure into place.

23 Surely, there will be opponents to drilling in Alaska's
24 OCS who refer to the Deepwater Horizon incident in the Gulf of
25 Mexico. The last time Mayor Sullivan testified before your

1 Agency on August 26, 2010, in front of Director Michael
2 Bronwich, he said, quote, The action to suspend drilling
3 announced by Interior Secretary Ken Salazar on July 12, 2010,
4 was likely a prudent move, given what we did not know about the
5 Deepwater accident. However, now is the time to move forward.
6 Mayor Sullivan also said, nearly four months ago, quote, We
7 must, as a nation responsibly move forward with domestic
8 offshore energy production to meet our needs by building a
9 robust and inclusive OCS leasing program that includes both the
10 Beaufort and Chukchi Seas. He urged BOEM to continue its work
11 to evaluate regulatory structures that improve safety and spill
12 response, while simultaneously making sure any changes are
13 appropriate to make certain that offshore energy production can
14 be done responsibly, taking heed to protect the environment,
15 workers, American consumers and our economy.

16 Again, now is the time to move this leasing program
17 forward. We have learned much from the Deepwater incident, and
18 we know that drilling in the shallow Arctic is far different
19 from drilling in the deep Gulf, including overall geology, well
20 design and pressure. More than 250 studies have been funded in
21 the Arctic in the past decade, with the bulk focused on the
22 Chukchi and Beaufort Seas. We know that there's never been a
23 blowout in Alaska, or the Canadian Arctic that resulted in an
24 oil spill. Five wells have been drilled in the Chukchi and 30
25 wells have been drilled in the Beaufort, and all without

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 incident. What's more is that these wells were drilled in the
2 1980s when technology was not nearly as advanced, as it is
3 today.

4 One tenant of Alaska's Constitution that we hold dear is
5 that we will control our own destiny. Article 8, Section 1,
6 establishes the policy of the State to develop our resources by
7 making them available for maximum use consistent with public
8 interest. Access to Alaska's assets is fundamental to our
9 national security interests. If the U.S. Government doesn't
10 provide a reasonable, regulatory environment, the multi-national
11 companies who are in a position to invest, will do so outside
12 our country and, therefore, funneling hundreds of millions, even
13 billions of dollars to outside economies that likely do not have
14 the stringent regulatory framework to support America's
15 interests.

16 Through our actions with Shell, including a steadfast
17 commitment to prevention, and a rigorous review of Alaska Spill
18 Response Plans during recent legislative hearings,
19 Mayor Sullivan has the confidence that now is the time to move
20 forward with OCS drilling. We have, for too long, delayed our
21 country, of Alaska's available resources. Our economy will
22 benefit from an annual average of 35,000 jobs with a total
23 payroll of more than \$72 billion in the next 50 years. Other
24 States will benefit from enhanced private sector demands made
25 possible by exporting Alaska's high volume of oil and gas

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 resources.

2 What if that risk is more delay and overburdens and
3 regulation, significant market disruptions that are likely to
4 lead to price volatility and higher prices for American energy
5 consumers and for Alaskans who are so dependent on oil and gas
6 revenues to make our economy tick. To that end, Mayor Sullivan
7 encourages action by Congress to provide States with a fair
8 share of revenues derived from production (indiscernible) to
9 drive revenue and help direct a more responsive path forward.

10 I'd like to reiterate Mayor Sullivan's opposition to any
11 further delay to development of Alaska's offshore oil and gas
12 resources, and to encourage you to expeditiously affirm Lease
13 Sale 193.

14 MR. LOMAN: Thank you.

15 UNIDENTIFIED MALE: Point of order.

16 MR. LOMAN: Ms.Beardsley. Sit down sir.

17 UNIDENTIFIED MALE: No, point of order.

18 MR. LOMAN: No, sit down sir. No, sit down sir. Sit
19 down.

20 UNIDENTIFIED MALE: I am sitting down. But I feel I'm
21 obligated (indiscernible).

22 MR. LOMAN: You will sit, please, thank you. Ms.
23 Beardsley. And Mr. Danson on deck. Again, please, in the
24 effort to allow people enough time to speak, please summarize
25 your statements, if you can. We appreciate it.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MS. BEARDSLEY: My name is Betsy Beardsley. I'm the
2 Environmental Justice Program Director for Alaska Wilderness
3 League. For the record, I'm a life long Alaskan, born and
4 raised here, deeply rooted in this State. I have a child and my
5 mother-in-law is here in the audience to support me, so I'm not
6 an Outside Environmental Extremist.

7 We're at an important crossroads right now to the Arctic
8 Ocean. And while I'm glad to see that BOEMRE is here, holding
9 this public meeting to learn about the issues at hand, I am for
10 the Agency to listen local voices, to improve its process in
11 working with the community, and to gather the necessary
12 scientific data and make decisions based upon sound science.

13 The process, so far, has been bureaucratic, rushed and
14 technical, to the detriment of capturing local voices on these
15 issues. These voices do not only have the most knowledge about
16 this pristine wondrous place, but also stand to lose the most,
17 if the risky aggressive development proposed by Shell Oil and
18 others is allowed to move forward.

19 For example, BOEMRE needs to improve outreach to the
20 community. In October BOEMRE released a 300 page document on
21 its draft FEIS for the Chukchi Sea and an (indiscernible)
22 community hearing was ten days after releasing this document.
23 This timeline does not give communities adequate enough time to
24 digest the hundreds of pages of vital information affecting
25 their communities. BOEMRE can do a better job in engaging

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 communities in a transparent and fair process.

2 Also, very little is known about the icy waters of our
3 Arctic Oceans. And the necessary science is still being
4 gathered. For this reason, the Obama Administration and two
5 Federal Judges suspended all drilling activities in the Arctic
6 earlier this summer, with the requests for necessary and missing
7 scientific information. The draft FEIS for the Chukchi should
8 address the missing scientific information. Instead, the Agency
9 dismissed the need to collect missing science and, at this time,
10 its potential negative impact on entire species of Arctic
11 wildlife.

12 We hope that the process could be similar in the Beaufort
13 where Agency would release a new draft FEIS that would base
14 decisions on sound science, such as the research that your
15 sister Agency, the U.S. Geological Survey, is currently working
16 on. And, also, that you take into account the lessons learned
17 from the BP oil spill.

18 We learned through the tragedy in the Gulf of Mexico that
19 there were significant problems with the way that oil and gas
20 development in our nation is managed. In fact, BP's massive
21 mistakes in the Gulf have shown the spotlight on something we,
22 in Alaska, have known for years, that the oil industry cannot be
23 trusted with our precious natural resources. BP's track record
24 on Alaska's North Slope has been terrible, averaging more than a
25 spill a day over the past 15 years. Just last week, the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 independent investigative news group, Pro Publica, released
2 BP's internal report that found that some pipeline walls in
3 Alaska's North Slope are 80 percent corroded and could rupture.
4 And while Shell has not yet build a track record in the
5 Arctic Ocean, the gross inadequacies in their plans for drilling
6 have been exposed by Federal Court after Federal Court and don't
7 do much to build our confidence that they will be any different.
8 What's more, there is extremely limited response capacity to
9 deal with a spill in the Arctic Ocean. Simply put, there's no
10 way to clean up a spill in the Arctic icy waters.

11 Bottom line is that, until we feel confident with the oil
12 industry's ability to drill safely and responsibly, no drilling
13 should be allowed to move forward in the Arctic Ocean. This is
14 a great time to have a time-out, a pause so we can wait for this
15 necessary scientific data to be collected, so that, if we are
16 going to drill in the Arctic Ocean, that it's done right and
17 that local communities are involved, from the beginning.

18 This lawsuit, that's brought us here today, was filed by
19 the Inupiat Community of the Arctic Slope, among others. The
20 Inupiat Community of the Arctic Slope is the Regional Tribal
21 government for the entire North Slope, representing eight
22 villages along the North Slope and then 1,000 of Inupiat Tribal
23 members that live there. I think we need to listen to them and
24 their concerns. Thank you.

25 MR. LOMAN: Thank you Betsy. Mr. Danson. And, on deck,

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Mr. Steiner.

2 MR. DANSON: I am not from Alaska and I am an
3 Environmentalist but I hope I'm not an extremist. My name is
4 Ted Danson. I'm on the Board of Directors of Oceana which is an
5 International Ocean Advocacy Group, conservation group, with
6 offices in Juneau, Alaska.

7 I went to Prudhoe Bay, at the invitation of oil companies,
8 about 20 years ago because, I was on the opposite side of the
9 fence, trying to keep Occidental Petroleum from drilling in
10 Santa Monica Bay. We became friends and they flew me and a
11 friend of mine up there. And we agreed to disagree. But we did
12 find ways to keep oil out of the system by creating a recycled
13 used motor oil program. So I firmly believe in working with oil
14 companies, when you can.

15 I was also able to go to Barrow about five days ago. And
16 I met with Mayor Itta and saw somebody in the middle of this
17 conversation. Somebody's whose entire -- the people he
18 represents have been lifted up economically oil money into a
19 place where they can live in a much more sustainable way. And
20 at the same time, their spiritual and cultural life depends on
21 whaling, the bowhead whale. And they feel that that may or may
22 not be in jeopardy from this drilling. But they feel that the
23 science -- well, let me now speak for them.

24 Oceana now feels that, what you need to do with so much at
25 risk, is make sure that the planning and the science is accurate

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 so that you are not putting these people at risk.

2 We feel like draft that's come out is, actually, basically
3 saying, yes we know we don't know this certain amount of
4 science. But it's okay that we don't know that science to go
5 ahead and start drilling. We disagree. We feel that that would
6 be a mistake. I also feel that it's a bit of a mistake that the
7 train has left the station and -- before you've done the basic,
8 the base science. And by that I mean, really knowing how the
9 entire ecosystem works, and is dependent on all, you know, on
10 the food chain. That you start leasing things and then say,
11 you'll do the science, as you go along the way, each step of the
12 way. Whereas, if you'd done the science to begin with, maybe
13 you would have said, you know, don't drill here, drill there.
14 It has, you know, less impact on the environment. And you can
15 still get your oil but you can do it in a safer way over here.

16 So our suggestion is, to stop this draft. Do the real
17 science, the base science. And it would take, maybe four or
18 five years to do that at \$20 million a year, but would well be
19 worth that effort. And, we also have many pages of comments and
20 suggestions that will be submitted later. Thank you for this
21 opportunity.

22 MR. LOMAN: Thank you Mr. Danson. Mr. Steiner. And
23 coming up after Mr. Steiner, Doris Hugo? Yes.

24 MR. STEINER: Thank you very much to son of MMS for
25 holding the hearing. I also want to thank Mr. Danson. This

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 guy's the real deal. He's not just a Hollywood celeb that steps
2 into an issue and then walks back to Hollywood. He's been
3 involved in ocean conservation issues for decades. And I
4 certainly commend him for that. Thank you.

5 There were hearings like this prior to TAPS in which
6 people said, it's important for jobs, for energy and don't
7 worry, there will not be one drop of oil spilled in the Prince
8 William Sound. We all know that the -- what's wrong about that,
9 at this point. There were hearings like this in the Gulf of
10 Mexico prior to deepwater drilling. Obviously, we know what the
11 fallacy in that logic as well, right now.

12 This is a high risk gamble. I realize that politics are
13 against us in Alaska. Most of the people in this room and
14 probably, most of the people in Alaska want OCS drilling. We
15 get that. The problem is, who shoulders the risk and who gets
16 the benefit? The people of the Arctic Slope certainly shoulder
17 the majority of the risk. And the environment of the Arctic
18 Ocean has most of the risk. So we have to be conscious about
19 that.

20 My suggestion would be, Alternative II in the FEIS, which
21 is, no action. But realizing the political realities, might not
22 line up with that. I would suggest, then, an Alternative III-A.
23 And Alternative III is the 60 mile deferral corridor one against
24 the beach. And would ask that it be suspended for a year while
25 further risk analysis and risk assessment is conducted.

1 We don't even really know the full causes of the Deepwater
2 Horizon at this point. And it's ludicrous, one, to lift the
3 moratorium. The Federal Court just suspended the rules that
4 were issued by the Department of Interior. And now it's a
5 complete free-for-all in the Gulf of Mexico.

6 I don't think the industry has it together. The Agency,
7 with all due respect, has shown that it does not have it
8 together, providing Federal oversight. So we're all, you know,
9 we're all on the same team here, I think. We all need to have
10 responsible energy. But the way we've been doing it, obviously,
11 has been chaotic and hasn't worked, so we need to drop back for
12 a year or two, do the risk assessment. Do the blowout
13 prevention systems that are much better than what we have right
14 now. And do the response planning.

15 We know that oil spill response doesn't work. It has
16 never, ever, ever worked anywhere, period. We need to disabuse
17 ourselves of that notion, period. And, particularly, in broken
18 ice situations in the Arctic. If an oil spill were to happen
19 right up against -- freeze up, there'd be virtually nothing that
20 could be done about it under the ice.

21 Should the Alternatives go forward, which I suspect they
22 will, regardless of what we say here tonight, I'd ask that an
23 Arctic Regional Citizens Advisory Council be a stipulation, and
24 a legitimate, independent fully funded one that includes the
25 Village and Tribal governments, not necessarily the Regional

1 Corporations. That's the latest draft of the Bill reads. And I
2 would also ask that real time drilling monitoring be conducted
3 by Federal Engineers and better inspections be conducted on the
4 rigs.

5 And lastly, I guess I'd just like to say that I and many
6 of my colleagues in the conservation and scientific community
7 have been somewhat disappointed so far in the Obama
8 Administration. 00 I'm sure a number of people in here have been
9 disappointed, as well, for different reasons. But I think it's
10 time for the Administration to start governing and stop
11 campaigning. And the same for Congress. The gridlock can't --
12 is not helping anyone.

13 So, we need a sustainable energy policy. I don't think
14 this is where we're going to get there.

15 MR. LOMAN: Thank you -- Doris you're next.

16 MS. HUGO-SHAVIGNS: Good evening I am Doris Hugo-Shavigns.
17 I am a Tribal Member of Barrow and the Arctic Slope. I am
18 submitting my written testimony for the public hearing regarding
19 confirmation of the Chukchi Sea Lease Sale 193.

20 SEIS provides ample information and analysis to support an
21 educated decision for support of Lease Sale 193. Chukchi Basin
22 holds enormously massive amounts of oil and natural gas which
23 our nation, State and local residents need now. We must stop
24 relying on foreign oil. Onshore oil and gas exploration and
25 development has afforded many benefits to my people of the

1 Arctic Slope region and we're in an economic crisis. Revenues
2 are dwindling with the decline of TAPS and fewer companies
3 investing in on shore exploration.

4 There is no alternative to off shore exploration for the
5 people of the North Slope in terms of economic development and
6 stability. Good paying jobs are on vast decline and families in
7 rural Alaska are at the forefront of the nation's economic
8 crisis. Many residents, including some in the North Slope, live
9 in third world conditions in inadequate homes not suitable for
10 the Arctic.

11 Oil and gas revenues has provided education, health and
12 social services and numerous other facilities such as proper
13 sanitation services, roads, bridges, airstrips and other
14 critical infrastructure needed for the well-being of our
15 communities.

16 I personally had my higher education paid for and
17 graduated from the University of Alaska Anchorage with a
18 Bachelor's degree thanks to oil and gas dollars provided to my
19 region. This also includes the hundreds of other North Slope
20 Inupiat that continue to receive scholarships through endowments
21 and foundations established with oil and gas dollars. It is not
22 a handout, it is a hand up to help our people live in the ever
23 changing world. Even subsistence hunting costs money, money
24 that comes from jobs that are on the decline. Offshore
25 exploration and subsistence hunting co-exist.

1 It would be a major disservice to my people and to the
2 State of Alaska if BOEM rescinds the leases allowing a de facto
3 moratorium to continue, which will do more harm than good. I
4 strongly urge you to affirm Lease Sale 193 and commence with
5 necessary permits to allow development of these important energy
6 resources without delay.

7 MR. LOMAN: Thank you. Mr. Banks for the Governor of
8 Alaska. And Ms. St. John on deck.

9 MR. BANKS: Thank you. My name is Kevin Banks. I am the
10 Director of Oil and Gas at the Department of Natural Resources.
11 And I'm here on behalf of Governor Farnell and I thank you all
12 for this opportunity to testify.

13 The State of Alaska supports Alternative IV in the
14 Supplemental Environmental Impact Statement on oil and gas Lease
15 Sale 193 in the Chukchi Sea. And affirming the Sale 193 as it
16 was held in February 6, 2008. As all are aware, that Sale
17 yielded \$2.6 billion in successful bonus bids from some of the
18 most experienced offshore oil companies in the world. Bidding
19 behavior such as this is undeniably a huge endorsement of the
20 scientific opinion by both BOEMRE and the USGS in their
21 assessments of the resource potential in the Chukchi Sea. I'll
22 try to be brief for you all.

23 Now, almost three years after that sale, in which time
24 these companies would have had the opportunity under less
25 litigious circumstances, to begin exploration in earnest, the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Secretary must revisit this decision. We're here today because
2 the U.S. District Court in Anchorage remanded the Sale 193
3 decision to BOEMRE. The Court asked the Agency only to revisit
4 three aspects of the original decision.

5 Now, while the State would have hoped for a ruling from
6 the Court that would have upheld the Lease Sale, Judge Beistline
7 certainly did not deliver a complete victory to those who would
8 want to bar any oil and gas activity in the Chukchi Sea. He
9 said, quote, This does not necessarily require the Agency to
10 completely redo the permitting process. In all other respects
11 the Court finds Defendants, that is BOEMRE, have complied with
12 NEPA.

13 As for natural gas development, the first of the three
14 issues raised by the Court, there can be little doubt that this
15 will occur in association with and incrementally to oil
16 development. BOEMRE correctly concludes the natural gas
17 development would merely extend the life of existing plays and
18 infrastructure and build new facilities within the previously
19 disturbed areas. For this reason, environmental impacts are
20 described with words as localized, temporary, minor.

21 Should there be a large-scale gas release into the
22 environment, the environment would be affected temporary to
23 short term and at a negligible to minor level. While impacts
24 may occur because of direct operations, over-flights, marine
25 transits, pipelines, et cetera, the Agency says that these may

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 be avoidable through avoidance and mitigation. And the impacts
2 on the human environment from natural gas development are
3 described with the comments in the SEIS as, no major impacts are
4 expected for Alaska Inupiat Natives.

5 These conclusions about the environmental impacts of
6 incremental natural gas development, combined with the
7 conclusions already made by the BOEMRE and essentially affirmed
8 by the District Court in the original Sale 193 FEIS means the
9 decision to go ahead with the lease sale has met the
10 requirements of NEPA.

11 The Agency's analysis of the second and third issues
12 identified by the Court is encyclopedic and rigorous. It was
13 our impression that the number of instances in the original Sale
14 193 FEIS where BOEMRE identified incomplete or unavailable
15 information, indicated that the care of the scientist at the
16 Alaska OCS Region took to avoid exaggerated and polemic
17 statements. On the other hand, the Plaintiffs, before the U.S.
18 District Court, presumed that, in spite of exercising an
19 abundance of caution that the Agency had somehow erred in
20 pressing forward with a lease sale, as if it were completely
21 ignorant of the environmental impacts.

22 The Court didn't go so far as the Plaintiffs. Instead the
23 court recognized that the Agency be given deference in meeting
24 the requirement, and we believe that they have done so
25 comprehensively.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Lacking a crystal ball or the prescience of our Creator
2 should not condemn all human endeavors. Obviously at this stage
3 in the process, we can be sufficiently informed about the likely
4 impacts of selling oil and gas leases in the Chukchi Sea. Later
5 we can address what we need to know to authorize exploration
6 activities. When uncertainties exist, everyone understands that
7 we must act with caution. The State of Alaska believes we need
8 to act now.

9 To wrap up, in deference to all of you, State of Alaska
10 has consistently argued that oil and gas development in the
11 Arctic OCS is an essential component of the future of our
12 industry and our State economy. It will contribute to
13 sustaining our livelihoods and our varied cultures. Often lost
14 in the debate about OCS development, it's a simple fact that
15 when we fail to develop our own resources, we export our
16 nation's wealth through deeper trade imbalances and costs to
17 maintain our international energy security.

18 Failure to develop our domestic resources exacerbates the
19 impacts on the environment and other parts of the world where
20 values about environmental protection and the laws that minimize
21 the impact of industrial activity are non-existent.

22 We compliment BOEMRE for the work they've put into this
23 SEIS. And we believe that it provides more than sufficient
24 support for the decision to affirm the February 6, 2008 Sale
25 193. Thank you very much.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MR. LOMAN: Thank you, Kevin. Okay, I sense the
2 frustration. So I'm going to ask one more time to please keep
3 your statements down to two minutes. It's appreciated by a lot
4 of people. Thank you.

5 MS. ST. JOHN: For the record, my name is Jeanine St.
6 John. And I'm here representing an Alaska company that many of
7 you now, Lynden. We represent a privately held company that has
8 over 500 employees in the State Alaska.

9 And I'm going to keep my comments extremely brief. I'll
10 leave my written comments. What I'd like to say is that we have
11 testified at all of these public hearings on everything related
12 to this lease sale. It's gone on and on and on. You can see
13 all the studies, the scientific studies that have been done. I
14 believe -- we believe that people understand that oil and gas
15 Development has to be done responsibly. And we appreciate the
16 fact that companies have had the patience to go through this
17 process. However, it's disheartening to go on and on and on
18 through this process.

19 So we urge quick expeditious activity. And let's move
20 forward. We want to keep our employees employed. And we know
21 that you guys all want a good Alaska economy.

22 So, that's it. .

23 MR. LOMAN: Thank you. Thank you very much. Mr. Kendall.
24 Mr. Pratt right after Mr. Kendall. Mr. Kendall. Well, Mr.
25 Pratt, we have an empty seat for those that are up next.

1 UNIDENTIFIED MALE: Well, I see the same faces in different
2 places. Earlier tonight I rose in the back to call a point of
3 order, a point of inquiry to Mr. Loman, here. Again, I see one
4 injustice, one inconsistency, one contradiction, one hypocrisy
5 after another, to limit us to two minutes. But those people
6 that are special, get a longer time. It appears to me that your
7 society is decaying. It is unraveling. It is aberating (ph) at
8 a scope and scale the likes of which I have never seen before.
9 It almost appears to be an insect high colony like design, which
10 if you take the money out of the picture, it appears to be a
11 natural formulation of revolution.

12 My concern is this, you can do all the oil you want. But
13 we deserve an equal amount of time for us to evolve as a
14 society. Alaska's a very, very special place, ladies and
15 gentlemen. It is an intersection of the likes I have never seen
16 before. And to put that into some criteria as opposed to a
17 philosophical and theoretical position, a ten by ten by ten
18 block of water, which is really a hydrogen body, they use water
19 as a tricked up term, so that it disconnects you from some
20 greater understanding, irrelevancy. But that body of water
21 weighs 31 tons, a ten by ten by ten block of water, 31 tons.

22 You have the Cook Inlet out here, the Knik Arm area. You
23 have one of the world's highest tide flows. You have three
24 incoming rivers. You have the capacity to go into that Inlet
25 overnight and generate huge amounts of clean energy called in-

1 harmony energy. You have the chance to make your residential
2 sector in the Valley, in Anchorage and Girdwood to be all
3 electrical residential, one of the first areas in the world.
4 You have a chance, if you do that, to literally launch the new
5 age which is going to be energy based.

6 And instead of sharing that moment with some of these
7 companies which were some of the most influential in the world,
8 to bring (indiscernible) to Mr. Loman to be able to hold over a
9 hearing for two minutes at a time, instead of being able to have
10 a three or five day, these companies portend levels of influence
11 I've never seen the likes of before.

12 And what happens is this. Instead of them joining us to
13 make this a very special place to evolve our society, to show
14 that two paradigms can exist simultaneously, and win out, you
15 now, in a fair mode, they continue to evade accountability.
16 There is not going to be anymore (indiscernible) Alaska ladies
17 and gentlemen. And if you look at the rational factors and all
18 the data outside of those people who want to mindset you, by
19 occupation, you will realize that technology is coming unleashed
20 like I have never seen before in my lifetime.

21 Carbon and the fossil fuel distribution network system of
22 associates, they have so maligned, they have so connived and
23 contrived the markets across, just not America, but the planet
24 in all reality. That all sectors are now looking to fail. The
25 only way to come back is for the true free market enterprise to

1 push back with new and in-harmony designs.

2 These oil companies know this. And let me give you an
3 example. I'm going to do a little something here that hopes to
4 connect you or unfold you. There is no such thing as water. It
5 is an ancient archaic and distracting term. When you send that
6 child over to get you a glass. If you do water, you may as well
7 put that child in a cardboard box and bury him. You need to
8 send him over to get you a glass of hydrogen with oxygen.

9 And when he says to you, mom or dad, what is hydrogen, you
10 can explain to him that the ocean is a complex hydrogen body, a
11 compound of various particulates and partnerships and life
12 forms. It's almost another dimension and to reach into it.

13 A river is a hydrogen body. A lake is a hydrogen body.
14 When you drink that hydrogen, your body makes electricity and
15 sends you a synaptic impulse. When you have two synaptic
16 impulses there about, you have what we call a State of Being
17 because you can contrast data. You are maintained by a State of
18 Being by hydrogen, ladies and gentlemen.

19 It is oxygen under which you die -- pardon me? I didn't
20 see a timepiece. But out of respect for your distinguished
21 guests, here I will do that.

22 I'm not sure how you summarize it in a moment of such
23 wonders. Well, I am angry at those companies who now, having
24 pursued the almost Biblical proportions of greed to feed on
25 money that which, no longer has value. Or insect mentality,

1 insect mentality is like, I need a job. What is a job get you?
2 I missed that one. But, my point -- men like me is like
3 kryptonite to Superman. You put me in a time block, fine, but
4 I'm down. Really falls off a branch.
5 Complex problems ladies and gentlemen requires slower
6 thought process at a greater body. And just as you're having
7 here tonight, it is an injustice. He should have reconvened
8 this meeting. He should have made a three day meeting, brought
9 cameras in so that men could rise and challenge other men and
10 probe, interrogate and then sit down. And rise again. You are
11 in a very special place ladies and gentlemen. You have a chance
12 in summary for a moment. You have a chance for your children to
13 lead the rest of the world. Within the next two to eight years,
14 you could make this transition. The oil companies would be
15 there with you. Quite frankly I think they're occupying their -
16 they're about to desert you. But the point is, it is my outrage
17 and sense of anger and disposition here is because you see a
18 great moment, instead of your children. Which are the ones we're
19 supposed to be about, to be a more free people. Instead of
20 bringing them to that new day and age, by having these
21 discussions that expand us all, we're having these Dodge City,
22 Kansas moments which are just simply influenced by bullying or
23 intimidation. And I'm sad by this.
24 Ten seconds. I thank you for the opportunity. And it is
25 a special place that I can sit with such a distinguished crowd

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 in opposition and not hear weapons being cocked and loaded.
2 MR. LOMAN: Thank you.
3 MR. PRATT: I've served on Mayor Sullivan's Council. So,
4 I am speaking on behalf of myself and my family who moved here
5 30 years ago. Alaska is where we chose to raise our family.
6 We've had great adventures and hope to continue to do so.
7 Alaska economics needs to heal. Sale 193 should be
8 affirmed. This is critical to the nation. It would have
9 benefits to homes, families and business. It has an economical
10 value. Sale 193 has the potential to add domestic supplies, at
11 least equal to what has been produced on the North Slope. We
12 have a moral imperative to develop and use domestic energy
13 supplies.
14 Additional onshore and offshore oil development production
15 is necessary to extend the useful life of TAPS. An early
16 shutdown, due to either physical or economical constraints would
17 be devastating to Alaska and America. It was mentioned earlier
18 that OCS production in Alaska would provide about 35,000 new
19 jobs and \$72 billion worth of payroll over the next 50 years.
20 It would also generate thousands of new high paying jobs
21 throughout all 50 States in manufacturing, computer technology,
22 construction, maintenance, et cetera, et cetera.
23 Responsible development of Alaska's onshore and offshore
24 resources is critical to the advancement of Alaska's economic
25 engine. We are a young State. Population wise, we are a small

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 engine. We are a young State. Population wise, we are a small
2 State. We know each other. With fewer than 700,000 residents
3 and barely 50 years of Statehood under our belt, we need all the
4 economic development we can muster to be a self sustaining,
5 envisioned by the Statehood Act. Unless we commercialize our
6 natural resources, we have little hope of surviving
7 economically.
8 Please allow us to continue to live in this thriving
9 healthy, pristine, magical place we call Alaska. This is the
10 right thing to do for America. This is the right thing to do
11 for Alaska families. Affirm Sale 193. Thank you.
12 MR. LOMAN: Thank you, sir. And, Kate Williams, next.
13 Sir, the floor is yours.
14 MR. MALONEY: Thank you. My name is Sam Maloney. My
15 father, Tom, is delivering my testimony this evening as I have
16 English and math classes Tuesday and Thursday evenings at UAA
17 that I cannot afford to miss. I agree with him.
18 A few months ago I had the opportunity to personally
19 testify on the OCS and importance to Alaska and the country's
20 situation with Secretary of the Interior Salazar.
21 This has been a big year for me. High school graduation
22 in May from South High School. I attended KCC in the morning
23 for their welding program. This great technical program led me
24 to major in welding and non-destructive testing at UAA. My goal
25 is to become a certified Welding Inspector in the next few

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 years. By working very hard I already have four welding certs.
2 It cost a lot of money to attend a university and take
3 these kind of programs. The welding supplies, books, materials
4 are all very expensive. I and my fellow students need to pay
5 the piper and not expect anyone else to foot the bill. I worked
6 60 hours a week all summer to help pay my way.
7 A few years ago the Federal government accepted almost \$3
8 billion for lease sales from oil companies. So far, it appears
9 that not much is happening to create future employment
10 opportunities for Alaskans, like myself. Many of my fellow
11 students who are willing to work and obtain the necessary
12 education and technical skills are concerned that we will not
13 have an oil industry in Alaska a few years from now. Isn't
14 there a few trillion dollars worth of oil and gas reserves in
15 the OCS that the Federal Treasury may need to pay its debt?
16 When my Dad came here about 20 years ago, the Trans-Alaska
17 Pipeline had over two million barrels a day. Now we have less
18 than a third of that. Will the pipeline shut down when it's
19 only one third of what it is now? Will the oil industry, which
20 provides almost all of our State revenues, be forced to leave
21 Alaska to pursue opportunities overseas? Can I get a job
22 related to the oil industry, which is in rapid decline in
23 Alaska? Will I be able to pay my student loans and other debts?
24 Several of my friends' parents have relocated to places
25 like China, Australia, Canada and Germany to develop new oil and

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Alaskan expertise to other countries that are developing their
2 own resources. Why not develop our Alaskan resources to benefit
3 Alaskans and Americans?

4 We need to develop America's own resources especially
5 those here in Alaska. People like me need good paying jobs to
6 support families. The oil industry has been good for my family
7 and thousands of others. We need to keep it going. I do not
8 want to move out of Alaska or maybe the entire United States to
9 work as a Welding Inspector.

10 Let's get Alaska and America working again. It would be
11 nice to see some of my friends return to Alaska with their
12 families instead of communication through Facebook, Twitter,
13 MySpace and phone calls.

14 Thanks for listening and feel free to call or email. Sam
15 Maloney.

16 MR. LOMAN: Thank you.

17 MS. WILLIAMS: My name is Kate Williams and I am the
18 Regulatory Affairs Representative for the Alaska Oil and Gas
19 Association, AOGA. AOGA is a private, nonprofit trade
20 association whose member companies account for the majority of
21 oil and gas exploration, development, production,
22 transportation, refining and marketing activities in Alaska.

23 We appreciate this opportunity to provide comments on the
24 draft Supplemental Environmental Impact Statement, for the
25 Chukchi Sea Lease Sale 193.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200

1 Chukchi Sea Lease Sale 193.

2 Lease Sale 193 should be affirmed as held in 2008 and in a
3 timeframe that does not further delay exploration and
4 development in the Chukchi. As stated by BOEM, the purpose of
5 the SEIS is to provide new analysis as directed by the U.S.
6 District Court for Alaska in a July 2010 Order. This Order
7 instructed BOEM to address only three concerns. The SEIS
8 addresses those concerns and recommends the sale be affirmed as
9 held. AOGA urges the Secretary to accept the conclusions of the
10 SEIS and expeditiously affirm Sale 193.

11 Lease Sale 193 is the most successful oil and gas lease
12 sale in Alaska's history, and at the time in U.S. history,
13 generating \$2.7 billion in high bids for 487 leases. The time
14 required to get from lease sale to first production is estimated
15 to be 20 years. Yet, to date, not even one exploratory well
16 associated with Sale 193 has been drilled.

17 Development of Alaska's Outer Continental Shelf is vital,
18 not only to Alaska's economy, but the nation's energy
19 independence. According to conservative Department of Interior
20 estimates, Alaska's OCS holds 27 billion barrels of oil and 132
21 trillion cubic feet of natural gas. By comparison, total
22 production from the North Slope has been approximately 16
23 billion barrels of oil. If access to Alaska's OCS resources is
24 allowed, Alaska would have the ninth largest oil resources in
25 the world, ahead of Nigeria, Libya, Russia and Norway.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Access to these resources is critical to the continued
2 operation of the Trans-Alaska Pipeline system, which is
3 currently operating at about one-third of its capacity and could
4 be uneconomic to operate after 2020 without additional
5 throughput. Access is also a key component to the economic
6 feasibility of the proposed natural gas pipeline from the North
7 Slope to the Lower 48. OCS oil and gas development would also
8 benefit Alaska's economy by providing thousands of high paying
9 jobs over a long-term period.

10 To reiterate earlier testimony, a study by the University
11 of Alaska's Institute of Social and Economic Research and
12 Northern Economics found that new offshore energy production in
13 Alaska would create an annual average of 35,000 new jobs in the
14 State with a total payroll of approximately \$72 billion over the
15 50 year life of the project. New offshore development in Alaska
16 would also generate thousands of new high paying jobs throughout
17 the country across a variety of industries.

18 Alaska's North Slope and OCS are now perhaps the most
19 studied energy basins in the U.S. In the past decade alone over
20 250 studies have been funded in the Arctic with the majority
21 focused on the Beaufort and Chukchi Seas. All told over \$500
22 million have been spent on more than 5,000 independent studies
23 since 1973.

24 AOGA strongly urges the Secretary to affirm Chukchi Sea
25 Lease Sale 193 as recommended by the SEIS. The leases issued

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 analysis. And the specific concerns the District Court raised
2 about the original lease sale in its July 2010 Order are
3 sufficiently addressed in the SEIS. Failure to affirm the sale
4 would allow a moratorium on exploration and development of
5 Alaska's OCS to continue, harming Alaska's economy and the
6 nation's energy security, without a corresponding benefit to the
7 environment. Thank you.

8 MR. LOMAN: You made it, thank you. It is now 8:30 p.m.
9 and at a couple of requests. The temperature in this room is no
10 longer fit. We'll take a five minute break. Go outside and
11 cool off and save your seats. Five minutes. Thank you.

12 (Off record at 8:30 p.m.)

13 (On record at 8:40 p.m.)

14 MR. LOMAN: All right we're going to get started. Mr.
15 Hendrix. Mr. Harbour is up next. Okay please be seated. In
16 five seconds -- four -- three -- two. Thank you.

17 MR. HENDRIX: Good evening, my name is Tom Hendrix. I'm
18 Vice President of Governmental Affairs for the Alliance. And
19 testifying on behalf of the Alaska Support Industry Alliance.
20 The Alliance is a nonprofit trade organization representing
21 almost 500 members -- organizations and more than 40,000 Alaskan
22 employees that provide goods and services to Alaska's oil and
23 gas and mining industries. Our livelihoods depend on a healthy
24 Alaska oil and as industry and investment climate. OCS
25 exploration and development is critical to our future.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Unfortunately, as a result of a depressed business
2 activity in Alaska's oil patch, hundreds of Alaska oilfield
3 workers and professionals have lost their job. On behalf of the
4 Alliance and its members, I first want to thank the MMS and the
5 EIS that you've done, to date. And I have one simple request
6 tonight. Please submit your Supplemental Environmental Impact
7 Statement to the Court immediately.

8 Thirty-five thousand Alaska jobs are at stake. Alaskans
9 are ready to go to work. It's time for the Bureau of Ocean
10 Energy Management Regulation and Enforcement to do the same, and
11 fulfill their obligation to properly develop Alaska's Federal
12 resources and create business opportunities for Alaska's oil
13 field contractors and suppliers and their employees. Thank you.

14 MR. LOMAN: Thank you very much. Mr. Lakosh, two minutes.

15 MR. LAKOSH: Thank you for accommodating my disability. My
16 name is Tom Lakosh. I'm an Oil Spill Researcher. I've been
17 involved in assessing the legal and technical requirements of
18 affected oil spill prevention and mitigation.

19 I'd like to say -- start -- I admit that I'm not entirely
20 prepared to produce comments on the EIS. But it's apparent that
21 certain questions need to be addressed because of the concerns
22 of the citizenry. I'd like to remind all of those that are
23 interested in development that, because of scrutiny, there has
24 been half a billion dollars already invested in studying
25 environmental impacts.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 environmental impacts.

2 If the conservation community and support industries would
3 get together, I think you'd find that we could probably do this
4 job right and provide much more -- provide for the rights of
5 Alaskans to superior public uses of their resources.

6 By the way, oil spills are illegal so they could never be
7 a superior public use. But we could provide for more jobs and
8 more investments here in Alaska, if we do the job right. Right
9 now we find that the regulatory system does not properly account
10 for effective planning.

11 In the Gulf of Mexico, you'll see that BP planned for a
12 491,000 barrel per day spill. They said they had the capability
13 of recovering that amount of oil. They would cover an average
14 of 1,800 barrels per day. So the methodology called the
15 estimated daily recovery capacity was 273 times off of the mark,
16 and what it could realistically be recovered. The technology is
17 available to do it a lot better, if the industry put as much
18 time and effort into developing those technologies as they did
19 in extraction equipment.

20 They spend billion dollars on floating production and
21 offshore storage platforms. They could spend the money on the
22 technology and do it. Shell has contributed to the oil skimmer
23 X-Prize (ph) but they're not going to study for Arctic skimmers.
24 Their present skimmer systems are not -- cannot be used in
25 broken ice, because they are not designed to process ice. They

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 of the oil area. They will not be able to concentrate the oil
2 to get to the skimmers that produce the recovery rates that they
3 profess.

4 They have not -- nobody has studied the effects of burning
5 oil. A recent symposium on that this spring showed pictures of
6 the soot coming right back down, due to temperature inversions,
7 spreading the oil soot all over the place where bears and fox
8 and seals will all roll around in it. They plan to leave the
9 oil in the winter, which is against the law. They're supposed
10 to recover it in a set period of time. They need to develop the
11 technology that can advance in broken ice. They need, to
12 Shell's credit, they need those ice breakers, the first that
13 have been brought up to the North Slope for recovery purposes.
14 And so they're sort of in the right way. They need to spend
15 more money. BOEMRE really needs to put some of that \$2.7
16 billion into an Arctic skimmer X-Prize (ph). Shell needs to
17 cough up a little bit more.

18 We could find the solutions, create more jobs and protect
19 the rights of the citizens to use the natural resources, if we
20 work together. Thank you.

21 MR. LOMAN: Thank you. June Childress.

22 MS. CHILDRESS: My name is June Childress. I live in
23 Wainwright, Alaska, and also the President of the Village
24 Corporation. And I live right smack dab in the middle of the
25 Chukchi Sea. So, this comes from our community as well as our

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Chukchi Sea. So, this comes from our community as well as our
2 Board of Directors of Olgoonik Corporation, our Tribal
3 organization and the City of Wainwright.

4 For generations we have followed a subsistence lifestyle.
5 While the waters of the Chukchi Sea provide many basic food
6 sources, it is important to consider the fact that we also must
7 rely on jobs to support subsistence. The cost to buy gas for
8 our boats, snow machines and 4-wheelers is high. In addition,
9 we must pay for the modern community conveniences we enjoy,
10 public water, electricity, telecommunications services. Without
11 the means of buying supplies, we cannot practice our way of life
12 as Inupiat people, let alone pass along cultural values to our
13 young people.

14 To meet this need for income, we are keenly aware of the
15 value of economic development in our community. For that
16 reason, the Village of Wainwright sees oil exploration in the
17 Chukchi Sea as one of the most important opportunities we have
18 for creating jobs. That is why we took the initiative in 2007
19 to make some preliminary investments in the local facilities,
20 equipment and training needed to support oil company operations
21 in the area.

22 Over the past four years, Olgoonik has invested in excess
23 of \$5.5 million in this effort. This business decision has made
24 it possible for Olgoonik to supply oil industry activities with
25 Marine Mammal Observers. a Communications Center that helps

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 and supply support operation for companies conducting science
2 studies in the region and shore-based logistics and camp
3 facilities.
4 Let me emphasize that the Oigoonik Corporation is not
5 doing this alone. We are working as a team with the City of
6 Wainwright, the Tribal Council and the Whaling Captains. You
7 heard statements from these groups during testimony in
8 Wainwright on November 4th. It is also worth mentioning that
9 it's not only Wainwright that supplies properly managed oil
10 explorations in the Chukchi. Despite what a few social critics
11 say, and the media's focus on this minority, a great many
12 residents throughout the North Slope understand that a realistic
13 balance between subsistence lifestyle and exploration can be
14 maintained. Given the need to bring more jobs to these remote
15 villages, we urge the Federal government allow exploration to go
16 forward.
17 Thank you for your time.
18 MR. LOMAN: Dave Harbour.
19 MR. HARBOUR: I'll leave you with my written testimony,
20 which will be more succinct than the verbal. But I'll offer the
21 verbal in view of the time constraint.
22 MR. LOMAN: Thank you.
23 MR. HARBOUR: And maybe, after hearing the other witnesses
24 talk a little bit about things that maybe the panel has not
25 heard.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 heard.
2 The State of Alaska, when it was formed 51 years ago, was
3 formed really via a triumvirate of actions. One was a publicite
4 (ph) of the people of Alaska. Second, was the formation of the
5 Constitution of the State. And third, was enactment by Congress
6 of the Statehood Act. All three, to one degree or another,
7 recognized the fact that Alaska should not become a ward of the
8 Federal government ever again, that it should be able to sustain
9 itself based upon its significant array of natural resources.
10 Since Statehood, we've seen a gradual erosion of the
11 ability of this State to make a living based on its natural
12 resources. And were there more time and if anybody in the
13 audience who's shaking a head, wishes to explore that matter we
14 could explore it with specific examples at great length.
15 At this point, let's look at current actions leading up to
16 the present. First of all, Judge Beistline, in effect blessed
17 the good work of the MMS, BOEM with the exceptions of some
18 remedies that he sought and remanded the work to the BOEM.
19 Thanks to conversations that you shared with me before the
20 meeting, I learned that you did not have to construct an SEIS
21 which is part of NEPA required public hearings like we're having
22 around the State now. Rather, you could have submitted the
23 remedies more directly to the Court as the Court ordered. But
24 out of abundance of caution, you didn't. You went through this
25 process. I respect that.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 At this point, as a former regulator in the State of
2 Alaska, my advice would be, that because of the delays that have
3 been incurred over a long period of time, at a cost to the
4 lessees of several billion dollars, about a billion more than
5 was originally bid. We're at the point, I believe, where Alaska
6 is on the cusp of losing OCS development. If we lose OCS
7 development due to further delay, and that delay could be a BOEM
8 decision and a Secretary Salazar decision not to provide the
9 approvals necessary by the end of this year -- if that doesn't
10 happen, we could see the ability of the industry to mobilize for
11 the next summer season lost.
12 If that happens, we may see a loss of OCS altogether.
13 That could result in an inability of the State to sustain the
14 Trans-Alaska Pipeline. A previous witness estimated that it
15 could be in 20 years that that pipeline could be -- to fall into
16 disuse. But if at three-quarters empty, at this point, between
17 500,000 and 600,000 barrels a day declining, at a rate of about
18 six percent per year -- you do the math. In a cold winter day,
19 out of an abundance of caution, the owners of the pipeline may
20 well decide to surplus that pipeline well before that time,
21 perhaps as soon as seven years from now.
22 Since 90 percent of the State operating budget is based on
23 that, and since one-third of the entire State economy is based
24 on the throughput of that pipeline, the Chukchi Sea with a
25 potential of over twice the productivity of Prudhoe Bay, and

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 on the Slope, could provide the ability of the State of Alaska
2 not to again become a ward of the Federal government.
3 In addition, the provision of Federal income taxes and
4 royalties as well as the ability of the State and the local
5 governments to achieve property taxes and sustain the dwindling
6 throughput of the Trans-Alaska Pipeline, could enable the State
7 to continue to function. Thank you for the opportunity.
8 MR. LOMAN: Thank you. Mr. Thompson. Rachael Daniel.
9 That was donated by a member of our audience, to help. And Kirk
10 Jackson after Rachael. Kirk -- Rachael, the floor is yours.
11 MS. DANIEL: My name is Rachael Daniel and I was born and
12 raised in Alaska in a family dependent on a subsistence
13 lifestyle. And, tonight I'm speaking on behalf of the PUGH (ph)
14 Environment Group and we will be submitting comments, written
15 comments. So as we have limited time, I will only have enough
16 time to focus on one point tonight. Unfortunately, I can't
17 cover all the points I'd like to make. And so I'm going to
18 focus on one that's important to me and, that's science.
19 As a scientist, I would like to say that while there has
20 been a great -- well there has been and there continues to be
21 really good research conducted in the Chukchi Sea. There
22 remains a great deal of unknowns such as those acknowledged by
23 BOEMRE in the original Lease Sale 193, both on the lack of
24 information about species and habitats, as well as on the
25 effects of oil and gas activity on species and habitats.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 effects of oil and gas activity on species and habitats.
2 The U.S. Geological Survey office in DOI is currently
3 conducting an initial review on science gaps related to Outer
4 Continental Shelf oil and gas Development in the Arctic,
5 Beaufort and Chukchi Seas. This review, under the direction of
6 Secretary, was to identify gaps in knowledge about the Arctic
7 Ocean with the results are to be viewed -- to be public in April
8 of 2011. And this information obtained in the USGS review would
9 likely have provided relevant information of data gaps, and the
10 means by which to address those gaps as related to OCS oil and
11 gas activity.

12 Furthermore, Secretarial Order Number 3305 on Scientific
13 Integrity signed by Secretary Salazar on September 29, 2010,
14 provides policy and direction that any decision from DOI will be
15 based on the best available science.

16 We do not believe that the review of the gaps in the
17 Chukchi Sea EIS was consistent with that policy. And we believe
18 that the BOEMRE should coordinate its lease 193 remand analysis
19 with the ongoing USGS analysis.

20 And related to science, one other point that I'd like to
21 make is that missing information could also be incorporated with
22 the use of traditional knowledge. And this traditional
23 knowledge should accompany research to aid western scientific
24 understanding of the Arctic marine environment. In the
25 documentation of existing knowledge and gathering of new

1 throughout the research and management continue to help analyze.
2 Interpret and apply that knowledge appropriately, in conjunction
3 with western scientific findings and other relevant information.
4 Thank you.

5 MR. LOMAN: Thank you Rachael.

6 MR. JACKSON: My name is Kirk Jackson. I'm a Business
7 Agent for Local 375, the Plumbers and Pipefitters of Fairbanks,
8 Alaska. I'm also an instructor at the Pipeline Training
9 Facility in Fairbanks. I'll be extremely brief. A lot of the
10 points I was going to talk about have been hit multiple times
11 this evening from the strongest support the Sale of the Lease
12 193 in the Chukchi and, similarly, the Beaufort.

13 The decline of Prudhoe Bay and, of course, TAPS at one
14 third and the continued decline of that over the next eight to
15 ten years, the development of the Chukchi is vital to Alaskans
16 and Alaskans' families and the economy of Alaska. Thanks for
17 your time, appreciate it.

18 MR. LOMAN: Rick Braun, then Kimberly Howard.

19 MR. BRAUN: I'll try to be short. I'm one of the few
20 people probably here that doesn't have some sort of financial
21 interest in all of this. I'm just a guy who lives here and
22 wants to keep living here. And want my kids to keep living
23 here. That requires a functioning economy. And I can see with
24 the rope-a-dope that's been going on with this lease sale, the
25 endless delays, the endless studies -- pretty soon you're going

1 endless delays, the endless studies -- pretty soon you're going
2 to have to have charts that go over the horizon to list the
3 studies I think -- or else go to a smaller font, I don't know.

4 That will never be enough. They'll want more. They'll
5 want another study of this, another delay for that. This is a
6 resource State as Mr. Harbour pointed out. We became a State
7 because we have resources sufficient to supposedly allow us to
8 be a functioning State. We're being strangled with our
9 resources, to the point where maybe we won't function anymore
10 and we'll be a welfare society State. And I don't know if the
11 government's got enough money left to make us a welfare society
12 State.

13 Instead of going with the Chicken Little scenarios of
14 worrying about what about this and what about that, and let's
15 study it some more. And that study is two days old so we got to
16 do another one because that one is out of date. Let's just get
17 on with it. Let's approve the EIS, the Supplemental EIS, the
18 whatever EIS you come up with. And let's go do something.
19 Because that's the best way to learn what you need to do, how to
20 do it, just like in the Gulf. In the McCondo (ph) well,
21 everybody had ideas, plans, you name it, theories. Well,
22 something went wrong. It didn't all work. And they've learned
23 a heck of a lot, I'm sure. That's a 5,000 foot and below well.
24 We're talking 150 feet. I think the pressure differential is
25 just a little bit different. And maybe we won't have a McCondo

1 (ph).

2 It's amazing to see in your study that you're trying to
3 calculate CO2 and CH3 releases when, isn't the idea of drilling
4 a well -- to pull something out and burn it? And you're going
5 to worry about how much CO2 and CH3 is -- might be released
6 while you're drilling for it? That's a waste of time. The lady
7 from Wainwright, I'm sure and other villages, would love some
8 natural gas just like this city is starving for natural gas.
9 Because even though -- I don't know what the barrels per
10 equivalent is of 75 bodies in here, but this is pretty warm.
11 But if you shut the gas off, it's not going to be that warm. I
12 lived in North Pole for 20 years. Man, when it gets 40 below,
13 man I love my heating oil. You just can't make it without it.
14 So let's get on with it.

15 You keep calling for basing it on sound science. That's
16 just a rope-a-dope trick of, we need one more study. We need
17 one more study. We need one more, one more -- we'll never get
18 to the actual thing.

19 Mr. Danson left, and his recycling motor oil thing, well
20 we do that over here at the Transfer facility. I don't think
21 that'll heat this building, let alone the City of Anchorage.
22 Ideas like that might be nice, feel good but that isn't it. We
23 need to drill some holes, get some oil, get some gas so we can
24 keep on living like we are. Thank you.

25 MR. LOMAN: Thank you sir. Kimberly Howard. Mindy

1 Mr. Portman, Mr. Portman.

2 MR. STOLTZ: Bill Stoltz. Just got another two year
3 contract renewal, the fifth one in the Legislature. But I'm
4 speaking for myself. The Legislature has also affirmed support
5 for this and other developments. Wish I could have been here a
6 week ago. Everybody was pro-development a week ago, at least
7 the folks who were running against it.

8 I support forwarding the Lease 192 (sic), that's EIS. I
9 look at one of my grade school friends I wasn't expecting to see
10 here. I know his -- he doesn't want his legacy project on
11 another study. He's going to -- Colville River to be his legacy
12 project. He'd like to be building some things and pointing to
13 dams and other projects, not saying well this is my 15 years, I
14 got an EIS through. But I'll leave it at that, and I'll supply
15 written testimony later.

16 MR. LOMAN: Thank you sir. Mr. Portman then Rebecca.

17 MR. PORTMAN: Good evening. My name is Carl Portman. I'm
18 the Deputy Director of the Resource Development Council here in
19 Anchorage. RDC urges the Bureau of Ocean Energy Management to
20 confirm Lease Sale 193. We believe the SEIS provides sufficient
21 information and analysis to support a decision affirming this
22 sale.

23 OCS oil and gas production is absolutely critical to
24 Alaska's future economy. With the Trans-Alaska Pipeline now
25 running at one-third capacity. exploration blocked in ANWR, and

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 running at one-third capacity. exploration blocked in ANWR, and
2 non-development activists working toward wilderness designations
3 in the National Petroleum Reserve, nothing less than Alaska's
4 future economy is at stake. The responsible development of
5 potentially immense oil and gas deposits in the Chukchi Sea
6 would significantly boost the economy and extend the life of our
7 oil pipeline. Without new Federal oil production, TAPS could be
8 uneconomic to operate sometime in the next decade as we have
9 heard here this evening.

10 Between ANWR, the Alaska OCS, and NPRA there could be
11 nearly 40 billion barrels of oil in place. The sustainability
12 of TAPS in our economy will largely depend on some combination
13 of oil production from these Federal areas. Yet there are
14 forces working hard to prevent development in these areas which
15 represent the nation's best onshore and offshore oil and gas
16 prospects. If there is no oil and gas development in ANWR or in
17 the Chukchi Sea, and the best prospects in NPRA are ultimately
18 taken off the table, the Federal government must then accept the
19 consequences, including heavier reliance on foreign oil, soaring
20 trade deficits, a weaker and more vulnerable national economy
21 and compromised national and energy security. For Alaska, our
22 future will be bleak with the State losing 90 percent of its
23 revenue base.

24 Not developing Federal oil in Alaska makes no sense from
25 an economic and energy security standpoint, especially given the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 great cost. OCS development in Alaska would generate hundreds
2 of billions of dollars in royalty and tax revenues and aid the
3 nation's economic recovery by reducing the trade deficit and
4 creating tens of thousands of new jobs.

5 In addition, OCS gas discoveries would significantly
6 improve the long-term economic viability of the proposed gas
7 pipeline from the North Slope to the Lower 48, a clean energy
8 priority of the Obama Administration.

9 In concluding, RDC has a high level of confidence that
10 exploration development can occur safely in the Arctic. Alaska
11 does have a bright future and has much to contribute to the
12 nation with this abundant natural resources. All that is
13 required are policies and key decisions from Washington
14 encouraging development of these resources. Thank you.

15 MR. LOMAN: Thank you Mr. Portman. Rebecca and then
16 Colleen.

17 MS. NOBLIN: Hi, my name is Rebecca Noblin, and I'm the
18 Alaska Director of the Center for Biological Diversity. And I'm
19 also an Alaska resident and a big fan of the Arctic. As you
20 know the Arctic is in trouble. It's warming at twice the rate
21 of the rest of the world. And Arctic summer sea ice is
22 disappearing more rapidly than any of the climate models
23 predicted. Chukchi species including, polar bears and Pacific
24 walrus are already showing signs of stress from this
25 unprecedented loss of their sea ice habitat. This fall Pacific

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 unprecedented loss of their sea ice habitat. This fall Pacific
2 walrus are already showing signs of stress from this
3 unprecedented loss of their sea ice habitat. This fall Pacific
4 walrus congregated on the shore near Pt. Lay in the tens of
5 thousands, an absolutely unheard of number, because there was no
6 suitable sea ice for them. The climate change isn't the only
7 thing threatening these Arctic animals with extinction. They're
8 also threatened with increasing industrial oil and gas drilling
9 in the Chukchi and Beaufort Seas.

10 The Agency formerly, known as MMS, and still acting like
11 MMS, has determined that despite huge gaps in information about
12 bowhead whales, polar bears, walrus, and pretty much all living
13 things in the Arctic, it was not a mistake to sell the Chukchi
14 Sea off to the highest bidders in 2008.

15 MMS, I'm here to urge you -- or I'm here to tell you
16 something that you should already know. You cannot
17 realistically claim that drilling in the Arctic is safe. People
18 from Alaska Native communities have been telling you that for
19 years. Scientists have been telling you that for years. Courts
20 have been telling you that for years. But I'll say it one more
21 time. Drilling in the Arctic is too risky.

22 No one has the technology to clean up oil in broken ice
23 conditions. There is no way to mobilize even a fraction of the
24 response required for the Gulf disaster in the remote Arctic.
25 And the truth is, that a large oil spill could mean the

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 species.

2 Unfortunately, your draft Supplemental Environmental
3 Impact Statement doesn't come anywhere near addressing these
4 problems of critical importance. Your draft EIS doesn't satisfy
5 your obligation to protect America's Arctic and it does not
6 comply with the law. In order to comply with the law, you must
7 analyze the substantial gaps in scientific information in the
8 current EIS, and make a good faith effort at obtaining that
9 information that's realistically attainable. And most
10 importantly, you must not allow drilling to go forward unless
11 you have the scientific knowledge to say, truthfully, that
12 drilling in the Arctic is safe.

13 MR. LOMAN: Thank you, Rebecca. Colleen Keane and then
14 Barbara Huff.

15 MS. KEANE: My name is Colleen Keane, and I'm the Alaska
16 Program Associate with Pacific Environment. Thank you for the
17 opportunity to provide comments tonight. I would like to urge
18 the Alaska Region of the Bureau of Ocean Energy Management
19 Regulation and Enforcement to issue a new draft SEIS after it
20 has reviewed relevant reports from the U.S. Geological Survey
21 covering Arctic Ocean science, and from the National Commission
22 on the BP Deepwater Horizon oil spill and offshore drilling
23 covering BOEMRE shortcomings.

24 This new draft Supplemental Environmental Impact Statement
25 needs to include information from these upcoming reports and

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 needs to include information from these upcoming reports and
2 reassess which scientific information in Appendix A of the
3 current draft SEIS is obtainable at a cost that is not
4 exorbitant, rather than dismissing the need to gather such
5 information as was done in the current draft SEIS.

6 By dismissing the need to gather such information, the
7 Bureau under President Obama, after the Deepwater Horizon spill
8 is saying the same thing as the former MMS. That is, that no
9 matter what the impacts will be, it would allow drilling to
10 proceed. As example, the draft SEIS says that if a large oil
11 spill occurs, significant impacts could follow. And it is well
12 understood that the environmental impacts associated with a
13 large oil spill could be quite severe. Yet the Agency still
14 chooses to proceed with drilling.

15 The hastily issued draft SEIS runs counter to the law and
16 to the Department of Interior's recent commitments to the
17 American public to ensure scientific integrity and to improve
18 the Agency's leasing decisions and regulatory oversight.

19 The consequences of rushing through offshore oil and gas
20 drilling approvals, without understanding and disclosing to the
21 public the potential impacts, were tragically displayed in the
22 Gulf of Mexico. The Bureau should not allow the Arctic Ocean,
23 its wildlife or its people to experience a similar disaster.
24 Responsible development means not proceeding faster than can be
25 justified. Thank you again for the opportunity to comment.

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MS. HUFF TUCKNESS: Thank you for the opportunity to
2 testify this evening. I am not going to bore you with a lot of
3 written testimony. We are going to submit more detailed
4 information directly to the Bureau. For the record, my name is
5 Barbara Huff Tuckness. I'm the Director of Governmental and
6 Legislative Affairs for Teamsters, Local 959. And I'm here
7 tonight to speak on behalf of Ken Coleman who, unfortunately, is
8 out of town.

9 We represent approximately 6,000 employees, members of our
10 institution, of which we've had hundreds that have worked on the
11 Slope. Just for the record, we also represent workers in the
12 mining industry. We also represent workers in the film
13 industry. So, we have a pretty broad gambit of members that we
14 represent across the State. And, fortunately, we believe that
15 the industry does have opportunities out there. We also believe
16 that the industry can do so in a safe and responsible manner.

17 We've talked about the Gulf of Mexico. There's also been
18 discussion about the Exxon oil spill. Those are all unfortunate
19 situations that did occur. I do believe that a lot of us have
20 learned from those particular experiences. And that, just
21 looking at the studies that have been done, and we do believe
22 that the Bureau has been tasked to continue to make sure that
23 the environment is protected, as the industry moves forward with
24 the particular job opportunities as well as -- not only on
25 offshore but onshore, as well.

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 offshore but onshore, as well.

2 And with that I appreciate the work and the effort that
3 you've done. And hopefully you move forward with this. Thank
4 you.

5 MR. LOMAN: Vince and then Bob Scheidemann.

6 MR. BELTRAMI: Thank you and thank you for the opportunity
7 to testify. My name's Vince Beltrami. I'm President of the
8 Alaska AFL-CIO, representing about 60,000 working families in
9 the State of Alaska. And I've also heard from a lot of my
10 affiliates in the building trades from Fairbanks who didn't have
11 an opportunity to testify, in person, so I carry their message
12 as well.

13 And with all due respects to my friends in the
14 environmental movement who are in opposition to these leases, I
15 strongly encourage you to affirm the decision made on Lease Sale
16 193 in 2008. And there's nothing in the SEIS that I've seen
17 that should derail this process.

18 If these leases are rescinded, I think one of the greatest
19 opportunities in our nation to create jobs, contribute to the
20 reduction of our massive Federal deficit, and wean ourselves as
21 a nation away from the grip that foreign oil has on our country,
22 will be lost. To be able to produce roughly 29 billion barrels,
23 another possible 200 trillion cubic feet of natural gas, the
24 Chukchi may well hold the key to helping us solve a significant
25 part of our country's energy woes. To rescind these leases

KRON ASSOCIATES
1113 W. Firwood Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 would be to remove the potential of 35,000 year-round jobs and a
2 payroll of more than \$70 billion.

3 Obviously, concerns about the safety of the environment
4 are paramount. And Shell should and, I'm sure, will be held to
5 the highest safety accountability standards possible. And as
6 everyone knows, we can ill afford a Gulf Coast style catastrophe
7 in our Arctic waters. But this company's got an excellent track
8 record in Alaska. They've got a robust safety plan. They've
9 been safely drilling in Alaska for 50 years. And as long as the
10 company can meet all environmental and regulatory benchmarks,
11 they should be allowed to proceed towards development.

12 As it's been said, dozens of wells have been drilled in
13 the Beaufort and Chukchi, all without incident and all with
14 older technologies. I'm confident and appreciative in knowing
15 that the Obama Administration trusts and values the concerns
16 expressed by the hard-working men and women of the Alaska labor
17 movement. The ability to safely explore and produce oil in
18 Alaska is among the highest priority of Alaska's building and
19 construction trades unions.

20 And thank you again for the opportunity.

21 MR. LOMAN: Thank you sir. Bob Scheidemann and then
22 Robert Foster.

23 MR. SCHEIDEMANN: I'm Bob Scheidemann. I'm a scientist.
24 A lot of the points supporting exploration, I agree with. And
25 I'd like to concur with those people and recommend that we

1 been drilled in the Alaska OCS since 1980, all without
2 significant incident or any incident, whatsoever. And I think
3 it's prudent to move forward at this time and ask for the SEIS
4 to let them move forward.

5 MR. LOMAN: Thank you sir. Mr. Foster.

6 MR. FOSTER: My name is Robert Foster. I work for Shell
7 Oil Company. I'm a Geophysicist. I think most of my points
8 have already been covered. I just want to say that I urge the
9 Department to affirm its previous lease sale decision and allow
10 exploration Sale 193 to proceed.

11 MR. LOMAN: Thank you sir. John Shepherd and then Mr.
12 Grafe.

13 MR. SHEPHERD: Well, I'm John Shepherd. I'm a scientist
14 and taxpayer. And my main points in support of Sale 193
15 exploration have already been made by others. So to allow more
16 time for others, all I need to say is that the Environmental
17 Impact Statement and the Supplemental Environmental Impact
18 Statement do provide sound scientific basis to allow exploration
19 to begin in the Chukchi. And so I urge the Department of the
20 Interior to affirm its previous lease sale decision and let's
21 get started with exploration. Thank you.

22 MR. LOMAN: Thank you, sir. Mr. Grafe. And then it looks
23 like after Mr. Grafe, Craig Johnson.

24 MR. GRAFE: My name is Erik Grafe and I am here on behalf
25 of Earthjustice. It's an environmental law firm. And broadly,

1 it's our position that offshore oil and gas leasing and drilling
2 in the Arctic Ocean should not occur until we have a basic
3 scientific understanding of the region, and duly obtain adequate
4 spill clean-up capability. Neither exists now. And the
5 Deepwater Horizon tragedy shows us that offshore oil and gas
6 drilling is terribly risky business. We need to understand and
7 fully disclose those risks before making decisions to commit the
8 Arctic's people and its wildlife to those risks.

9 Specifically, we believe that BOEMRE's Alaska Region has
10 failed to meet the obligations of NEPA and the District Court's
11 Order in its draft Supplemental EIS here. In the original EIS
12 and in the Supplemental EIS, the Agency admits that much
13 information -- here it's over 100 pages of admissions of missing
14 information is not known. And that a lot this information is
15 relevant to significant effects from oil and gas activity.

16 Yet, amazingly, in this document BOEMRE concludes that
17 none -- not a single piece of that missing information is
18 essential to a decision about whether -- where, how, if,
19 (indiscernible) in the Chukchi Sea. To take one example, the
20 original EIS and the draft Supplement says, we don't know enough
21 about marine mammals. And that's a lot of things in the Chukchi
22 Sea. We don't know enough so, at this time, we're not able to
23 determine whether or not there would be significant effects from
24 oil and gas activity on marine mammals.

25 Yet, the Agency concludes this isn't essential to our

1 choice about where or whether to allow this to happen. This is
2 just -- it's simply not credible. The BOEMRE, you owe an
3 obligation to the American public so people, to everybody, to do
4 your job and figure out what is the information that's missing.
5 That it's essential to the lease sale choice and not just paper
6 over with -- not just paper the problem over, but do an honest
7 effort, a big and honest effort to identify what's missing.

8 There are other parts of the government that are doing
9 this now. The USGS is conducting a survey about what are the
10 important missing information. NOAA says there's important
11 missing information. They closed the fisheries up there because
12 they need to get more information before you make management
13 decisions. This is simply the first step. And doing proper
14 management and ensuring that we know it's there. So we know how
15 to manage oil and gas in the region and whether it can go
16 forward and whether it's a good idea to do so.

17 So we urge BOEMRE not to finalize this draft Supplemental
18 EIS, but rather to go back, take another look and do an honest -
19 - take an honest crack at identifying the missing information.
20 And finding out, which of it can be gotten, not at an exorbitant
21 expense rather than concluding that, simply none of it, not any
22 of the hundreds of missing pieces of information is essential to
23 the lease sale choice.

24 Thank you very much for this opportunity to testify.

25 MR. LOMAN: Thank you.

1 MR. JOHNSON: My name is Craig Johnson. I'm the sitting
2 Chair of Natural Resources Co-Chair in the House of
3 Representatives. I'm here today to, hopefully, bring this
4 conversation back to why we're here. We've heard about polar
5 bears. We've heard about shrinking ice. We've heard about, yes
6 we should, no we shouldn't.

7 What we're here today for, is to decide whether or not --
8 and your charge is to decide whether or not to return something
9 that a Judge has asked you for. That's the bottom line. If
10 you've done your job, and I believe you have. I've looked
11 through the document. Then I encourage you tonight, put a stamp
12 on it. Send it to the Judge. And then he'll be the person that
13 determines whether or not you did a good job. That's where it's
14 going to end up. It's not going to end up in this group. It's
15 not going to end up with you. It's going to end up in the hands
16 of the Judge who's going to say, yes you did, or no you didn't.
17 If you did, we're done. If you didn't, we'll be back here in
18 three weeks doing this all over again.

19 We just had a President go to India. And he's saying,
20 35,000 jobs, boy, look what we did. We could provide 35,000
21 jobs here starting quickly. And we don't even want a seat on
22 the Security Council. We don't even want to be in the U.N. We
23 just want our jobs. We want our resources. You've done your
24 job. Finish it up. Put a stamp on it. Do it tonight.

25 MR. LOMAN: Thank you very much. Mr. Pastos, Nikos

1 Patstos, Center for Water Advocacy. Jeff Jones. Jeff Jones?
2 MR. JONES: Thank you. For the record, my name is Jeff
3 Jones. I want to thank the Bureau for the opportunity to speak
4 tonight.

5 I think it's clear to a lot of people who live here. I've
6 lived here for ten years -- that the topic under discussion
7 tonight is vital to the future economy of the State of Alaska.
8 Our economy has been and will continue to be, in large part,
9 tied to the Trans-Alaska Pipeline. And OCS plays an integral
10 role in, hopefully, putting some additional oil, potentially a
11 large amount of oil, into that pipeline and keeping it going,
12 and keeping people working in this State.

13 But I think that it goes much beyond our borders and
14 affects what is taking place in the rest of our country and in
15 North America. The energy needs in North America and all over
16 the world are going to continue to increase drastically in the
17 next decades. Alaska can play a vital role in helping to
18 provide the energy that is needed, not only in our country, but
19 throughout the world. There are a lot of positives. It creates
20 jobs. Development of OCS creates wealth. It helps to offset
21 our huge negative imbalance with our trades overseas. And it
22 also keeps us from sending a lot of money overseas to countries
23 like Venezuela and Iran. So I would just like to strongly
24 affirm the moving forward with the Lease Sale of 193.

25 MR. LOMAN: Thank you sir. Nikos, one last time. Carl

1 Wassilie? Andrew Hartsig, Andrew? Nikos?

2 MR. WASSILIE: No, Carl Wassilie.

3 MR. LOMAN: Carl. Going down a long list. Carl, it's all
4 yours.

5 MR. WASSILIE: Hello, my name is Carl Wassilie, born and
6 raised in Alaska. Come from a strong subsistence family, as
7 well as a family that's been involved in safety, pipeline
8 safety, as well as safety of workers. And I'm really concerned
9 about the -- about drilling in the Arctic Ocean, not only
10 because of the lack of infrastructure, but the current Bureau of
11 Ocean Energy Management. I'm sorry, you used to be called the
12 Minerals Management Service, so I keep pausing on that. So the
13 Bureau of Ocean Energy Management and Regulation and Enforcement
14 is still learning from the Gulf of Mexico, Deepwater Horizon
15 catastrophe.

16 There's definitely shown that technology and engineering
17 for drilling is rapidly outpacing the technology for safety of
18 spill prevention. And so the risks are not adequate for the
19 pace of development, particularly in the Chukchi Sea and the
20 Arctic. Under the current conditions, weather patterns -- and
21 so, that's just something that needs to be addressed, as more
22 information develops from the hearings that are currently
23 happening in D.C., with the Presidential Commission.

24 The Arctic is one of the most complex and dynamic
25 ecosystems on the earth, at this point in time. It is rapidly

1 changing but there's still hadn't been a whole lot of
2 information regarding species. And there's a -- the diversity
3 of interlocking oceans connected up to the Arctic around the
4 planet. So, there's still questionable process of allowing the
5 193 Sale to continue without the baseline studies on --
6 particularly with the scientific information of indigenous
7 science when including traditional ecological knowledge.

8 A lot of the basis of long term knowledge of changes, as
9 well as species, resides with the indigenous observers that have
10 been here for thousands of years. And incorporating this
11 knowledge into various systems that are in the culture, that are
12 in the indigenous societies that live in the environment that
13 are being discussed here today in the Chukchi Sea.

14 So the message is clear from the communities that live
15 there and subsist off the wildlife and the marine mammals, that
16 they want to protect that. And so, got to make sure that all
17 the information is there, including that we bring up to speed
18 the technology of safety for the environment, for the benefit of
19 all the people. But this is -- so I'm opposed to the offshore
20 drilling, at this point in time, until there is adequate science
21 on oil spill cleanup and technology that catches up to the
22 drilling technology, as noticed in the Gulf of Mexico. Thank
23 you very much.

24 MR. LOMAN: Thank you sir. Keith Silver, then Susan Childs

25 MR. PASTOS: Sir, my name is Nikos Pastos.

1 MR. LOMAN: Yeah, I called your name. Keith Silver is
2 next.
3 UNIDENTIFIED MALE: What about Andrew Hartsig would he be
4 next?
5 MR. LOMAN: Okay I didn't know you were here. Okay,
6 sorry. Andrew, Keith, Susan Childs, then you sir.
7 UNIDENTIFIED MALE: All right thank you.
8 MR. HARTSIG: My name is Andrew Hartsig. And I'm a
9 Director of Ocean Conservancy's Arctic Program. In preparing
10 the draft SEIS the Alaska Region should have reviewed the
11 information gaps in the original EIS and taken a fresh look at
12 the decision to hold a lease sale. Instead, the draft SEIS
13 ignores important information gaps in an improper attempt to
14 justify a previously made decision. So, despite all these
15 charts on the wall and all these studies, the original EIS
16 identified hundreds of instances of missing information.
17 The draft SEIS concluded that not a single piece of that -
18 - those missing information was essential to the Agency's
19 decision. That conclusion is not plausible. It's not supported
20 by the record. And it's inconsistent with the Obama
21 Administration's commitment to science-based decision making.
22 So the Agency needs to go back to the drawing board and it
23 should satisfy this flawed draft SEIS, undertake a more serious
24 attempt to identify essential missing information.
25 And to do that, the new analysis should be based in part

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 on the data generated by the ongoing USGS analysis. Once that
2 missing information is identified, the Agency should obtain that
3 information, ideally through a comprehensive scientific research
4 and monitoring program. And then, finally, the Agency should
5 prepare a revised draft SEIS and re-evaluate the lease sale in
6 light of the new information. Thanks.
7 MR. LOMAN: Thank you, sir.
8 MR. SILVER: Good evening. My name is Keith Silver and
9 I'm a resident of Anchorage. We must move forward with Lease
10 Sale 193 -- opportunities for employment for those in the area
11 as well as other parts of Alaska. Although I realize that the
12 U.S. District Court sent this back to you, it is vitally
13 important that the EIS be approved. I'm an unemployed oilfield
14 service worker. I worked in -- previously, just recently worked
15 in Anchorage. It's a lack of activity in the oilfield,
16 including that of the Chukchi Sea and the Beaufort Sea, caused
17 my firm to downsize. I am one of thousands idle. How do I pay
18 for my mortgage or feed my family is the question being asked by
19 many of those displaced persons.
20 The Trans-Alaska Pipeline is only one-third full and needs
21 additional sources of oil to keep it operating. This is the
22 sixth or seventh time I have testified on OCS leasing issues. I
23 will continue to advocate for environmentally responsible oil
24 development, as long as necessary. Thank you for your time.
25 MR. LOMAN: Thank you. Susan Childs and then Michael

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 Droege.
2 MS. CHILDS: Good evening. So my name is Susan Childs and
3 I'm the Alaska Venture Support Integrator for Shell here in
4 Alaska. So there have been lots of comments made that I hope I
5 don't repeat. But, the one thing I would ask is that the Agency
6 continue with the process that you're on. It's a legal NEPA
7 process to go through the draft, to collect these comments, to
8 take the comments from the North Slope and from Kotzebue, to
9 incorporate those comments into your final report and then on to
10 a record of decision. So that's the process that you go through
11 in NEPA. And so I support that process and I just encourage you
12 to expedite that process.
13 So, if you'll indulge me, I'd like to go back to February
14 of 2008. It was when the Chukchi Sea Lease Sale 193 signaled
15 for all in attendance that the offshore was clearly the next
16 chapter in this State's oil and gas history. There were audible
17 gasps that day when the bids were opened, and with good reason
18 because there was \$2.7 billion committed in bonus bids. The
19 leases in the Chukchi Sea, which made it the largest lease sale
20 in Alaska's history.
21 Shell's \$2.1 billion in successful bids also solidified
22 our standing as the major leaseholder in the Alaska offshore,
23 including in the Beaufort Sea where Shell first started
24 purchasing leases again in 2005. So, since we have re-entered
25 Alaska, we have spent over \$3.5 billion in pursuit of Arctic

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 exploration. And we will commit to many billions more if we are
2 able to go forward to a development program. I would like to
3 repeat that sentence to you. This company has spent over \$3.5
4 billion in pursuit of an exploration program. Not a development
5 program, but to drill a well. So for those opposed to OCS
6 development, this comment period is another bite at the apple,
7 and to take your course.
8 But I will tell you there many that understand the issues
9 and they are stark and here they are. America depends on oil to
10 drive our economy. We will import all oil we do not produce in
11 this country. America continues to expand its percentage of
12 imported oil today. Alaska depends upon energy development for
13 vast portions of our economy. TAPS through-put continues to
14 diminish and currently flows at a third of capacity. Alaska's
15 OCS could be, and we believe it will be, the new heartland for
16 energy and for Alaska and for this country.
17 We are ready to go. We have been ready to pursue a
18 drilling program since 2007. And yet we wait. We wait upon an
19 Administration to establish an Arctic policy to allow the
20 permitting process to proceed. We wait upon courts to review an
21 incessant number of litigation. We wait for Agencies to review
22 and assess more rounds of comments and submissions. And we know
23 what's at stake. We've been to over 450 stakeholder engagement
24 processes over the last four years on the North Slope. So we
25 have engaged with the community. Ae have engaged a great deal

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 with the people on the North Slope.
2 We just signed a North Slope Borough Science Agreement
3 with the mayor and his staff. So that was a long awaited
4 collaborative effort. And we look very much forward to making
5 sure that we do that, and that we get more studies done.
6 Because, I will tell you, the North Slope and the Arctic
7 offshore are now perhaps the most studied energy basins in this
8 country. In the past decade, over 250 studies have been funded
9 in the Arctic with the majority focused on the Beaufort and the
10 Chukchi Seas. You can argue with that, but those are the stats.
11 Since 1973, more stats -- the Federal agencies and
12 industry have performed more than 5,000 environmental
13 assessments, studies to better understand the Alaska Outer
14 Continental Shelf and coastal environment, because that's very
15 important to understand the coastal environment, as well.
16 So we've been ready to explore Alaska's OCS. And I do
17 thank you for this opportunity to express our wishes for this
18 NEPA process to go forward expeditiously.
19 MR. LOMAN: Thank you.
20 MR. DROEGE: Hi, I'm Michael Droege. I'm the President
21 Elect of the Anchorage Board of Realtors. I sit on the State
22 Board of Realtors and I'm the Realtor Political Action
23 Committee, one of our -- the three Trustees in this state.
24 I was born and raised in Alaska. I moved out of the State
25 once for six months to L.A. where all of our supposed

1 opposition, or a lot of it, comes from. The point of my
2 comments are first, personal, and then professional.
3 Growing up in the State of Alaska, I've seen industry
4 after industry after industry being shut down because the answer
5 to most developmental questions from environmental groups is not
6 maybe, but no. In this particular project, doing the simple
7 math, we've spent nearly \$400 million, at this point, studying
8 on a lease sale that generated \$2.7 billion, nearly 17 percent,
9 somewhere in that, just going off the top of my head, in
10 studying. We studied our way out of the timber industry. We've
11 studied our way out of all kinds of economic activity.
12 Now the realtors are a very diverse group of people, as
13 you can imagine. And we have a lot of different opinions on
14 social issues, on environmental issues. But the one issue that
15 we coalesce around is economy. If it works, we're for it in a
16 responsible way. If it doesn't work, then we'll sit back and
17 assess it but the last answer to the question cannot always be
18 no, it must be maybe.
19 The studies have been completed. With all due respect to
20 the people that come here to advocate on behalf of the
21 environment, the group of people that you see in front of you
22 that are for it, a lot of us are hunters, fishers. We've spent
23 time in Prince William Sound. We spend time on the tundras out
24 in Western Alaska. We're up in the Arctic Slope. We've been up
25 to the Wrangell Mountains, hunting.

1 There's no more environmentally conscious or conservation
2 minded people than the people that live here, want to work here,
3 want to continue to have our children do the same as we've been
4 privileged to do. So I encourage you, Jeff, keep rolling.
5 Thank you.
6 MR. LOMAN: Thank you. Cathy Giessel, Representative
7 Cathy Giessel? Doug Smith?
8 UNIDENTIFIED MALE: He's gone. Doug Smith is gone.
9 MR. LOMAN: Michael. Nikos I'm sorry.
10 MR. PASTOS: I'll make it quick.
11 UNIDENTIFIED MALE: Thank you.
12 MR. LOMAN: Thank you. Sorry about that.
13 MR. PASTOS: My name is Nikos Pastos and I was born here
14 in Anchorage, didn't come here to get rich. I'm an
15 Environmental Sociologist, so I study technological disasters
16 and the social impacts of technological disasters of the oil
17 spills.
18 My comments here are on behalf of the Center for Water
19 Advocacy. I'm on the Board of Directors for a nonprofit public
20 interest law firm. And simply, our comments are focused at --
21 there's three natural resource trusts in the United States.
22 There's the State, the Federal government, which is Federal
23 Agencies, and Tribal governments. And our comments will
24 incorporate a lot of the aspects of conversancy. And there will
25 be an extensive written form. All I want to do is simply

1 summarize a couple of points.
2 We also are completely aligned with the Alaska Inter-
3 Tribal Council's Resolution 200508 which opposes Outer
4 Continental Shelf drilling and drilling in the Arctic National
5 Wildlife Refuge. There is a Federal trust responsibility, it's
6 an Executive Order that government Agencies have to consult on a
7 government to government on par basis with Tribal governments.
8 I think it's legally questionable whether Tribal governments
9 have been included in the original scoping process for the EIS
10 that we're talking about in the Sale 193.
11 Furthermore, we completely support the Native village of
12 Point Hope and their Resolutions against the offenses to the
13 peace and dignity of humankind. Which, I may be paraphrasing
14 the title of it, but there's a -- Point Hope has a Resolution
15 opposing Outer Continental Shelf oil development and drilling in
16 the Arctic National Wildlife Refuge.
17 So, given the Gulf of Mexico Deepwater Horizon tragedy
18 which, again in the news today, there's absolutely no scientific
19 proof that we can adequately clean up spilled oil in broken ice
20 conditions. It's -- environmentally that's too big a risk to
21 take in the Arctic Ocean. Arctic Ocean is much more complex
22 than the studies that we've spent so much money on.
23 As far as Shell Oil spending so much money, good. We're
24 going to hold your feet to the fire and get you to get, you
25 know, the best valid peer review -- science available. Beyond

1 that, the Tribal governments have the only valid claim in the
2 Arctic. The State of Alaska has a fraudulent claim and the
3 United States' claim is not fully substantiated when it comes to
4 who owns our Outer Continental Shelf.

5 So, in the summary, Center of Water Advocacy is in support
6 of Resolutions that are standing through the Alaska Inter-Tribal
7 Council, and especially with the Native Village of Point Hope.
8 This is not just about billions of dollars, it's about the
9 health of the oceans and the future of customary and traditional
10 life ways of indigenous peoples who have lived in the Arctic
11 since time immemorial.

12 This is just no simple quick rush oil lease. And so we
13 can afford to do a fair and decent and adequate process of
14 looking at this. Thank you.

15 MR. LOMAN: Thank you. Geoff.

16 MR. HADDAD: All right. It's kind of funny talking to
17 this mic. I'm not sure it works. All right, I'll talk into it.
18 My name is Geoff Haddad and I'm the Alaska Exploration Manager
19 for Conoco Phillips. Thank you for the opportunity to speak
20 here tonight at this public meeting.

21 Conoco Phillips favors developing all forms of energy,
22 conventional, renewable and alternative. However, we recognize
23 that even with aggressive alternative energy research and
24 development, most sources estimate that fossil fuels will still
25 represent more than 80 percent of the world's total energy

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 supply, even by 2030.

2 In addition, the United States currently produces only
3 approximately 40 percent of the oil it uses each day. So the
4 majority of our oil must be imported. Given this background in
5 the analysis and studies that support the decision to lease in
6 the Chukchi Sea, Conoco Phillips strongly encourages the Bureau
7 of Ocean Energy Management to firm the leases as issued in 2008.

8 Conoco Phillips sees great potential in the Chukchi Sea as
9 evidenced by our investment to \$506 million on 98 OCS leases.
10 And Conoco Phillips has also invested tens of millions of
11 dollars on environmental studies, working with other offshore
12 operators, universities, research institutions and local
13 stakeholders on a multi-year program collecting biological,
14 oceanographic and air quality data in the Chukchi Sea. This
15 program has been well received by the North Slope communities
16 and several environmental groups.

17 As one of the largest owners of State and Federal leases
18 in Alaska, a major owner in the three largest oilfields on the
19 Alaska North Slope, operator of both Kuparuk and Alpine
20 Oilfields, and operator in the Alaska Cook Inlet, Conoco
21 Phillips has over 40 years of safe and environmentally
22 responsible operating experience in Arctic conditions. We bring
23 decades of experience in preparing our permit applications and
24 operational plans for activities in the Arctic.

25 Alaska's North Slope production continues to decline with

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 TAPS currently flowing at a third of the pipeline capacity.
2 Persistent onshore exploration in Alaska has not resulted in oil
3 discoveries sufficient to fully extend the decline and supply to
4 TAPS. The Arctic OCS waters, particularly the Chukchi Sea, have
5 potential to significantly extend the life of TAPS.

6 So Conoco Phillips believes progress is needed on
7 exploring the lease to that acreage in the OCS, including the
8 Chukchi Sea. We are committed to explore the Chukchi Sea lands
9 responsibly with respect for the environment, and in a manner
10 that also respects the subsistence way of life of the residents
11 of the Alaska's North Slope.

12 We believe the Supplemental EIS addresses the three issues
13 raised by the U.S. District Court of Alaska and that the leases
14 awarded in 2008 should be affirmed. We intend to provide more
15 comprehensive written comments by the November 30th deadline.
16 Thank you.

17 MR. LOMAN: Joseph Liska. And then Christine Klein.
18 Christine in here? You're next. Followed by Len Horst.

19 MR. LISKA: Good evening my name is Joe Liska. I'm a 40
20 year resident of Alaska. Never thought I'd be here this long,
21 but I have to say that I'm probably as environmentally conscious
22 and as environmentally conservative as anybody in this room.
23 I've worked for BP Alaska for -- for BP for 24 years and now I
24 work for a Native Corporation, so I've built a livelihood here.
25 I've built family here, and I'll probably going to be buried in

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 buried in this State.

2 And I've heard a lot of pros and cons about development
3 but the big idea is this. When the Pilgrims came over here, if
4 they would have had to complete an EIS comparable to what Shell
5 is going through, we would never have developed America. And
6 the big idea is even this, we are a country of doers and
7 explorers and producers. And we've always been that way. But
8 in the last two decades, this country has taken a turn to the
9 left. A turn, which I believe, is prejudicial to the future of
10 this country as a world leader, give that whatever you want it
11 to be.

12 Certainly, scientific studies are important. But we have
13 studied this to death. Also what's not -- I haven't heard here
14 -- there are Arctic countries which could be threatened by --
15 more by an oil spill than our own coastline could be threatened
16 in the Arctic, because of the distances from where these leases
17 actually exist. And these wells are going to be drilled from an
18 exploration standpoint in open water. Yes, there are threats
19 for ice. There's always threats. But what's missing in all of
20 this is the thread that Americans are doers. They are creators.
21 We wouldn't have gone to the moon, we wouldn't have done other
22 creative things if we would just -- if we would have let people
23 with that whisper say to us, we can't do it. You can't do it.
24 You'll never be able to do this. That is a big problem.

25 Obviously, I'm pro-development. Thank you.

KRON ASSOCIATES
1113 W. Fireweed Lane, Suite 200
Anchorage, Alaska 99503
(907) 276-3554

1 MS. KLEIN: For the record, my name is Christine Klein.
2 I'm the COO of Calista Native Corporation. We are one of the
3 largest Native Corporations in Alaska but, unfortunately, one of
4 the poorest socio-economically, and one of the poorest regions
5 actually in the United States.

6 I want to bring up that our Corporation represents more
7 than 13,000 direct shareholders and 20,000 descendants of Yupik,
8 Cupik and the Athabascan heritage. And that is 56 villages in
9 Alaska and the Yukon Kuskokwim Bering Sea coast. Our
10 shareholders, the cheapest airfare to get here was \$600, the
11 average was \$1,200, and due to the large distances in our Region
12 and the lack of infrastructure, basic infrastructure.

13 Many of our shareholders continue to live in remote
14 villages, which experience higher costs of living than you can
15 imagine. Especially, when it comes to fuel and heating oil
16 which, due to the lack of transportation infrastructure, people
17 have to travel by boat up the rivers, by aircraft and airports
18 in the State and snow machines in winter. Fuel is currently
19 three to five times higher than you're seeing at the pump here
20 in Anchorage. And, of course, much higher than the rest of the
21 United States. Heating fuel often costs \$13 a gallon right now
22 in our Region.

23 I would like to remind you here, my fellow citizens in
24 Alaska as well as others, that the people in Emmonak had to
25 choose between fuel and staying warm and food in the Village of

1 Emmonak last winter. And that will probably happen again this
2 winter. We are tired of being forgotten, treated like a colony
3 and being used. Imagine if this would happen to you, here in
4 Anchorage even, \$13 a gallon, let alone the rest of the United
5 States. If that were to happen to you, do you think we would be
6 here having these questions asked of us?

7 Calista supports OCS development in an environmentally
8 safe drilling manner. We want to see MMS, BOEM, I'm sorry,
9 Lease Sale 193 affirmed as intended in 2008 for the purposes of
10 producing oil and boosting domestic oil production from our
11 existing resources and energy here in Alaska, as well as helping
12 the economy of the United States.

13 We have many points. I'm not going to go through them. I
14 know everyone is very tired and it's extremely hot in here. But
15 the second two points are that, we have confidence in the
16 existing regulatory and scientific community of Alaska. Those
17 regulators and scientists have risen to the challenges of
18 responsibly overseeing offshore oil and gas development. And we
19 are comfortable that they will ensure the protection of vital
20 wildlife and water resources.

21 I also wanted to point out that the State of Alaska,
22 having been a former regulator and I worked for the State in the
23 past, has one of the first and only Pipeline Petroleum
24 Inspection and Oversight Programs in the United States. So
25 while we're the youngest State and Department in the U.S., or

1 one of the few, we do have programs. And so we are very pro-
2 active in the State.

3 The petroleum industry, third, has demonstrated that it
4 can, in fact, operate safely in Arctic and sub-Arctic
5 conditions. All of these things, along with the intense
6 scrutiny that occurs in Alaska, case in point here, and the
7 tough permitting processes in our State give us confidence in
8 our Region that the exploration and development can occur in the
9 OCS safely to all creatures, great and small. Thank you.

10 MR. LOMAN: Thank you.

11 MR. HORST: I'm not sure if I should say good evening or
12 good morning, the way the clock is going here. But for the
13 record, my name is Leonard Horst.

14 I wanted to speak to the issue of Lease 193 from three
15 perspectives tonight and strongly encourage the Bureau to move
16 forward quickly so we can get on with development here in
17 Alaska.

18 First of all, I want to speak as an Alaskan. I'm a
19 relative newcomer here. I've only been here since 1977, but I
20 am privileged to be married to a third generation Alaskan. Our
21 kids we call fourth generation, and looking forward to the fifth
22 coming on soon.

23 I've been privileged to travel to every corner of this
24 State. I have, through work, had the chance to -- many of the
25 things that Michael talked about, hunting and fishing, all

1 across the State. And having done business in many, many
2 places. I'm excited about Alaska's future. But I'm also really
3 concerned about the message that we're sending right now with
4 the delays that we have undertaken on this project, in
5 particular.

6 Secondly, I have the privilege of serving as a Senior Vice
7 President of Northrim Bank and manage their commercial and
8 industrial banking across the State. As a banker and as an
9 economist, I got to tell you, I'm extremely concerned about
10 where we are right now. We have not suffered like our friends
11 and neighbors in the Lower 48 have. But believe me when I say
12 it, we are on the verge. It is absolutely time for us to move
13 forward with development in this State. We were founded as a
14 State based on our ability to stand upon our own resource base.
15 And that is what we need to do, and we need to do it now.

16 Finally, I have also the privilege of serving on the
17 Resource Development Council's Executive Committee and Board of
18 Directors. And I joined that group simply because of their
19 mission which is to responsibly develop the natural resources
20 of the State of Alaska. I believe we've proven we can do it. I
21 think it is again, time for us to do it again, and do it now.

22 I again urge you, as the Bureau, to move forward as
23 quickly as possible and affirm Lease Sale 193. Thank you.

24 MR. LOMAN: Lois Epstein.

25 MS. EPSTEIN: There are actually a few things that haven't

1 haven't been said today, so far, so I'll try and hit on those.
2 My name is Lois Epstein and I am Arctic Program Director for the
3 Wilderness Society. I'm a Licensed Engineer in Alaska. I've
4 spent over 20 years working on oil and gas technical and policy
5 issues as a private consultant and as an employee of nonprofit
6 organizations. I served on Federal Advisory Committees for U.S.
7 DOT on pipeline safety and for U.S. EPA on refining. And I was
8 a Technical Advisor on the report to the President in May 2010
9 which contained recommendations on increasing offshore drilling
10 safety.

11 In September I served on a Bureau of Ocean Energy
12 Management panel in Houston on safety. My message was that,
13 business as usual is unacceptable to the public. And that
14 significant regulatory inspection and enforcement changes are
15 needed, as well as transparent performance reporting by industry
16 and government.

17 With respect to the Arctic, I focused on the fact that a
18 key safety concern is going to be related to human factors, a
19 major cause of accidents. Because of the cold and the darkness
20 in the Arctic, which we're all familiar with, human factors
21 likely would be a greater concern than elsewhere. Moreover,
22 frontier and pristine areas always require extra precautions and
23 extra safety factors.

24 The Wilderness Society's position is that the Bureau needs
25 to take the time needed to make scientifically justified

1 decisions before allowing drilling in the Chukchi. This
2 includes reassessing which scientific information in Appendix A
3 of the draft SEIS is obtainable, at a cost that is not
4 exorbitant, rather than the Bureau dismissing the need to gather
5 such information all together. In effect, the Bureau states in
6 the draft SEIS, that it has decided to allow drilling regardless
7 of the impacts. The public needs to know those impacts and in
8 as specific detail as possible, for rational decision making.

9 I was hired on to improve oil and gas operations. I'm not
10 opposed to them in Alaska. They just have to be as good as
11 possible and made in a rational way, the decisions. If there is
12 any doubt about blowouts and other offshore problems in the
13 Arctic, consider the following events which also occurred in
14 Alaska's shallow offshore areas in Cook Inlet.

15 1985. There was a gas blowout, contrary to what we've
16 heard earlier, that we had no blowouts in the State, at the
17 Grayling Offshore Platform, which shut down production.

18 1987-1988. A gas blowout at the Steelhead Offshore
19 Platform occurred while drilling an oil production well. Fire
20 burned for one week. While drilling the relief well, another
21 blowout occurred. The relief well was finally completed in
22 August of 1988.

23 1989. Amoco's Anna Offshore Platform caused a spill of
24 over 20,000 gallons of crude. Clean-up was not attempted due to
25 80 to 90 percent moving ice flows in Cook Inlet.

1 As some of you, possibly Jeff may have done, I woke up at
2 five a.m. yesterday and today to watch the Oil Spill
3 Commissions, two days of hearings in D.C., the causes of the
4 Deepwater Horizon tragedy. Director Bromwich from the Bureau
5 today noted the extreme sensitivity of the Arctic environment
6 and its marine resources and their importance to subsistence, as
7 well as the region's spill clean-up challenges.

8 On a technical level, the two days of hearings may clear
9 how well-financed drilling companies nevertheless could,

10 One, misinterpret data from a key integrity test.

11 Two, decide not to utilize potentially critical well
12 components known as centralizers, because they would take too
13 long to arrive. And imagine that kind of situation occurring in
14 the Arctic where it'd be much worse in terms of timing.

15 Three, the companies decided not to take actions that
16 would have mitigated much of the tragedy, possibly because it
17 all occurred so quickly. For example, using the platform's
18 divert-a-system (ph) to mitigate some of the damage.

19 What the hearings, these past two days, demonstrate is
20 that no matter how good the regulatory oversight, and everyone
21 acknowledges that the Bureau needs regulatory improvements,
22 there will be infrequent but highly tragic spill events. This
23 information, combined with a clear need for collection analysis
24 of scientific data on the Arctic's natural resources which was
25 recognized by the Court, demonstrates that the Bureau is not

1 ready, at this time, to proceed with offshore drilling in the
2 Chukchi. The Bureau should not rush through the EIS process
3 like a student rushing to complete a term paper, as quickly as
4 possible. Thank you for this opportunity.

5 MR. LOMAN: Thank you. So tomorrow morning I have a press
6 interview that I have to give. And here's what I'm going to
7 say.

8 That at 10:00 p.m. we had to close this hearing. I
9 apologize to those that we didn't get to hear from. Here's what
10 I'm going to tell them. They didn't come because Ted Danson was
11 here. They didn't come because they wanted get some movie
12 star's autograph or get on TV. They came because they care
13 about Alaska, about the economy, about the environment.

14 Whatever your passion and position is, I appreciate the
15 fact that everyone of you left in this room is, sat here and
16 listened to this testimony. And I apologize to those that we
17 didn't get to hear from tonight. We will take your written
18 comments and we will, by law, respond to those in the final
19 document.

20 Thank you and good night.

Anchorage, Alaska 99503-5820

Re: U.S. Environmental Protection Agency (EPA) Comments on the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) Draft Supplemental Environmental Impact Statement (EIS) for Chukchi Sea Lease Sale 193, EPA Project # 05-049-MMS

Dear Mr. Goll:

We have reviewed BOEMRE's Draft Supplemental EIS for Chukchi Sea Lease Sale 193. Our review of the EIS was conducted in accordance with our responsibilities under National Environmental Policy Act (NEPA) and Section 309 of the Clean Air Act. Section 309 specifically directs the EPA to review and comment in writing on the environmental impacts associated with all major federal actions. Under our Section 309 authority, our review of the EIS considers the expected environmental impacts as well as the adequacy of the EIS in meeting procedural and public disclosure requirements of NEPA.

EPA recognizes that the limited scope of the EIS (evaluation of natural gas development and production, and missing or incomplete information and cost) is in response to the U.S. District Court, District of Alaska order. This order directed BOEMRE to address these deficiencies identified in the initial EIS.

We believe that BOEMRE has produced a succinct document that clearly addresses these deficiencies. We are particularly pleased with the methodical and understandable analysis of incomplete or missing information in Appendix A. We also believe the process employed by your agency fully meets the intent of the Council of Environmental Quality's requirements for such situations. Additionally, the analysis of potential impacts from possible gas exploration, development and production is quite thorough, with clear indication of relatively minor impacts (with the potential exception of unknown archeological resources) from such activities.

Based on our review and, in part due to the limited scope of the analysis, we have assigned a rating of LO (Lack of Objection) to this EIS. A summary of our rating system is enclosed.

If you have any questions concerning our rating, please contact Jennifer Curtis of my staff in Anchorage at 907-271-6324 or by email at curtis.jennifer@epa.gov. Thank you for the opportunity to review this EIS.

Sincerely,

Christine B. Reichgott, Manager
Environmental Review and Sediment Management Unit

Enclosure

MARINE MAMMAL COMMISSION

6 December 2010

U.S. Environmental Protection Agency Rating System for
Draft Environmental Impact Statements
Definitions and Follow-Up Action*

Environmental Impact of the Action

LO – Lack of Objections

The U.S. Environmental Protection Agency (EPA) review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC – Environmental Concerns

EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce these impacts.

EO – Environmental Objections

EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no-action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU – Environmentally Unsatisfactory

EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

Adequacy of the Impact Statement

Category 1 – Adequate

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis of data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2 – Insufficient Information

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses or discussion should be included in the final EIS.

Category 3 – Inadequate

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the National Environmental Policy Act and or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

Mr. John T. Goll, Regional Director
Alaska Outer Continental Shelf Region
Bureau of Ocean Energy Management, Regulation, and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503-5820

Dear Mr. Goll:

The Marine Mammal Commission, in consultation with its Committee of Scientific Advisors on Marine Mammals, has reviewed the Draft Supplemental Environmental Impact Statement for the Chukchi Sea Planning Area Oil and Gas Lease Sale 193. The Bureau prepared the draft statement as a supplement to its 2007 Final Environmental Impact Statement for Oil and Gas Lease Sale 193 and Seismic Surveying Activities in the Chukchi Sea. The Commission also has reviewed the Bureau's 5 October 2010 *Federal Register* notice (75 Fed. Reg. 61511) requesting comments. When appropriate, the Commission will comment in detail on site-specific activities associated with oil and gas operations in the Chukchi Sea Planning Area. For now, the Commission offers the following recommendations and rationale.

RECOMMENDATIONS

The Marine Mammal Commission recommends that the Bureau of Ocean Energy Management, Regulation, and Enforcement—

- consider and adopt a slow, phased approach to oil and gas development in the Chukchi Sea Planning Area by limiting initial operations to one or two active lease areas until the Bureau, industry, and all responsible parties have demonstrated their ability to conduct oil and gas operations safely in this region, have developed means for responding to oil spills in icy waters, and have collected needed baseline information on the marine wildlife and habitat at risk from such operations;
- strengthen its supplemental environmental impact statement by providing a more complete description of the added risks associated with natural gas extraction, including a large-scale spill or loss of well control, prolonged use of platforms in the harsh Arctic environment, and construction and maintenance of the proposed gas pipeline;
- work with other agencies with related responsibilities, the oil and gas industry, conservation organizations, and other stakeholders to develop standards and seek resources for baseline research and monitoring in areas under consideration for oil and gas development, including the Chukchi Sea Planning Area; such standards must take into account the rapidly changing conditions in the Arctic; and
- work with the Department of Energy and related agencies to develop a national energy policy that will reduce the environmental risks being imposed by the nation's current dependence on oil and gas for energy.

RATIONALE

The purpose of an environmental impact statement prepared under the National Environmental Policy Act is to inform decision-makers and the public about the environmental risks associated with various alternative approaches to a proposed federal action, including a no-action alternative. From the Commission's perspective, the three main concerns or issues associated with oil and gas development in the Chukchi Sea Planning Area are (1) a major spill that exposes the Chukchi and Beaufort Sea ecosystems to large amounts of crude oil, (2) a long-term, cumulative degradation of those ecosystems to the extent that species (including some that are threatened or in danger of extinction) abandon preferred habitat or are otherwise adversely affected by habitat degradation, and (3) a shift in the distribution of wildlife, including marine mammals, such that they are less readily available to Alaska Natives for subsistence. Whether and to what extent these concerns are realized in the Chukchi Sea may well depend on the spatial and temporal pattern of oil and gas development in the areas included in lease sale 193.

After reviewing the subject documents, the Commission believes that the most environmentally cautious way to manage oil and gas development in the Chukchi Sea is through a slow, phased approach that initially limits the amount of oil and gas development to one or two active lease areas until the responsible agencies have collected essential baseline information on the wildlife and habitat in the Chukchi Sea Planning area, the industry has demonstrated its ability to produce oil and gas safely in such a harsh environment, and the agencies and industry together have developed more reliable means to mitigate and monitor the ever-present risks and respond effectively to a large-scale accident. Such an approach would allow the Secretary of the Interior to pursue oil and gas development as required under the Outer Continental Shelf Lands Act but would balance that development against environmental risk by proceeding slowly and cautiously.

The coastal-offshore distinction that forms the basis for the alternatives reflects a continuum of risks from oil and gas operations, including—

- the propensity for wildlife and habitat disturbance during exploratory drilling, construction, and production;
- the likelihood of oil from a major spill contacting wildlife (marine mammals, seabirds, fish, invertebrates) and habitat, including polynyas and leads off the northwestern coast of Alaska and productive benthic communities located offshore;
- the nature and degree of weathering of spilled oil before it reaches particularly sensitive areas and, therefore, the nature of the risks that weathered oil poses to those areas or the wildlife dependent upon them;
- the potential for disruption of subsistence hunting;
- the length of oil and gas pipelines from platforms to shore and the implications for a pipeline accident involving oil, gas, or both; and
- the ability of industry, the Coast Guard, and others to respond to a spill.

These and other considerations all pertain to the nature and extent of risk from oil and gas activities to the Chukchi Sea marine ecosystem. Still, the Commission recognizes that the Secretary must balance the environmental risks against our nation's energy needs. To achieve that balance, the

Marine Mammal Commission recommends that the Bureau of Ocean Energy Management, Regulation, and Enforcement consider and adopt a slow, phased approach to oil and gas development in the Chukchi Sea Planning Area by limiting initial operations to one or two active lease areas until the Bureau, industry, and all responsible parties have demonstrated their ability to conduct oil and gas operations safely in this region, have developed means for responding to oil spills in icy waters, and have collected needed baseline information on the marine wildlife and habitat at risk from such operations.

The Environmental Impact of Natural Gas Development

One area where the Commission believes that the Bureau could strengthen the supplemental environmental impact statement is in its description of the risks associated with natural gas development. On this topic, the supplemental impact statement provides little information and then argues that the lack of information is not a concern because any relevant information would not help distinguish between the action alternatives. Here the Commission disagrees with the Bureau for the following reasons. First, if one of the major concerns with regard to oil and gas development is a blowout or loss of well control, then the Bureau should provide a description of the added risk associated with producing both oil and gas during the later stages of oil extraction. How are both oil and gas extracted simultaneously, and how does the extraction of the gas affect the probability of a serious accident? If gas production adds appreciably to the risk of a blowout or loss of well control, then decision-makers should take that added risk into account when determining when and where drilling will be allowed.

Second, what are the added risks associated with the shift from a primary focus on extraction of oil to extraction of gas, which will require extending the life of the platforms for several more decades? Given the harsh conditions in which these platforms are built and maintained, how does the addition of several decades of operation affect the risks of a platform failure?

Third, when and how will the additional pipeline for gas be built and how will that affect the risks to the environment? If the gas pipeline is constructed concurrently with the oil pipeline, does it simply lie inactive for 10 to 20 years before it is used and, if so, how does that affect the integrity of the pipeline and the risk of an accident? If it is constructed just prior to the initiation of gas recovery operations, then the impact statement should account for the additional disturbance caused by the second construction period.

Each of these considerations may not help decision-makers distinguish between the action alternatives, but they do help decision-makers account for the full effects of the proposed operations and thereby distinguish between the no-action and action alternatives. Because the no-action alternative should be considered seriously, the Marine Mammal Commission recommends that the Bureau of Ocean Energy Management, Regulation, and Enforcement strengthen its supplemental environmental impact statement by providing a more complete description of the added risks associated with natural gas extraction, including a large-scale spill or loss of well control, prolonged use of platforms in the harsh Arctic environment, and construction and maintenance of the proposed gas pipeline.

Gathering Missing Information

In general, anticipating and preventing effects on marine mammals from oil and gas operations in the Chukchi Sea requires good knowledge of the species' population status; distribution and movements; ecology, habitat use, and behavior; and vulnerability to other risk factors. Some Arctic marine mammals (e.g., bowhead whales) have been relatively well studied, whereas others are still poorly understood and/or in a state of flux that makes it difficult to characterize their potential vulnerability to the proposed oil and gas operations (e.g., walrus). Therefore, much of the baseline information that is generally deemed essential for assessing (identifying and measuring) changes caused by human activities is lacking. Scientists attempting to assess the effects of the Exxon Valdez oil spill found that their analyses were confounded, if not made impossible, by lack of baseline information for some species. Similarly, baseline information for marine mammals in the Gulf of Mexico is proving inadequate for detecting and measuring potentially significant impacts from the Deepwater Horizon oil spill.

The methods for collecting such information exist and the costs of doing so are not exorbitant, particularly when viewed in the context of the billions of dollars involved in oil and gas development. Examples of methods for studying status include surveys or other means (e.g., mark-recapture) of estimating abundance and trends (e.g., Ashjian et al. 2010, George et al. 2004); satellite telemetry for characterizing distribution and movements (e.g., Quakenbush et al. 2010a, Quakenbush et al. 2010b); time-depth recorders, visual and acoustic surveys, and a wide variety of electronic tags for assessing habitat use (e.g., Laidre et al. 2002, Moore et al. 2010a); and observations of feeding animals and investigations of stomach contents for investigating prey and feeding behavior (e.g., Moore et al. 2010b, Lowry et al. 2004). Conducting such studies is certainly a challenge because of the difficulty of working in the Arctic environment, but the methods exist and are being applied. The major limitation has not been scientific or technological; instead, it stems from a failure to commit sufficient resources to these studies in advance of planned oil and gas development. Simply put, the failure to commit the resources needed to conduct such studies undermines our collective efforts to implement a science-based approach as we seek to limit the impacts of human activities on ocean resources.

The Commission has long argued that the industry and regulatory agencies have a responsibility to support the kinds of research needed to investigate the potential effects of oil and gas operations. In fact, the former Minerals Management Service has contributed significantly to marine mammal science over past decades. In recent years, the industry also has contributed significantly to such research. However, the resources provided still fall short of what is needed, and the Commission believes that the Bureau and the industry need to find additional means of supporting essential research. The industry, in particular, should provide more support because the risks stem from their activities and the amounts in question are trivial compared to the annual profits of oil and gas companies. Addressing these risks in a responsible manner should be considered a cost of doing business for this industry.

The Commission believes that the development of a rigorous program of scientific research on the wildlife and habitat in the Chukchi Sea Planning Area is well within our scientific capacity and would require the commitment of only a very small fraction of the total cost of developing and operating oil and gas facilities in this region. With that in mind, the Marine Mammal Commission

recommends that the Bureau of Ocean Energy Management, Regulation, and Enforcement work with other agencies with related responsibilities, the oil and gas industry, conservation organizations, and other stakeholders to develop standards and seek resources for baseline research and monitoring in areas under consideration for oil and gas development, including the Chukchi Sea Planning Area. Such standards must take into account the rapidly changing conditions in the Arctic. The Commission would be pleased to work with the Bureau to accomplish this goal.

The Bureau's Responsibility in Developing a National Energy Policy

Undoubtedly, oil and gas will continue to be major sources of energy for the United States for decades to come. However, the pattern that we are seeing is that oil and gas operations are shifting into areas where drilling and production impose increasing risks. Such drilling and production may be necessary, not just because of decisions made in the past year or even the past few administrations, but because for decades we as a nation have failed to develop and implement a national energy policy, despite the predictable complications that we are now facing. On a number of occasions, the Marine Mammal Commission has written to the former Minerals Management Service recommending that the Service work with the Department of Energy to develop a national energy policy that, over time, would result in a shift away from our reliance on oil and gas development in high-risk areas. To be sure, such a policy would not provide immediate relief from those risks but should put our nation on a path that reduces the risks faced by future generations. The Bureau and the Department of Energy already may be working on such a policy; if so, it would be useful to engage other agencies and the public to help shape and develop the policy and, particularly, to facilitate its implementation. To reduce the likelihood that future generations are faced with energy challenges similar to or worse than those we are facing now, the Marine Mammal Commission recommends that the Bureau of Ocean Energy Management, Regulation, and Enforcement work with the Department of Energy and related agencies to develop a national energy policy that will reduce the environmental risks being imposed by the nation's current dependence on oil and gas for energy.

The Commission hopes you find these recommendations helpful. Please contact me if you have questions about our recommendations or if we can provide any further assistance.

Sincerely,

Timothy J. Ragen, Ph.D.
Executive Director

cc: Michael R. Bromwich, Esq.

James Kendall
Acting Regional Director
Bureau of Ocean Energy Management,
Regulation and Enforcement
Alaska Outer Continental Shelf Region
3801 Centerpoint Drive, Suite 500
Anchorage, AK 99503-5823

Subject: Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) Draft Supplemental Environmental Impact Statement (Draft SEIS) for the Chukchi Sea Planning Area - Oil and Gas Lease Sale 193 in the Chukchi Sea.

Dear Mr. Kendall:

The National Marine Fisheries Service (NMFS) has reviewed the subject Draft SEIS which analyzes natural gas development and production scenarios and incomplete, missing, or unavailable information for Lease Sale 193. We apologize for commenting outside the public review period, but offer these comments from our Protected Resources Division, Habitat Conservation Division, and the Alaska Fisheries Science Center to assist in your decision-making process.

The Draft SEIS evaluates the four alternatives presented in the Alaska Outer Continental Shelf (OCS), Chukchi Sea Planning Area Oil and Gas Lease Sale 193 and Seismic Surveying Activities in the Chukchi Sea Final Environmental Impact Statement (FEIS), May 2007. Alternative I (Proposed Action) would lease 6,156 whole or partial blocks, which covers approximately 34 million acres within the Chukchi Sea. Alternative I would exclude the 25 Statute Mile buffer implemented by the Secretary in the Final OCS Leasing Program for 2007-2012. Alternative II (No Lease Sale) would not reaffirm Lease Sale 193. Alternative III (Corridor I Deferral) is the Proposed Action minus a corridor extending 60 miles offshore along the coastward edge of the proposed sale area in an attempt to reduce potential impacts to subsistence hunting and various wildlife species and habitats. This would lease approximately 1,765 whole or partial blocks comprising 9.1 million acres. Alternative IV (Corridor II Deferral) is the Proposed Action minus approximately 795 whole or partial blocks along the coastward edge of the sale area. The Corridor II deferral area is a subset of the Corridor I area.

Lease Sale 193 was held in February 2008 consistent with Alternative IV (Corridor II Deferral). BOEMRE notes however, that upon reviewing the Final SEIS, the Secretary will select one of the four alternatives in the Draft SEIS, which could reaffirm, cancel, or modify Sale 193.

ALASKA REGION - www.fakr.noaa.gov

National Marine Fisheries Service Comment

General Comments

As NOAA has commented in the past, we remain very concerned about potential impacts to living marine resources and their habitats, fisheries, and subsistence uses of marine resources as a result of lease sales, exploration, and development in the Chukchi Sea Planning Area (CSPA). The individual and cumulative effects of development in this relatively pristine environment could be significant. The Arctic waters are experiencing a change in oceanic condition, and the effects to marine resources and their movements are uncertain. Any proposals for development in this area should fully account for the associated environmental, economic, and social consequences to ensure the continued productivity of living marine resources for future generations.

In 2006, the North Pacific Fishery Management Council began considering options for fishery management in the Arctic. Ultimately, the Council decided to take a precautionary approach, voting to prohibit commercial fisheries in the Arctic Management Area (federal waters north of Bering Strait) until sufficient information on the Arctic marine environment is available to sustainably manage commercial fishing.

The Draft SEIS recognizes that not all Essential Fish Habitat (EFH) has been determined yet in the Chukchi Sea. For several life stages of various fish species in the Chukchi Sea NMFS simply does not have enough information to designate EFH. Such data gaps heighten the need to obtain a better understanding of the ecosystem and for BOEMRE to also take a precautionary approach regarding potential activities in the Chukchi Sea.

Marine Mammal Issues

NMFS is proposing to list four subspecies of ringed seals, found in the Arctic Basin and the North Atlantic, and two distinct population segments of bearded seals in the Pacific Ocean, as threatened under the Endangered Species Act. Please visit our website <http://www.fakr.noaa.gov/protectedresources/seals/ice.htm> for more information.

In Chapter II, **Alternatives, Mitigation Measures, and Issues in the 193 FEIS**, as part of the description of Alternative III (Corridor I Deferral), BOEMRE notes that this alternative is to protect important bowhead whale habitat used for migration, feeding, nursing calves, and breeding. NMFS concurs that Alternative III would provide some degree of impact reduction for the endangered bowhead whale, as this population migrates through the nearshore lead system of the sea ice during its spring migration into the Beaufort Sea. The spring lead system is one of the most sensitive environments for these whales. Alternative III would also afford some mitigation and avoidance for the Native villages along the Chukchi coast which depend on subsistence resources, especially marine mammals.

NMFS notes that the Draft EIS contains some misinterpretations or omission of existing scientific references that, when corrected, do not affect conclusions of the Draft SEIS. For example, on Page 27 the Draft EIS reads, "Because fall migrating bowhead whales are not expected to use the deferred area, fall bowhead encounters with oil and gas-related industrial noise and oil spills would be the same as for Alternative I (Proposed Action)." The 2008-2010 BOEMRE-sponsored COMIDA (Chukchi Offshore Monitoring in Drilling Area) marine

National Marine Fisheries Service Comment

mammal aerial surveys completed with NMFS have observed bowhead whales migrating within the deferred area during the fall. While the Final Report on COMIDA surveys has not been sent to BOEMRE, all of the information has been presented as Annual Reports which could be utilized to ensure the most current information is presented.

In Chapter III, **Description of the Environment**, the Draft SEIS information on bowhead whales use of lead systems to transit to summering grounds in the Canadian Beaufort Sea is no longer supported by the recent satellite tagging studies. NMFS recommends incorporating the information found in the BOEMRE-sponsored study "Satellite Tracking of Western Arctic Bowhead Whales." (Quakenbush et al. 2010).

NMFS has provided a more comprehensive list of current scientific information regarding marine mammals and their environment as an attachment to this letter.

Essential Fish Habitat

Section 305(b)(2) of the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) requires federal agencies to consult on all actions or proposed actions authorized, funded, or undertaken by the agency that may adversely affect EFH. If a federal action agency determines that an action will not adversely affect EFH, no consultation is required, and the federal action agency is not required to contact NMFS about their determination. Please see our website for more information: <http://www.fakr.noaa.gov/habitat/efh.htm>.

The Draft SEIS noted that in 2006 BOEMRE consulted with NMFS regarding the potential effects to EFH of all five species of Pacific salmon, and that no additional EFH consultation is required for Pacific salmon as result of the Draft SEIS. NMFS would like to note that as a result of that consultation, in a letter to BOEMRE dated January 30, 2007, we recommended that BOEMRE select Alternative III (Corridor I).

Since the FEIS in 2007, EFH has been identified for Arctic cod, saffron cod, and opilio crab in the Fishery Management Plan for Fish Resources of the Arctic Management Area adopted by the Secretary of Commerce in August 2009. BOEMRE states that the agency is "...currently assessing whether additional consultation is required for potential effects of Sale 193 on Arctic cod, saffron cod, and opilio crab EFH."

In a summary of past relevant completed EFH consultations, BOEMRE refers to a Supplemental EFH Analysis completed in 2010 for Arctic cod, saffron cod, and opilio crab. The supplemental EFH assessment that BOEMRE provided to NMFS on May 4, 2010, analyzed anticipated activities in 2010 (July-December) in the Beaufort Sea and Chukchi Sea that included exploration drilling for oil and gas, geophysical and geological surveys (2D/3D seismic surveys), and anticipated ancillary activities (site clearance surveys). However, due to the administration policy on offshore drilling at that time, the consultation only addressed proposed surveys and anticipated ancillary activities. This consultation clearly stated that it did not encompass any other current or future activities which were not analyzed in the provided EFH assessment. Also, BOEMRE noted that designated opilio crab EFH was located at least 160 km (100 miles) south of proposed activities and therefore no assessments of impacts were

considered for this species. Thus, the scope of this 2010 supplemental EFH assessment does not include all activities and Arctic EFH species covered in Lease Sale 193.

It was difficult to find a clear determination in the Draft SEIS stating whether BOEMRE's preferred alternative may adversely affect EFH. In the Summary of Impacts section for the Alternative I, BOEMRE described effects to EFH using such terminology as: "temporary to short-term and at a negligible level" and "minor adverse impacts". Under this section for Alternative III (Corridor I Deferral), BOEMRE notes that "all of the potential effect categories remain the same as the proposed action, but the anticipated impacts would be lower due to the setback from the coast." Under Alternative IV (Corridor II Deferral), BOEMRE comments that "the primary benefit of the deferral of Corridor II under Alternative IV is that it would move sources of potential adverse effects further away from important fish habitats".

The Magnuson-Stevens Fishery Conservation and Management Act and its implementing regulations at 50 CFR 600.920 use specific terms regarding the level of effect on EFH and what constitutes an adverse effect to EFH. NMFS recommends using exact terminology from the Magnuson-Stevens Act and its regulations in future decision making documents to avoid confusion between our agencies and to ensure that the public can ascertain if the Magnuson-Stevens Act consultation requirements have been satisfied. BOEMRE should also clearly state for each alternative whether the proposed action may adversely affect EFH and if any EFH consultation would be within the scope of our programmatic EFH Consultation for Lease Sales.

While not clearly stated, this Draft SEIS does imply that EFH may be adversely affected. NMFS agrees. In 2008, BOEMRE chose Alternative IV (smaller deferral area) instead of Alternative III (larger deferral area). NMFS has previously recommended the larger deferral area which allows for more protection of NMFS' trust resources.

BOEMRE did adopt the mitigation measures that were outlined in the Draft EIS for Lease Sale 193, Section II.B.3 (and in the Draft SEIS Section II.C.1), which NMFS recommended in the 2007 consultation. However, this Draft SEIS does not mention mitigation measures for seismic survey activities, whereas the Draft EIS for Lease Sale 193 specifically did in Section II.B.4 and B.4.a. Our January 30, 2007 EFH consultation for the Lease Sale 193 Draft EIS recommended that these specific mitigation measures for seismic survey activities be part of the final lease sale. It is not clear in any of the documents if these were indeed part of the final sale. If BOEMRE adopts both mitigation measures, as listed in Section II.B.3 and Section II.B.4 and B.4.a in the Draft EIS, no further EFH consultation with NMFS will be necessary. BOEMRE should notify NMFS of their decision regarding this matter.

Fish Resources

The Draft SEIS includes a review of all statements in the FEIS that dealt with missing or incomplete information and evaluates whether the statements are (1) relevant to identifying potentially significant effects and (2) essential to making a reasoned choice (section 1502.22 Analysis).

Sixteen of the statements reviewed in the 1502.22 analysis section dealt with potential effects of seismic exploration in the Lease 193 area on fish stocks. Of these, four statements were not

4

considered to be relevant to potentially significant effects. NMFS does not concur with the Draft EIS conclusion that the lack of empirical data to document potential impacts on fish populations from seismic surveys is not relevant to potentially significant effects. The actual statement notes that "experiments conducted to date have not contained adequate controls to allow us to predict the nature of a change or that any change would occur." This statement appears to be in contradiction to the response that the "available scientific information is sufficient to conclude that there will be no significant adverse effects." As such, NMFS believes this statement to be relevant and the lacking information is essential to making an informed decision. Thus, it seems the next step would be to address the issue of whether the cost to obtain the missing information is exorbitant, or the means of doing so unclear.

NMFS recommends BOEMRE consider two additional references in addition to the citation of Mecklenburg, Mecklenburg, and Thorsteinson, 2002 when describing the fish resources of the Alaskan Chukchi and western Beaufort seas:

1. Fautin et al. (2010) An Overview of Marine Biodiversity in United States Waters. PLoS ONE 5(8): e11914. doi:10.1371/journal.pone.0011914
2. Mecklenburg, C.W., D.L. Stern, B.A. Sheiko, N.V. Chernova, T. A. Mecklenburg, B.A. Holladay. 2007. Russian-American long-term census of the Arctic: benthic fishes trawled in the Chukchi Sea and Bering Strait, August 2004. *Northwestern Naturalist*. 88:168-187.

Recent work by Nahrung and Camus on polar cod may prove helpful in better understanding and describing responses to oil exposure: Nahrung, J., L. Camus, et al. (2010). "Biomarker responses in polar cod (*Boreogadus saida*) exposed to the water soluble fraction of crude oil." *Aquatic Toxicology* 97: 232-242.

Additionally, recent nearshore and intertidal research has been conducted in limited locations near Barrow (see <http://alaskafisheries.noaa.gov/habitat/fishatlas/default.htm>)

Socioeconomic Concerns

The Draft DEIS contains a good overview of the cultural and economic value of subsistence and would benefit from including the nutritional contribution to subsistence-reliant communities. Within the Subsistence Harvest Patterns section, the analysis uses colloquialisms to describe measures and terms. While this increases the readability of the document, the meanings of some of the terms are ambiguous. For example, "hunting effort" is used as a measure of resource importance with no description of what constituted this effort; and the bowhead whale is identified as "of primary importance," with no basis for this ranking. Finally, Latin binomials for species would provide clarification to local terms for hunted animals.

The Subsistence-Harvest Patterns section does not address the concern of bioaccumulation of contaminants. We believe that this important topic should be addressed in either this section, or in the cumulative effects section given the relevance and potential human health effects of long term exposure. Contaminant releases into the water are discussed elsewhere along with water quality standards; however it is known that water quality standards based on seafood consumption in the average American diet are not adequate for assessing exposure risks in tribal

5

communities where seafood consumption may be a magnitude of order greater than that used in the models.

Finally, the statement on Page 101, "Because of the nearly homogeneous Inupiat population, it is not possible to identify a 'reference' or 'control' group within the potentially affected geographic area (for purposes of analytical comparison) to determine if the Inupiat are affected disproportionately" is a questionable interpretation of the Environmental Justice Executive Order that would negate a large proportion of Environmental Justice Analyses conducted to date.

Additional Comments

The Draft SEIS does not analyze the potential introduction of marine invasive species under the Cumulative Impacts section. Few industrial activities occur in the CSPA currently. The risk of invasive species being introduced from drilling equipment, ballast water of large tankers, etc. would increase with OCS development in these areas.

The Draft SEIS does not examine the effects of natural gas development and production on any unique habitat areas, such as Hanna Shoal, which are present in the lease sale area. It is important for other agencies and the public to understand what special areas may be present, how they function in the ecosystem, and how they may be impacted.

Oil spill clean-up in the broken ice and open water conditions that characterize Arctic waters is problematic. BOEMRE acknowledges that the larger deferral area would allow more time to respond to any potential oil spills before they reach the bowhead spring-migratory route and sensitive coastal resources. The greater distance would also potentially allow for increased weathering of oil before it reaches these areas. Given the difficult and unique challenges in responding to potential spills in the Arctic environment, these factors could be vital during a response and should factor heavily in BOEMRE's examination of alternatives for this sale.

Conclusion

As BOEMRE notes under the Summary of Impacts for Alternative III, the greatest net ecological benefits to EFH would accrue from this alternative because it contains the largest deferral area. Alternative III also offers a larger migration corridor for marine resources, including those that are important to subsistence activities. BOEMRE recognizes in the Summary of Environmental Impacts that "...any differences in the potential environmental impacts associated with the gas development and production under each action alternative analyzed are directly traceable to the size and location of proposed deferrals". Alternative III would protect nearshore marine resources and reduces the potential for a catastrophic event to impact benthic habitats, migratory current corridors, and nearshore estuarine habitats. It would also increase the distance between sensitive nearshore areas and any discharges, emissions, and noise associated with drilling and platform installation and operations.

BOEMRE's online graphic (http://www.alaska.boemre.gov/Maps/Sale_193_leases_issued.pdf) depicts the areas leased as a result of Sale 193. Although the Draft SEIS does not examine the issue of how many leases have already been issued within Corridor I, the graphic does not show

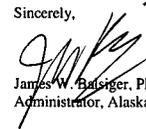

6

many leased tracts within the 60 mile buffer zone. From this graphic, it appears that most industry interest (with a few exceptions) lies well offshore and outside of Corridor I.

NMFS recommends that BOEMRE modify Lease Sale 193 and adopt Alternative III (Corridor I Deferral) given that the larger corridor offers a precautionary approach to afford protection of marine resources in a data limited environment.

Should you have any questions, please contact LT Amy Cox by email at amy.b.cox@noaa.gov or by telephone at (907) 271-6620.

Sincerely,

James W. Balsiger, Ph.D.

Page numbers in square brackets refer to those in the Draft SEIS.

I. Misinterpretation or omission of existing scientific references that, when corrected, do not affect conclusions of the Draft SEIS.

- A. [p. 27, and similar comment on p. 30] "Because fall migrating bowhead whales are not expected to use the deferred area, fall bowhead encounters with oil and gas-related industrial noise and oil spills would be the same as for Alternative I (Proposed Action)."
- The 2008-2010 BOEMRE-sponsored COMIDA (Chukchi Offshore Monitoring in Drilling Area) marine mammal aerial surveys have in fact observed bowhead whales migrating within the deferred area during the fall. The following figure is from OCS Study BOEMRE 2011-06 (in prep):

Bowhead whale sightings per month, on- and off-effort, 2008-2010 combined.

B. [p.40] "Bowhead whales are unique in their ecology and their obligate use of lead systems to transit to summering grounds in the Canadian Beaufort Sea..."

- Due to recent satellite tagging studies, this is now known to be false. The following excerpt came from p. 54 of Quakenbush et al. 2010 (OCS Study BOEMRE 2010-033):

1 Clarke, J.T. and M.C. Ferguson. Large whale aerial surveys in the northeastern Chukchi Sea, 2008-2009, with review of 1982-1991 data. Paper SC/62/BRG13 presented to the IWC Scientific Committee, June 2010 (Unpublished).

"Sea ice is generally assumed to limit the distribution of bowhead whales. However, even though the Beaufort Sea has virtually 100% ice cover when bowhead whales migrate through in the spring, ice does not seem to limit the movements of tagged whales between Barrow and Amundsen Gulf (e.g., Fig. 23). There must be enough openings and thin ice to allow whales to travel straight from Barrow to Amundsen Gulf without lingering and waiting for leads to open. Likewise, sea ice within the Bering Sea does not seem to limit the movements of tagged whales.

"Bowhead whales wintering in the Bering Sea were believed to be restricted to polynas or the ice edge (Ainana et al. 1997, Brueggeman 1982). We found that whales used areas with 100% ice cover, even when polynas were available (Figs. 17 and 18). However, land-fast ice does seem to limit the distribution of bowhead whales. For example, in the spring of 2009, six bowheads migrated to Amundsen Gulf, which was filled with land-fast ice. The whales remained at the ice edge until the gulf cleared of land-fast ice (Fig. 24)."

- However, this does not discount the importance of the coastal region in the northeastern Chukchi Sea to bowheads during the spring migration, as Quakenbush et al. (2010) state on p. 29: "Bowhead whales traveled mostly parallel and within 40 km of the Alaskan coast during the spring migration."

- Quakenbush et al (2010) state on p. 53 that they suggest that this variability in the width of the bowhead migratory corridors is "linked to variability in forage conditions."

C. [p. 40] "In many years, large numbers of bowheads have been observed feeding in the western Chukchi Sea."

- It should be added that the northeastern Chukchi Sea is a foraging area for some bowheads during some years. The following excerpt and figure are from Clarke and Ferguson (2010)²
"Most bowhead whales were recorded as engaged in directional swimming (59%). Feeding behavior was rarely recorded on-effort and is likely underrepresented in the database due to the difficulty of identifying this behavior in the brief periods of time allowed during transects. Bowhead whale feeding behavior was recorded off-effort (while on search or circling) in two years during this study, under very different circumstances. In 1983, a heavy ice year, nine bowheads were observed feeding on 17 and 18 October (Figure 5) in 70-80% ice cover. In 2009, a light ice year, bowhead whales were observed feeding from 30 June to 11 July near Pt Franklin, and at least one easily re-identifiable whale was present during this 13-day period. Ice cover at this time ranged from 5% to 80%. A group of at least 12 bowheads was also observed feeding southwest of Pt Barrow on 19 September 2009 when no ice was present."

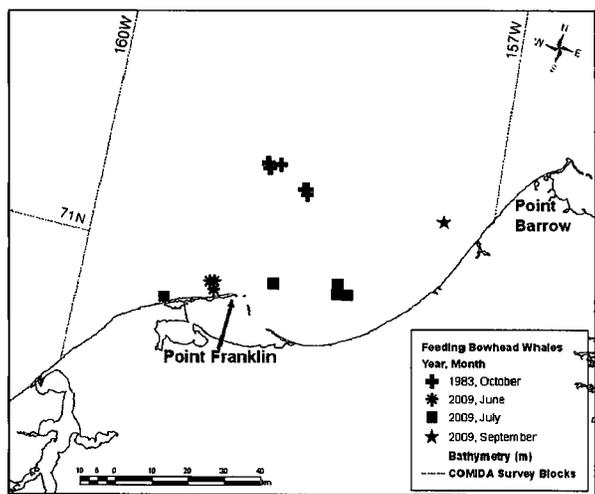

Figure caption from Clarke and Ferguson (2010): "Locations of on- and off-effort feeding bowhead whales, 1983 and 2009."

D. [p. 51] "The northeastern-most recurring known gray whale feeding area is in the Chukchi Sea southwest of Barrow (Clarke, Moore, and Ljungblad, 1989). Gray whale feeding habits in the northern Chukchi Sea appear limited to shoal and coastal waters and their selection of shoal and coastal habitat is greatest in the summer (Moore et al., 2000). Shallow coastal areas and offshore shoals provide habitat rich in gray whale prey."

- The first sentence is a misrepresentation of the findings in Clarke et al. 1989. Clarke et al. 1989 noted gray whales feeding off Hanna Shoal, which is located at the northern boundary of the CSPA.
- The last sentence is not accurate, based on COMIDA marine mammal aerial surveys conducted in 2008, 2009, and 2010. The following quote was taken from OCS Study BOEMRE 2011-06, which is the final report for the COMIDA marine mammal aerial surveys conducted in the CSPA from 2008-2010:
"The relative lack of gray whale sightings (and mud plumes, which are indicative of the presence of feeding gray whales) offshore was markedly different from that documented during surveys conducted from 1982-

1991, when gray whales were frequently seen on Hanna Shoal (Moore and Clarke, 1992²)."

- Taken together, we think it is more appropriate to say that gray whales are known to feed in offshore shoals at least as far north and west as Hanna Shoal (located at the northern end of the CSPA) in the time period from 1982-1991; however, recent aerial surveys have found an apparent shift in distribution, with no gray whales seen in the offshore shoals in 2008, 2009, and 2010.

E. The following two instances refer to minimal survey altitudes in order to minimize disturbance to walrus:

- [p. 88] "Researchers conducting aerial surveys for walrus in sea-ice habitats have reported little reaction to aircraft above 1,500 ft (457 m), meaning that BOEM's minimum altitude requirements would preclude adverse impacts to walrus, to the extent that human safety considerations permit flying at this altitude."
- [p. 96] "Researchers conducting aerial surveys for walrus in sea ice habitats have reported little reaction to aircraft above 1,000 ft (305 m)."

However, the 2010 Annual Report to BOEMRE for the COMIDA marine mammal aerial survey project stated the following:

"In early August, walrus were distributed throughout the survey area north of latitude 71°N, both in the water and hauled out on the few remaining scattered ice floes. In late August, most walrus were very near shore between Pt. Lay and Barrow, Alaska. On 30 August, several large walrus haulouts on the coast were documented by the COMIDA team. Walrus were observed at three haulouts located 22 miles east of Cape Lisburne, comprising an estimated 2,500, 1,000 and 200 animals each (Figure 9). These haulouts were on narrow beaches along rocky cliff faces. Despite the aircraft maintaining a survey altitude of 1,500 ft and avoiding direct overflight of the animals, walrus in the smallest aggregation seemed to respond to the aircraft by flushing into the water."

The COMIDA surveys found that the reaction of hauled out walrus to the survey aircraft depended on the following factors: 1) whether the aircraft passed by the haulout over water or over land; and 2) the terrain near the haulout, with evidence that a stronger response was solicited from animals in haulouts near cliffs compared to those along open coastlines. Therefore, we believe this issue of a minimum altitude for aircraft in the vicinity of walrus to fly without causing disturbance should be given more attention.

II. Misinterpretation or omission of existing scientific references that, when corrected, could affect conclusions of the Draft SEIS.

A. Expected effectiveness of mitigation measures for marine mammals

- [p. 20; similar statement made on p. 110] "While the complexity of how marine mammal species react to underwater and above water sound renders an exact determination of potential adverse impacts difficult, abundant regulatory review and careful design of mitigation measures are expected to preclude instances of level A, or "harm" take of marine mammals and to reduce the potential for level B or "harassment" take."
 - What reference supports the claim that the proposed mitigation measures are effective in reducing the potential for level B harassment? BOEMRE should substitute the term "injury" for "harm" as the latter term is not

² Moore, SE and JT Clarke. 1992. Distribution, abundance and behavior of endangered whales in the Alaskan Chukchi and western Beaufort Seas, 1991: with a review 1982-91. Prepared for Minerals Management Service, OCS Study MMS 92-0029.

contained in the Marine Mammal Protection Act. Likewise, when referring to "Level B" take, we suggest you state "Level B or 'behavioral harassment' take".

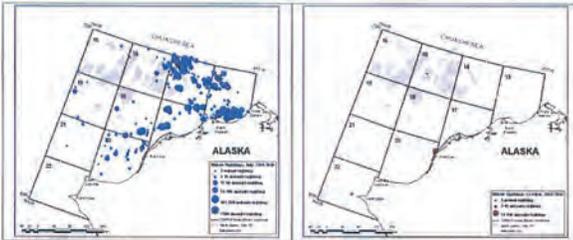

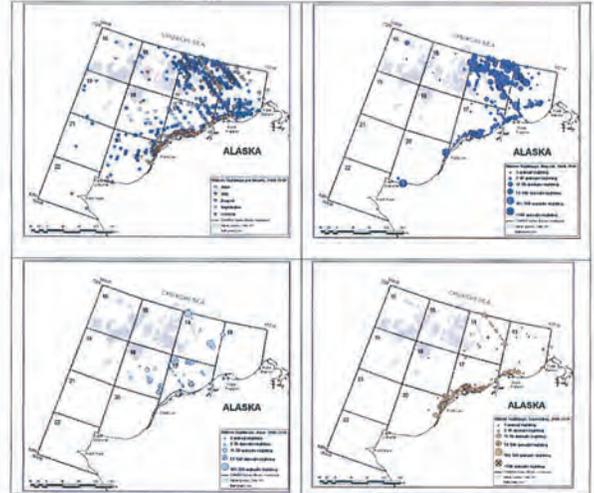

- The report entitled, "Expert Panel Review of Monitoring and Mitigation Protocols in Applications for Incidental Take Authorizations Related to Oil and Gas Exploration, Including Seismic Surveys, in the Chukchi and Beaufort Seas,"³ which was written in 2010 by the peer-review panel that NMFS Office of Protected Resources convened to review all IHA applications for 2010, discussed weaknesses in existing mitigation and monitoring methods for marine mammals. In light of the peer-review panel's report, we recommend that BOEMRE include additional explanation to support its contention that the mitigation measures critiqued by the panel are effective.
- B. [p. 30] "The primary benefit of this corridor is that it would move sources of potential adverse effects further away from important coastal habitats. The increased distance between offshore development and coastal habitats also could slightly decrease the percent chance of spilled oil contacting marine mammals, increase weathering of spilled oil prior to contact coastal habitats, and increase available spill-response time."
- True only for coastal habitats. Polar bears, walrus, and ice seals prefer sea ice habitats, which are located offshore. Alternatives III (Corridor I deferral) and IV (Corridor II deferral) provide no additional protection to marine mammals associated with sea ice habitats.
- C. [p. 31] "Because potential launch points for oil spills would move seaward, time for spilled oil to weather and time to mount an oil-spill response would be increased. Consequently, the effects on subsistence-harvest patterns would be expected to be reduced."
- This is true only for landfast or shorefast ice-based hunts. Need to contact North Slope Borough or the Alaska Eskimo Whaling Commission to find out how far offshore bowheads are hunted. The bowhead hunt might occur within the boundaries of the regions in which drilling is permitted under Alternatives III and IV.
- D. [p. 48] "Walrus rely on sea ice as a substrate for resting and giving birth (Angliss and Outlaw, 2005) and generally require ice thicknesses of 50 cm or more to support their weight (Fay, 1982). When suitable pack ice is not available, walrus will haul out on land, preferring sites sheltered from wind and surf. Traditional haulout sites in the eastern Chukchi Sea include Cape Thompson, Cape Lisburne, Icy Cape, and the barrier islands off of Kasegaluk Lagoon. In low ice years, when the pack ice retreats northward of the continental shelf, walrus come ashore to rest and remain near foraging areas. By August, depending on the retreat of the pack ice, walrus are found farther offshore, with principal concentrations to the northwest of Barrow. As the pack ice advances at the

³ <http://www.nmfs.noaa.gov/pr/pdfs/permits/openwater/panel2010.pdf>

end of the summer open-water season, large herds begin moving back down to the Bering Sea."

- This information on coastal walrus haulouts is outdated and missing significant changes in walrus behavior in the northeastern Chukchi Sea over the past few years. The following excerpt and figures are from OCS Study BOEMRE 2011-06, which is the final report for the COMIDA marine mammal aerial surveys conducted in the CSPA from 2008-2010. Note, in particular, the large numbers of walrus hauled out on land in August and September in the figures below:

"Walrus were seen every month except November (Figure 14; Table 1). Distribution was associated with sea ice coverage in June through early August, and shifted to nearshore habitat, both in the water and in coastal haulouts, in late August and September. Few walrus were seen in the study area in October of any year. Coastal haulouts were not reported in 2008, when sea ice remained in the COMIDA study area throughout summer and autumn (NSIDC, 2008). Haulouts were reported in autumn 2009 (Appendix 2) and 2010 (Appendix 3) when sea ice retreated far offshore."

E. [p. 110] "Available data indicates that noise and disturbance from oil and gas exploration and development activities since the mid-1970's have had localized, short-term adverse effects and no lasting population-level adverse effect on bowhead whales. There is no indication that human activities (other than historic commercial whaling) have caused long-term displacement in bowheads."

- A statement like this should be supported with references. Specifically, what data? What methods were used to analyze the data?
- This excerpt seems to contradict the following statement from the Final EIS for Lease Sale 193 (p. V-20 in OCS EIS/EA MMS 2007-026):
"There are not sufficient data about past human activities, including, but not limited to, past offshore oil and gas-related seismic surveys, or ice-management activities, to address whether there are any long-term impacts on [bowhead whale] behavior from such activities in either evaluation area."
- The quote from p. V-20 of the FEIS is a more accurate representation of the scientific evidence.
- The previously-mentioned 2010 report⁴ from the NMFS Office of Protected Resources peer-review panel acknowledged this lack of information, and recommended that industry should "accommodate specific requests for raw data, including tracks of all vessels associated with the operation and activity logs documenting when and what types of sounds are introduced into the environment by the operation."

**Re: Comments on the Chukchi Sea Planning Area Oil and Gas Lease Sale 193
Draft Supplemental Environmental Impact Statement (75 Fed. Reg. 63504
(Oct. 15, 2010)).**

Dear Mr. LaBelle,

Thank you for the opportunity to provide input on the Bureau of Ocean Energy Management, Regulation and Enforcement's (BOEMRE) Supplemental Draft Environmental Impact Statement (SDEIS) for Lease Sale 193. These comments are submitted on behalf of the Alaska Eskimo Whaling Commission (AEWC). The AEWC represents the eleven bowhead whale subsistence hunting villages of Barrow, Nuiqsut, Kaktovik, Point Hope, Wainwright, Kivalina, Wales, Savoonga, Gambell, Little Diomedé, and Point Lay. Our villages rely on the living resources of the Beaufort and Chukchi Seas for the majority of our food and for the continuation of our subsistence society and culture.

The AEWC was formed by the whaling captains of our constituent villages in 1980, for the purpose of protecting our bowhead whale resource and subsistence hunt. We carry out our responsibilities through locally-delegated tribal authority and through federal authority delegated pursuant to the NOAA-AEWC Cooperative Agreement. Alaskan Native subsistence takes of marine mammals are exempt from the Marine Mammal Protection Act's (MMPA) moratorium on the take of marine mammals. MMPA 101 (b). In addition, Congress has given our subsistence livelihood priority over other uses of the marine environment, requiring that other users mitigate the impacts of any activities with the potential to adversely affect the availability of our subsistence resources. Our communities potentially face very significant impacts from oil and gas exploration and development in the Chukchi Sea. Therefore, the AEWC must insist that

1

Alaska Eskimo Whaling Commission Comment

the proposed action. 40 C.F.R. § 1502.9(c)(1). Here BOEMRE has significant new information regarding bowhead whale migratory patterns in the Chukchi Sea and oil spills and well blowouts that was not disclosed or analyzed in the SDEIS.

Significant New Information About Bowhead Whale Use Of The Chukchi Was Not Included In The SDEIS. In its rush to justify why further information is not necessary for a reasoned decision, BOEMRE skipped over new and incredibly relevant information regarding bowhead whale use of the Chukchi Sea. This new information includes: ADPFG, et al. Satellite Tracking of Western Arctic Bowhead Whales (July 2010) (DOI/BOEMRE is listed as the funding agency); Quakenbush, et al. Fall and Winter Movements of Bowhead Whales in the Chukchi Sea (2009); and NMFS's July 2010 Biological Opinion for Oil and Gas Activities in the Beaufort and Chukchi Seas. According to these scientific studies *almost every single bowhead whale in the Western Stock passes through the proposed lease sale area during the fall migration.*

This information was not known when the original EIS was prepared for Lease Sale 193. BOEMRE now has significant new information about how bowhead whales use the lease sale area. Nevertheless, the agency failed to disclose and analyze the impacts to bowhead whales in light of this information. As a result, BOEMRE must prepare another NEPA document that takes a hard look at bowhead whale use of the lease sale area and considers new alternatives based on the extensive use of the lease sale area by bowhead whales during the fall migration. AEWC asks that BOEMRE provide for public comment on that analysis before deciding whether to move forward with the lease sale.

Significant New Information From The Deepwater Horizon Catastrophe Was Not Included In The NEPA Process. The on-going catastrophic in the Gulf of Mexico as a result of the Deepwater Horizon blowout has yielded significant new information and circumstances that are relevant to Lease Sale 193. The Council on Environmental Quality has stated that "[t]o the extent that the effects of a catastrophic spill have been projected or modeled, that analysis would have to be compared to the effects of this spill to provide current information to the decisionmaker."¹ CEQ Report Regarding the Minerals Management Service's National Environmental Policy Act Policies, Practices, and Procedures as They Relate to Outer Continental Shelf Oil and Gas Exploration and Development at 34 (August 16, 2010).¹ Nevertheless, BOEMRE has not considered this information and new circumstances in its supplemental analysis.

The Range Of Alternatives In The SDEIS Is Unreasonable. The new information pertaining to bowhead whale use of the proposed lease sale area and of the inadequacies of BOEMRE's previous oil spill analyses requires the development of new alternatives. Currently, as BOEMRE acknowledges, all the alternatives would result in similar environmental impacts. Therefore, it is clear by the agency's admissions that it has failed to present a reasonable range of alternatives. At the least, BOEMRE needs to consider alternatives that put in place time and area restrictions to protect migrating bowhead whales.

¹ Available at: <http://www.whitehouse.gov/sites/default/files/microsites/ceq/20100816-ceq-mms-ocs-nepa.pdf>

3

BOEMRE undertake careful review and thorough analysis of potential impacts from the proposed lease sale, and that the agency ensure that all impacts with the potential to affect the availability of our subsistence resources be mitigated properly under the terms of the MMPA.

On remand, the District Court of Alaska has instructed the agency (1) to disclose potentially relevant scientific information not available during the NEPA review and to analyze whether that information could be necessary for the lease sale decision, and (2) to analyze the impacts of natural gas development in the lease sale area. Unfortunately, in the resulting SDEIS, BOEMRE offers an empty exercise designed to address the letter but not the intent of the court order. Similarly, and inexplicably, the agency ignores its own research providing important new information about bowhead whale use of the lease sale area. Specifically, a five-year report on a bowhead whale satellite tagging study funded by BOEMRE was published in July 2010, two months before the SDEIS was finalized. Virtually every whale tagged during the five-year period migrated through the lease sale area; some whales moved through the area multiple times in a season. The information from this study was available to BOEMRE throughout its review for the SDEIS; it was updated regularly on the study's website prior to publication of the study; and it is important to the lease sale decision, certainly from the perspective of the agency's analysis of marine mammal impacts. Yet there is no mention of this work at all in the SDEIS.

In addition to the above, the AEWC would like to bring to your attention the fact that the SDEIS continues the MMS's practice of assuming that our villages could sustain up to two years of a potentially serious reduction in food supply without experiencing a significant impact from development.

Finally, BOEMRE, continuing the practice of MMS, supports its recommended alternative by asserting that impacts to our subsistence livelihood will be addressed through "conflict avoidance measures." Yet BOEMRE also continues MMS's practice of not requiring that lessees adhere to the Open Water Season Conflict Avoidance Agreement, which specifies negotiated and reasonable

It is the AEWC's sincere hope that during the current Administration we might see greater integrity and a higher quality of work from your agency. Unfortunately, this hope is not realized in the SDEIS.

I. SUMMARY OF THE COMMENTS

The Remand Order And NEPA Were Not Complied With. As an initial matter, BOEMRE missed the point of the remand and of the National Environmental Policy Act (NEPA) in the SDEIS. The pages and pages of nothing in the SDEIS do nothing to address our concerns about impacts to subsistence resources and missing information and certainly, they fail to provide the analysis required by NEPA and the Council on Environmental Quality (CEQ)'s regulations.

BOEMRE Has An Independent Duty To Analyze Significant New Information And Circumstances And Has Failed To Carry Out That Duty. NEPA requires the preparation of a supplemental EIS when significant new circumstances or information emerges that is relevant to

2

Alaska Eskimo Whaling Commission Comment

The Significance Thresholds Are Unlawful. The threshold BOEMRE is using to define a significant impact fails to comport with NEPA. The SDEIS includes a plethora of impacts to natural and subsistence resources, including the harm to cetaceans from noise and potential oil spills that the agency concludes do not warrant concern. For example, the agency discusses several potentially serious impacts to whales from noise, pipelines, and oil spills. *See e.g.,* SDEIS at 79-80. Serious impacts to whales could be devastating to our communities who rely on whales for our survival, yet the agency concludes that there will be no "major adverse impacts" to Alaskan natives. SDEIS at 103.

Moreover, the agency makes unrealistic assumptions about how Inupiat can mitigate these potentially significant impacts without actually explaining how these mitigation measures would be possible. For example, the agency assumes that if subsistence resources become unavailable, our communities can simply turn to store-bought foods. SDEIS at 101 (explaining the metabolic effects and other health problems that would result from replacing a subsistence diet with Western foods). But the agency's assumption not only disregards the social and cultural dependence of our communities on subsistence hunting -- especially whaling -- it fails to take account of the fact that the majority of our families do not have the income to afford store-bought foods, which are extremely expensive and not always available in our villages.

Another NEPA Analysis Is Required. A new NEPA process is necessary to: comply with the terms of the remand order and 40 C.F.R. § 1502.22(b); analyze significant new circumstances and information pertaining to bowhead whale use of the Chukchi Sea and oil spills in the U.S. OCS; develop a reasonable range of alternatives; and to analyze the significance of the impacts of the lease sale in a manner that comports with NEPA. The public must be afforded notice of this NEPA process and the opportunity to comment on BOEMRE's analysis. In re-analyzing the environmental impacts, the agency must not merely go through the motions of the NEPA process to reach a pre-determined result, as it seems to have done here. Rather, a new process is necessary that truly enables BOEMRE to make a well-informed decision and how to hold a lease sale in the Chukchi.

II. THE REMAND ORDER AND NEPA WERE NOT COMPLIED WITH BY BOEMRE.

A. BOEMRE Has Failed To Comply With The Remand Order.

BOEMRE has failed to fully and meaningfully comply with the District Court of Alaska's order to correct flaws in the FEIS for Lease Sale 193 related to the missing and inadequate information. In *Native Village of Point Hope v. Salazar*, --- F.Supp.2d ---, 2010 WL 3083541 (D. Alaska 2010), the District Court of Alaska found that the FEIS included "dozens if not hundreds of entries indicating a lack of information about species/habitat, as well as a lack of information about effects of various activities on many species." *Id.* (emphasis added). Instead of appropriately identifying and addressing the missing information according to NEPA's requirements, the court found that the agency had acted arbitrarily by ignoring the procedures required by 40 C.F.R. § 1502.22 and ordered the agency to comply with the regulation on remand.

4

Section 1502.22 requires that

[i]f the information relevant to reasonably foreseeable significant adverse impacts cannot be obtained . . . the agency shall include within the environmental impact statement:

- (1) A statement that such information is incomplete or unavailable;
- (2) a statement of the relevance of the incomplete or unavailable information to evaluating reasonably foreseeable significant adverse impacts on the human environment;
- (3) a summary of existing credible scientific evidence which is relevant to evaluating the reasonably foreseeable significant adverse impacts on the human environment; and
- (4) the agency's evaluation of such impacts based upon theoretical approaches or research methods generally accepted in the scientific community.

40 C.F.R. § 1502.22(b). To comply with this requirement in the SDEIS, BOEMRE established a three-part test for each piece of information that was missing from the original FEIS, asking whether the missing information is: 1) relevant to reasonably foreseeable significant adverse effects on the human environment; 2) essential to a reasoned choice among alternatives; and 3) obtainable. SDEIS Appendix A at 1-2. This test is fundamentally flawed because nowhere in section 1502.22(b) is a reasoned choice among alternatives the focus. Rather, the agency is to focus on the importance of the information to evaluating "reasonably foreseeable significant adverse impacts." 40 C.F.R. § 1502.22(b). Of course, these impacts should influence the decision maker's choice of alternatives, but that does not mean that BOEMRE can do what it has done: say that none of the missing information is essential to deciding among the alternatives.

Additionally, BOEMRE's test and the accompanying pages of missing information fail to provide the analysis required by sections 1502.22(b)(3) and (4). Nowhere does the SEIS provide a summary of the "existing credible science" or the agency's evaluation of impacts based on generally accepted methodologies. 40 C.F.R. § 1502.22(b).

It is astonishing that for the *hundreds* of pieces of missing information, the agency concluded that *not one piece of information* was essential for evaluating reasonably foreseeable impacts or to a reasoned choice among alternatives. SDEIS at 3; *id.* at 10 ("none" of the missing information was "essential for a reasoned choice among alternatives"). Yet the missing information relates to the presence and severity of the environmental impacts of Lease Sale 193, such as the existence of subsistence resources in the project area and the likelihood of a catastrophic oil spill. By providing broad-sweeping, conclusory, and unsupported statements that none of this information is essential to the decision-making process, BOEMRE fails to comply with the requirements of section 1502.22. See *Mayo Found. v. STB*, 472 F.3d 545, 555-556 (8th Cir. 2006) (explaining what the agency had to do to comply with section 1502.22).

The agency provided five overarching reasons for its conclusion that none of the missing information is essential to a reasoned choice among alternatives:

5

Alaska Eskimo Whaling Commission Comment

the severity of potential impacts would be nearly identical under any action alternative; therefore, very specific types of information relevant to species, particular life history traits, or behavior do not help substantially in distinguishing among alternatives.

SDEIS App. A at 3. This conclusion ignores the fact that BOEMRE can and should develop a new range of alternatives based on the information it has acquired since the first round of NEPA on the proposed lease sale. If all the alternatives have the same environmental consequences, then BOEMRE has failed to present a reasonable range of alternatives in the SDEIS. *Veneman*, 313 F.3d at 1120 (discussing NEPA's requirement that an agency "[r]igorously explore[] and objectively evaluate[] all reasonable alternatives" to "sharply defin[e] the issues and provid[e] a clear basis for choice among options by the decisionmaker and the public" (citing 40 C.F.R. § 1502.14)).

This conclusion also ignores the differences in localized effects that are likely to result between the alternatives (that provide for different buffer areas) and the no-action alternative (under which no action would take place). For example, the Proposed Action and Alternative III provide different sized buffer zones, which could alter the severity of an oil spill or other potential impacts. The missing information would shed light on these differences, such as the location of subsistence resources in the buffer zones because it is essential to make an informed and reasoned choice between these alternatives.

Fourth, BOEMRE cannot rely on the other environmental laws to avoid assessing the environmental impacts in this NEPA process. Clean Water or Clean Air Act permits, or other non-NEPA documents cannot "satisfy a federal agency's obligations under NEPA." *S. Fork Band Council of W. Shoshone of Nevada v. U.S. Dept. of Interior*, 588 F.3d 718, 726 (9th Cir. 2009) (internal citations omitted); *Mayo Found. v. STB*, 472 F.3d 545, 555 (8th Cir. 2006) (quoting *Mid States Coalition for Progress v. Surface Transp. Bd.*, 345 F.3d 520, 550 (8th Cir. 2003)) (finding "fault with the FEIS conclusion that further study of this issue was not warranted because the 1990 Clean Air Act Amendments placed caps on sulfur dioxide emissions"); *League of Wilderness Defenders-Blue Mountains Biodiversity Project v. U.S. Forest Service*, 549 F.3d 1211, 1219 (9th Cir. 2008) (rejecting agency's attempt to tie to a non-NEPA document). Yet here the agency relies on compliance with other environmental laws to excuse its failure to obtain missing information. The agency provides the following example to support this decision:

comprehensive regulatory standards under the Clean Air Act are sufficient to preclude air quality impacts from reaching a level of significance. Incomplete information regarding air quality issues is in this sense less useful to the decision maker, who is assured that no matter which alternative he or she selects, significant adverse effects to air quality will be avoided.

SDEIS Appendix A at 3. This conclusion ignores and undermines NEPA's purpose of independent disclosure and analysis of environmental impacts. Regardless of whether the Clean Air Act process, or other similar environmental laws, will mitigate environmental impacts, the agency is still required to identify these in the NEPA process.

7

- 1) The availability of sufficient information to support sound scientific judgments and reasoned managerial decisions, even without the identified incomplete or unavailable information.
- 2) The presumption that adverse effects would certainly occur under the specific circumstances to which the incomplete information applies.
- 3) The commonality of potential impacts amongst all action alternatives, which lessened the utility of incomplete information to the decision-maker.
- 4) The existence of other environmental laws and regulations that would preclude significant adverse effects on particular resources.
- 5) The understanding that certain items of presently missing or incomplete information will be known (and utilized to avoid or minimize adverse impacts) at a later stage of OCS Lands Act environmental review.

Id. at 3-4. These reasons fail to justify the lack of critical information about the impacts of the lease sale as require by section 1502.22.

First, the agency's conclusion that the existing information is sufficient to make a reasoned decision is contrary to the evidence in the record. There is too little information about the impacts from oil and gas exploration activities on whales to make an *informed* decision to authorize this lease sale. For example, the agency admits that "there is uncertainty about effects on cetaceans in the event of a large spill," but concludes that this information is not necessary to make a reasoned decision. SDEIS, App. A at 1. This conclusion shows that no matter what the impact to the whales, including complete extirpation of the species, the agency would still authorize this lease sale. This ill-informed decision-making is what NEPA is designed to avoid by assuring that a full analysis is prepared before "resources have been committed or the die otherwise cast." *Methow Valley*, 490 U.S. at 349.

Second, BOEMRE cannot rely on the presumption that adverse effects will occur to meet the obligations of section 1502.22. Again, the agency's discussion of adverse impacts must include a "summary of existing credible scientific evidence" that is relevant to the impacts and the "agency's evaluation of such impacts" based on accepted methods. 40 C.F.R. § 1502.22(b)(3)-(4). Nor can BOEMRE rely on this presumption to avoid its duties to disclose and explain the environmental impacts. In fact, this reasoning is contrary to NEPA's dual goals of insuring that 1) that the agency has *carefully and fully* contemplated the environmental effects of its action and 2) that the public has sufficient information to challenge the agency." *Robertson*, 490 U.S. at 349; 40 C.F.R. § 1500.1(b). To comply with these goals, NEPA requires the agency to determine what those impacts will be and describe them in the appropriate document, regardless of whether the agency already knows they will be significant or adverse. By presuming that no amount of information about the severity of the impacts could change the agency's decision among alternatives, BOEMRE is admitting that its mind is already made up about Lease Sale 193.

Third, BOEMRE's conclusion about the commonality of the impacts between alternatives ignores the import of the alternatives analysis, which the NEPA regulations describe the "as the 'heart' of the EIS." *Kootenai Tribe of Idaho v. Veneman*, 313 F.3d 1094, 1120 (9th Cir. 2002). For example, the agency has stated that

6

Alaska Eskimo Whaling Commission Comment

Fifth, BOEMRE's conclusion that information "will be known . . . at a later stage of OCS Lands Act environmental review" is contrary to the language of section 1502.22. Either the information "cannot be obtained" because it is too costly to obtain or "the means to obtain it are not known" in which case the agency must follow the procedure laid out in section 1502.22(b). Alternatively, the information can be obtained in which case the procedure in section 1502.22(a) should be followed. Justifying missing information by saying it will be known later is simply not adequate, especially here where the agency has already received at least one proposed exploration plan for a lease block in the sale area and several "ancillary activity" proposals, and can readily identify and extrapolate impacts from these proposals. Activities such as seismic surveying, which occur before any later stages in the OCSLA process, can have significant impacts on bowhead whales and other marine mammals so it is imperative that the agency use the available information at this stage to take the "hard look" required by NEPA.

Despite the agency's astonishing conclusion to the contrary, much of the missing information is essential to assessing the environmental impacts of the lease sale, establishing a reasonable range of alternatives to deal with those impacts, and making a decision among the alternatives for Lease Sale 193. For example, the missing information related to the effects of noise and oil spills on whales is imperative to properly assessing the impacts to our subsistence resources and communities. See, e.g., SDEIS App. A at 1 (acknowledging the uncertainty about the impact of an oil spill on whales). By learning about the extent of these impacts, the agency can determine which alternative allows the agency to meet NEPA's policy "to restore and enhance the quality of the human environment and avoid or minimize any possible adverse effects of their actions upon the quality of the human environment." 40 C.F.R. § 1500.2.

By failing to obtain the hundreds of pieces of missing information, BOEMRE is undermining NEPA's emphasis on "the importance of *coherent and comprehensive up-front* environmental analysis to ensure informed decision making to the end that 'the agency will not act on incomplete information, only to regret its decision after it is too late to correct.'" *Churchill County v. Norton*, 276 F.3d 1060, 1072-73 (9th Cir. 2001) *opinion amended on denial of reh'g*, 282 F.3d 1055 (9th Cir. 2002) (emphasis added).

B. BOEMRE Has An Independent Obligation Under NEPA To Consider The New Information And Circumstances That Have Arisen Since The FEIS Was Prepared.

BOEMRE cannot rely on the narrow scope of the remand to exclude new information and circumstances arising since the FEIS for Lease Sale 193 was prepared. Even if the District Court of Alaska had not remanded the FEIS, the agency would still need to conduct a supplemental EIS to address the new information that has come to light about bowhead whales and oil spills.

NEPA requires an agency to prepare a supplemental EIS when "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." 40 C.F.R. § 1502.9(c)(ii). When new information related to an EIS comes to light, the agency must take a "hard look" at whether the new information is significant to the environmental impact analysis. *N. Idaho Cmty. Action Network v. United*

8

States DOT, 545 F.3d 1147, 1154-1155 (9th Cir. 2008) (citing *Price Road Neighborhood Ass'n v. U.S. Dep't of Transp.*, 113 F.3d 1505, 1510 (9th Cir. 1997)). If the new information may give rise to significant environmental impacts "in a manner not previously evaluated and considered," the agency must conduct an SEIS. *Id.* at 1157.

NEPA also requires that an agency use "high-quality information and accurate scientific analysis. 40 C.F.R. § 1500.1(b); *Lands Council v. Powell*, 395 F.3d 1019, 1031 (9th Cir. 2005). An agency cannot rely on "outdated data" or fail "to acknowledge the limitations in a methodology." *Nw. Ecosystem Alliance v. Rep.*, 380 F. Supp. 2d 1175, 1195 (W.D. Wash. 2005).

I. The SDEIS must include current scientific information about bowhead whale use of the proposed Lease Sale area.

AEWC is concerned about the impacts of the proposed Lease Sale on bowhead whales and other subsistence resources. Bowhead whales are "critical to the nutritional and cultural health of indigenous people of Alaska, Russia, and Canada for at least the last 2000 years." Quakenbush at 1. As pressure for oil and gas development have increased in the Chukchi Sea, one of the historic locations of our subsistence whaling hunts, we have repeatedly emphasized that there is a serious lack of scientific information on the baseline conditions of this area and the impacts of exploration on the environment and these whales. Despite this serious lack of information, the agency has proceeded to auction lease blocks and approve exploration plans in the area.

BOEMRE has chosen to ignore new scientific information about bowhead whales in the Chukchi Sea that was previously unknown. This includes: ADFG, et al. Satellite Tracking of Western Arctic Bowhead Whales (July 2010) (DOI/BOEMRE is listed as the funding agency); Quakenbush, et al. Fall and Winter Movements of Bowhead Whales in the Chukchi Sea (2009); and NMFS's July 2010 Biological Opinion for Oil and Gas Activities in the Beaufort and Chukchi Seas. All of this research acknowledges that a majority of bowhead whales in the Western Arctic stock migrate through the Lease Sale 193 area. BiOp at 19; ADFG Report at 54. Yet, BOEMRE has failed to include this information in the SDEIS.

This failure is critical. For example, the SDEIS concludes that "[p]rolonged exposure to freshly spilled oil could cause adult whale mortalities" but that "number would be small." SDEIS at 19. This conclusion is undermined by the new scientific information on bowhead whales, which shows a far more extensive use of the Lease Sale 193 area than previously expected.

The ADFG study monitored the annual distribution of these whales, including in summering and wintering locations and throughout migration, and described how these whales move throughout the Lease Sale 193. ADFG Report at 1. The report describes where and when certain tagged bowheads migrated through the Lease Sale 193 area, suggesting the times at which the potential for disturbances are greatest. ADFG Report at 54-55. For example, the report found it was likely that all tagged whales migrated through some portion of the lease area. *Id.* Despite this information, the report recommended that additional information is needed on the migration and feeding habits of bowhead whales. *Id.* at 58. While BOEMRE

9

helped fund this research, it fails to acknowledge it (let alone analyze it) in the SDEIS. The Quakenbush report reaches similar conclusions.

Additionally, NMFS's 2010 BiOp on small takes of marine mammals by the oil and gas industry updates and synthesizes some of the information about baseline environmental conditions and discusses the potential impacts to marine mammals, including bowhead whales. The BiOp concludes that the oil and gas activities are "likely to adversely affect these whales due to vessel operations, noise from marine geophysical (seismic) exploration, and aircraft traffic." BiOp at 79. Despite the relevance of this information to the analysis in the SEIS, BOEMRE does not address the BiOp or discuss whether it provides additional information that results in a substantial change to the previous analysis or is essential to a reasoned decision. Rather, the SEIS completely ignores NMFS's data and conclusions.

The Quakenbush et al. report, and BOEMRE's bowhead whale studies have provided significant new information on bowhead whales in the Lease Sale 193 area. This information bears directly on the adequacy of the environmental analysis and conclusions in both the FEIS and the SDEIS. Because this information paints the environmental impacts in a light not previously considered, the agency must analyze this information to determine whether the locations of the bowhead whales change the severity of the environmental impacts. Now that the agency can identify the areas through which bowhead whales migrate, it must disclose this information to the public, analyze it, develop alternatives based on it and draw new conclusions regarding the significance of the impacts from the proposed lease sale.

BOEMRE has helped fund some of this research, undertaken some of it, and certainly is aware of it – yet it does not appear in the SDEIS. The telemetry research was even raised in litigation over BOEMRE's approval of Shell's exploration plan for the Chukchi Sea. Nevertheless, the agency ignored this information in the SDEIS. In sharp contrast, the SDEIS includes updated information on other species, including fin whales, humpback whales, and polar bears. SDEIS at 43 ("With respect to threatened and endangered species, the following new information was reviewed"). By failing to update the bowhead whale information, the agency has violated its duties under NEPA. *Native Ecosystems Council v. Tidwell*, 599 F.3d 926, 937-8 (9th Cir. 2010) (finding that the Forest Service violated NEPA by failing to supplement an EA when new information on potential habitat in the project area became available).

2. The new circumstances and information pertaining to oil spills and blowouts from the Gulf of Mexico require review in a SEIS.

BOEMRE cannot rely on the limited scope of the District Court of Alaska's remand to evade its ongoing duty to supplement the EIS with new information and analysis regarding the possibility of an oil spill and blowout in the U.S. OCS. NEPA imposes an independent obligation to supplement an EIS when significant new information or circumstances arise. 40 C.F.R. § 1502.9(c)(ii). The Deepwater Horizon oil spill constitutes new information and circumstances that are relevant to BOEMRE's analyses of oil and gas leasing in the Outer Continental Shelf. The catastrophe in the Gulf of Mexico raises substantial questions about the efficacy of BOEMRE's prior analysis of oil spills in the OCS.

10

As previously discussed, NEPA requires additional environmental analyses when new information arises that paints "a seriously different picture of the environmental landscape such that another hard look is necessary." *Wisconsin v. Weinberger*, 745 F.2d 412, 418 (7th Cir. 1984). Taking this NEPA requirement into account, CEQ issued a report that addressed whether the new information stemming from the Deepwater Horizon Oil Spill requires BOEMRE to revisit its prior NEPA analysis regarding oil spills in the Outer Continental Shelf (OCS). CEQ Report Regarding the Minerals Management Service's National Environmental Policy Act Policies, Practices, and Procedures as They Relate to Outer Continental Shelf Oil and Gas Exploration and Development (August 16, 2010) (hereafter CEQ Report). Specifically, the CEQ concluded that

[t]he BP Oil Spill constitutes significant new information and circumstances that may require reevaluation of some conclusions reached in prior NEPA reviews and other environmental analyses and studies. Specifically, conclusions may change about the likelihood, magnitude, and environmental impacts of a major spill in connection with OCS oil and gas drilling activities.

Id. at 32. The report went on to state "the fact and effects of the BP Oil Spill requires revisiting prior assessments of the risk of catastrophic spills and their probability analysis." *Id.* at 34.

Even though CEQ issued this report before BOEMRE conducted the SDEIS, the agency ignored the CEQ report and decided not to reconsider the oil spill assessment in the SDEIS. In so doing, BOEMRE provided three irrelevant reasons for its decision not to consider the Deepwater Horizon spill or re-analyze the oil spill analysis in the FEIS:

- 1) the [Deepwater Horizon] DWH did not change the background conditions in the Chukchi Sea;
- 2) the Chukchi Sea is predominately shallow water unlike the DWH area;
- 3) even if an oil spill is more likely the impacts have already been analyzed.

SDEIS at 16. The agency cannot rely on any of these reasons to justify its failure to re-conduct the oil-spill analysis because they are unrelated to the overarching reason why additional analysis is needed.

BOEMRE's first argument is flawed because the need for additional analysis does not stem from changed background conditions in the Chukchi Sea. Rather, it stems from the inadequacy of MMS's review processes for approving OCS oil-spill assessments and contingency plans that proved disastrous in the Gulf of Mexico. Second, BOEMRE cannot rely on the fact that the Chukchi Sea is shallower than the Deepwater Horizon location as a distinction that makes drilling in the Arctic incomparable to drilling in the Gulf. If anything, drilling in the Chukchi Sea presents significantly more difficult and dangerous conditions due to the harsh Arctic climate that are not present in the Gulf of Mexico.

Nor can the agency rely on the previous analysis in the FEIS. The CEQ report has made clear that the new information related to the Deepwater Horizon Spill triggers the NEPA requirement that the agency re-consider previous analyses related to oil spills in the OCS. CEQ

11

Report at 32. The magnitude of the spill in the Gulf highlights the fundamental flaws within the agency review process that allowed such irreparable harm to the Gulf ecosystem. To prevent these harms in the Chukchi Sea, the agency must re-assess the likelihood of an oil spill and consider the environmental impacts that would result. This additional analysis is essential in the Chukchi where the environmental impacts from an oil spill or well blowout would imperil the environment and subsistence resources on which we depend.

The existing analysis is not sufficient to address these impacts – nor does it acknowledge and assess the impacts from a well-blowout. Throughout the SDEIS, BOEMRE describes the multitude of adverse impacts to Arctic ecosystems in the event of an oil spill. For the missing pieces of information related to the impacts of an oil spill on various resources, the agency frequently concludes that the agency "assumes that a large oil spill would lead to significant impacts," so additional information is unnecessary to assist in the decision-making process. SDEIS 1502.22 Analysis at 103; *Id.* at 96 ("The decision-maker already has sufficient information regarding the relative probability and various impacts of a large oil spill to allow a reasoned choice among alternatives"). To us, this callous attitude shows that the agency has already made an "irretrievable commitment of resources" and is unconcerned with identifying and assessing the environmental impacts stemming from an oil spill in any meaningful way.

C. The New Information On Bowhead Whales And Oil Spills Requires A New Range Of Alternatives.

The new scientific information on bowhead whales demonstrates that the range of alternatives in the SDEIS are not adequate – especially since they would all have similar impacts on whales. Scientific studies show bowhead whales use the area in which the agency has auctioned lease blocks. As a result, BOEMRE must propose alternatives that address the impacts to the whales. Yet, the SDEIS fails to meet this objective.

For example, one concern in the SDEIS is whether natural gas production would cause noise and disturbance that would force whales to avoid "high value areas" and risk biological consequences. SDEIS at 79. But the agency concludes that "[a]t present, available data do not suggest that strikes of bowheads by oil and gas-related vessels will become an important source of injury or mortality." SDEIS at 80. Because the new data shows significant use of the proposed lease sale area by bowhead whales, there is an increased likelihood that noise and disturbance will be greater such that strikes may now become an important source of injury.

As this example illustrates, the agency's limited range of alternatives is inadequate in light of the new information about bowhead use of the proposed Lease Sale area. AEWC asks BOEMRE to propose new alternatives based on time area restrictions that will mitigate the impacts to bowhead whales from oil and gas activities in the proposed lease sale area. AEWC also asks that the agency develop an alternative that requires the use of new and improved technologies that again would mitigate impacts to bowhead whales. For example, requiring the use of survey equipment that does not depend upon seismic waves to function should be included in this alternative. Currently, the agency's range of alternatives is inadequate. *See, e.g., Te-Moak Tribe of W. Shoshone of Nevada v. U.S. Dept. of Interior*, 608 F.3d 592, 602 (9th Cir.

12

2010) (internal citations omitted) (“[t]he existence of a viable but unexamined alternative renders an environmental impact statement inadequate”).

D. The Significance Thresholds BOEMRE Relied Upon Are Unlawful.

Once again BOEMRE has adopted “significance thresholds” that are far beyond the level of impacts that should ever be permitted by the agency. The prime example is the point at which BOEMRE has determined impacts to subsistence are significant – i.e., “when one or more important subsistence resources becomes unavailable, undesirable for use, or available only in greatly reduced numbers for a period of 1-2 years.” SDEIS at 60. The fact that one or more subsistence resources would be greatly reduced for any period of time let alone a year or two years would be devastating to our communities.

Allowing such impacts to occur would also violate the MMPA. In order to ensure compliance with the MMPA, BOEMRE cannot authorize any activity that would “reduce the availability of the species to a level insufficient for a harvest to meet subsistence needs.” 50 C.F.R. § 216.103 (emphasis added). The International Whaling Commission has recognized a subsistence need by the AEWC villages for 61 landed bowhead whales per year. IWC Schedule, par. 13 (b). Meeting the MMPA’s limitations on industrial activities to protect subsistence harvests is critical since these seasonal, opportunistic harvests are a principal source of food for the AEWC’s villages. Pursuant to the MMPA, the significance threshold adopted by BOEMRE is unlawful. As a result, AEWC recommends that BOEMRE adopt as a significant threshold the following: when the activity will reduce the availability of a subsistence species to a level insufficient for a harvest to meet subsistence needs.

Similar significance thresholds are set for impacts to water, air, and other resources that likewise would have catastrophic consequences for our people and culture and the environment upon which we depend. BOEMRE must set significance thresholds that comport with applicable environmental laws instead of significance thresholds that assume major violations of statutes such as the Clean Water Act, Clean Air Act, and MMPA. In essence what BOEMRE has done here is to assume that activities could be conducted in violation of numerous environmental laws without causing significant impacts. This practice is not supported by the CEQ’s definition of significance. 40 C.F.R. § 1508.27(b)(10) (defining the intensity of the action to include an analysis of violations of other federal environmental laws).

The significance thresholds also unlawfully stress only impacts of a long duration. SDEIS at 60. The CEQ regulations stress that the context for significance includes “[b]oth short- and long-term effects . . .” 40 C.F.R. § 1508.27(a). BOEMRE cannot legally approve short-term disturbances under the theory that subsistence harvests will recover at some point in the future. Instead, the agency must manage offshore activities so that harvest opportunities during each and every harvest season are protected from interference due to activities the agency has authorized.

13

E. BOEMRE Did Not Provide An Adequate Analysis of the Impacts from Natural Gas Development and Production.

In the SDEIS, BOEMRE completed the natural gas development analysis in response to the remand from the District Court of Alaska because the FEIS did not include a discussion of the “environmental impacts of natural gas developments, despite industry interest and specific lease incentives for such development.” SDEIS at 10. In BOEMRE’s discussion of impacts from natural gas activities, the agency identifies additional impacts to the environment and subsistence resources but incredibly concludes that these impacts will not be significant. See, e.g., SDEIS at 103 (“No major adverse impacts are expected for Alaska Inupiat Natives, the only significant ‘minority’ group within the action area.”).

This conclusion is inadequate for two primary reasons. First, the agency failed to identify or discuss more mitigation measures that will compensate for these additional impacts. Second, the agency failed to provide an adequate cumulative impacts analysis that is based upon specific data, detailed information, or a meaningful analysis. In the absence of these discussions, the agency did not meet NEPA’s “hard-look” standard for the natural gas development and production analysis.

1. BOEMRE failed to discuss additional mitigation measures.

NEPA requires that an agency include a discussion of mitigation measures in an environmental impact statement. 40 C.F.R. §§ 1502.14(f), 1502.16(h). CEQ regulations explain that “mitigation” includes:

- (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
- (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
- (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- (e) Compensating for the impact by replacing or providing substitute resources or environments.

40 C.F.R. § 1508.20. The Supreme Court has made clear that:

omission of a reasonably complete discussion of possible mitigation measures would undermine the “action-forcing” function of NEPA. Without such a discussion, neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects.

Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 352 (1989).

14

As an initial point, the “mitigation measures” in the FEIS are inadequate. The NEPA document fails to call for meaningful mitigation measures that can be enforced at later stages of the OCSLA process. For example, to mitigate the impacts to subsistence users, AEWC recommends that BOEMRE require leasees to enter into Conflict Avoidance Agreements (CAAs) with meaningful measures – such as those AEWC develops each year.

BOEMRE’s decision to not improve upon the measures and to not identify any additional mitigation measures that are “specific” to natural gas development and production is disappointing. SDEIS at 13. By failing to identify new measures, BOEMRE has failed to provide enforceable protections for subsistence and other resources in the Chukchi.

BOEMRE needs to identify additional mitigation measures because the natural gas development and production will have impacts to the environment, natural resources, and subsistence lifestyles that are in addition to and different from those related to oil and gas development. For example, BOEMRE identifies several aspects of natural gas development that may affect the human environment, including:

the presence of infrastructure (offshore platform, offshore and onshore pipelines, and shore base); noise and other disturbance from development activities; vessel, air, and ground transportation; emissions and discharges; and accidental events.

SDEIS at 66.

Specifically, the agency identifies additional impacts to whales from the noise associated with natural gas construction and development activities. See, e.g., SDEIS at 19 (“Natural gas development and production could result in increased noise and disturbance to bowhead as well as fin and humpback whales.”). The agency goes on to say that “it is possible that disturbance caused by these activities could alter the local availability of these resources to harvesters.” *Id.* at 23. But the agency fails to identify any additional measures or discuss how these specific impacts will be mitigated. BOEMRE must provide a complete discussion of additional mitigation measures for natural gas development and production.

2. BOEMRE failed to provide an adequate cumulative impacts analysis.

An agency’s failure to properly conduct a cumulative impacts analysis can be fatal to the NEPA process. *Blue Mountains Biodiversity Project v. Blackwood*, 161 F.3d 1208, 1214 (9th Cir. 1998) (finding an environment assessment inadequate in addressing the cumulative impacts of a proposed action). A proper cumulative impact analysis must include “some quantified or detailed information; . . . [g]eneral statements about possible effects and some risk do not constitute a hard look absent a justification regarding why more definitive information could not be provided.” *Klamath-Siskiyou Wetlands Cir. v. Bureau of Land Mgmt.*, 387 F.3d 989, 993 (9th Cir. 2004) (internal citations omitted). Courts have made clear that cumulative impacts analyses based on “very broad and general statements devoid of specific, reasoned conclusions” are inadequate. *Muckleshoot Indian Tribe v. U.S. Forest Serv.*, 177 F.3d 800, 811 (9th Cir. 1999).

15

In the cumulative impacts analysis for natural gas development, BOEMRE failed to provide a meaningful analysis of the cumulative impacts of Lease Sale 193. Among the agency’s conclusions carried over from the FEIS is the statement that “no significant cumulative impacts would result from routine activities associated the Proposed Action or alternatives.” SDEIS at 106. This conclusion is unsupported by data, specific discussion, or a meaningful analysis and is contrary to the plethora of serious impacts discussed throughout the SDEIS.

Natural gas development and production will have impacts to the environment that are above and beyond those associated with oil and gas development from the following activities:

the presence of infrastructure (offshore platform, offshore and onshore pipelines, and shore base); noise and other disturbance from development activities; vessel, air, and ground transportation; emissions and discharges; and accidental events.

SDEIS at 66. In the SDEIS, the agency discusses how these activities can have adverse impacts to the environment and subsistence resources on which the members of AEWC depend for survival. SDEIS at 79 (“Generally speaking, noise impacts on cetaceans can range from annoyance to behavioral change to physical harm such as hearing loss, the latter of which can result (in serious cases) in an inability to communicate, detect, and/or echolocate.”). Most notably, these impacts include additional disturbance to whales from the noise. SDEIS at 116 (“The most serious concern to Inupiat subsistence users is that potential increases in noise from OCS development could disrupt the normal migration of howhead whales, forcing subsistence whalers into longer hunts farther from shore.”).

When the agency adds the effects from these impacts to those already identified for oil and gas development and other actions in the area, such as shipping, the agency concludes that these do not rise to the level of significant cumulative impacts. SDEIS at 106. AEWC is astonished that additional disturbance to whales from a natural gas pipeline, when combined with the potential for extirpation of species, an already identified potential impact from an oil spill, SDEIS, App. A at 104, does not rise to the level of significant.

Additionally, there is a lack of data and meaningful analysis with which to understand the agency’s conclusion. Throughout the cumulative impacts analysis the agency makes several unsupported statements without providing a meaningful analysis. For example, the agency has not provided specific data to support its conclusion that noise levels will not significantly impact whales. To understand the agency’s conclusion, the public needs a comparison of the levels of noise that whales can withstand to the levels of noise that are cumulatively expected to occur in the project area. In the absence of this data, the public cannot understand the agency’s conclusion that the impacts to whales will be minor and not significant. Thus, it appears that the agency has tailored its conclusions and analysis to fit its prior decision to auction off Lease Sale 193. This is woefully inadequate to meet the “hard look” requirements of NEPA.

16

CONCLUSION

One purpose of NEPA is to ensure that an agency conducts a thorough environmental analysis *before* "resources have been committed or the die otherwise cast." *Methow Valley*, 490 U.S. at 349. It is clear BOEMRE has failed to meet this goal and that another supplemental EIS is necessary before the agency decides how to proceed in the Chukchi. We ask that the new EIS: provide a meaningful response to the remand order; address new science about bowhead whale use of the lease sale area; provide a new oil spill analysis; provide a reasonable range of alternatives that include time area restrictions and technological requirements; provide improved mitigation measures that are enforceable; and include a process that involves the public and enables BOEMRE to make an informed decision.

Sincerely,

Harry Brower

Re: Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)

Dear Regional Director:

Native Village of Point Lay submits the following comments on the Bureau of Ocean Energy Management, Regulation and Enforcement's (BOEMRE) draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (draft SEIS).

[DESCRIPTION OF GROUP – example:

The Native Village of Point Lay is a federally recognized tribal government that is responsible for the well being of its 950 members. It is also the oldest, continuously inhabited village in all of North America. Our members have harvested the sea for thousands of years. We preserve our traditional way of life, hunting bowhead whales, walrus, seals, polar bears, beluga whales, and various fish and sea birds. Where we live, a half-gallon of milk costs nine dollars, and families depend on subsistence hunting as a source of healthy food. Subsistence resources are so vital to our well being that if the health of the ocean deteriorates so will the physical health of our people. Yet, the importance of hunting runs much deeper. Hunting is central to our culture as a way to celebrate our heritage and maintain ties within the community. The ocean is our garden. It is what sustains us physically and spiritually as individuals and as community members.]

The Arctic Ocean is central to our communities' cultural and subsistence traditions, and we are gravely concerned about the potential effects of oil and gas exploration and development upon it. We are worried that BOEMRE intends to allow oil and gas leases and drilling in the Chukchi Sea without first obtaining basic scientific data about the Chukchi Sea and the Arctic environment as a whole. As demonstrated by the National Ocean Policy, the U.S. Geological Survey's Arctic science gap analysis, and the decision to close the Arctic Ocean to commercial fishing until more

Native Village of Point Lay, Native Village of Point Hope, Alaska Inter-Tribal Council Comment

scientific information can be obtained, the Obama Administration has repeatedly promised a commitment to a scientific-based decision-making process for the Arctic Ocean. However, in direct opposition to the Administration's promise, the Alaska Region office of BOEMRE has hastily published a draft SEIS in response to a court order to reconsider the 2008 lease sale 193 in the Chukchi Sea. The court ordered BOEMRE to redo its analysis of missing information about the region and natural gas development that could result from the lease sale. BOEMRE is then supposed to reconsider whether to cancel, modify, or affirm the leases in the Chukchi Sea in light of the new environmental analysis. Instead of doing a thorough job and fulfilling its duties under the National Environmental Policy Act, BOEMRE has rushed out a draft document that seeks to justify the lease sale and the earlier environmental analysis that the court found insufficient.

The current draft SEIS concludes that BOEMRE has no obligation to fill the massive gaps in Arctic scientific knowledge before finalizing its analysis of lease sale 193. The Alaska Region has determined that it does not need even minimal scientific data on things like the distribution of Arctic species and their key habitat to reach conclusions regarding the risks of oil and gas development. It appears to believe that it can base its oil and gas leasing decisions on mere speculation. We find this unwillingness to analyze the lease sale with scientific rigor deeply offensive. BOEMRE is putting at risk our way of life without even knowing enough to disclose the risks or consequences of the decisions. It needs to do better—as the *Deepwater Horizon* spill demonstrates, we need to know the environmental effects of offshore drilling *before* it happens. Instead of finalizing the current proposed draft, BOEMRE should undertake a complete and thorough analysis of all missing scientific information concerning the Chukchi Sea and the Arctic environment, prepare a revised draft SEIS that incorporates the new information, and reevaluate the impacts of the lease sale in light of the new information. It should then assess anew whether to cancel the leases, modify the leases or affirm the leases. In making this decision, it should not take into account that there are existing lease sale 193 leases in the Chukchi Sea. BOEMRE needs to make a fresh, new decision about lease sale 193.

BOEMRE should move slowly and cautiously before allowing oil and gas activities in the Chukchi Sea. Oil and gas development, especially without adequate planning, gambles not only a pristine, changing, and rich wilderness—it gambles our home and our way of life. If an oil spill occurs and the sea and its subsistence resources that we rely upon are polluted or disappear, we are the ones who will bear the ultimate consequences. You have an opportunity to prevent this injustice. BOEMRE must set a new course and reassess what information it needs to complete a proper environmental analysis.

BOEMRE should also ensure that, as required by law, it involves Alaska Native governing bodies and local populations in the decision-making process. The policy of the United States is that "[w]hen undertaking to formulate and implement policies that tribal implications, agencies shall . . . consult with tribal officials as to the need for Federal standards and any alternatives that would limit the scope of Federal standards or otherwise preserve the prerogatives and authority of Indian tribes." Executive Order 13175 § 3(c)(3). We ask that BOEMRE meet this government-to-government consultation requirement by sitting down with Alaska Native governing bodies to discuss the lease sale decision. The input of Alaska Native governments is essential because decisions concerning lease sale 193 will affect the ability of our communities

Native Village of Point Lay, Native Village of Point Hope, Alaska Inter-Tribal Council Comment

to sustain themselves. We also request that BOEMRE provide a meaningful opportunity for public involvement. This was not done here. For example, the Point Hope hearing on lease sale 193 was held on Election Day, which placed an unfair burden on the ability of the community to make its voice heard.

We will do everything in our power to protect our water, land, and way of life and hope that you will address our concerns. We look forward to meeting with your agency on this important issue.

Sincerely,

Native Village of Point Lay IRA Council

Re: Chukchi Sea Draft SEIS

Dear Sir/Madam:

This letter provides comments on the Bureau of Ocean Energy Management, Regulation and Enforcement ("BOEMRE") Draft Supplemental Environmental Impact Statement ("SEIS") for the Chukchi Sea Planning Area, Oil and Gas Lease Sale 193.

Introduction

These comments are submitted by the Arctic Slope Regional Corporation ("ASRC"). ASRC is an Alaska Native Regional Corporation created at the direction of Congress under the terms of the Alaska Native Claims Settlement Act of 1971 ("ANCSA"). See 43 U.S.C. § 1606. This landmark legislation extinguished Alaskan aboriginal land rights, and authorized and directed Alaskan Natives to adopt a western corporate model, managing lands, funds and natural resources. Although the western corporate model was foreign to Alaska Natives, our people were also able to manage our assets consistent with our sound stewardship and values. Under ANCSA, Iñupiat Eskimos living on the North Slope in 1971 were enrolled as shareholders in ASRC. ASRC has since issued additional shares to their descendants, giving ASRC a shareholder base of approximately 11,000 Iñupiat Eskimos.

Through ANCSA, Congress created ASRC and provided ASRC with the ability – and duty – to use the North Slope's natural resources to benefit Iñupiat people financially and culturally. Congress authorized ASRC "to provide benefits to its shareholders who are Natives or descendants of Natives or to its shareholders' immediate family members who are Natives or descendants of Natives to promote the health, education or welfare of such shareholders or family members." 43 U.S.C. § 1606(r) (emphasis added). Consistent with this unique legislation, ASRC is a for-profit business that is committed both to providing sound returns to our shareholders and to preserving our Iñupiat way of life, culture, and traditions.

Operating in one of the least hospitable natural climate in the world, we have built businesses to provide jobs for our people, tax revenues for our Villages and Boroughs, and cash dividends for our shareholders. At the same time, we have integrated

maintenance and protection of the Iñupiat cultural and traditional practices into the ASRC business.¹

ASRC itself owns approximately 5,000,000 acres of on-shore land (surface and subsurface) on the North Slope – an area nearly the size of Massachusetts. Our lands are located within our regional area of 89,000 square miles – an area the size of Minnesota. Our regional area follows the coastline of the Beaufort and Chukchi Seas. There are eight Iñupiat Villages in the region, six of which are located on or near the coastline of the Beaufort and Chukchi Seas, each of which have Village Corporations pursuant to ANCSA. In addition to ASRC-owned lands, Alaskan Native-owned lands include property of Village Corporations, Villages or Boroughs and native allottees. These lands are distributed within a rugged and challenging terrain. Our businesses depend on activities on lands owned by others, including the federal and state governments. The Iñupiat and our ancestors have occupied and depended upon these Northern Alaska lands and waters since time immemorial, extending at least 10,000 years.

In just a few short decades, the Iñupiat have adapted from an economy based almost solely on subsistence to a mixed economy. We operate ASRC consistent with Iñupiat cultural values, and our 21st century life is an integration of traditions into a contemporary economy. The cash portion of that mixed economy depends on oil and gas and other natural resource activity to provide the jobs, economic activity, and a tax base for our local government that make available basic amenities such as schools, health care and sanitation facilities – all of which, although taken for granted elsewhere in the United States, are operated and maintained in our region at considerable cost. In carrying out its congressionally-mandated mission, ASRC and its subsidiary companies² are active participants in North Slope oil exploration, development, and production. This is the source of many jobs for ASRC's Iñupiat shareholders and many contracting opportunities for ASRC's subsidiaries. This includes work as contractors in oil field developments, engineering work, maintenance of pipelines, and leasing property for exploration and development.

In the 21st century and into the future, the Iñupiat's ability to maintain our traditions, our communities and the rudimentary services and amenities that make it possible for our

¹ Even with this increasingly mixed economy, subsistence hunting continues to provide 40% of caloric intake for Iñupiat Eskimos on the North Slope, with substantially higher percentages in the more rural villages. Alaska Natives' unique cultural and subsistence needs have been repeatedly recognized by Congress. Although the Iñupiat's aboriginal hunting rights were extinguished by ANCSA, see 43 U.S.C. § 1603(b), Congress ensured that subsistence rights to hunt, fish and make handicrafts would be protected through a number of other statutes, including the Alaska National Interest Lands Conservation Act ("ANILCA"), 16 U.S.C. § 3111(1), 3111(4), the Marine Mammal Protection Act of 1972 ("MMPA"), 16 U.S.C. § 1371(b) and the ESA, 16 U.S.C. § 1539(e).

² The ASRC family of companies includes ASRC Energy Services, Inc.; ASRC Construction Holding Company, Inc.; Petro Star, Inc.; ASRC Federal and other entities and subsidiaries.

shareholders to survive and thrive on the North Slope all depend upon access to natural resources and an active local resource development industry - it is the only economic development in our region.

Comments

ASRC has purposely not commented on previous Outer Continental Shelf Lease Activities. In fact ASRC, through its Board of Directors, has historically opposed on-shore exploration in both the Chukchi and Beaufort Seas. However, ASRC has evaluated the long-term scenarios with respect to the onshore North Slope oil and gas industry. We have come to the conclusion that the future of the Trans Alaska Pipeline System depends on additional oil production. Onshore lands have been rendered off-limits by government policy. With the production decline of the larger onshore fields and few marginal discoveries to replace them, the future of TAPS (and the economic future of both the Alaskan North Slope and the State of Alaska itself) depends on the development of additional production from offshore prospects. If the TAPS goes away, then there is no North Slope economy. We have moved beyond the "pro" and "anti" OCS discussion; our communities and our region need additional development. And yet we depend upon environmentally responsible development, as our communities also depend upon a healthy marine ecosystem. It is for these reasons that ASRC is submitting comments on the Draft Supplemental Environmental Impact Statement for the Chukchi Sea Oil and Gas Lease Sale 193.

The Arctic Outer Continental Shelf ("OCS") holds significant potential for discovery of large oil and gas accumulations that could assist in meeting the nation's energy needs. The Chukchi Sea is considered the nation's most prolific, unexplored offshore basin in North America. BOEMRE has estimated that Alaska's OCS has up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The size and significance of the potential in the Chukchi Sea has caused ASRC to re-evaluate its impacts to our shareholders, our communities, our borough and our businesses – all of which our region relies on for a viable economic future.

In the Draft SEIS the BOEMRE analyzes three specific issues raised by the U.S. District Court of Alaska. The District Court Ordered remanding the BOEMRE's Chukchi Sea Lease Sale 193 Final EIS ("FEIS") to address three areas of concern with the FEIS. The three concerns are:

1. Analyze the environmental impact of natural gas development;
2. Determine whether missing information identified by BOEM in the FEIS for Lease Sale 193 was essential or relevant under statute; and
3. Determine whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown.

The SEIS is intended to provide the Secretary of the Interior with sufficient information and analysis to make a final informed decision among the alternatives on whether to affirm, modify or cancel Lease Sale 193.

Summary of Major Comments by ASRC

ASRC has historically been very concerned about Arctic OCS exploration and its effects on the subsistence activities of our communities and shareholders. Our concerns have centered around four fundamental areas:

- Impacts to the marine mammals our culture is dependent on;
- Impacts to the environment our marine mammals are dependent on;
- Risks of a catastrophic oil spill that would affect our coast and communities; and,
- Industry's ability to clean up a spill in ice-infested waters.

With respect to the above issues we have taken the stance that the Iñupiat have the most to lose if any or all of the above impacts occur. Based on these fundamental concerns ASRC has been notably silent on the process and issues with respect to oil and gas leasing in the Arctic OCS. We have diligently worked to gain an understanding of the new technologies to be employed by industry and we have watched with disbelief the Gulf of Mexico oil spill that occurred in April 2010. It is with this background and careful consideration that ASRC has decided to comment on the Draft SEIS.

ASRC recommends that Lease Sale 193 be affirmed as held in 2008. After careful review and analysis we feel the Draft SEIS provides sufficient information and analysis to support an informed decision by the Secretary of Interior affirming Sale 193. Under our review of the Draft SEIS we have also reviewed the earlier FEIS for Lease Sale 193 and we feel the agencies have sufficiently addressed this issues set forth by the District Court.

Item One for review ordered by the District Court was to analyze the environmental impact of natural gas development. We believe that gas development scenarios have been adequately analyzed for environmental cumulative impacts. Gas development for the on-shore areas of the North Slope of Alaska is still an economic uncertainty despite the fact of large gas accumulations existing at the Prudhoe Bay and Pt. Thomson fields. Based on this experience we feel it is actually premature to try to evaluate the environmental impacts of gas development from the Chukchi lease area as part of this document despite the fact that industry expressed interest in gas and asked for specific lease incentives for gas development.

Item Two for review ordered by the District Court was to determine whether missing information identified by BOEM in the FEIS for Lease Sale 193 was essential or relevant under 40 CFR 1502.22. In the Draft SEIS the BOEMRE states that "[R]ecurring reasons why missing information is not essential to a reasoned choice among alternatives under 40 CFR 1502.22 include:

- The availability of sufficient information to support sound scientific judgments and reasoned managerial decisions, even without the identified incomplete, missing, or unavailable information.

- The presumption that adverse effects would certainly occur under the specific circumstance to which the incomplete information applies. For instance, significant adverse effects are presumed if marine mammals are contacted by a large oil spill; it may not be essential to understand every potential physiological mechanism (for instance, potential impacts to the function of a whale's blowhole) through which these adverse effects may occur.
- The commonality of potential impacts and their severity among all action alternatives, which substantially reduced the utility of incomplete information to the decision-maker.
- The existence of other environmental laws and regulations that would preclude significant adverse effects on particular resources.
- The understanding that certain items of presently missing or incomplete information will be known (and utilized to avoid or minimize adverse impacts) at a later stage of OCS Lands Act environmental review, when the information could potentially become essential."

ASRC feels that it is necessary to acknowledge that there will always be project opponents who feel there is not enough data to be deemed sufficient in any analysis. In the case of the previous FEIS and now with the Draft SEIS ASRC contends that there is sufficient information available to support sound scientific judgment and decisions. Additional data and information collection continues to occur with respect to all aspects of the Arctic OCS and as that data and information is collected and analyzed all parties continue to gain knowledge that can be built into mitigations and future environmental review.

It is actually through the concerns brought forward due to Arctic OCS leasing that research dollars have increased to allow for the collection of important data with respect to the Arctic marine environment. The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas. After the Gulf of Mexico incident we have seen increased scrutiny on the Arctic OCS with calls that there is not enough data.

Our position is to not allow the de facto moratorium to continue while additional research conducted and analyzed but to instead make the research a component of a solid regulatory program and industry mandate moving forward. All parties benefit from the resources and research being directed at the Arctic OCS.

Item Three ordered for review by the District Court is to determine whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown. In responding to this item of review the BOEMRE has stated that if information relevant to reasonably foreseeable significant adverse impacts cannot be obtain because the costs of obtaining it are exorbitant the a statement will be made that such information was incomplete or unavailable. A statement of the relevance of the missing data will be made as to its impacts on the human environment, and a summary of credible scientific evidence as to its impact on the human environment will be included in the

environmental impact statement. ASRC feels this is a reasonable approach to addressing the costs of obtaining missing information. Our response to this item is consistent with our response for item two since both addresses the issue of missing data. Ongoing research and data collection will continue and there are other times in the OCS process that new data and research can be incorporated into the knowledge-base to make informed decisions.

On-going data collection is a critical component of the affirming the FEIS and continuing with the lease activities. It is through this additional activity that our communities and residents gain Western scientific information about our off-shore environment while at the same time having the opportunity to incorporate our Inupiat traditional knowledge into the mix. Our shareholders have been employed as researchers and marine mammal observers in the Chukchi lease area as new scientific baseline data is collected. This is a double-win for our people; they are employed in the research and data collection process while at the same time learning more about our nature environment in the process. We see this as a positive impact to our region and our understanding.

ASRC believes rescinding the leases and allowing a de facto moratorium to continue will harm the North Slope's and Alaska's economies and discourage future industry investment, without a corresponding benefit to the environment. Economic estimates state that the Arctic OCS would provide upwards of 4,000 direct jobs on the North Slope with direct tax revenue to the North Slope Borough of over \$3.0 billion from the on-shore facilities and infrastructure. Jobs and the North Slope Borough tax base are critical to the long-term economic sustainability to our communities. As such it is important to ASRC that the Secretary affirms Sale 193.

We feel the oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations identified in the FEIS and SEIS. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities. There has never been a blowout in the Alaska or the Canadian Arctic that resulted in an oil spill. Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.

Despite the Gulf of Mexico incident, we recognize the difference in geologic conditions between the Macondo Well in the Gulf and prospective exploratory drilling in the Chukchi Sea. The differences between the two areas are significant and they cannot be compared as analogues. First the Macondo Well was drilled in an ultra-deep water column into a high- or over-pressured reservoir. By contrast geologic targets in the Chukchi are in relatively shallow water and based on past drilling in the leased area we know that the geologic targets are normally pressured greatly reducing the potential for a 'Macondo-style' blow-out in the Chukchi.

Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. In addition, we are familiar with, and favorably impressed by the additional drilling safeguards introduced by the Chukchi Sea explorers and by their methods to minimize other environmental impacts that have historically been deemed inevitable for all OCS exploration wells. The spill prevention portion of today's Arctic OCS plans is truly and offers us great confidence in a successful outcome. Any oil spill in the Arctic OCS will be catastrophic to our communities and people and so ASRC has taken a very deliberate approach in our consideration for off-shore exploration and development. As part of our assessment we have reviewed the spill prevention and response components anticipated for the Arctic OCS and we feel industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give us a high level of confidence that exploration and development can occur safely and without harm to our off-shore subsistence environment. Since the Gulf of Mexico spill, industry has increased its prevention and spill response plans creating a system of redundancy that provides us with some comfort they will be able to respond to the unlikely event of a spill in an immediate and responsive manner.

All of these contrasts should lead BOEMRE to conclude that exploration should move forward in the Chukchi.

ASRC appreciates the opportunity to present these comments on the Draft Supplemental Environmental Impact Statement for the Chukchi Sea Oil and Gas Lease Sale 193.

Sincerely,
ARCTIC SLOPE REGIONAL CORPORATION

Richard Glenn

Regional Director, Alaska OCS Bureau
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503-5820

Subject: OCS Testimony, Calista Corporation
Hearing Date: Tuesday, November 9, 2010
Time: 7:00 p.m.

My name is Christine Klein, Chief Operating Officer for Calista Corporation. I'm here to provide testimony on behalf of Calista, one of Alaska's 13 Regional Native Corporations created after Alaska Native Claims Settlement Act in 1971. Calista represents more than 13,000 direct shareholders, as well as, their descendants of Yupik, Cupik, and Athabascan heritage. It includes 56 remote villages throughout Yukon-Kuskokwim Delta and Bering Sea coast of western Alaska.

Many of our shareholders continue to live in remote villages which experience higher costs of living especially fuel and heating oil which due to a lack of transportation infrastructure –people must travel by boat on the rivers, aircraft, and snow machines. Fuel is 3 to 5 times higher than in the rest of Alaska and Lower 48 States! Heating fuel can often cost more than \$13/gallon. Can YOU imagine what would or will happen when You and Other citizens in the rest of Alaska and US get the opportunity to pay \$13/gallon for heating fuel—like our Calista residents pay, right now, right here, already???

1. We support OCS environmentally safe drilling and want to see MMS/BOEM Lease Sale 193 affirmed as intended in 2008, for the purpose of producing oil, and boosting domestic oil production from existing U.S. energy deposits.
 - a. To renege on the intent of that sale which was upheld in the EIS and SEIS process is an injustice defying reason given current economic circumstances.
 - b. The SEIS provides sufficient information & analysis to support an informed decision.
 - c. More delay, rescinding of leases, and continuing moratoriums will further harm the Alaska and U.S. economy, and discourage industry investment, without any corresponding benefit to either the environment or citizens.
2. We have confidence in the regulatory and scientific community of Alaska that has risen to the challenges of responsibly overseeing offshore oil and gas development in ensuring protection of vital wildlife and water resources.
 - a. There has never been a blowout in Alaska or Canadian Arctic that resulted in an oil spill. Thirty wells were drilled in Beaufort and five in Chukchi – all without incident in the '80's utilizing older technology compared to what exists today.

- b. The North Slope of Alaska and offshore environment are some of the most studied energy basins in the world. Over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
 - c. Any oil and gas production will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations identified in the FEIS and SEIS, as well as state processes & permits
 - d. The State of Alaska Dept. of Environmental Conservation has the first and one of the only petroleum pipeline inspection and oversight programs in the U.S. despite being one of the youngest states in the country. It is leading the way in such programs aren't even yet developed elsewhere like California and Nevada
3. The petroleum industry in Alaska, has demonstrated that it can in fact operate safely in arctic and subarctic conditions.
- a. The industry in Alaska has committed to unprecedented actions and measure to prevent spills and response actions far above and beyond required by law, or done any other place in the world.
 - b. Shell has spent billions of dollars on Leases, baseline studies, seismic, engineering, environmental protection, created good partnerships with the indigenous 1st peoples of Alaska to further our economic development goals participating in the global economy while preserving our native culture. They have gone far beyond environmental and safety standards required anywhere else; yet, U.S. Federal actions have resulted in further delay and uncertainty, sending a loud message to industry the U.S. and Alaska are very risky places to do business. These actions have caused Alaska and the US financial harm that may never be overcome.

All of these things along with the intense scrutiny that occurs in AK and tough permitting processes, give us a high level of confidence that exploration and development can occur in the OCS safely to all creatures great and small.

Energy costs continue rising, further challenging our families and businesses, as well as, the struggling US economy. It makes no sense when there is oil that can be produced in an environmentally safe manner here in our own state and country best.

Today, parents, children, Native corporation shareholders and leaders in the Calista Region need affordable energy to survive, as well as, an opportunity to participate in a global economy. Responsible development of petroleum resources in the outer continental shelf of Alaska, and offshore leasing by BOEM in the OCS, will provide that opportunity.

thorough job and fulfilling its duties under the National Environmental Policy Act, BOEMRE has rushed out a draft document that seeks to justify the lease sale and the earlier environmental analysis that the court found insufficient.

The current draft SEIS concludes that BOEMRE has no obligation to fill the massive gaps in Arctic scientific knowledge before finalizing its analysis of lease sale 193. The Alaska Region has determined that it does not need even minimal scientific data on things like the distribution of Arctic species and their key habitat to reach conclusions regarding the risks of oil and gas development. It appears to believe that it can base its oil and gas leasing decisions on mere speculation. We find this unwillingness to analyze the lease sale with scientific rigor deeply offensive. BOEMRE is putting at risk our way of life without even knowing enough to disclose the risks or consequences of the decisions. It needs to do better—as the *Deepwater Horizon* spill demonstrates, we need to know the environmental effects of offshore drilling *before* it happens. Instead of finalizing the current proposed draft, BOEMRE should undertake a complete and thorough analysis of all missing scientific information concerning the Chukchi Sea and the Arctic environment, prepare a revised draft SEIS that incorporates the new information, and reevaluate the impacts of the lease sale in light of the new information. It should then assess anew whether to cancel the leases, modify the leases or affirm the leases. In making this decision, it should not take into account that there are existing lease sale 193 leases in the Chukchi Sea. BOEMRE needs to make a fresh, new decision about lease sale 193.

BOEMRE should move slowly and cautiously before allowing oil and gas activities in the Chukchi Sea. Oil and gas development, especially without adequate planning, gambles not only a pristine, changing, and rich wilderness—it gambles our home and our way of life. If an oil spill occurs and the sea and its subsistence resources that we rely upon are polluted or disappear, we are the ones who will bear the ultimate consequences. You have an opportunity to prevent this injustice. BOEMRE must set a new course and reassess what information it needs to complete a proper environmental analysis.

BOEMRE should also ensure that, as required by law, it involves Alaska Native governing bodies and local populations in the decision-making process. The policy of the United States is that "[w]hen undertaking to formulate and implement policies that tribal implications, agencies shall . . . consult with tribal officials as to the need for Federal standards and any alternatives that would limit the scope of Federal standards or otherwise preserve the prerogatives and authority of Indian tribes." Executive Order 13175 § 3(c)(3). We ask that BOEMRE meet this government-to-government consultation requirement by sitting down with Alaska Native governing bodies to discuss the lease sale decision. The input of Alaska Native governments is essential because decisions concerning lease sale 193 will affect the ability of our communities to sustain themselves. We also request that BOEMRE provide a meaningful opportunity for public involvement. This was not done here. For example, the Point Hope hearing on lease sale 193 was held on election day, which placed an unfair burden on the ability of the community to make its voice heard, and no government to government meeting was held after Point Hope had to cancel an initial meeting due to conflicts. In Barrow, BOEMRE held the public hearing on the lease sale at the same time as the government to government meeting with ICAS, causing board members to have to chose between the two.

We support and join the comments submitted on the draft SEIS by the Alaska Eskimo Whaling Commission and the Alaska Wilderness League, et al. conservation groups. We will do everything in our power to protect our water, land, and way of life and hope that you will address our concerns.

Sincerely,

Doreen Lampe

Re: Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)

Dear Regional Director:

The Inupiat Community of the Arctic Slope (ICAS) submits the following comments on the Bureau of Ocean Energy Management, Regulation and Enforcement's (BOEMRE) draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (draft SEIS).

ICAS is the federally recognized regional tribal government for the Inupiat people of the North Slope. ICAS represents communities—Anaktuvuk Pass, Atkasuk, Barrow, Kaktovik, Nuiqsut, Point Hope, Point Lay, and Wainwright—that depend upon Arctic marine mammals to sustain and continue a subsistence lifestyle that is central to our culture and traditions. We are concerned that offshore oil and gas activities may put at risk areas of importance to Inupiat subsistence resources and cultural traditions, and we believe such activities require careful review.

The Arctic Ocean is central to our communities' cultural and subsistence traditions, and we are gravely concerned about the potential effects of oil and gas exploration and development upon it. We are worried that BOEMRE intends to allow oil and gas leases and drilling in the Chukchi Sea without first obtaining basic scientific data about the Chukchi Sea and the Arctic environment as a whole. As demonstrated by the National Ocean Policy, the U.S. Geological Survey's Arctic science gap analysis, and the decision to close the Arctic Ocean to commercial fishing until more scientific information can be obtained, the Obama Administration has repeatedly promised a commitment to a scientific-based decision-making process for the Arctic Ocean. However, in direct opposition to the Administration's promise, the Alaska Region office of BOEMRE has hastily published a draft SEIS in response to a court order to reconsider the 2008 lease sale 193 in the Chukchi Sea. The court ordered BOEMRE to redo its analysis of missing information about the region and natural gas development that could result from the lease sale. BOEMRE is then supposed to reconsider whether to cancel, modify, or affirm the leases in the Chukchi Sea in light of the new environmental analysis. Instead of doing a

RE: Chukchi Sea Draft SEIS

<i>Knowledge of Language</i>	The Native Village of Kotzebue appreciates the opportunity to comment on the recent release of the draft Chukchi SEIS to address the issues specified by the U.S. District Court for Alaska in regards to insufficiencies with the original EIS and for the government-to-government meeting held between BOEM and the Tribe as part of this process.
<i>Knowledge of Family Tree</i>	
<i>Sharing</i>	
<i>Humility</i>	
<i>Respect for Others</i>	The members of the Tribe continue to rely on the healthy populations of fish and wildlife that use the Chukchi Sea for feeding, reproduction and overall survival. In the case of the associated overland pipeline and road on the North Slope this would include terrestrial species used for subsistence, especially the Western Arctic Caribou Herd, which calves in the area and uses the coastline for insect relief. The Tribe believes that the high quality of the current environment of the Chukchi Sea provides for robust and healthy populations of marine wildlife and negative impacts on this habitat through poorly informed development, would pose an unnecessary risk to this continued quality; it is for this reason that the Tribe has been undertaking and supporting continued research into the ecology of the Chukchi Sea and Kotzebue Sound specifically. Unfortunately, the current level of baseline environmental information makes it very challenging, if not in the majority of cases impossible, to track changes in the environment, or harm to fish and wildlife, caused by industry during the exploration phase of the Lease 193 area. This makes it difficult to know what impacts actually occur, or may occur, or whether mitigation plans put in place are effective.
<i>Love for Children</i>	
<i>Cooperation</i>	
<i>Hard Work</i>	
<i>Respect for Elders</i>	
<i>Respect for Nature</i>	
<i>Avoid Conflict</i>	
<i>Family Roles</i>	
<i>Humor</i>	
<i>Spirituality</i>	While the Tribe concurs with the court that it is important to address the environmental impacts of natural gas development and the BOEM attempts to do this in the draft SEIS, without a sufficient level of understanding of the ecological processes in place it will be difficult to sufficiently address basic environmental impacts. A very cursory understanding of the ecology also makes determining whether missing information identified by BOEM in the sale 193 FEIS is essential, or relevant, a very difficult undertaking. Both of these issues are at the heart of the courts instructions.
<i>Domestic Skills</i>	
<i>Hunter Success</i>	
<i>Responsibility to Tribe</i>	

Apparently the strategy by BOEM in response to the courts instructions is to list a lot of what is not known and summarily conclude that none of this information is needed before the lease sale proceeds. This conclusion can be reasonably interpreted by affected communities to demonstrate a lack of serious concern by BOEM for the Chukchi Sea environment and all the wildlife and communities that it supports. This approach appears to defy the science driven policy committed to by the Obama Administration and does nothing to reassure affected communities that the federal government is serious about demanding a sufficient environmental understanding before the process moves forward.

Native Village of Kotzebue Comment

While admittedly it is only possible to obtain a basic level of knowledge in regard to the complex interrelated ecological processes at play in the Chukchi Sea, it is the position of the Tribe that a serious attempt to obtain this level of understanding is necessary before the process moves forward. As BOEM is aware many research projects are currently underway and much of the needed missing information is being collected and analyzed. For instance the Tribe has spent the last 6 years studying ice seals and their habits and habitats, yet sufficient time for publication of results has not been provided before BOEM actions are being taken. There are many more similar research undertakings occurring by other parties, but again without sufficient time to publish and incorporate findings in an analysis of environmental impacts of a lease sale. In addition, as recent assessments of the ability to clean oil in ice have demonstrated, there remain serious challenges and concerns regarding the ability to respond successfully to such an event, especially under worst case scenarios of both kind of spill and seasonal timing of such an incident

Instead of finalizing the current proposed draft, BOEM should undertake a thorough analysis of all missing scientific information concerning the Chukchi Sea and the Arctic environment, prepare a revised draft SEIS that incorporates the new information, and reevaluate the impacts of the lease sale. In order to meet this need there must be an ongoing commitment from BOEM, other federal agencies, and industry, to aggressively fund and seek to increase the knowledge of the affected environment and impacts on communities, so there will not remain such a large knowledge gap on which to base decisions in the future. Part of this effort should include specific opportunities for communities along the Chukchi Sea to undertake research to provide information on concerns of priority to them and which will inform subsequent steps and decisions in the development of the Lease 193 area. Currently, targeted communication and involvement with the Alaska Studies Program, in relation to local Chukchi Sea communities, is largely absent, and the BOEM could correct this by informing coastal communities living on the shores of the Chukchi Sea about current research and creating specific funding opportunities for communities to undertake, or actively participate in, future research related to Lease 193 development.

Thank you for your consideration.

Native Village of Point Hope Comment

demonstrated by the National Ocean Policy, the U.S. Geological Survey's Arctic science gap analysis, and the decision to close the Arctic Ocean to commercial fishing until more scientific information can be obtained, the Obama Administration has repeatedly promised a commitment to a scientific-based decision-making process for the Arctic Ocean. However, in direct opposition to the Administration's promise, the Alaska Region office of BOEMRE has hastily published a draft SEIS in response to a court order to reconsider the 2008 lease sale 193 in the Chukchi Sea. The court ordered BOEMRE to redo its analysis of missing information about the region and natural gas development that could result from the lease sale. BOEMRE is then supposed to reconsider whether to cancel, modify, or affirm the leases in the Chukchi Sea in light of the new environmental analysis. Instead of doing a thorough job and fulfilling its duties under the National Environmental Policy Act, BOEMRE has rushed out a draft document that seeks to justify the lease sale and the earlier environmental analysis that the court found insufficient.

The current draft SEIS concludes that BOEMRE has no obligation to fill the many gaps in Arctic scientific knowledge before finalizing its analysis of lease sale 193. The Alaska Region has determined that it does not need even minimal scientific data on things like the distribution of Arctic species and their key habitat to reach conclusions regarding the risks of oil and gas development. It appears to believe that it can base its oil and gas leasing decisions on mere speculation. We find this unwillingness to analyze the lease sale with scientific rigor deeply offensive. BOEMRE is putting at risk our way of life without even knowing enough to disclose the risks or consequences of the decisions. It needs to do better—as the *Deepwater Horizon* spill demonstrates, we need to know the environmental effects of offshore drilling *before* it happens. Instead of finalizing the current proposed draft, BOEMRE should undertake a complete and thorough analysis of all missing scientific information concerning the Chukchi Sea and the Arctic environment, prepare a revised draft SEIS that incorporates the new information, and reevaluate the impacts of the lease sale in light of the new information. It should then assess anew whether to cancel the leases, modify the leases or affirm the leases. In making this decision, it should not take into account that there are existing lease sale 193 leases in the Chukchi Sea. BOEMRE needs to make a fresh, new decision about lease sale 193.

BOEMRE should move slowly and cautiously before allowing oil and gas activities in the Chukchi Sea. Oil and gas development, especially without adequate planning, puts at risk not only a pristine, changing, and rich wilderness—it puts at risk our home and our way of life. If an oil spill occurs and the sea and its subsistence resources that we rely upon are polluted or disappear, we are the ones who will bear the ultimate consequences. You have an opportunity to prevent this injustice. BOEMRE must set a new course and reassess what information it needs to complete a proper environmental analysis.

BOEMRE should also ensure that, as required by law, it involves Alaska Native governing bodies and local populations in the decision-making process. The policy of the United States is that "[w]hen undertaking to formulate and implement policies that tribal implications, agencies shall . . . consult with tribal officials as to the need for Federal standards and any alternatives that would limit the scope of Federal standards or otherwise preserve the prerogatives and authority of Indian tribes." Executive Order 13175 § 3(c)(3). We ask that BOEMRE meet this government-to-government consultation requirement by sitting down with Alaska Native governing bodies to discuss the lease sale decision. The input of Alaska Native governments is essential because decisions concerning lease sale 193 will affect the ability of our communities to sustain themselves. No government to government meeting was held after Point Hope had to cancel an initial meeting due to conflicts; we request that BOEMRE reschedule the missed government to government meeting. We also request that BOEMRE provide a meaningful opportunity for public involvement. The Point Hope hearing on lease sale 193 was held on Election Day, which placed an unfair burden on the ability of the community to make its voice heard.

Re: Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)

Dear Regional Director:

The Native Village of Point Hope submits the following comments on the Bureau of Ocean Energy Management, Regulation and Enforcement's (BOEMRE) draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (draft SEIS).

The Native Village of Point Hope is a federally recognized tribal government that is responsible for the well being of its 950 members. It is also the oldest, continuously inhabited village in all of North America. Our members have harvested the sea for thousands of years. We preserve our traditional way of life, hunting bowhead whales, walrus, seals, polar bears, beluga whales, and various fish and sea birds. Where we live, a half-gallon of milk costs nine dollars, and families depend on subsistence hunting as a source of healthy food. Subsistence resources are so vital to our well being that if the health of the ocean deteriorates, so will the physical health of our people. Yet, the importance of hunting runs much deeper. Hunting is central to our culture as a way to celebrate our heritage and maintain ties within the community. The ocean is our garden. It is what sustains us physically and spiritually as individuals and as community members.

The Arctic Ocean is central to our communities' cultural and subsistence traditions, and we are gravely concerned about the potential effects of oil and gas exploration and development upon it. We are worried that BOEMRE intends to allow oil and gas leases and drilling in the Chukchi Sea without first obtaining basic scientific data about the Chukchi Sea and the Arctic environment as a whole. As

Re: Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)

Dear Regional Director:

The Native Village of Point Hope submits the following comments on the Bureau of Ocean Energy Management, Regulation and Enforcement's (BOEMRE) draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (draft SEIS).

The Native Village of Point Hope is a federally recognized tribal government that is responsible for the well being of its 950 members. It is also the oldest, continuously inhabited village in all of North America. Our members have harvested the sea for thousands of years. We preserve our traditional way of life, hunting bowhead whales, walrus, seals, polar bears, beluga whales, and various fish and sea birds. Where we live, a half-gallon of milk costs nine dollars, and families depend on subsistence hunting as a source of healthy food. Subsistence resources are so vital to our well being that if the health of the ocean deteriorates, so will the physical health of our people. Yet, the importance of hunting runs much deeper. Hunting is central to our culture as a way to celebrate our heritage and maintain ties within the community. The ocean is our garden.

Native Village of Point Hope Comment

It is what sustains us physically and spiritually as individuals and as community members.

The Arctic Ocean is central to our communities' cultural and subsistence traditions, and we are gravely concerned about the potential effects of oil and gas exploration and development upon it. We are worried that BOEMRE intends to allow oil and gas leases and drilling in the Chukchi Sea without first obtaining basic scientific data about the Chukchi Sea and the Arctic environment as a whole. As demonstrated by the National Ocean Policy, the U.S. Geological Survey's Arctic science gap analysis, and the decision to close the Arctic Ocean to commercial fishing until more scientific information can be obtained, the Obama Administration has repeatedly promised a commitment to a scientific-based decision-making process for the Arctic Ocean. However, in direct opposition to the Administration's promise, the Alaska Region office of BOEMRE has hastily published a draft SEIS in response to a court order to reconsider the 2008 lease sale 193 in the Chukchi Sea. The court ordered BOEMRE to redo its analysis of missing information about the region and natural gas development that could result from the lease sale. BOEMRE is then supposed to reconsider whether to cancel, modify, or affirm the leases in the Chukchi Sea in light of the new environmental analysis. Instead of doing a thorough job and fulfilling its duties under the National Environmental Policy Act, BOEMRE has rushed out a draft document that seeks to justify the lease sale and the earlier environmental analysis that the court found insufficient.

The current draft SEIS concludes that BOEMRE has no obligation to fill the many gaps in Arctic scientific knowledge before finalizing its analysis of lease sale 193. The Alaska Region has determined that it does not need even minimal scientific data on things like the distribution of Arctic species and their key habitat to reach conclusions regarding the risks of oil and gas development. It appears to believe that it can base its oil and gas leasing decisions on mere speculation. We find this unwillingness to analyze the lease sale with scientific rigor deeply offensive. BOEMRE is putting at risk our way of life without even knowing enough to disclose the risks or consequences of the decisions. It needs to do better—as the *Deepwater Horizon* spill demonstrates, we need to know the environmental effects of offshore drilling *before* it happens. Instead of finalizing the current proposed draft, BOEMRE should undertake a complete and thorough analysis of all missing scientific information concerning the Chukchi Sea and the Arctic environment, prepare a revised draft SEIS that incorporates the new information, and reevaluate the impacts of the lease sale in light of the new information. It should then assess anew whether to cancel the leases, modify the leases or affirm the leases. In making this decision, it should not take into account that there are existing lease sale 193 leases in the Chukchi Sea. BOEMRE needs to make a fresh, new decision about lease sale 193.

BOEMRE should move slowly and cautiously before allowing oil and gas activities in the Chukchi Sea. Oil and gas development, especially without adequate planning, puts at risk not only a pristine, changing, and rich wilderness—it puts at risk our home and our way of life. If an oil spill occurs and the sea and its subsistence resources that we rely upon are polluted or disappear, we are the ones who will bear the

Native Village of Point Hope Comment

ultimate consequences. You have an opportunity to prevent this injustice. BOEMRE must set a new course and reassess what information it needs to complete a proper environmental analysis.

BOEMRE should also ensure that, as required by law, it involves Alaska Native governing bodies and local populations in the decision-making process. The policy of the United States is that "[w]hen undertaking to formulate and implement policies that tribal implications, agencies shall . . . consult with tribal officials as to the need for Federal standards and any alternatives that would limit the scope of Federal standards or otherwise preserve the prerogatives and authority of Indian tribes." Executive Order 13175 § 3(c)(3). We ask that BOEMRE meet this government-to-government consultation requirement by sitting down with Alaska Native governing bodies to discuss the lease sale decision. The input of Alaska Native governments is essential because decisions concerning lease sale 193 will affect the ability of our communities to sustain themselves. No government to government meeting was held after Point Hope had to cancel an initial meeting due to conflicts; we request that BOEMRE reschedule the missed government to government meeting. We also request that BOEMRE provide a meaningful opportunity for public involvement. The Point Hope hearing on lease sale 193 was held on Election Day, which placed an unfair burden on the ability of the community to make its voice heard.

We support and join the comments submitted on the draft SEIS by the Alaska Wilderness League, et al. conservation groups. We will do everything in our power to protect our water, land, and way of life and hope that you will address our concerns.

Anchorage, Alaska 99503-5820

30 November 2010

RE: OCS Lease Sale 193 Supplemental EIS Comments

Dear Mr. Goll:

Ukpeagvik Inupiat Corporation (commonly known as UIC), created under the Alaska Native Claims Settlement Act of 1972, serves the social and economic interests of the Inupiat people from the community of Barrow, Alaska - the northernmost community in the United States. UIC is the village corporation of Barrow, one of eight villages in the Arctic Slope Region.

UIC actively supports the oil and gas industry in Alaska. Our family of companies employs 1,400 people worldwide with 750 employees here in Alaska. Core services include scientific support, engineering, construction, logistical, and marine transportation services, as well as regulatory consulting and compliance for the oil and gas industry.

Our community and shareholders hold enormous value for the Inupiat traditional subsistence lifestyle and depend upon the Arctic Ocean. We also recognize the need for, and economic opportunity provided by oil and gas development to our people.

UIC shares the interests of the North Slope Borough, as our coastal district governing body, to create a strong and growing industrial sector in the Alaskan Arctic. We strive to develop long-term, meaningful employment opportunities for our shareholders, their descendants and dependents.

Each year our young people go further from our community to take advantage of employment opportunities. Responsible oil and gas development in the Chukchi and Beaufort Seas will provide diverse employment opportunities and careers for our young shareholders and support the continuity of our way of life - balancing responsible resource exploration and development with our customary and traditional subsistence practices.

UIC continues to support responsible and accountable oil and gas exploration and development as captured in a policy statement from our Board of Directors:

In our interactions with the oil and gas industry, we will leverage our position to benefit the Ukpeagvik Inupiat Corporation Family of Companies, its shareholders,

Ukepeagvik Inupiat Corporation Comment

Bureau of Energy and Ocean Management Regulation and Enforcement

Page 2

and the community. We acknowledge the inevitability of exploration and development by the oil and gas industry and we will support exploration and development activities as long as they are done in a way that ensures:

- *Protection and preservation of the Inupiat culture and subsistence lifestyle*
- *Economic benefit for our community*
- *Employment for our shareholders and their families, and*
- *Contract opportunities for our companies*

UIC shares an interest with the North Slope Borough in protecting our Inupiat heritage and traditional way of life through local participation in project planning and implementation, including engagement in all OCS proposed activities in our region.

We believe industry should integrate local and traditional knowledge with scientific knowledge to support environmentally sound and culturally sensitive activities in the Arctic.

We believe that when industry partners with the local people to share and apply this Traditional Knowledge, it will lead to preservation of our land, our resources, and our way of life.

UIC recognizes that finding balance between the goals of economic opportunity and preserving our way of life will require compromise, diligence, creative thinking, open communications and active stakeholder engagement.

In addition to employment opportunities, UIC believes there should be a provision for coastal producing states to share in federal oil and gas revenues generated on the adjacent OCS. Specifically, UIC recommends federal OCS revenues generated in Alaska should be allocated to the communities within reasonable distance to development. These communities serve as the platforms for onshore and offshore lease activities, and must develop resources and infrastructure to support industrial development while managing potential effects of that development on the people and environment.

UIC values the opportunity to provide comments and looks forward to continued engagement with BOEMRE to communicate the challenges, impacts, and opportunities that the OCS presents to our locally affected community.

Respectfully,

Chris J. Morgan

Re: Chukchi Sea Planning Area Oil and Gas Lease Sale 193
Draft Supplemental Environmental Impact Statement

The State has reviewed the Draft Supplemental Environmental Impact Statement (SEIS) for the Chukchi Sea Planning Area Oil and Gas Lease Sale 193. We compliment the BOEMRE for the work put into this SEIS. Alaska has a tremendous stake in the successful progress of leasing, exploration, and development of the Arctic OCS. In a study conducted by the University of Alaska Anchorage Institute of Social and Economic Research, the Alaska economy would be sustained by the addition of 35,000 jobs with a \$72 billion payroll over a 50-year period. Development of the OCS would spin off approximately \$5.8 billion in additional state and local revenues. OCS development is a prime source of the continued health and diversity of our onshore oil industry. Production from the OCS has several indirect effects including lower pipeline tariffs and longer life of the TAPS pipeline, a more robust and lower cost service industry, and longer-lived onshore facilities. Note also that these state impacts pale in comparison to the many more jobs, incomes, and energy for the Nation as a whole.

The purpose of the SEIS is to provide new analysis in accordance with the United States District Court for the District of Alaska Order remanding the BOEMRE's Chukchi Sea Lease Sale 193 Final EIS. The District Court's Order instructs the BOEMRE to address three concerns: (1) Analyze the environmental impact of natural gas development; (2) determine whether missing information identified by BOEMRE in the 193 FEIS was essential or relevant under 40 CFR 1502.22; and (3) "determine whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown."

It is apparent from our review of the SEIS that BOEMRE has addressed the court's three concerns in a comprehensive manner. Moreover, the Governor of Alaska previously expressed support for Lease Sale 193 with the inclusion of the Corridor II Deferral in 2007 and Lease Sale 193 was reviewed and found consistent with the Alaska Coastal Management Program on October 30, 2007. The State of Alaska's position remains that the Corridor II Deferral represents the best balance of environmental protection and development of the nation's oil and gas resources. Therefore, we urge the Secretary to affirm Lease Sale 193 without delay. The comments below summarize the State's review of the SEIS in the context of the court's instruction to BOEMRE.

Regarding the court's concern for analysis of the environmental impact of natural gas development, the BOEMRE correctly concludes that natural gas development "would merely extend the life of existing plays and infrastructure and build new facilities within previously disturbed areas." The State concurs with BOEMRE that the incremental nature of natural gas development "would be

"Develop, Conserve, and Enhance Natural Resources for Present and Future Alaskans"

November 29, 2010
Page 2 of 2

considerably smaller than the incremental contribution of Sale 193 as analyzed in the [Sale] 193 FEIS and that leasing, exploration, and oil and gas development and production would represent only a small percentage of the foreseeable cumulative activities."

Regarding the court's concern about information identified as missing from the Lease Sale 193 Final EIS, it is the State's position that BOEMRE's comprehensive analysis and methodology is in compliance with 40 CFR 1502.22 and meets the requirements of NEPA. The State also appreciates the effort that BOEMRE took to update a number of the references cited. To address the missing information concern, BOEMRE adopted a methodology where each instance of an identified information gap was carefully examined based on tests in §1502.22 and regulations from the CEQ. This methodology allows BOEMRE to make conscious determinations for every statement it made about information gaps, considering whether the information gap is relevant, essential, or obtainable.

Generally speaking many of these instances simply are not relevant to the question at hand: whether to hold a lease sale and how much acreage to include in the sale. As exploration proceeds, so much more will be known about the Chukchi Sea planning area. Research has and continues to be conducted in this area.

In summary, the State concludes that the SEIS for Chukchi Lease Sale 193 provides more than sufficient support for the Secretary to affirm the February 6, 2008 Chukchi Lease Sale 193 and that it is well past time for lease holders to proceed to the next phase of exploration. Thank you for the opportunity to provide comments on this SEIS.

Sincerely,

Thomas B. Irwin

RE: Chukchi Sea Draft SEIS Comment

Dear Director Goll:

I am writing to you today to express my strongest support for immediate transmission of the Draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea OCS Lease Sale 193 (Sale 193). Without a doubt, the extensive SEIS offers adequate data and analysis on which to make an informed decision regarding that critical lease. The SEIS not only specifically addresses the issues raised by the US District Court, but it does so in a comprehensive, scientifically defensible – and compelling manner.

Reasonable minds may disagree on the merits of drilling for oil and gas resources on Alaska's arctic OCS. There are impassioned and valid arguments on both sides of the issue. But such is always the case with natural resource development issues. For this hearing, therefore, it's critical to bear in mind that a decision regarding whether or not to affirm Sale 193 is not currently before you. The decision before you is merely whether or not the SEIS meets the mandates of the court and provides the baseline scientific and environmental data necessary for a reasonable decision to be made.

Undeniably, "perfect science" does not exist on this, or any other resource project. But equally undeniably, few projects have ever been subjected to the kind of regulatory scrutiny and stringent permitting requirements applied to Sale 193 and other Alaska OCS exploration projects. Without exaggeration, the requirements are some of the toughest safety and environmental standards found anywhere in the world. Activities here would be governed by the stringent lease stipulations identified in the FEIS and SEIS.

In addition, industry has complied with, met, and surpassed every regulatory and permitting requirement at every stage of this project to date. Industry has committed to unprecedented provisions for spill prevention and response. They have spent tens of millions on studies specific to these leases and conditions in the arctic. They have engaged in hundreds of meetings with local communities and stakeholders to hear their concerns and adapt their plans to ensure protection of Alaska's critical subsistence lifestyles. In short, they have done everything regulators have asked and everything in their power to make sure Alaska OCS exploration and development meets the highest safety, environmental and technological standards in the world and in doing so raises the bar for future oil and gas development.

Nevertheless, some will argue that we should not proceed with Sale 193 simply because we don't have "perfect information." They will argue that anything less than perfect knowledge creates too great a risk.

Representative Elect Feige Comment

Implicitly they suggest, that enlightenment can be gained through greater study, or merely through inaction. Human history and experience suggests otherwise.

Many of our country's greatest scientific achievements and technological breakthroughs have come about as a direct result of private sector experience gained in the field. It is only through doing that we can learn how to do things better. Moreover, Alaska's North Slope and OCS are already perhaps some of the most studied energy basins in the country. The shallow water geologic conditions here are substantially different and less dangerous than those encountered in the Gulf. And a forty-year, major incident free offshore development track record proves the technology already exists to safely develop Alaska's OCS.

But all of that is argument for another day. The only issue properly before you now is whether or not to allow the SEIS information to move forward so a decision on Sale 193 can be made. In the absence of specific omissions in the SEIS pursuant to the court order, the decision should be made to forward the SEIS immediately to the court for its consideration in order to keep the regulatory process moving.

Best Regards,

Eric A. Feige

To: BOEMRE AK Public Comments
Subject: attn: Chukchi Sea Draft SEIS

Dear Sirs,
 My name is Cathy Giessel, Alaska State Senator-elect, but, more importantly, a lifelong Alaskan. I was born in the Territory of Alaska and there are four generations of my family living in our state today. I have watched our economy change over the years from before statehood until now. The vibrant economy we currently enjoy is based on the development of our vast natural resources.

I am advocating that the OCS lease sale 193 be affirmed as held in 2008. Rescinding those leases would destroy Alaska's economy and Alaskans' future in this wonderful state.

I enjoyed hearing the testimony from my fellow Alaskans of native ancestry. I have spent several years working for the North Slope Borough School District and I am concerned about the future for the young people of our rural communities.

Presently the schools of the North Slope Borough (Point Hope, Point Lay, Wainwright, Barrow, Nuiqsut, Kaktovik, Atkasuk and Anaktuvuk) are wonderful facilities. The schools are well-staffed and supplied. All the schools have wireless internet in the buildings, with high school students issued new laptop computers. In fact, I can walk into any North Slope school, open my laptop, and in minutes I am connected to the internet. The schools are community centers for evening activities for the whole community, in the gym and library. Several of the schools even have swimming pools. All of this educational opportunity is funded by petroleum tax revenues to the North Slope Borough.

After graduation, these rural students have the opportunity to pursue jobs in resource development close to home on the North Slope. These are good paying jobs, in a place where jobs are limited. The income brought home from resource development jobs benefit the entire community by injecting revenue into their economy.

Alaskans, present and future, need these valuable jobs.

I strongly support affirmation of the OCS Lease Sale 193.

Respectfully,

Cathy

Attn: Chukchi Sea Draft SEIS

Dear Mr. Goll,

I strongly support affirmation of Lease Sale 193 as held in 2008. I urge you to eliminate any further delays in allowing lease holders to develop Chukchi Sea interests. Companies paid top dollar for their Chukchi Sea leases in 2008, with the full expectation that the federal government would allow development already deemed in the best interests of Alaska and of the nation. Delays - including rescinding leases - discourage crucial new industry investment in Alaska.

Alaskan OCS development is critical to the state's economic health. Delays are costing real jobs and generally discouraging investment in the face of growing uncertainties and higher risks. With eventual development - if plans meet the most stringent environmental and regulatory standards - Alaska's rich OCS reserves may drive 35,000 additional jobs, annually, over 50 years, and would generate an estimated \$72 billion in new payroll. Tapping into those 27 billion barrels of oil and 132 trillion cubic feet of natural gas would secure Alaska's economic health through a new generation of support industries, jobs and modest tax revenues, while funneling billions into the federal treasury.

The United States already imports more than 60 percent of its oil, refusing to tap extraordinarily rich resources within its own bounds. This risks financial and political security in a global game of prices and production, manipulated by foreign leaders in direct competition with the private sector oil and gas interests based here at home. If there ever was a time to promote responsible, active drilling, it is now.

We can, as numerous projects and companies have demonstrated, produce resources without compromising the environment and subsistence lifestyles prized in Alaska. I urge prompt approval of Chukchi Sea lease development, and affirmation of the 2008 Lease Sale 193, an action clearly supported by BOEMRE's supplement to the EIS.

Sincerely,

RE: Chukchi Sea Draft SEIS - Allow Responsible Access to Alaska's Resources

Dear Mr. Goll:

I strongly support resource development in Alaska including the development of oil and gas in the Chukchi Sea. As you are aware, drilling in the Chukchi Sea is very different than drilling a deep water well in the Gulf of Mexico. We have the technology and expertise required to safely extract oil and gas without harm to the environment or wildlife. I urge you to lift the de facto moratorium in the Chukchi Sea for the good of Alaska and our nation.

Thank you for consideration.

Sincerely,

Representative Bob Lynn
 Alaska State House of Representatives

RE: Chukchi Sea Draft SEIS – Support of Local Energy Resource Development

Dear Mr. Goll:

Please accept this letter in support for the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska. As a representative of local government in California, I believe that the development of local energy resources is critical to local, state and national economic development efforts. I am hopeful that the federal government will finally approve the responsible development of the Chukchi's abundant oil and natural gas resources as well as others throughout the country.

It is important that the federal government brings Alaska's vast oil and natural gas reserves back online. Jobs in Alaska and across the nation depend on the opportunities that offshore oil and gas production can and will provide. I am in support of large-scale local projects that have the potential to fuel growth and stability for the long term.

In my opinion, the federal government should move forward with the SEIS process and the development of Lease Sale 193 in the Chukchi, as well as pave the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing.

Now is the time to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

Sincerely,

Regan M. Candelario

Subject: Chukchi Sea Draft SEIS Comments
Submitted by email: BOEMREAKPublicCommen@boemre.gov

Dear Mr. Goll:

The Northwest Arctic Borough Administration (NWAB) submits these comments on the September 2010 draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193. The NWAB believes the SEIS did not adequately address missing information, and it urges the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEM) to develop a comprehensive interagency research plan before issuing the final SEIS. The research plan would identify what information is needed for the lease sale, exploration and development phases and use a coordinated approach among agencies and industry to obtain this information.

On October 12, 2010, the Alaska Region of the BOEM released the draft SEIS in response to a June ruling by the U.S. District Court that the environmental analysis for Lease Sale 193 was inadequate. The order required the BOEM to address three subjects: Complete an analysis of the environmental impact of natural gas development, determine whether missing information identified by BOEM in the 193 FEIS was essential or relevant under 40 CFR 1502.22, and determine whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown.

While most of our comments address outstanding information needs, the NWAB is also concerned about the *significance thresholds* outlined in Section IV.A.1 of the SEIS. The thresholds for determining significant impacts are too high. For example, an impact to a marine mammal would not be considered significant unless it took 3 or more generations for a population to recover to its former status. An impact to subsistence harvest would not be considered significant unless subsistence resources were "unavailable, undesirable for use, or

November 29, 2010
Page 2

available only in greatly reduced numbers for a period of 1-2 years" (p. 60). For the people of this region, impacts to fish and wildlife and subsistence would be significant at much lower levels.

The NWAB urges BOEM to ensure that any decision on oil and gas drilling in the Chukchi Sea is based on sound science and a basic respect for Arctic wildlife and the people who live in this region. The analyses in the original FEIS notes hundreds of areas in which information was missing.

In response to the court mandate, the draft SEIS made an across the board determination that none of the missing information was essential to a reasoned choice, and that no matter what impacts might result, it would allow drilling to proceed. Appendix A of the Lease Sale 193 SEIS summarily dismisses the need to collect missing science and discounts potential negative impacts on entire species of Arctic wildlife. The SEIS implies that since there will always be incomplete information, the missing information is not necessary at the lease sale stage. Nowhere in Appendix A, however, does the BOEM explain why existing information is sufficient for making decisions among the alternatives.

The SEIS repeatedly states that more information will be required at the exploration and development phases, but it does not indicate what specific information will be needed at those phases. The NWAB is concerned that few information gaps will be filled during reviews of exploration projects, especially considering the 30-day requirement for BOEM to make a decision on a proposed exploration plan. During review of Shell's Chukchi Sea exploration plan, there was little emphasis on filling information gaps. In addition, Shell's exploration plan dismissed a large oil spill as not being reasonably foreseeable. Considering the recent oil spill in the Gulf of Mexico occurred during the drilling of an exploration well, it is important that the BOEM specify exactly what information gaps it identified in the FEIS that will be filled during the exploration phase.

The BOEM's decision to release the draft SEIS without acknowledging the need to fill information gaps goes against science-based decision-making, especially in light of the systemic failures made evident by the *Deepwater Horizon* accident. New information about oil spill response capabilities should be incorporated into the SEIS. The original FEIS was developed on historic spill data from the Gulf of Mexico and incorrect assumptions about the capability of responding to a large spill. Considering only about 25 percent of the oil from the *Deepwater Horizon* blowout was removed by mechanical means, assumptions for oil recovery in the

Mayor Northwest Arctic Borough Comment

John Goll
November 29, 2010
Page 3

Chukchi Sea need to be revised. The extreme conditions in the Arctic and distance from infrastructure would make it difficult to recover oil from a large oil spill, especially under adverse weather conditions. In addition, considering it took 4.5 months to complete the relief well for the *Deepwater Horizon*, a spill occurring late in the drilling season in the Chukchi would mean a relief well would need to be drilled throughout the harsh Arctic winter.

Since issuing the FEIS, the agency knows what specific locations of the planning area have been leased. This knowledge makes it more feasible to fill information gaps for this lease sale.

We must be thoughtful and responsible in developing offshore resources in Alaska so that we protect the pristine fisheries, wildlife, and subsistence way of life for generations to come. In the Arctic, we must continue to be guided by science and the voices of Northwest Arctic and North Slope communities as we chart a wise path forward.

The process for development of oil and gas resources in the Alaska Outer Continental Shelf (OCS) should recognize the need to fill information gaps before leasing proceeds. The fact that there will always be additional information needs should not be a reason to proceed without obtaining essential information. The NWAB believes a precautionary approach, such as the one used by the North Pacific Management Council for the Arctic fisheries, provides a model for oil and gas development. The August 2009, *Fishery Management Plan for the Fish Resources of the Arctic Management Area* found that commercial fishing in Alaska's Arctic waters should not proceed until more information is available to support sustainable fisheries management.

Instead of proceeding with the current draft SEIS, the NWAB requests BOEM first develop a complete plan for fulfilling information needs. The plan should put a priority on collecting essential missing information and what level of information is necessary at the lease sale, exploration, and development phases. The plan should be based in part on the data generated by the ongoing United States Geological Survey analysis of Arctic oil and gas activities due out in spring 2011. Before making any final decisions, the agency should prepare a revised draft SEIS, followed by public review and comment.

BOEM's first priority must be to protect the people of the Northwest and North Slope boroughs whose survival is directly linked to the Arctic Ocean. It is critical that all necessary science and lessons learned from the Gulf of Mexico spill are incorporated into any final decision about where to allow oil drilling in the Chukchi Sea.

John Goll

Subject: Chukchi Sea Draft SEIS Comments
Submitted by email: BOEMREAKPublicCommen@boemre.gov

Dear Mr. Goll:

The Northwest Arctic Borough (NWAB) submits these comments on the September 2010 draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193. Overall, the NWAB believes the SEIS did not adequately address missing information, and we urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEM) to develop a comprehensive interagency research plan before issuing the final SEIS. The research plan should identify what information is needed for the lease sale, exploration and development phases and use a coordinated approach among agencies and industry to obtain this information.

While most of our comments address outstanding information needs, the NWAB is also concerned about the significance thresholds outlined in Section IV.A.1 of the SEIS. The thresholds for determining significant impacts are too high. For example, an impact to a marine mammal would not be considered significant unless it took 3 or more generations for a population to recover to its former status. An impact to subsistence harvest would not be considered significant unless subsistence resources were "unavailable, undesirable for use, or available only in greatly reduced numbers for a period of 1-2 years" (p. 60). For the people of this region, impacts to fish and wildlife and subsistence would be significant at much lower levels.

The NWAB urges BOEM to ensure that any decision on oil and gas drilling in the Chukchi Sea is based on sound science and respect for Arctic people who live in this region and depend upon the wildlife for culture and subsistence. Note, the analyses in the original FEIS notes hundreds of areas in which information was missing.

In response to the court mandate, the draft SEIS made an across the board determination that none of the missing information was essential to a reasoned choice, and that no

Re: Draft Supplemental EIS for Chukchi Sea OCS Lease Sale 193

Dear Director Goll:

The North Slope Borough (Borough) appreciates this opportunity to comment on the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) Alaska Region's Draft Supplemental Environmental Impact Statement (DSEIS) for Chukchi Sea Outer Continental Shelf (OCS) Lease Sale 193.

As you are well aware, it is the Borough's position that leasing and oil and gas industry operations should not be permitted in the Chukchi Sea. This position is based on our strong and continuing beliefs that the risk of a significant oil spill cannot be eliminated, that the capability does not exist to effectively respond to such a spill in our remote and challenging environment, and that too little is known about this ecosystem and the potential impacts to its resources—either from a cataclysmic spill or from routine operations—to credibly balance the potential risks against the projected benefits.

The DSEIS provides inadequate justification for moving forward without a credible assessment of the true risks posed by arctic OCS leasing and operations. There remains a widespread lack of critical baseline environmental information—information that is essential and relevant to the decisions which the agency is charged with making at this lease sale phase. This information is needed not for the sake of collecting information, but to protect the future of people who are both part of and dependent upon the Chukchi Sea ecosystem.

Our comments will first address deficiencies in the methodology of the DSEIS analysis. We then consider the depth, breadth, and cumulative significance of what BOEMRE does not know.

Next, we discuss additional analysis still lacking in the document, including the need for an expanded human health impact assessment. Finally, we suggest a slightly revised timeline for drafting of the Final SEIS. This will enable BOEMRE to better identify and address potential risks associated with the critical lack of data to support responsible decision making, and therefore better comply with the order of the District Court.¹

A. DEFICIENCIES IN DSEIS ANALYSIS

Appendix A of the DSEIS provides an analysis of individual statements from the 193 FEIS that identify incomplete or unavailable information. We are told that the analysis "comprehensively addresses each item of incomplete or unavailable information." The methodology used in the analysis is briefly described as follows:

...information was considered *relevant* if it could be connected to reasonably foreseeable significant adverse impacts as stipulated by CEQ regulation and following the significance criteria described for each resource in the 193 FEIS. All statements indicating relevant incomplete or unavailable information that would be relevant were then evaluated to determine whether the information was *essential* to a reasoned choice among alternatives. To be essential, the information must provide a means for making a clear distinction between two or more alternatives. Lastly, if missing information was determined to be relevant and essential, managers evaluated the potential means of obtaining the information to determine whether cost would be *exorbitant*.²

This entire approach is problematic in several respects, both in terms of its logical construction, and its implementation.

1. Focus on Individual Statements Ignores Data Gaps in these Statements

By focusing only on each individual statement, the analysis avoids acknowledging the sheer weight of all of the information not known that, taken as a whole, reveals a poorly understood ecosystem and poorly understood potential impacts. Small data gaps, which individually may be dismissed as not greatly significant, can through their interrelatedness and accumulation present significant risks. And small data gaps are critical in light of the almost total lack of information on the use of the Chukchi Sea by most marine mammal species.

BOEMRE explains its reason for ignoring particular scientific data as follows:

...some information is simply not of a type that would alter scientific judgments or affect decision-making. Some information simply is not significant or relevant enough to be considered essential to a reasoned decision among alternatives. For example, additional information about the winter food habits of a whale that is

¹ *Native Village of Point Hope v. Salazar*, No. 1:08-cv-00004-RRB (D. Alaska), Order dated July 21, 2010, as amended Aug. 5, 2010, and Sep. 2, 2010.

² DSEIS, Appendix A, p. 1 [emphasis in original].

only present within the action area during summer months may not be significant or relevant enough to be considered essential to a reasoned decision among alternatives.³

It is our belief that, precisely because little is known about whale numbers, distribution, and behavior in the Chukchi Sea "action area" during the summer months, more attention should be paid to the animals' habits elsewhere during other times of the year (including food habits and any stresses to those habits that the population maybe experiencing). Given what is known about the rapidly and unpredictably changing arctic and sub-arctic marine environments, it is reasonably foreseeable that whales may be experiencing stresses throughout their migratory range. This must be considered in assessing the wisdom of permitting additional activities that have the potential to further affect the population.

We ask that BOEMRE consider for each resource and conflicting use the totality of what it knows and does not know. The agency should, on a case-by-case basis, determine whether it can credibly say that projected activities can be conducted in a manner that does not significantly impact each wildlife resource, environmental value, or use.

The agency's inability to identify specific impacts should not lead it to conclude that there are no impacts. In our many years of reviewing lease sale documents, we have seen this BOEMRE's predecessor agency employ this flawed reasoning all too often.

We remind you of comments made by then President-elect Obama in his December 17, 2008 weekly radio address taking a bold stand for making decisions based on science and facts rather than ideology as he introduced leading members of his science and technology team. "The truth is that promoting science isn't just about providing resources—it's about protecting free and open inquiry," President-elect Obama said. "It's about ensuring that facts and evidence are never twisted or obscured by politics or ideology. It's about listening to what our scientists have to say, even when it's inconvenient—especially when it's inconvenient. Because the highest purpose of science is the search for knowledge, truth and a greater understanding of the world around us. That will be my goal as President of the United States..."

2. Range of Alternatives is Inadequate

BOEMRE's acknowledgement of just how much it does not know about Chukchi Sea resources and values renders the agency's identification of alternatives, against which the importance and relevance of missing information is measured, defective as a means of ensuring that effects to those resources and values can be avoided, minimized, or mitigated.

A coalition of conservation organizations discussed the improper framing of Sale 193 alternatives in an October 27, 2010 letter to Secretary Salazar and BOEMRE Director Bromwich:

³ *Id.* at p. 3.

Missing information about the basic biology of the region and about the effects of oil and gas activities on the species that inhabit it is essential to a reasoned choice among the alternatives actually proposed in the original EIS. It is also essential to framing an appropriate range of alternatives in the first place. BOEMRE's Alaska Region concludes in the draft SEIS that the effects under all the action alternatives presented in the original EIS are basically the same . . . This conclusion suggests that the range of alternatives is inadequate. The basic information about the Chukchi Sea ecosystem that the Alaska Region concedes is missing and concedes is, in many instances, relevant to potentially significant effects from the lease sale, is essential to proposing a meaningful range of alternatives that would have meaningfully different effects on the environment.⁴

We strongly agree with this assessment. We ask that BOEMRE reframe DSEIS alternatives based on the admittedly incomplete available science within the framework of a conservative precautionary approach designed to avoid adverse impacts where they cannot be reliably quantified or qualified due to a lack of available information.

The Council on Environmental Quality (CEQ) refers to the alternatives analysis section as the "heart of the environmental impact statement."⁵ CEQ regulations require agencies to present the environmental impacts of the proposal and the alternatives in comparative form, "thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public."⁶ Yet the alternatives in the Sale 193 EIS are defined without reference to a clear and scientifically grounded baseline of ecosystem information. They are therefore not based on sharply differing levels of impacts and associated risks to resources and competing uses, and there is no clear basis for choice among them.

B. SIGNIFICANCE OF THE MISSING INFORMATION

1. Need to Consider Information at this Stage

Decisions made as a result of a lease sale planning process are consequential in that they determine whether, when, where, and under what conditions to issue leases in a particular OCS region. Information concerning the resources in the area and the effects of oil and gas activity on those resources is essential to making those critical leasing decisions.

On September 16, 2009, more than 400 Ph.D.-level scientists signed a letter to President Obama as Secretary Salazar was taking comments on a proposed interim 5-year OCS Leasing Program. The Secretary was in part considering what level of offshore oil and gas activity to allow in the Chukchi and Beaufort Seas. The scientists cited the changes taking place and urged the President

⁴ Letter from Alaska Wilderness League, et al., to Secretary Salazar and Director Bromwich Re: Pending Decisions in the Arctic Ocean: Chukchi Sea Lease Sale 193 Remand and Shell Oil Company's Beaufort Sea Exploration Drilling Plan for 2011 (Oct. 27, 2010).

⁵ 40 C.F.R. 1502.14.

⁶ *Id.*

to take a time out from offshore industrial activity to allow for a precautionary, science-based approach that better assesses the consequences of development in a rapidly changing ecosystem:

We believe that the environmental impacts of oil and gas development in the waters of the U. S. Arctic are not adequately assessed and cannot yet be accurately predicted . . . Before offshore oil and gas development can take place safely and appropriately, we must have a better understanding of the ecosystem, adequate consultation with Alaska residents in the Arctic about their needs and concerns, and adequate prevention, mitigation, and response capacity and measures.

As scientists, we urge the President of the United States and his administration to take a science-based precautionary approach on decisions regarding the offshore oil and gas development of the U.S. Arctic Ocean. Prior to permitting any new oil and gas development, there must be thorough research, sustained monitoring, and comprehensive planning to better understand and avoid impacts and determine the best way to proceed in the U.S. waters of the Chukchi and Beaufort Seas.⁷

The DSEIS does not acknowledge or address the concerns and recommendations of these scientists. Its conclusion that "while many items of incomplete, missing, or unavailable information were broadly relevant to the important issues at hand, none were essential for a reasoned choice among alternatives" begs credibility and suggests a pro forma effort to comply with the order of the U.S. District Court to determine whether missing information identified in the Sale 193 FEIS was essential or relevant under 40 C.F.R. 1502.22.

A lease sale involves concrete and consequential decisions that by law and by practice greatly enhance the likelihood that future oil and gas activities will be permitted. In no small measure, as we have seen in recent years, lessees have the capability to bring considerable pressure on agencies, mount public relations campaigns, and otherwise marshal substantial resources and information far beyond the capabilities of decision makers, other stakeholders, and the public to support their desired offshore operations. Good, reasonably complete, and credible information about the biological functions of different parts of the planning area, and the relative importance and interconnectedness of those parts to the regional ecosystem as a whole, are essential to leasing decisions. Similarly, a reasonably complete understanding of the potential effects of industrial activities, alone and in combination with other foreseeable activities and forces, on different components of the ecosystem is essential in deciding whether, where, when, and under what conditions those activities should be permitted.

2. Same Information Gaps in DSEIS and FEIS

Our comments today are similar to those we and others submitted during the development of the original EIS. We are concerned that the DSEIS has come no closer to a thorough, reasoned

⁷ Letter from Gabriela Chavarria, et al. to the President (Sep. 16, 2009) available at http://www.pewtrusts.org/uploadedfiles/wwwpewtrustsorg/News/Press_Releases/Protecting_ocean_life/Scientists%20Letter%20to%20the%20President_Sept%202017.pdf [citations omitted].

analysis than the Draft (DEIS) and Final Sale 193 EIS (FEIS) documents that BOEMRE was required to supplement.

In the DSEIS, BOEMRE concedes that much of the information identified as missing in the Sale 193 EIS was relevant to potentially significant effects of the lease sale. The agency concludes, however, that none of the missing information is essential to reasoned choices among alternatives, and thus there is no obligation to obtain the information.⁸ This of course echoes the conclusions reached in the Final 2007 EIS.

We could not disagree more. The missing information concerns the most basic details concerning the abundance, distribution, and life history characteristics for most marine mammal and other upper trophic level species occurring in the region. There is a near total lack of information concerning lower trophic level species, and no assessment of the potential impacts of industrial activities on these critical components of the Chukchi Sea ecosystem.

In our comments on the DEIS, we set out a compelling basis for our assertion that the range of alternatives was inadequate. But rather than respond to our points, the Mineral Management Service (MMS) simply stated that it disagreed with our conclusion.⁹ No additional or modified alternatives were presented in the FEIS. With the exception of the added and narrow gas development scenario, none are included in the DSEIS that reflect the absence of essential information and adopt an appropriately cautious approach to leasing.

In the FEIS, BOEMRE avoids consideration of nearby projects as follows:

At present, no process is in place to acquire meaningful information regarding Russian commercialization and industrialization in the high Arctic. While MMS acknowledges the existence of various industrial activities, these activities are not well understood and, as a result, fall into the speculative category of activity as defined in Section V of this EIS.¹⁰

As we pointed out in our comments on the FEIS, information is readily available concerning large-scale oil and gas development at Russia's Sakhalin Island. The details of the project, and the challenges it has and continues to face, have been extensively reported in the industry and general press. Shell's website describes that company's involvement on Sakhalin. Thousands of other references are identifiable through a simple web search. Industrial operations in adjacent Russian waters are clearly relevant and essential to a credible cumulative effects analysis considering oil and gas leasing in the Alaskan Chukchi Sea, yet BOEMRE has still made no attempt to gather readily available information.

To adequately respond to the Court's order, BOEMRE must expand its definitions of what information is essential and relevant to include information on all effects producing activities and

⁸ See DSEIS at p. 10.

⁹ MMS Responses to North Slope Borough Comments, response to NSB 006-001 available at http://alaska.boemre.gov/re/FEIS%20EA/Chukchi_FEIS_193/Vol%20II%20Sec%202%20WEB.pdf

¹⁰ *Id.*, response to NSB 006-006.

forces that have the potential to act upon the resources and uses of the planning area. Particularly with respect to potential cumulative effects, an understanding of exposures and stresses throughout the ranges of migratory species is relevant to assessing their vulnerability to potential additional effects associated with oil and gas activities within the planning area. We ask BOEMRE to adopt a more common sense approach to identifying essential and relevant information, be more proactive in obtaining the information that does exist, be more assertive in setting priorities and imposing conditions that will lead to the securing of missing information, and adopt a cautionary approach to leasing and project permitting until sufficient information is available for responsible decision making.

3. New Information and Circumstances to Consider

We strongly believe that BOEMRE must consider new information and circumstances that have arisen since the FEIS was prepared more than three years ago. With so little known about the Chukchi Sea ecosystem, consideration of new information becomes all the important to leasing decisions.

Under the National Environmental Protection Act (NEPA) and its regulations, such new information would have triggered a supplemental EIS (regardless of what the court order requires).¹¹ NEPA also requires that an agency use "high-quality information and accurate scientific analysis."¹² An agency cannot rely on "outdated data" or fail "to acknowledge the limitations in a methodology."¹³

Although new and relevant reports regarding bowhead whales in the Chukchi Sea have been released since the issuance of the FEIS, the DSEIS does not consider them.¹⁴ We urge you to consider an important finding of these reports: **the majority of bowhead whales in the Western Arctic stock migrate through the Lease Sale 193 area.** This information is available, is relevant to and would seem to contradict key conclusions reached in the FEIS and DSEIS, but has yet to be considered by BOEMRE.

The results of these studies, their implications with respect to potential impacts to bowhead whales and other resources associated with Sale 193 related activities, and the failure of BOEMRE to appropriately acknowledge and analyze them are discussed in detail in comments on the DSEIS to be submitted by the Alaska Eskimo Whaling Commission (AEWC). We share

¹¹ A supplemental EIS must be prepared when "[t]here are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts." 40 C.F.R. § 1502.9(c)(ii). When new information related to an EIS comes to light, the agency must take a "hard look" at whether the new information is significant to the environmental impact analysis. *N. Idaho Cmty. Action Network v. United States DOT*, 545 F.3d 1147, 1154-1155 (9th Cir. 2008) (citing *Price Road Neighborhood Ass'n v. U.S. Dept of Transp.*, 113 F.3d 1505, 1510 (9th Cir. 1997)). If the new information may give rise to significant environmental impacts "in a manner not previously evaluated and considered," the agency must conduct a SEIS. *Id.* at 1157.

¹² 40 C.F.R. § 1500.1(b); *Lands Council v. Powell*, 395 F.3d 1019, 1031 (9th Cir. 2005).

¹³ *Nw. Ecosystem Alliance v. Rey*, 380 F. Supp. 2d 1175, 1195 (W.D. Wash. 2005).

¹⁴ See, e.g., ADFG, et al. Satellite Tracking of Western Arctic Bowhead Whales (July 2010) (DOI/BOEMRE is listed as the funding agency); Quakenbush, et al. Fall and Winter Movements of Bowhead Whales in the Chukchi Sea (2009); and NMFS's July 2010 Biological Opinion for Oil and Gas Activities in the Beaufort and Chukchi Seas.

AEWC's concerns regarding the failure of BOEMRE to analyze new bowhead whale information. We question why the agency has chosen to include in the DSEIS new information on other species, while not including bowhead data that is arguably more central to subsistence concerns.

C. NEED FOR ADDITIONAL EXPANDED ANALYSIS

The District Court in part ordered BOEMRE to analyze the environmental impact of natural gas development. But the DSEIS does not expand the human health impact analysis of the Sale 193 EIS. To the extent that the assessment of the potential impacts of gas development is new and additional analysis in the DSEIS, it requires an expansion of the human health impact analysis

The North Slope Borough, our communities, and individual residents have long been concerned about the potential human health impacts from potential oil and gas exploration, development, and production activities. These concerns include air quality issues and subsequent increases in respiratory problems, contamination of subsistence resources through water and air pollution, displacement and impairment of access to subsistence resources and associated food insecurity, and social issues associated with increased contact with non-resident industrial workers. BOEMRE is obligated by NEPA,¹⁵ by Executive Order 12898,¹⁶ and by subsequent guidance from the Council on Environmental Quality to assess possible human health impacts. A commitment to perform this required assessment at the lease sale planning phase was made in the 2007-2012 OCS Leasing Program. We remind you that the assessment is not itself the required objective. It is but a means of identifying potential health related impacts. The legal mandate then is to attempt to mitigate those identified potential impacts.

Neither the FEIS nor the DSEIS adequately recognizes and addresses as a component of its cumulative effects analysis the likely long-term impacts on human residents of the increased industrialization of the Arctic. There are numerous studies funded by the petroleum industry and others concluding that many potential impacts to wildlife can be mitigated to varying degrees. We are unaware, however, of any comparable literature identifying an adequate and proven approach to mitigating impacts on subsistence activities.

The FEIS referred to a wide array of potential human health impacts associated with Sale 193 leasing and the cumulative case, and included some analysis of these impacts provided to the agency by the Borough. Public health issues were mentioned in the "sociocultural" impacts and "environmental justice" discussion, yet there was not an effort to systematically and thoroughly address human health concerns separately in the document.

The DSEIS neither corrects these deficiencies nor provides any meaningful analysis of potential human health effects associated with gas development alone, or with other potential development and factors that may cumulatively impact the health of our people. Nor does the DSEIS identify any potential mitigation measures to address those impacts.

¹⁵ See, e.g., 42 U.S.C. 4331(b)(2); 40 C.F.R. 1508.8, 1508.14;

¹⁶ See Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations* (Feb. 11, 1994) at 1-101, 3-301.

BOEMRE is legally and ethically required to include a rigorous, systematic assessment of human health impacts in its NEPA analyses, and to identify strategies to mitigate identified potential impacts.

D. ENVIRONMENTAL JUSTICE

Federal agencies must "make achieving environmental justice part of ... [their] mission[s]" pursuant to Executive Order 12898.¹⁷ It has been troubling to hear some of the consistent themes of comments and testimony offered to date by industry stakeholders, the State of Alaska, and the Municipality of Anchorage, among others, concerning the Sale 193 DSEIS. They have spoken repeatedly of the great resource potential of the arctic OCS, the need to reduce the nation's dependence on foreign sources of oil, the jobs that would be generated, and the revenues that will be received at the state level. They have said that in light of these considerable benefits, the risks are worth taking.

First, we believe that it is always wise when fantastic resource estimates are offered as justification for industrial expansion into a frontier area to remember that they are largely speculative. It is somewhat ironic that during this Lease Sale 193 comment period the estimate of recoverable oil within the National Petroleum Reserve-Alaska, once heralded to hold over 10 billion barrels, was dramatically downgraded to less than one billion barrels.

Second, our nation's dependence on foreign oil would annually be reduced by only single-digit percentage points even if the wildly optimistic estimates of recoverable volume prove accurate. The jobs figures quoted are misleading. Only a fraction would be the direct oil industry positions implied, and it is likely that many of those slots would be filled by workers not now residing in Alaska. And yes, it is true that the State would receive considerable revenue from oil transported through the Trans-Alaska Pipeline System. The Borough also would receive some measure of revenue from taxes on industrial facilities constructed onshore and in state waters, and perhaps funds from the Coastal Impact Assistance Program if it is continued into the distant future.

That all being said, it is clear that the great majority of any benefits associated with Chukchi Sea OCS leasing, exploration, development, and production will be realized not by the Borough and our residents, but by companies, agencies, organizations, and workers elsewhere. The great majority of the risks, however, will be borne by our people, and our social and cultural institutions and systems. That imbalance in benefits and risks is exactly what environmental justice requirements were created to identify and avoid. But the DSEIS fails to meaningfully assess the potential environmental justice implications of Lease Sale 193.

Here too, the unavailability of critical relevant information, and the framing of alternatives that do not provide clear choices defined by levels of potential impacts and risks, confounds any attempt to meaningfully assess the potential threats of this sale to our people.

¹⁷ *Id.* at 1-101.

This is true with respect to the myriad of potential impacts to marine resources and subsistence associated with both routine industrial operations and oil spills. Given the extraordinarily harsh regional weather and ice conditions of the Chukchi Sea, its remoteness from existing industrial and emergency response infrastructure, and the failure of the oil industry to demonstrate the capability to effectively respond to a major oil spill under conditions elsewhere that are far less challenging all speak to a significant, yet unacceptably unquantifiable risk to the Chukchi Sea ecosystem and to those of us who depend on the resources of this region for our physical health and cultural and social well being.

E. ALASKA COASTAL MANAGEMENT PROGRAM REVIEW

In 2007, BOEMRE prepared a consistency determination for Lease Sale 193 pursuant to the Alaska Coastal Management Program (ACMP) and the Coastal Zone Management Act. Given that the District Court's order to assess the potential impacts of gas development is new requirement calling for assessment beyond that of the original EIS, BOEMRE must prepare and submit to the State of Alaska a revised consistency determination reassessing the consistency of Lease Sale 193 with ACMP.

The requirement for a supplemental consistency determination is set forth in 15 C.F.R. § 930.46 (Supplemental coordination for proposed activities):

(a) For proposed Federal agency activities that were previously determined by the State agency to be consistent with the management program, but which have not yet begun, Federal agencies shall further coordinate with the State agency and prepare a supplemental consistency determination if the proposed activity will affect any coastal use or resource substantially different than originally described. Substantially different coastal effects are reasonably foreseeable if:
...

(2) There are significant new circumstances or information relevant to the proposed activity and the proposed activity's effect on any coastal use or resource
...

Here, a new component, a gas development scenario, has been added to the range of activities projected to result from the lease sale. Also, given how little is known about the presence, distribution, and use within the sale area of most marine mammals, fish, and other resources, any new information must be seen as significant and relevant. There is new information, and, as discussed above, BOEMRE has an independent obligation under NEPA to consider the new information and circumstances that have arisen since the FEIS was prepared. With the requirement to consider this new information comes a need for supplemental coordination with the State of Alaska concerning the consistency of Lease Sale 193 with the ACMP.

F. MORE TIME WILL IMPROVE FINAL SEIS

The interests of all stakeholders would be served by allowing BOEMRE just a few more months to prepare and publish the Final SEIS. The District Court's order required the agency to make

reasonable efforts to respond to the issues raised on remand by January 21, 2011, and to file a report with the Court outlining the status of the matter if the deadline proves unrealistic. We recognize that BOEMRE intends to finalize the SEIS by January 21, 2011, but believe that if the agency articulates a legitimate reason, there is room for extending the deadline. We ask that BOEMRE seek such an extension delay from the Court to accommodate the need to review additional information not yet available, but which has the potential to enhance the agency's ability to comply with the orders of the Court.

Independent of the January 21, 2011 date set by the Court, there is no urgent need for the SEIS to be completed by January 2011 or for a Record of Decision (ROD) to be issued by March 2011. There is no drilling now proposed in the Chukchi Sea during the 2011 open water season. Shell, which had proposed exploratory operations on its Sale 193 leases in recent years, has announced that it will be drilling only in the Beaufort Sea in 2011.

Secretary Salazar has already acknowledged that significant data gaps exist with respect to the arctic marine ecosystem and the associated changes being caused by accelerating climate change. He has ordered the U.S. Geological Survey (USGS) to prepare a report outlining the effects of oil and gas exploration on marine mammals and other resources, to determine what research is needed for effective and reliable oil spill response in ice-covered regions, to evaluate what is known about cumulative effects of energy extraction on ecosystems and other natural resources, and to review how ongoing climate change may mitigate or compound arctic energy development impacts.

The task assigned to BOEMRE by the Court and that assigned to the USGS by the Secretary are somewhat overlapping and clearly complementary. BOEMRE must determine whether missing information identified in the FEIS for Lease Sale 193 was essential or relevant, and the USGS must identify Chukchi and Beaufort Sea knowledge gaps. With the USGS report due to the Secretary in April, it would seem to make good sense to time the production of the Final SEIS and ROD to align the results of both efforts and to ensure that BOEMRE's compliance with the Court's order can benefit from the work of the USGS.

CONCLUSION

We have long advocated a precautionary approach to oil and gas leasing and operations in our arctic waters. In the past year, we have pointed to the essential components of such an approach adopted in August 2009 by the Department of Commerce in its Arctic Fishery and Management Plan, and asked that a comparable strategy be adopted by the Department of the Interior with respect to its responsibilities in the same arctic waters. The Commerce approach was adopted largely in response to the recognition that a warming arctic is bringing rapid and unpredictable change to the region. Disturbing revelations concerning failures in planning, preparation, oversight, and oil spill response in the less extreme and better understood waters of the Gulf of Mexico following the April 20, 2010 Deepwater Horizon blowout only bolster the arguments for caution in the challenging frontier of the Arctic. Significantly, retired U.S. Coast Guard Commandant Thad Allen, who oversaw the federal spill response in the Gulf, heralded the Fishery Management Plan as "a wise proactive measure to ensure that we find the right balance between the environment and economics for a healthy and sustainable Arctic region." We ask

that in finalizing the Lease Sale 193 SEIS, BOEMRE review the language and approach of the Arctic Fishery Management Plan, and either adopt a comparable approach and conditions for oil and gas leasing here, or explain why the caution appropriate with respect to fisheries is not appropriate with respect to oil and gas operations.

In the further interests of caution and consistency, we also urge BOEMRE to pursue with the Court the possibility of timing the publication of the Final SEIS to allow for review and consideration of the data gap analysis now being prepared by the USGS.

We ask that BOEMRE expand its analysis of potential human health impacts associated with new analyses in the SEIS and consider in more depth potential environmental justice concerns associated with the relative benefits and risks of leasing to our Inupiat residents.

Finally, BOEMRE should also submit to the State of Alaska a revised consistency determination assessing compliance of Sale 193 with the provisions of the Alaska Coastal Management Program.

Thank you for considering these comments.

Sincerely,

Edward S. Ita, Mayor

Re: Comments on Chukchi Sea Lease Sale 193 Final EIS

Dear Mr. Cowles:

The North Slope Borough (Borough) appreciates this opportunity to comment to the Minerals Management Service (MMS) on the Final Environmental Impact Statement (FEIS) for proposed Chukchi Sea OCS Lease Sale 193. We are pleased that some of our comments on the Draft EIS (DEIS) have resulted in changes in the FEIS.

However, MMS has essentially taken the position that leasing is prudent regardless of inadequate knowledge of the area to be leased; the potential for significant impacts to so many resources, to our critical subsistence harvests, and to our health; and regardless of the near-impossibility of an effective response to oil spills under Chukchi Sea conditions. The persistent theme of the affected environment and environmental consequences sections of the document is the staggering lack of information regarding this vast marine area. With so little information upon which to base its decisions, it is unreasonable for MMS to allow Sale 193 to proceed.

Our position remains unchanged that oil and gas leasing should not occur in the Chukchi Sea, and therefore recommend adoption of Alternative II. Among the action alternatives, we join the Alaska Eskimo Whaling Commission (AEWC) in believing that Alternative III is preferable, and fully endorse the AEWC's FEIS comments on this point. We also

believe that adoption of Alternative IV is indefensible given that MMS acknowledged that it was based on a 20-year-old biological opinion from the National Marine Fisheries Service that is surely out of date and has in any event been unavailable for review.

With respect to the Exploration Seismic Survey Activities Alternatives, it is unclear why an additional alternative was not analyzed. Namely an alternative that would prohibit pre-Sale 193 seismic surveys in the 1,765 whole or partial blocks of the Corridor I (Alternative III) Deferral area along the coastward edge of the sale area until the lease sale decisions have been made and the NMFS/MMS Seismic Programmatic EIS has been completed. It would seem logical to have included such an alternative to track with Alternative III, in the same way Seismic Alternative B tracks with Alternative IV.

As was the case throughout the DEIS, many of the conclusions reached in the FEIS lack meaningful support. The same is true with respect to some responses to comments. The tact taken by MMS' response to the Borough's first identified comment, NSB 006-001, that the range of alternatives presented in the DEIS was inadequate, is one example. We set out a compelling basis for our assertion that the range of alternatives was inadequate. Rather than respond to our points, MMS simply states that it disagrees.

There are problems as well when an actual response is provided. With respect to response NSB 006-006, for example, MMS states: "[a]t present, no process is in place to acquire meaningful information regarding Russian commercialization and industrialization in the high Arctic. While MMS acknowledges the existence of various industrial activities, these activities are not well understood and, as a result, fall into the speculative category of activity as defined in Section V of this EIS." On the contrary, information is readily available concerning large-scale oil and gas development at Russia's Sakhalin Island. The details of the project, and the challenges it has and continues to face, have been extensively reported in the industry and general press. Shell's website describes that company's involvement, and thousands of other references are identifiable through a simple web search.

Response NSB 006-010 is non-responsive. We appreciate that "[t]he MMS acknowledges the impact of numerous meetings and documents reviews on the planning staff of the NSB and the even more limited manpower available in smaller communities". It is also apparent that "[t]he accelerated MMS leasing timetable and an increase in the number of seismic survey and exploration permits has taxed the agency, as well." None of this, however, relieves MMS of its responsibility to mitigate the identified and significant impacts to our minority North Slope population.

The workload of MMS and other agency staff is not of concern under the Environmental Justice Executive Order 12898. Nor were our comments limited to concerns about Borough and community staff workloads. They were meant to explain the dual nature of the impacts associated with continuous multiple overlapping planning processes. Each single review within the seemingly unending multitude of reviews deals with a proposal that would threaten the health and culture of the majority of our residents. Moreover, the reviews themselves have a hugely significant impact: The fear and anxiety engendered by

so much activity, independent of the outcomes, burdens both our subsistence-dependent residents and our community institutions.

NSB 006-016 is also non-responsive on any meaningful level to our identification of the cascading and complex impacts associated with the many overlapping planning processes, including the choices that must be made, and the effects felt by individual North Slope residents and the community as a whole.

With respect to NSB 006-011 and other responses to our comments concerning the necessity of MMS fulfilling its responsibility to analyze and mitigate the potential impacts of OCS oil and gas leasing on human health, we appreciate the additions to the document resulting from the consultation between MMS and Dr. Aaron Wernham, representing the Borough on these issues. However, MMS has failed to include or even respond to the health-related mitigation measures submitted by Dr. Wernham. This is a significant omission that must be corrected before any leasing decision can be made based on this EIS.

In conclusion, we strongly believe that oil and gas leasing, exploration, and development should not occur in the Chukchi Sea. The absence of baseline environmental data, the region's harsh weather and ice conditions, its remoteness from existing infrastructure, and the established lack of capacity to respond to a spill under even less challenging conditions require that there be no oil and gas leasing in the Chukchi Sea.

Thank you for considering these comments.

Sincerely,

Edward S. Itta

COMMENTS OF THE
ALASKA ESKIMO WHALING COMMISSION ON THE
FINAL ENVIRONMENTAL IMPACT STATEMENT
FOR OIL AND GAS LEASE SALE 193, CHUKCHI SEA PLANNING AREA

July 16, 2007

INTRODUCTION

MMS is in the final process of conducting an environmental review for proposed oil and gas Lease Sale 193. The National Environmental Policy Act (NEPA) and the OCS Lands Act require that MMS use this process to do more than help fulfill the agency's responsibility to oversee offshore oil and gas development. Through these Acts, Congress also has required that the Secretary of the Interior, acting through MMS, undertake concrete, proactive measures to protect the marine and human environments affected by OCS development. These responsibilities can be met by selecting the alternative that is most able to meet the purpose and need of the proposed action while protecting the human and marine environments. In addition, under the Marine Mammal Protection Act's standard for the protection of our marine mammal subsistence resources, MMS must analyze and implement mitigation measures that preserve the availability of bowhead whales and other marine mammals for subsistence uses. MMPA 101a(5)(A) and (D).

Given the unique situation the agency faces in overseeing proposed development in the Arctic Ocean, the AEWC finds MMS' proposed environmental review process inadequate. The AEWC further believes that MMS has not presented adequate alternatives. As a means of enhancing its environmental review and expediting the current process, the AEWC strongly encourages MMS to support our community's efforts to participate more fully in the process, including participation in the development of mitigation measures.

The issues our community faces as a result of OCS oil and gas activities fall into two broad categories: environmental and socio-cultural. Under federal law, MMS is responsible for working with local communities to address impacts in both of these categories. We are aware of MMS' presence among our people as it gathers information and traditional knowledge to include in the EIS. We read promises in the Draft EIS that our input will be considered in the final decisions regarding this sale as others before it. Yet in northern Alaska, MMS, historically, has shown little willingness to take on the issues that it must face in order to address these impacts.

With respect to environmental issues, we urge the Secretary to reject MMS's preferred alternative IV and adopt Alternative III, which is highly likely to accomplish the purpose and need of the proposed action while simultaneously offering a protective buffer between oil and gas operations and the spring lead system where our villages conduct their spring bowhead whale hunts. In addition, certain of our villages are planning to

conduct fall whaling, and an adequate distance between whaling activities and oil and gas activities in the Chukchi Sea will be crucial to a successful hunt and to maintaining the safety of whaling captains and crew.

With respect to socio-cultural issues, we remain adamant that MMS revise its significance thresholds, or abandon them and review impacts on a case by case basis, using the regulations of the Council on Environmental Quality on the evaluation of significance using an analysis of context and ten intensity factors.

Finally, as we review the list of mitigation stipulations that fall short of our expectations and our recommendations, we are afraid that MMS once again is prepared to make decisions that do not address our needs and fears. For instance, we disagree with MMS's characterization that the only significant adverse effect to our bowhead whale subsistence hunt, our sociocultural systems, and environmental justice will occur in the "unlikely event" of a large oil spill. Significant adverse effects will occur as a result of routine program operations, such as exploration, construction, operations, and decommissioning of oil and gas development facilities.

We urge MMS, as always, to select the alternative and mitigation measures that will protect our marine resources and our subsistence livelihood, rather than focusing solely on the objectives of oil and gas companies in a time of soaring gas prices and record profit.

COMMENTS

I. The Secretary Should Adopt Alternative III As the Choice that Strikes the Most Effective Balance Between Development of the Resources of the Outer Continental Shelf and the Protection of Human and Marine Environments.

A. Alternative III Offers MMS The Best Chance To Serve The Purpose And Need Of The Proposed Action While Protecting The Living Marine Resources of the OCS and The Bowhead Whale Subsistence Hunt.

The purpose and need of the Proposed Action are to offer for lease areas in the Chukchi Sea OCS that might contain economically recoverable oil and gas resources. FEIS I-1. Both Alternative III and Alternative IV accomplish the purpose and need; however, Alternative III, which defers 1,765 lease blocks (Corridor I) from the Sale, offers greater protection of the human, biological and physical environments than does Alternative IV, the agency's Preferred Alternative.

According to MMS's "Opportunity Index," Alternative III allows very good odds that industry will successfully produce the one commercial development that MMS envisions occurring under its Proposed Action. FEIS IV-7. Also, Alternative III offers a greater buffer between the noise disturbance of exploration and development than does

Alternative IV. Fewer exploration and production wells are likely to be drilled if a smaller planning area is offered for leasing. This means fewer support vessels, less barging, fewer fixed wing and helicopter trips from offshore project sites to the mainland, and generally less activity in the Chukchi Sea.

B. MMS Inexplicably Cites to A Twenty-Year-Old Biological Opinion To Support Its Choice of Alternative IV.

MMS uses a 1987 Biological Opinion from the National Marine Fisheries Service to support its Alternative IV, the Preferred Action. This decision creates two problems for the agency's recommendation. First, it is based on an out-dated analysis rather than the best available science.

Second, the agency apparently is unable to provide a cite that would allow members of the public to locate this reference. If MMS plans to recommend to the Secretary a particular set of resource management choices, the agency should be able to cite to the study that provides support for those choices.

However, the citation to the study is missing from the FEIS's bibliography, and NMFS Administrative Office in Anchorage cannot locate the referenced study from the information, "1987 NMFS Biological Opinion on the Chukchi Sea" which is the only clue to the reader of where to look for this analysis. MMS should not make its primary resources inaccessible to the reader in this way. It leads to a loss of transparency and to situations of mistrust and anger.

II. MMS Discounts the Degree to Which Current High Oil Prices Drive the Oil and Gas Industry's Race to the Chukchi Sea.

Throughout the FEIS, MMS maintains that industry will encounter regulatory and logistical obstacles that will reduce the likelihood that development will occur – less than 10 percent, according to MMS. [However, the Open Water Season of 2006 touched off an explosive increase in seismic exploration in the Chukchi and Beaufort Seas. The intensity continues during the 2007 Open Water Season, as Shell and other companies will spend hundreds of millions of dollars to search for oil in the waters from which we take our native foods. The future planned level of seismic activity is forecast in stark relief in the National Marine Fisheries Service's (NMFS) and the Minerals Management Service's (MMS) Draft Programmatic Environmental Impact Statement for seismic operations, which contemplates six seismic operations in the Chukchi Sea. It is unfathomable that companies would devote so much money and human effort into an enterprise in which they have only a 10% chance of finding and developing the resources of the OCS.]

To accommodate industry demands for access to the Chukchi Sea in 2006, MMS prepared a Programmatic Environmental Assessment (see footnote 3). The PEA, and

especially its draft, offered an unusually thorough, well reasoned, and scientifically supported analysis, in which MMS identified numerous and extensive gaps in data on the use of the Chukchi Sea by wildlife, including endangered whales and birds. Given this lack of data, both MMS and NMFS imposed strict monitoring and mitigation measures on the geophysical operations permitted for 2006. However, one company sought legal protection from its obligation to meet these requirements, and NMFS and arctic OCS stakeholders still do not know, a year later, whether or not a second company in fact complied with them, since industry has not produced the analysis of the 2006 monitoring that would present the needed information.

It is clear that oil companies will not necessarily comply with the mitigation that is imposed on their permits. To the extent MMS is relying on its standard complement of mitigation measures, including any contingent incidental harassment authorizations from NMFS, MMS must include in its FEIS the fact that oil companies may not be willing to comply and may be factoring any non-compliance penalties into the cost of doing business offshore in the Arctic.

Industry interest in the Chukchi Sea at this time meets or exceeds historic levels. Although MMS dismisses oil price as a cause of soaring industry interest in the Chukchi Sea, the agency cannot ignore the possibility, even the probability, that this interest is driven by the price of oil, which on July 13 was \$74.35 per barrel.

III. MMS's Conclusions Regarding the Effects of Lease Sale 193 on Subsistence Harvest Patterns, Sociocultural Systems, and Environmental Justice are Based on Inappropriate Thresholds and a Misplaced Reliance on the Effectiveness of Current Mitigation Measures.

A. Significance Thresholds for Subsistence Harvest Patterns, Sociocultural Systems, and Environmental Justice are Inappropriate.

The AEWC recently learned of the existence of a letter from MMS to the AEWC's Executive Director, dated May of 2006. It is standard practice in the AEWC office to log all incoming mail. There is no record of this letter having been received at the AEWC's office in Barrow. The letter addresses MMS's approach to the evaluation and reporting of significance for Subsistence Harvest Patterns, Sociocultural Systems, and Environmental Justice, and much of its text is reproduced in the analysis for Lease Sale 193. Although we are writing a formal response, it is appropriate to address some issues in the letter in these comments.

The Council on Environmental Quality has promulgated regulations that define significance for NEPA purposes according to the context and intensity of the proposed action. 40 CFR §1508.27. With respect to context, CEQ requires that MMS determine significance through an analysis of local effects, and MMS does a reasonable job of assessing a range of possible effects on our Chukchi villages, in the context of the

Mayor North Slope Borough Comment

importance of subsistence practices in our communities, how they interconnect us, and how they are essential to our cultural and physical survival. However, when MMS arranges a scale depicting the degree of impacts, the departure from the CEQ regulations, and from reality, begins.

CEQ has listed ten "intensity factors" that MMS has never analyzed with respect to the effects of oil and gas activities on our coastal subsistence way of life. MMS has listed these factors, but not used them in analysis. We list them here, along with what we might expect MMS to consider in its analysis.

The following should be considered in evaluating intensity:

- 1. "Impacts that may be both beneficial and adverse. A significant effect may exist even if the Federal agency believes that on balance the effect will be beneficial."

As an example (and in the interest of time and space, we include only one), MMS is tasked with providing a regulatory program in which industry may exploit the OCS for oil and gas resources. This produces a national benefit, and MMS usually notes the "benefits" of local employment with oil and gas companies. But very few of these jobs are awarded to Native people. In fact, while average over-all salaries on the North Slope are relatively high, the majority of Inuqtiats live below the poverty line. There is a net, adverse significant effect here that MMS does not include in composing its significance thresholds for sociocultural systems.

- 2. The degree to which the proposed action affects public health or safety.

This is perhaps the most important of the intensity factors from the whaling captains' perspective. When noise and disturbance from oil and gas activities disrupt the migration and spook bowhead whales, it is the whaling captains and crews who risk their lives to pursue the whale farther offshore. Meat spoilage in a long tow home is a significant risk, and a great waste of the animal, the effort of the whalers, and the strike from our quota allotted to us by the International Whaling Commission. This "intensity factor" alone could vault most oil and gas related disturbances into significance. MMS does not provide this information in its letter to us, or in describing its approach to constructing its significance thresholds that are relevant to our people.

- 3. Unique characteristics of the geographic area such as proximity to historic or cultural resources, park lands, prime farmlands, wetlands, wild and scenic rivers, or ecologically critical areas.

We have not seen MMS discuss the importance of the cultural resource of the bowhead whale when formulating the significance thresholds. While we would discourage MMS from comparing the importance of one subsistence resource against another, the importance of the bowhead whale does exceed all others in our

Mayor North Slope Borough Comment

subsistence practices. The significance threshold for the resource of the bowhead whale should not be lumped into the "flexible" formula MMS has devised to encompass all resources. This is not our reality, and it should not be part of MMS's calculation of significance thresholds for our lives and our bowhead whale resource.

- 4. The degree to which the effects on the quality of the human environment are likely to be highly controversial.

There is no greater controversy in our villages than the effects of offshore oil and gas development on our bowhead whale and other marine mammal hunting and on the livelihood of our villages. This intensity factor, by itself, should qualify effects to our communities as significant.

- 5. The degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks.

The risks to our human environment could not be more unique, and the risks of impacts to the bowhead whale in the Chukchi Sea, where bowhead distribution and use of habitat is uncertain, are both unique and unknown. This intensity factor should appear with great emphasis in MMS analyses and its calculation of significance thresholds.

- 6. The degree to which the action may establish a precedent for future actions with significant effects or represents a decision in principle about a future consideration.

MMS's implementation of its regulatory program for oil and gas leasing will set precedent in the Chukchi Sea, where oil and gas exploration and development has not yet moved forward, leaving a still-pristine sea. MMS should address this factor in its significance threshold formula.

- 7. Whether the action is related to other actions with individually insignificant but cumulatively significant impacts. Significance exists if it is reasonable to anticipate a cumulatively significant impact on the environment. Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts.

MMS evaluates lease sales individually. It anticipates that leases will be bought, that seismic testing will occur, that exploration wells will be drilled. Bottom founded drilling structures will be constructed, with associated noise effects on bowhead whales. Production of oil is the goal of the program, and in the Chukchi Lease Sale 193, MMS anticipates 8.4 billion barrels of oil coming out of the seabed, piped onshore via a pipeline that will make landfall somewhere near one of our villages. Helicopters, marine traffic, seismic source vessels, supply boats, fixed wing aircraft, pile driving, all will attend the process of discovering, and producing oil. These activities will occur, MMS anticipates, as a result of this Sale. In the current OCS

Mayor North Slope Borough Comment

Five Year Program, another lease sale is planned for the Chukchi Sea that will have similar consequences. Cumulatively, these activities are certain to affect, significantly and adversely, the marine mammals using the Chukchi Sea habitat, including our bowhead whales, and similarly to adversely affect our marine mammal subsistence hunting. MMS must acknowledge this likelihood in its significance thresholds.

- 8. The degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register of Historic Places or may cause loss or destruction of significant scientific, cultural, or historical resources.

MMS's leasing activities will cause loss and possibly destruction of our cultural resources—our hunt, our livelihood, our food. This should be part of MMS's significance threshold formulation.

- 9. The degree to which the action may adversely affect an endangered or threatened species or its habitat that has been determined to be critical under the Endangered Species Act of 1973.

The bowhead whale is an endangered species. Although NMFS has issued a Biological Opinion declaring "no jeopardy" to bowhead whales, this goes to the survival of the bowhead whale. MMS's activities could have population level effects that stop short of endangering the survival of the bowhead whale population, but which slow its recovery. Permitted activities in the Beaufort Sea, between seismic surveying and exploratory drilling in Camden Bay, are likely to drive whales, including cow-calf pairs, from their nearshore feeding habitat. These are real effects on an endangered population of whales, and these facts should be represented in MMS's significance thresholds.

- 10. Whether the action threatens a violation of Federal, State, or local law or requirements imposed for the protection of the environment.

Last year one, and perhaps two OCS operators engaging in seismic data collection failed to comply with monitoring requirements that were listed in an incidental harassment authorization that had bearing on the validity of the G&G permit that MMS had issued to them. Ultimately one company evaded compliance by obtaining a stay of the monitoring requirement in federal court. Neither NMFS nor MMS suspended their permits of this company, even though it was in violation of federal law long before the court decision was issued. This year, we are aware that one oil company may intend to accept the financial penalty of failing to comply with an air permit from EPA, and factor it into the "cost of doing business." These are violations of federal law. At least one company this year has not responded to North Slope Borough ordinance requirements that it conduct monitoring because it disagrees with the Borough's Planning Department over the effects its activities are likely to have on marine mammals. This is potentially a violation of local law. MMS needs to

Mayor North Slope Borough Comment

factor these possibilities into its significance thresholds.

- B. In Setting Significance Thresholds, MMS Ignores the Context and Intensity Analysis Required by the Council on Environmental Quality, and Instead Arbitrarily Formulates Standards Based on "Magnitude" and "Duration."

MMS has chosen to base significance on the yardsticks of "magnitude and duration" of an effect, standards that can apply universally to any action by any agency. The CEQ criteria, however, are context-dependent. CEQ directs the agency to look at the unique substantive characteristics of an affected area and population, and the impacts of a specific proposed action in that context. Rather than do this, MMS created a scale of effects ranging from "very low" to "very high." Then the agency arbitrarily decided that "significant" effects equate to conditions described in the "high" category. MMS said it deemed the "high" category as significant to maintain continuity among the analyses for subsistence harvest patterns, sociocultural systems, and environmental justice.

While the AEWC recognizes that effects to subsistence is common to each of these three resource categories, we do not understand how selecting the "high" level as the significance standard for all three continuity among them. Certainly we do not agree that conditions for any of the categories should reach the "high" adverse effect level for MMS to consider them significant.

Principles of Environmental Justice in Executive Order 12898 direct that federal agencies take into account the views of low income minority communities. MMS says it has taken our comments over the years to inform its significance thresholds. Indeed, it includes in the discussion of the current lease sale the effect on subsistence resources and sociocultural systems remarks going back to the 1970s that describe the importance of subsistence to our communities. Citing to local testimony is only the first step, however. The next step is to use this testimony in an analysis of environmental and socio-cultural impacts within the context from which these comments arise.

Instead of employing the second step, MMS is using our testimony to select, over decades of remarks, those comments that support its approach or are neutral to it—comments that were made without the speaker knowing his or her words would be taken out of context and used against our community to come up with a 5-year, chronic-displacement significance threshold for everything that the speaker holds dear about our home and our subsistence livelihood.

Finally, MMS defends the current significance thresholds for subsistence by arguing that the thresholds were long in the making ("have been developed over many years by MMS anthropologists and socioeconomic specialists"). First, we would appreciate it if MMS would provide cites to the peer reviewed anthropological and sociological literature on which it relies. Second, such a rationale ("it took a long time for us to do

it") is not based in law or reason. It is possible to spend a very long time trying to do something and still get it wrong, as MMS has done here.

Until MMS addresses the CEQ "intensity factors" and explicitly seeks input on the issue of significance, its significance thresholds remain outside the contemplation of Congress in its enactment of NEPA, CEQ in its promulgation of its regulations describing intensity factors, Executive Order 12898 in requiring the incorporation of the views of the affected low income, minority communities, and plain common sense.

C. MMS Should not Rely on the Ability of the Standard Mitigation Measures to Mitigate Adverse Effects to the Bowhead Whale Subsistence Hunt.

MMS has long relied on its "standard mitigation measures" to conclude that any significant effects to subsistence harvest patterns, sociocultural systems, and environmental justice would be mitigated to the point where the effects were no longer significant for NEPA purposes. We disagree that these mitigation measures are effective to the point of rendering adverse effects insignificant.

Stipulation 2 Orientation Program. This program is designed to "increase workers' sensitivity to, and understanding of, values, customs, and lifestyles of local Native Communities." FEIS IV-223. While we certainly would not stand in the way of education for any person wishing to know more about our way of life, we do not see a direct connection with increasing someone's sensitivity and how this will "prevent any conflicts with subsistence communities." A sensitive oil worker with orders to shoot seismic or drill a hole or barge equipment from one place to another is still going to shoot seismic, drill the hole, or barge his equipment because he is being paid to do those things. How he feels about it is irrelevant. This is not mitigation as we understand the meaning of that word.

Stipulation 4 — Industry Site-Specific Monitoring Program for Marine Mammal Subsistence Resources. We support monitoring wholeheartedly. It is an important part of our negotiated Conflict Avoidance Agreements with industry, and NMFS requires it through implementing regulations of the Marine Mammal Protection Act. However, and we cannot overstate this, monitoring, of itself, is not mitigation. Monitoring has the potential to lead to mitigation after data are analyzed and understood, but it does not belong in a list of "mitigation measures." Monitoring, no matter how well conceived or well implemented or appropriately placed, is still just that – monitoring.

Stipulation 5- Conflict Avoidance Mechanisms to Protect Subsistence Whaling and Other Subsistence-Harvest Activities. The AEWC agrees with the goal of this stipulation and is pleased that MMS shares our view that the industry should be required to avoid conflicts with subsistence activities. However, there are elements of

this "mitigation" measure that will prevent it from ever being more than a representation of MMS's wishful thinking.

First, MMS places unreasonable and unjustified reliance on the CAA to solve all the potential conflicts that could arise from timing and location of oil and gas operations with respect to bowhead whaling. MMS repeatedly cites the CAA as a mitigation measure per se that will render adverse effects to the hunt insignificant. Unfortunately, as we have seen this year, the CAA's carefully designed mitigation measures are useful only when companies agree to comply with and implement them. Simply, an agreement is not mitigation. The activities undertaken pursuant to the agreement may or may not be mitigation, and compliance with those activities cannot be left to the discretion of the industry.

When companies are not willing to work with us, it is up to MMS and NMFS to have adequate mitigation measures in place. MMS should not use the CAA to deem potential adverse effects "mitigated," thereby excusing itself from its own responsibility for formulating and implementing effective mitigation. This is the only form of "enforcement" that will prove truly effective. Without strong mitigation standards promulgated up-front by MMS and NMFS, the odds are very low that an effective CAA can be developed or enforced.

Second, MMS's proposed approach to handling conflicts between us and the industry in the absence of a CAA does not inspire any confidence in us and appears consciously designed to ensure that we can never expect a fair deal or effective remedy. All major decisions are in the hands of the MMS Regional Supervisor ("RS"). In the case of a conflict between us, the proposed "Stip 5 process" would apparently work like this: A conflict will arise where whalers will anticipate or experience adverse effects to the whale migration so that hunting is or will become more difficult or impossible. Theoretically, the AEWC would respond by requesting that the MMS Regional Supervisor convene a group meeting. If the RS is convinced that there is a real problem, she may decide to call the meeting.

Next, our subsistence hunters would undergo an examination of the facts of our case in a hearing setting where the MMS RS – whose superiors have already approved the OCS operators' action – is the judge. The RS hears the facts from each side and determines "the adequacy of the measures taken to prevent unreasonable conflicts with subsistence harvests."

If, in the RS's judgment, the OCS operator is responsible for an "unreasonable" conflict, she would be put in the position of having to overrule her agency's prior decision to permit the activity she has determined causes "unreasonable conflicts." In the meantime, an entire hunting season and hundreds of tons of food can be lost. Hunting is an opportunistic activity, especially in the unpredictable ice and weather conditions of

the Arctic Ocean. It is therefore unlikely that our hunters would have time to attend a hearing and argue their case until after the season is over and the harm is done.

Furthermore, Stipulation 5 and its arbitration process are set up to favor OCS operators, not us. Its standards are not quantifiable, and therefore subject to manipulation and improper rationalization. For instance, how might one quantify an "unreasonable" conflict? If our whalers must go twenty miles rather than ten miles offshore to find whales, does that cross the "unreasonable" line? Is that a decision best left to the RS? If meat is spoiled, but not the muktuk, is the disruption a "reasonable" one? If the whales are "spooky" in the whalers' judgment, and harder to catch, does that mean the operator must close down operations? Should those kinds of choices be left to the RS? The same hard questions apply to the standard of what may or may not be an "adequate measure" to prevent the "unreasonable" conflicts.

In addition to these failures of substantive standards, the we are reluctant to sit in a room with oil and gas operators and engage in a game of "he said, she said." For many of us, English is our second language, and we communicate best through our actions, not our words.

For the reasons above, we do not consider Stipulation 5 effective mitigation, and MMS should not turn to Stipulation 5 to buttress its arbitrary conclusion that adverse effects to our hunt and our communities from oil and gas operations will be resolved through the "Stip 5 process."

Attn: Lease Sale 193 Draft SEIS - Chukchi Sea

Dear Mr. Goll:

The purpose of this letter is to provide comment on the Draft Supplemental Environmental Impact Statement for Lease Sale 193 (LS 193 Draft SEIS) in the Chukchi Sea, prepared as required by the U.S. District Court to address deficiencies in the original Lease Sale 193 Final EIS (LS 193 FEIS). The court has directed that the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) determine whether missing information, identified by the agency itself in the LS 193 FEIS, is “essential or relevant” to making a reasoned decision regarding Lease Sale 193 and, if so, “whether the cost of obtaining the missing information [would be] exorbitant or the means of doing so unknown.” *Federal Register*, Vol. 75, No. 199 (October 15, 2010).

The LS 193 Draft SEIS fails to provide the Secretary of the Interior with the information required to make a reasoned choice among alternatives, including the “No Action” alternative. The document should be rescinded and prepared anew. The original LS 193 FEIS included approximately two hundred and fifty specific instances in which BOEMRE explicitly identified a lack of scientific knowledge regarding resources that could be impacted as a result of the lease sale and the reasonably foreseeable oil and gas development that could follow. In many cases, these statements recognize a fundamental lack of knowledge regarding important biological resources, including many that are vital to continued subsistence harvest (e.g., marine mammals) by communities on the North Slope. Just a few of the statements in which BOEMRE expressly noted its lack of knowledge, include the following:

- “There is uncertainty about the effects on cetaceans in the event of a large spill.”
- “Given a lack of contemporary abundance and distribution information, large spill effects on rare or unique species (including potential extirpation) could occur, but would likely go unnoticed or undetected.”

¹ Minerals Management Service (MMS) at the time the Lease Sale 193 FEIS was published.

1

Audubon Alaska Comment

agency’s statements acknowledging myriad and sweeping scientific knowledge deficiencies in the LS 193 FEIS have been dismissed by BOEMRE as unimportant and irrelevant to the Lease Sale 193 environmental analysis required by the National Environmental Policy Act (NEPA).⁴

This conclusion is unjustified and fundamentally flawed. As a matter of law as well as sound policy, the environmental analysis for Lease Sale 193 must provide decision-makers with a sufficient understanding of the “reasonably foreseeable” environmental consequences of OCS leasing in the Chukchi Sea so as to permit a reasoned choice among alternatives. In light of the many admissions regarding fundamental knowledge gaps (e.g., “the paucity of information available on marine mammal ecology in the Chukchi Sea”), BOEMRE’s claim that it has available “sufficient information to support sound scientific judgments and reasoned managerial decisions”⁵ is not credible.

BOEMRE’s LS 193 Draft SEIS is inconsistent with the Obama Administration’s stated commitment to making decisions on the basis of sound science. This commitment to sound science includes the on-going effort by another agency within the Department of the Interior, the U.S. Geological Survey (USGS), as directed by Secretary Salazar, to identify and evaluate the importance of Arctic Ocean science knowledge gaps:

“As part of the Administration’s commitment to ensuring that offshore oil and gas decisions are based on science and sound information, the U.S. Geological Survey will examine and summarize what information is available about the Arctic and what knowledge gaps may exist regarding environmental sensitivities, including impending climate change, and other factors that would be considered in decisions about potential future development in the Chukchi and Beaufort Seas.”⁶

Rather than discounting so many scientific knowledge gaps as unimportant, BOEMRE should await the USGS findings regarding Arctic Ocean knowledge gaps and use that report to inform BOEMRE’s revised NEPA analysis of Lease Sale 193.

BOEMRE’s LS 193 Draft SEIS is also at odds with Secretary Salazar’s commitment to scientific integrity as reflected in the recently issued Order 3305 - Ensuring Scientific Integrity within the Department of the Interior. This departmental order expressly recognizes the critical role that sound scientific knowledge plays in the creation

⁴ In its justification for the dismissal of knowledge gaps and missing information as unimportant and “not essential to a reasoned choice among alternatives” BOEMRE cites the “existence of other environmental laws and regulations that would preclude significant adverse effects on particular resources.” (Lease Sale 193 Draft SEIS – Appendix A). The mere existence of other laws and regulations can not assure that significant adverse effects will be precluded. The fact that BP’s oil spill response plan for the Gulf of Mexico “existed” as required by law in no way precluded significant adverse effects from the *Deepwater Horizon* blowout (although it could be argued that BP’s plan did succeed to the extent that no walrus were harmed by the Gulf spill). Moreover, NEPA requires that the effects of alternatives be described and, if the agency relies upon mitigation to prevent or avoid adverse effects, then that these mitigation measures be described in detail. BOEMRE does not do this in the LS 193 Draft SEIS.

⁵ Lease Sale 193 Draft SEIS, Chapter 1, The Proposed Action, p. 11

⁶ Statement of USGS Director Marcia McNutt, “Secretary Salazar Unveils Arctic Studies Initiative that will Inform Oil and Gas Decisions for Beaufort and Chukchi Seas” DOI Press Release (April 13, 2010)

3

- “For many species [of coastal and marine birds], the most recent data is between 15 and 30 years old, making accurate analysis difficult. Overall, several species or species groups have a high probability of experiencing substantial negative impacts. The risk that several regional bird populations could experience significant adverse impacts is high.”
- “Based on the paucity of information available on marine mammal ecology in the Chukchi Sea and on specific locations of future developments, we are unable to determine at this time if significant impacts will or will not occur.”
- “Because of the lack of data on marine mammal distributions and habitat use in offshore areas of the Chukchi Sea, it is uncertain what the level of effects would be in offshore areas.”
- “Several species [of fish] are known only from a single specimen of each species; others are known from perhaps a handful of specimens collected years to decades ago. Population information is entirely lacking for such species.”
- “Late summer distribution and fall migration patterns [of beluga whales] are poorly known, wintering areas are effectively unknown, and areas that are particularly important for feeding have not been identified.”

This candor respecting BOEMRE’s recognition of a widespread dearth of scientific information available to support a well reasoned analysis of LS 193 impacts is consistent with recent observations of Alaska’s Governor Sean Parnell:

“The Arctic, literally, needs to be put on the map. Scientific research and economic exploration are set back by low quality, decades old mapping data. ... There is no accurate baseline to measure change, to identify trends and patterns, or predict potential outcomes.”⁷

Remarkably, however, BOEMRE’s court-ordered LS 193 Draft SEIS concludes that *none* of the many noted knowledge gaps identified in the original LS 193 FEIS must be addressed to support its environmental analysis.

“BOEM[RE] analysts determined that while many statements of incomplete or unavailable information were broadly relevant to the important issues at hand, *none* were essential for a reasoned choice among alternatives.”⁸ (emphasis added)

That is, BOEMRE has concluded that environmental impacts in the planning area have been sufficiently analyzed even as the agency acknowledges that rare or unique species could be extirpated but that due to a “lack of contemporary abundance and distribution information” such an impact “would likely go unnoticed or undetected.” All of the

⁸ Lease Sale 193 Draft SEIS – Appendix A

2

Audubon Alaska Comment

of policy because of DOI’s mandate to properly protect the nation’s natural resources. In short, if important policy choices, such as *whether or where* to lease lands for oil and gas development in the Arctic Ocean, are to be made on the basis of sound science they cannot be made in the absence of sound science. By definition, inadequate scientific knowledge precludes the possibility of a well reasoned decision.⁷

Of particular concern is BOEMRE’s continued reliance on manifestly inappropriate assumptions regarding the potential impact of a “large” oil spill. A realistic large-scale oil spill event has never been evaluated by BOEMRE for the Chukchi Sea. The LS 193 Draft SEIS, and the underlying LS 193 FEIS, persist in severely underestimating possible oil spill impacts. This precludes any meaningful evaluation or understanding of a credible large-scale spill scenario and negates the utility of the NEPA analysis prepared to this point. The so-called “large” spill considered by BOEMRE in the original LS 193 FEIS (i.e., 1,500 – 4,600 bbl) is inconsequential in light of what is known to be a realistic spill possibility in light of the Gulf of Mexico disaster. The maximum oil spill analyzed in the LS 193 FEIS – a 4,600 bbl spill from a ruptured pipeline – is less than one tenth of the daily estimated flow from the *Deepwater Horizon* spill (52,700 – 62,200 barrels per day). The maximum 4,600 bbl spill assumed for the Chukchi Sea in the LS 193 FEIS is less than one-tenth of one percent (0.09%) the size of the *Deepwater Horizon* spill (5 million barrels).⁸ While certainty about the exact size of a spill can not be known in advance, a disparity of *multiple orders of magnitude* between the BOEMRE-identified maximum spill (4,600 bbl) and a credible large-scale spill, is not reasonable. BOEMRE’s relatively small maximum spill assumption effectively cripples the evaluation of environmental impacts and prevents the Secretary of the Interior from receiving the necessary analysis required by NEPA.

The LS 193 FEIS analysis inappropriately dismissed the possibility of a blowout:

“We consider blowouts to be unlikely events.... Very few blowout events have resulted in spilled oil and the volumes spilled are often small After the Santa Barbara blowout in 1969, amendments to the OCS Lands Act and implementing regulations significantly strengthened safety and pollution-prevention requirements for offshore activities.”

Especially in light of the *Deepwater Horizon* and the widespread recognition that confidence in the regulatory oversight provided by the MMS (now BOEMRE) was thoroughly misplaced, this language seems darkly quaint. Dismissing even the possibility

⁷ While attention has been drawn to past and on-going industry-sponsored research in the Arctic Ocean, it is essential to recognize that research *activity* must not be confused with scientific *knowledge*. There is important research underway but the many identified knowledge gaps make it clear that numerous questions remain unaddressed regarding the basic ecology of the Arctic Ocean. The various wall charts displayed by BOEMRE at the public hearing in Anchorage listing research projects are no substitute for the much needed over-arching science plan for the Arctic Ocean. This plan should synthesize existing knowledge, identify key knowledge gaps and support long-term research to address information needs.

⁸ See: <http://www.oilspillcommission.gov/document/amount-and-fate-oil>, National Commission on the *Deepwater Horizon* Oil Spill.

4

of a blowout in the Chukchi Sea can not be considered reasonable nor can this omission be dismissed as a mere "technical deficiency at the lease sale stage."⁹

Failure to evaluate the consequences of a blowout contradicts the guidance provided by the Council on Environmental Quality (CEQ) regarding NEPA analysis of offshore oil and gas development. In the August 16, 2010 report published by the Office of the President, it is stated that BOEMRE "has committed to using the following CEQ recommendations...."¹⁰ This includes that BOEMRE's NEPA documents are to:

"provide decision makers with a robust analysis of reasonably foreseeable impacts and include an analysis of reasonably foreseeable impacts associated with low probability catastrophic spills for oil and gas activities on the Outer Continental Shelf."¹¹

The report notes that BOEMRE did not anticipate the possibility of a catastrophic spill as a reasonably foreseeable impact in the case of the *Deepwater Horizon*. The CEQ report unambiguously states:

"BOEM[RE] should identify potentially catastrophic environmental consequences and accurately assess them as part of its decision making. ... BOEM[RE] will ensure that potentially catastrophic consequences will be identified, assessed and considered as part of its decision making."¹²

That commitment has yet to be fulfilled with regard to the analysis of Lease Sale 193.

Failure to evaluate a large-scale blowout scenario as part of the Lease Sale 193 environmental review prevents the NEPA analysis from fulfilling its essential purpose: to provide decision-makers the ability to make a reasoned choice among leasing alternatives, including the "No Action" (no lease) alternative. Moreover, while it has been argued elsewhere that "additional Environmental Impact Statements will be required at the later exploration, production, and development stages"¹³ this has not, in fact, turned out to be the case. Reasonably foreseeable impacts from a blowout from Shell's drilling plans were not evaluated by BOEMRE prior to approval of Shell's exploration plans for drilling in the Arctic Ocean in 2010. Shell's most recent proposal to drill in 2011 also fails to analyze the effects of a blowout.

Audubon Alaska Comment

obtained (i.e., because costs of obtaining it are exorbitant or the means to obtain it are not known) the agency:

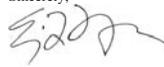

"shall include within the environmental impact statement the agency's evaluation of such impacts based upon theoretical approaches or research methods generally accepted in the scientific community."¹⁶ (emphasis added)

The regulatory definition of "reasonably foreseeable" includes "impacts which have catastrophic consequences, even if their probability of occurrence is low, provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason."¹⁷ The *Deepwater Horizon* experience has clearly established a blowout during exploration drilling as a "reasonably foreseeable" event that would have significant adverse impacts in the Arctic Ocean. A large-scale blowout scenario should now be rigorously evaluated. To meet the regulatory standard, this analysis should evaluate the impacts of a late season blowout that continues over an extended period of time into the winter freeze up.

Conclusion

1. The recently released LS 193 Draft SEIS is not credibly responsive to the court order that BOEMRE reconsider its analysis and determine whether: a) the knowledge gaps identified by the agency are relevant or essential to making a reasoned choice using the NEPA analysis, and b) the cost of obtaining the missing information is exorbitant, or the means of doing so unclear. The LS 193 Draft SEIS should be rescinded and prepared anew.
2. The NEPA analysis, including the LS 193 Draft SEIS and the associated LS 193 FEIS, remain deficient in the absence of an analysis of a credible "large" spill. The reasonably foreseeable impact of a blowout has not been analyzed and thereby precludes a reasoned decision-making process regarding Lease Sale 193.
3. A credible large-scale blowout scenario should now be evaluated as part of the LS 193 analysis. To be meaningful, this analysis should assess impacts of a late season blowout that continues over at least 30 days¹⁸ and extending into the winter freeze up.

Sincerely,

Eric F. Myers
Director of Policy

¹⁶ CEQ NEPA Regulation 1502

¹⁷ CEQ NEPA Regulation 1502

¹⁸ A minimum 30-day blowout is an appropriate standard for analysis as indicated by 30 CFR 254.47.

It should be noted that even if a blowout scenario were to be evaluated at a later point in the permitting process, analysis of a credible, large-scale spill/blowout is needed at the stage of the lease sale in order to permit the Secretary of the Interior to make a reasoned decision among leasing alternatives, including the "No Action" alternative. While it has been argued that more information will be available at later stages of the permitting process, thus allowing the Secretary of the Interior to possibly modify oil development plans, this perspective inherently acknowledges that decisions made at the lease sale stage are fundamentally distinct from subsequent authorizations.

It is at the time of the lease sale that the decision is made as to *whether or where* leasing should take place while subsequent authorizations concerning exploration or development are directed at making decisions about *how* activities should take place. The theoretical opportunity to analyze an appropriate large spill/blowout scenario at a subsequent point in the regulatory process can not be considered a substitute or otherwise fungible in terms of satisfying the NEPA analysis required at the time of a lease sale.

The LS 193 Draft SEIS further misleads when it seeks to justify the dismissal of incomplete, missing or unavailable information:

"[I]n the unlikely event of a large oil spill, it is well understood that environmental impacts could be severe. The severity of potential impacts would be nearly identical under any action alternative..."¹⁴

This statement does not withstand scrutiny as the true severity of potential impact that would be caused by a credible, large-scale spill in the Chukchi Sea has never been analyzed. A maximum spill of 4,600 bbl is only a small fraction of what should be evaluated as a reasonable spill/blowout possibility. Because the LS 193 FEIS assumed an unjustifiably small oil spill, the "severity of potential impacts" has not, in fact, been considered. Again, absent this needed analysis, critical information remains unavailable to decision-makers charged with evaluating whether or where to offer leases.

The LS 193 Draft SEIS purports to address this deficiency with the assertion:

"[A]ny change in likelihood of an oil spill from a blowout during exploration drilling would not alter the potential effects of the oil spill already analyzed."¹⁵

As noted, however, the impact analysis of the so-called "large" spill considered in the Lease Sale 193 FEIS is based upon the unreasonable assumption of an undersized spill that grossly understates possible impacts.

Analysis of a credible, large-scale spill/blowout scenario per se by BOEMRE is mandatory as a reasonably foreseeable adverse impact. Even if all of the information relevant to analyzing a "reasonably foreseeable" significant adverse impact cannot be

Re: Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)

Dear Regional Director:

The undersigned groups hereby submit the following comments to the draft Supplemental Environmental Impact Statement for Chukchi Sea Lease Sale 193 (draft SEIS) prepared by the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) pursuant to the National Environmental Policy Act (NEPA).

The draft SEIS purports to address the issues identified by the Alaska Federal District Court's remand order in *Native Village of Point Hope v. Salazar*, No. 1:08-cv-00004-RRB (D. Alaska). Rather than furthering the Obama administration's commitment to sound science, however, the draft appears to be a paper exercise designed to justify the earlier decision to hold Lease Sale 193. For the reasons explained below, the draft should be rescinded, a thorough assessment of missing information undertaken, and a re-assessment of natural gas development conducted. Once it has prepared an adequate and informative draft SEIS based on that information, BOEMRE should reengage in a public comment period. Thereafter, the agency should consider anew in light of these new analyses whether to cancel, modify, or affirm its decision to hold Lease Sale 193.

In *Native Village of Point Hope*, the Court determined that Lease Sale 193 was held in violation of NEPA because BOEMRE prepared a flawed environmental impact statement (EIS). BOEMRE failed to conduct a full analysis of missing information about the Chukchi Sea and the effects of oil and gas activities pursuant to Council on Environmental Quality regulation 40

C.F.R. § 1502.22, and it failed to analyze the potential impacts of natural gas development. Accordingly, the Court remanded the decision to the agency with direction to redo its environmental analysis in these respects. In the draft SEIS, BOEMRE falls far short of satisfying the Court's order to meet the requirements of NEPA.

With respect to the Section 1502.22 missing information analysis, BOEMRE acknowledges it cannot make basic assessments of the lease sale's impacts in light of data gaps, but it concludes in the draft SEIS that *not one piece of information* identified as missing in the original EIS is essential to the lease sale decision. The conclusion is not supported or credible, demonstrates a desire to proceed quickly rather than deliberately, does not comply with the law, does not reflect a thoughtful assessment of the nature of the information that should be available at the critical lease sale stage of the process, and is a significant step in the wrong direction. With respect to analyzing natural gas development, the draft SEIS contains little more than a justification of the analyses contained in the original EIS. BOEMRE's conclusion that natural gas development would have only minimal additive impacts suffers from significant flaws.

BOEMRE should take actions in the Arctic Ocean that are consistent with the Administration's commitment to science-based decision-making. It should ensure that the information required for informed decision-making is available, the systemic failures in regulatory oversight made evident by the *Deepwater Horizon* accident are addressed, and new decisions, including the decision whether to cancel, amend, or affirm Chukchi Sea Lease Sale 193, are made taking into account what we have learned. Accordingly, it must not finalize the draft SEIS as currently written, but should undertake a meaningful reanalysis of Lease Sale 193 that is consistent with NEPA, and the Administration's commitment to sound science in decision-making.

I. MISSING INFORMATION ANALYSIS

It is undisputed that there are significant gaps in basic information about the Arctic Ocean and that, absent this information, it is not possible, in many instances, to understand the scope of potential impacts from oil and gas activities on the region's wildlife and people. The need for more information has been acknowledged repeatedly by the Administration: in President Obama's National Ocean Policy process, the National Marine Fisheries Service's closure of the Arctic Ocean to commercial fishing, and in Secretary Salazar's initiation of a scientific gap analysis by the United States Geological Survey. The current draft SEIS clashes badly with the Administration's commitment to sound science in decision-making.

In the original Chukchi Sea Lease Sale 193 EIS, BOEMRE identified literally hundreds of instances in which it lacked information about the Chukchi Sea, ranging from basic science about the presence and behavior of species in the region to information about the effects of oil and gas activities on wildlife. However, it failed to analyze which of the missing information was relevant to reasonably foreseeable adverse impacts and essential to a reasoned choice among alternatives and to obtain that information absent a finding that the costs of obtaining the information are exorbitant. In *Native Village of Point Hope*, the Alaska Federal District Court ruled that this failure constituted a violation of 40 C.F.R. § 1502.22. The Court remanded the EIS to the agency and directed it to conduct this analysis as required by NEPA.

2

(OCSLA)] to developing an offshore oil well: (1) formulation of a five-year leasing plan by the Department of the Interior; (2) lease sales; (3) exploration by the lessees; (4) development and production." *Sec'y of the Interior v. California*, 464 U.S. 312, 337 (1984). Each of the four stages presents the decision-maker with a different and distinct choice about offshore development. The five-year leasing plan is a programmatic evaluation of the nation's outer continental shelf areas to determine whether any of those areas should be open to potential future oil and gas lease sales in the coming five years. 43 U.S.C. § 1344(a). At the lease sale stage, BOEMRE decides whether to hold the scheduled sales and, if so, under what conditions. In the third stage, the agency reviews exploration plans submitted by an oil company and determines whether to allow the company to drill wells on the lease tracts purchased during the second phase. If it finds recoverable reserves, the company would submit a development plan, which is reviewed and approved or denied during the fourth and final phase.

Before a lease sale, the government has complete discretion over whether to permit oil and gas activity in an area included in a five-year plan and, if so, under what conditions to permit the activity. Once valid leases are issued, the government's options are much more constrained. Once they have obtained leases, companies may conduct ancillary activities on their leases, such as certain seismic surveying, without further approval from BOEMRE, and they may submit for approval exploration drilling plans and development plans. Further, by selling leases, the government sells a promise to the lessee that it will comply with the procedures and standards set forth in OCSLA in permitting the exploration and development of the leases. *Mobil Oil Exploration & Producing Se. v. United States*, 530 U.S. 604, 620-621 (2000) (explaining that "lease contracts g[i]ve the companies more than rights to obtain approvals. They also g[i]ve the companies rights to explore for, and to develop, oil."). Accordingly, once the government has lawfully issued valid leases, it can suspend activities on leases only for reasons and pursuant to the procedures set forth in OCSLA and its implementing regulations. These include a "threat of serious, irreparable, or immediate harm or damage to life (including fish and other aquatic life), to property, to any mineral deposits (in areas leased or not leased), or to the marine, coastal, or human environment," 43 U.S.C. § 1334(a)(1)(B), or when "necessary to carry out the requirements of NEPA or to conduct an environmental analysis," 30 C.F.R. § 250.172(d). Similarly, it can only cancel leases for reasons and following procedures set forth in OCSLA, 43 U.S.C. § 1334(a)(2)(A) & (B); see also 30 C.F.R. § 256.77(d), and cancellation entitles lease holders to compensation, 43 U.S.C. § 1334(a)(2)(C); 30 C.F.R. § 250.184.

BOEMRE must comply with NEPA at each stage of OCSLA offshore development process. Because the decision being made at each stage differs, so do the NEPA analyses. At the five-year plan stage, the analysis is relatively general in light of the programmatic nature of the decision. An analysis at the lease sale stage must examine more closely the impacts of oil and gas activities in a particular area. It must provide information to the decision-maker and the public about the consequences of oil and gas activities in a particular area and offer a reasonable range of alternatives. These alternatives must encompass the size and scope of the sale, including whether to defer certain areas from leasing, and the imposition of stipulations in the leases that limit or mitigate the effects of activities under the leases. Because of the nature of the decision at the lease sale stage—whether, where, and under what conditions to open areas to oil and gas activities—the analysis of potential impacts is different and more specific than the more general programmatic analysis at the five-year plan stage. The lease sale analysis is also relevant

4

Section 1502.22 sets out an "ordered process" for an agency preparing an EIS in the face of missing information. *Save Our Ecosystems v. Clark*, 747 F.2d 1240, 1244 (9th Cir. 1984). When there is incomplete information relevant to reasonably foreseeable significant adverse impacts that is essential to a reasoned choice among alternatives, an agency must obtain and include the missing information in the EIS if the overall costs of obtaining it are not exorbitant. 40 C.F.R. § 1502.22. The regulation furthers NEPA's purpose of ensuring that agencies make "fully informed and well-considered decision[s] . . ." *Vi. Yankee Nuclear Power Corp. v. Natural Resources Def. Council*, 435 U.S. 519, 558 (1978), its mandate of "widespread discussion and consideration of the environmental risks and remedies associated with [a] pending project," and its "require[ment] that this evaluation take place *before* a project is approved." *LaFlamme v. FERC*, 852 F.2d 389, 398 (9th Cir. 1988) (internal quotation marks omitted).

The draft SEIS purports to respond to the Court's order to satisfy the requirements of Section 1502.22. However, BOEMRE's determination that none of the missing information is essential to a reasoned choice among alternatives is arbitrary and improper. Rather than engage in a good-faith effort to analyze the missing information and identify which of it is essential to a reasoned choice among alternatives, the agency appears instead to have spent its energy developing justifications for avoiding its obligation to obtain essential information. Appendix A of the draft SEIS contains a 140-page exposition of the instances in the original EIS in which the agency said "we don't know" about the Chukchi Sea and the effects of oil and gas activities there. For each instance of missing information, BOEMRE offers an arbitrary justification—usually one of the same five recurring excuses discussed below—for why it does not need to obtain the particular information before leasing in the Chukchi Sea. This approach is inconsistent with Section 1502.22 and the agency's obligation to reconsider the lease sale in light of a new analysis of missing information. Much of the missing information identified in the original Lease Sale 193 EIS is essential to the decision at issue—whether, when, where, and under what conditions to issue leases in the Chukchi Sea. The appendix demonstrates the agency's misdirection of resources into justifying an already-made decision, rather than engaging in a meaningful inquiry, real science, or research to inform a reexamination of the lease sale decision.

A. Because the decision to sell leases is a critical decision in the offshore development process, information relevant to the resources in the area and to the effects of oil and gas activity on those resources is essential to making that decision.

Because the lease sale stage involves concrete and consequential decisions about committing portions of planning areas to oil and gas activities, information about the biological function of different parts of the planning area and the importance of those parts to the regional ecosystem is essential to this choice. See, e.g., *Kettle Range Conservation Group v. U.S. Forest Serv.*, 148 F. Supp. 2d 1107, 1125-26 (E.D. Wash. 2001) (information is essential if without the data the agency cannot know if its conclusions regarding impacts are reliable). Similarly, understanding the effects of industrial oil and gas activities on different components of the ecosystem is essential to deciding where, if anywhere, those activities should be permitted and how they should be constrained.

A lease sale is a meaningful decision about the commitment of an area to oil and gas activity. It is the second of the "four distinct statutory stages [under the Outer Continental Shelf Lands Act

3

to later-stage analyses, such as those conducted at the exploration stage. Typically, those analyses tier to and expand upon the lease sale analysis. In practice, moreover, BOEMRE has not obtained additional information at the post-lease exploration stage, because it has prepared only short environmental assessments, rather than full EISs, for these plans.

Thus, a lease sale decision is a meaningful commitment in OCSLA's staged offshore development process, and a meaningful NEPA analysis must provide information to the decision-maker and the public about the potential effects of oil and gas activities on the areas under consideration for leasing. As described more fully below, missing information about the basic biology of the Chukchi Sea ecosystem and the effects of oil and gas activities to the biological resources of the areas under consideration for leasing is essential to the lease sale decision.

B. Missing information identified in the original Lease Sale 193 EIS is essential to the lease sale decision.

In the draft SEIS, BOEMRE concedes that much of the information identified as missing in the 2007 Chukchi Sea Lease Sale 193 EIS was relevant to potentially significant effects of the lease sale. See BOEMRE, Chukchi Sea Planning Area, Oil and Gas Lease Sale 193 in the Chukchi Sea, Alaska, Draft SEIS, OCS EIS/EA BOEMRE 2010-034 (Draft SEIS) at App. A (Sep. 2010). However, it concludes that *none* of the information was essential to reasoned choices among alternatives, and thus the agency was not obliged to obtain the information. *Id.* at 10-11. That conclusion is unwarranted.

I. Missing information is pervasive and goes to fundamental questions at issue in the lease sale decision.

The missing information that forms the basis for the Court's remand includes the most basic parameters for every one of the largest and most conspicuous animals in the ecosystem—all fish, marine mammals, and birds—which in other regions are typically the most well-studied segment of an ecosystem. The missing information includes the abundance, distribution, and life history characteristics for many of these species. The state of information about these more charismatic animals in the ecosystem is further evidence of the lack of information about the rest of the ecosystem, including the clams, worms, sea stars, and other species that are important prey for the more conspicuous species. The information that does exist is outdated and too spotty to provide an appropriate baseline for decision-making. This lack of basic information about the ecosystem makes it difficult, if not impossible, to determine whether there will be significant impacts to animals and the ecosystem. Additionally, there are substantial data gaps about the effects of oil and gas activities, like industrial noise, on marine mammals and fish. These gaps further limit the agency's ability to meaningfully analyze the impacts of the lease sale or chose among alternatives.

Gaps in data about the Chukchi Sea include missing basic information about species that inhabit the region and their habitat needs over both time and space. These types of gaps are widespread across the Chukchi Sea, and this lack of information has been widely acknowledged. See, e.g., NRDA – Coastal Response Research Center. 2010. Natural Resources Damage Assessment

5

(NRDA) in Arctic Waters: The Dialogue Begins. University of New Hampshire, Durham, NH; MBC Applied Environmental Sciences. 2007. Proceedings of a Workshop on Chukchi Sea Offshore Monitoring in Drilling Area OCS Study MMS 2007-002. Prepared by MBC Applied Environmental Sciences, Costa Mesa, CA for the U.S. Dept. of the Interior, Minerals Management Service, Alaska OCS Region) (MBC, 2007). Table 1 depicts by category some of the types of missing basic data about the Chukchi Sea ecosystem.

Type of Gap	Explanation	Examples of Gap
Resource	Some resources have not been studied in the Arctic or have very little basic, life history information.	Zooplankton, benthic organisms, fish
Abundance	For most species or species groups, there is little or no information on population size, relative abundance, and/or distribution. Furthermore, little is known about the ecological roles played by most species and thus which species are crucial for ecosystem health.	Zooplankton, Opilio crab, fish, ice seals, Chukchi polar bear population, Kittlitz's Murrelet
Spatial coverage	Many resources studied in depth still lack complete coverage across the Beaufort and Chukchi seas within the U.S. EEZ.	Benthic biomass, fish, Steller's Eider, pelagic birds, Arctic fox
Temporal coverage	Outside of remotely sensed satellite information (ice, temperature, chlorophyll-a, etc.), no resource in the Arctic has adequate data to detect change over annual or decadal time periods for the Beaufort and Chukchi seas.	Invertebrates, fish, pelagic birds, and mammals (surveyed in Beaufort only)
Seasonal coverage	Most surveys occur in July and August when weather, sea ice, and snow are optimal for human observers; direct observation is difficult at other times of the year. Most species lack adequate seasonal distribution data.	Invertebrates, benthic organisms, fish, polar bear, ribbon seal
Ecosystem Structure and Functioning	The physical, chemical and biological processes that help drive the composition of the food web, energy flow and spatial variability are not well understood.	Quantitative food web model, currents and winds, nutrient cycling, the effects of sea ice on productivity And species distribution
Applied research including understanding how the ecosystem is changing	Arctic marine ecosystems are poorly known to begin with, and are now changing in a myriad of ways. There is need for greater understanding of organismic and ecosystem-level responses to changes due to loss of sea ice, increased water temperature and acidification.	Effects of ocean acidification on benthic invertebrates, which are key part of the larger food web. Cumulative effects of disturbance and noise on bowhead whales and other marine mammals.

In addition to missing basic information about the ecosystem, including the species and relationships, we also lack a basic understanding of the effects of oil and gas exploration and development on species and habitats in the Chukchi Sea. One of the lessons we have learned from the Gulf spill is that BOEMRE must conduct meaningful environmental review, including a full analysis of impacts, before offshore oil and gas activities occur. See, e.g., Nuka Research

and Planning Group, LLC, Pearson Consulting LLC. 2010. Oil spill prevention and response in the U.S. Arctic Ocean: Unexamined risks, unacceptable consequences. Commissioned by the Pew Environment Group, U.S. Arctic Program, November 2010. Philadelphia, PA, USA, available at <http://oceansnorth.org/arctic-oil-spill-report>. For example, to prevent and prepare for oil spills in the Arctic Ocean, BOEMRE needs information about the physical environment and the unique challenges it poses to offshore oil and gas drilling. It also needs to understand the effect of drilling and oil spills on marine ecosystems. A prediction of the impacts of spilled oil in Arctic waters must take into account the behavior of oil in an environment with sea ice, the varying characteristics of sea ice throughout the year, Arctic weather conditions, the long-term fate of oil in cold water and the specific vulnerabilities of Arctic marine species and ecosystems. BOEMRE has not endeavored to obtain this information for the lease sale draft SEIS.

These broad areas of missing data about the basic ecology of the Chukchi Sea and the effects of oil and gas activities there render BOEMRE unable to answer questions that are essential to the decision about whether, where, when, and under what conditions to lease an area for oil and gas activities. Listed below are some examples of the types of questions essential to the decision.

- Where will Pacific walrus be during summer? In 2007 and 2009, walrus hauled out on land in large numbers in northern Alaska. Prior to 2007, walrus spent summers on sea ice in the Chukchi Sea. In 2010, a number of walrus hauled out along the U.S. Chukchi coast, yet a number of walrus also used the region around Hanna Shoal, which is squarely within the Lease Sale 193 area, extensively. Without knowing where walrus will be, infrastructure and activity cannot be positioned to avoid incidental takes and other impacts. See e.g., USGS 2010. *Walrus tracking and telemetry data acquired from walruses instrumented on the Alaska shores of the Chukchi Sea in September 2009*. Radio-tagging field report. USGS Alaska Science Center, Walrus research project, available at http://alaska.usgs.gov/science/biology/walrus/pdfs/EC09_Radio_Tagging_Field_Report.pdf; Jay, C.V. and A.S. Fishbach. (2008). *Pacific walrus response to Arctic sea ice losses*. U.S. Geological Survey Fact Sheet 2008-3041, available at <http://pubs.usgs.gov/fs/2008/3041/>.
- Which areas in the Chukchi Sea are crucial for various life stages of marine mammals? Satellite telemetry has shown that the movements of bowhead whales, beluga whales, walrus, spotted seals, ringed seals, bearded seals, and polar bears are more complex and variable than previously anticipated. Without an understanding of which areas are crucial and why, it is impossible to identify critical areas that must be avoided by development and protected in the event of oil spills.
- How have distributions of marine birds changed since the pelagic surveys conducted in the mid-1970s to mid-1980s in the Outer Continental Shelf Environmental Assessment Program (OCSEAP)? For birds at sea, these data are now at least 25 years out of date and much has changed since. Previous data point to the importance of areas overlapping the lease sale area in the Chukchi Sea. Furthermore, because of a lack of baseline information, there is very little knowledge about long-term trends and variation due to climate change [(CRRC 2010)]. In the Proceedings of the Northern Oil and Gas Research Forum held in Anchorage in October 2008, the forum acknowledged the importance of long-term studies compared to observations made at "a single point in time" and their usefulness. See http://alaska.boemre.gov/reports/2008rpts/2008_1028_proceedings.pdf.

- What are the distributions and life histories of species that are critical in marine food webs and how will loss of sea ice influence these species? Many marine birds and mammals rely on species like Arctic cod, yet there is a paucity of even basic knowledge about this species. Other of these species, such as Arctic cisco, are also very important for subsistence purposes. According to the environmental assessment on the recent Arctic Fishery Management Plan, sampling of fish and shellfish species is extremely limited, with only a small area of the Beaufort Sea off Barrow sampled adequately within the last 18 years. Some areas have never been sampled to determine even basic abundance estimates.
- How do the effects of climate change and industrial activity interact and are the effects cumulative?
- How will the distribution of species of concern (including ESA candidate or listed species) shift due to climate change? Species currently in the Chukchi may shift their ranges and key habitat areas. Species from the Bering Sea and farther south may move northwards, possibly requiring new areas or types of protection in the Chukchi Sea. The ability to reasonably predict such shifts is necessary to evaluate the life-cycle impacts of offshore development and infrastructure.
- How can quantitative risk and impact assessments be conducted? There is insufficient information about the distribution and productivity of plankton, benthic organisms, fishes, seabirds, the response of marine mammals to noise, ecological changes likely to be caused by sea ice loss, and other basic environmental parameters to support quantitative evaluation of potential and actual impacts from offshore activity, including oil spills. Without such information, risk and damage assessments are reduced to speculation or experts' opinions and recovery from an oil spill or other accident cannot be determined. Lack of an adequate quantitative baseline of information was the primary impediment to assessing ecological damages caused by the *Exxon Valdez* oil spill.
- What trajectories would spilled oil follow? The general atmospheric and circulation patterns of the Chukchi Sea have been mapped, but patterns and variability at the scale of an oil spill are not well known and are difficult to predict based on current understanding. In addition while general circulation patterns are known, there is relatively little understanding of the currents at the ocean's surface where the majority of oil collects in a spill. Without that knowledge, the placement of response equipment and the ability to respond promptly are hindered, reducing the ability to contain and recover spilled oil. Furthermore, there is insufficient information or monitoring capacity to project fine scale trajectories of spilled oil in real time to be projected in real time during a spill event, making it difficult or impossible to respond quickly and protect critical wildlife habitat areas, such as Kasegaluk Lagoon or Ledyard Bay.
- How can negative social and cultural impacts be avoided? Industrial development can disrupt traditional practices, interfere with cultural norms, and lead to social dislocation. Proper planning can help minimize such problems, but requires detailed understanding of local cultures and societies as well as the involvement of local communities in all phases of decision-making. The processes for such involvement have not yet been devised and tested for offshore oil and gas in U.S. Arctic waters. See Wernham, A. 2007. Inupiat health and proposed Alaskan oil development: Results of the first integrated health impact assessment/environmental impact statement for proposed oil development on Alaska's north slope. *Ecohealth* 4:500-513.

Because BOEMRE has not obtained any new information for this draft SEIS, it has left these and other questions unanswered, as they were in the original EIS. In light of the important decisions being made at the lease sale stage, as described above, the answer to these questions and others like them, are essential to the agency's choices at this stage.

During the remand, BOEMRE should obtain missing information to answer these and other important questions about the Chukchi Sea and the impacts of oil and gas development there. As discussed below and in the attachments, the most effective way to do this would be to engage in a comprehensive gap analysis, taking into account the ongoing United States Geological Survey effort, potentially supplemented by information from other federal agencies with expertise in the Arctic such as the National Oceanic and Atmospheric Administration, and then to undertake a comprehensive, coordinated, and integrated study plan to obtain essential missing information with which to analyze effects and make sound management decisions.

2. Missing information is essential to the choice among the alternatives identified in the original EIS.

The original EIS illustrates that the kind of information missing in the Chukchi Sea is essential to the choice among alternatives. BOEMRE "carried forward" the range of alternatives it analyzed in the original 2007 lease sale EIS in the draft SEIS. Draft SEIS at 12. It dismisses the importance of the missing information for choosing among these original alternatives. However, as several examples below illustrate, much of the missing information is essential to the reasoned choice among the original four alternatives in the 2007 analysis:

- Information about bowhead whale use of the Chukchi Sea is incomplete. The original EIS acknowledges that data on bowhead use of the Chukchi Sea are dated, provide only limited insight into areas where bowheads may be exposed to oil and gas activities should they occur, and "should not be interpreted as indicating current use of the Chukchi Sea by bowhead whales . . ." Draft SEIS, App. A at 21 of 143; see also Draft SEIS at 25 of 143 (noting that "recent data on distribution, abundance, or habitat use in the Chukchi Sea Planning Area are not available"). The original EIS acknowledges further that, even were distribution and use patterns better understood, the significance of bowhead use of areas to the overall food requirements of the population are not clear. See Draft SEIS, App. A at 24 of 143.

The original EIS's alternatives consisted of different sized coastal deferral zones. These different zones were proposed in part to provide different levels of protection for bowhead whales. See Minerals Management Service (MMS), Chukchi Sea Planning Area, Oil and Gas Lease Sale 193 and Seismic Surveying Activities in the Chukchi Sea, Alaska, Final EIS, OCS EIS/EA MMS 2007-026 (FEIS) at ES-7-8 (May 2007) (explaining reasons for each alternative). Indeed one alternative, Alternative IV, was developed specifically to afford protection to migrating bowhead whales. *Id.* at ES-8. Given the reason for positing the various alternatives—to offer, among other things, varying levels of protection for the bowhead whales—information that would allow BOEMRE to analyze the importance of the deferred areas to the species is essential to the choice among those alternatives.

- The original EIS for Lease Sale 193 acknowledged that information about marine and coastal birds is outdated or completely lacking for the Chukchi Sea. Draft SEIS, App. A at 4 of 143 (noting that several areas historically documented to be important for birds, as well as the entire lease sale area “lack site-specific data on habitat-use patterns, routes, and timing to assess impacts”); *id.* (noting that for many species, “the most recent data is between 15 and 30 years old, making accurate analysis difficult”). Yet, “several species or species-groups have a high probability of experiencing substantial negative impacts” and “[t]he risk that several regional bird populations could experience significant adverse impacts is high” in the event of an oil spill. *Id.*

BOEMRE proposed one of the alternatives, Alternative III, at least in part to reduce impacts to marine and coastal birds. See FEIS at ES-8. Given the reason for the alternative, information about areas that are important to marine and coastal bird species, and information about how and when those birds use these areas, is essential to making a choice between this and other potentially less-protective alternatives.

In the face of missing information, BOEMRE was left in the original EIS to speculate about the different effects among alternatives. For example, the original EIS states that in Alternatives III and IV, “[t]he increased distance between offshore development and coastal bird habitats would *conceivably* decrease the percent chance of spilled oil contact, increase weathering of spilled oil prior to contact, and increase available spill response time.” FEIS at IV-269, 273 (emphasis added); *id.* at II-42, 45 (“The increased distance between offshore development and coastal bird habitats also would *conceivably* decrease the percent chance of spilled oil contacting bird habitat”) (emphasis added). The alternatives analysis is replete with this sort of conjectural differentiation among alternatives. Conjectural language is used to describe different effects from oil spills on fish, fish habitat, bowhead whales, other marine and coastal birds, and terrestrial mammals. FEIS at IV-268-69 (Alternative III); *id.* at IV-272-73 (Alternative IV); see also *id.* at II-41, 45 (“Differences in noise and oil-spill effects to bowhead whales from this deferral compared to Alternative I [] and Alternative III/IV [] are difficult to quantify, but qualitatively can be described.”); *id.* at II-42, 45 (“any spill that would occur would *conceivably* take longer to reach and enter the spring-migratory route”); *id.* (“The increased distance between offshore development and coastal habitats also would *conceivably* decrease the percent chance of spilled oil contact with marine mammals”); *id.* at II-44 (“The increased distance between offshore development and coastal fish habitats also would *conceivably* decrease the percent chance of spilled oil contacting fish resources”); *id.* at II-41 (noting that “[i]n theory” Alternative III provides more protection for coastal and marine fish habitat). Because better information would enable BOEMRE to perform an actual, rather than a conjectural, analysis of the differences among potential alternatives, it is essential to a reasoned choice among alternatives.

3. Missing information is essential to determining an adequate range of alternatives.

Missing information is essential to the choice among alternatives, because it is essential to the agency’s definition of an adequate range of alternatives. NEPA requires that an EIS contain a detailed statement of the “alternatives to the proposed action.” 42 U.S.C. § 4332(C)(iii). The

10

and wildlife, subsistence, and cultural resources” and to provide at least one action alternative that “ensure[s] development can occur without significant impacts to critical resources”—is clearly essential to a choice among alternatives.

In the draft SEIS, BOEMRE concludes that the effects under all the action alternatives presented in the original EIS are basically the same. Draft SEIS at 11 (noting the “commonality of potential impacts and their severity among all action alternatives, which substantially reduced the utility of incomplete information to the decision-maker”); see also FEIS at ES-8 (noting that “[t]he EIS analysis concludes that for most resources, while the alternative [III and IV] would provide a measure of protection to the resources within the deferral area, the effects to the resources in the Chukchi Sea area under this alternative would be essentially the same as the effects under Alternative I.”). This conclusion, if true, which it is not,¹ suggests only that the range of alternatives in the original EIS was inadequate. It highlights, rather than excuses, the essential nature of missing information to the choice among alternatives.

For example, BOEMRE stated in the original EIS that information about beluga whales was both important for the lease sale decision and missing from the analysis. It stated that “[u]nderstanding the distribution and timing of movements of belugas is important for planning lease sales in the Chukchi Sea and designing possible mitigation measures.” FEIS at IV-163. But, “[l]ate-summer distribution and fall-migration patterns are poorly known, wintering areas effectively are unknown, and areas that are particularly important for feeding have not been identified” *Id.* Rather than obtaining this information acknowledged in 2007 to be important to planning lease sales, BOEMRE in the draft SEIS attempts to excuse itself from that work with general boilerplate language. See Draft SEIS, App. A at 99 of 143 (stating that “[w]hile additional information on the distribution and timing of movements of belugas would be useful, this information is not essential to a reasoned choice among alternatives in this case” because “[m]uch information is already known on the general habits of the many species of birds [sic] that use the Chukchi Sea” [and] “this level of available information is sufficient to support sound scientific judgments and reasoned managerial decisions regarding formulation and selection of lease sale alternatives” and “[t]he protections that this species receives under the MMPA will serve to preclude or reduce impacts under all action alternatives”). These generalizations are not credible attempts to comply with Section 1502.22 with respect to information the agency itself has admitted is important for the decision-maker. As described in the next section, BOEMRE’s rationales do not justify the agency’s course.

C. BOEMRE’s reasons for not to obtain any missing information are arbitrary.

BOEMRE advances five recurring excuses for its decision not to obtain a single piece of information during the remand period. A key BOEMRE excuse for this extraordinary decision, that is both explicit and implicit in several rationales, is that missing information is not essential to the lease sale decision, because that decision is not a consequential commitment of areas to oil

¹ The original EIS does acknowledge generally some differences in effects to a number of species among the alternatives. See FEIS at IV-268-69. However, as described above, the real problem is that there is not enough information about the biology of the region or effects of oil and gas activities on its wildlife to determine whether the different alternatives will in fact have different effects or to fashion different alternatives that will in fact ensure different effects if chosen.

12

discussion of alternatives “is the heart of the environmental impact statement.” 40 C.F.R. § 1502.14. That discussion should “provid[e] a clear basis for choice among options by the decisionmaker and the public.” *Id.*; see *City of Angoon v. Hodel*, 803 F.2d 1016, 1020 (9th Cir. 1986) (“[T]he touchstone for our inquiry is whether an EIS’s selection and discussion of alternatives fosters informed decision-making and informed public participation.”) (*quoting California v. Block*, 690 F.2d 753, 767 (9th Cir. 1982)). BOEMRE has chosen not to reexamine the range of alternatives for the lease sale in the draft SEIS process. The agency should reconsider this approach. As agencies and conservation groups explained in commenting on the original EIS, missing information about the basic biology of the region and about the effects of oil and gas activities on the species that inhabit it is essential to framing an appropriate range of alternatives that have meaningfully different effects. Without this information, neither the agency nor the public could determine whether the range of alternatives presented in the original EIS was adequate. The lack of information, in other words, thwarted the discussion of alternatives to the proposed lease sale, undermining a central component of the NEPA analysis.

The original EIS alternatives consist of three different-sized deferrals of coastal areas from leasing (the first of which, Alternative I, is inconsistent with the 25-mile coastal buffer zone mandated by the 2007-12 Five-Year Leasing Program, pursuant to which Lease Sale 193 was to be held, and is thus not a viable alternative). Because so much information about the Chukchi Sea is missing, however, it is impossible to determine whether these alternatives would have a different effect on the environment much less describe to a decision-maker why and how. The Environmental Protection Agency (EPA) identified this flaw, commenting on the draft of the original EIS:

Alternatives to the Proposed Action that are presented in the Draft EIS include two variations of exclusion areas along the coastward side of the Planning Area. However, it is unclear how the boundaries of the excluded areas in the two alternatives (Alternatives III and IV) were determined. Due to the lack of information about the Planning Area, the use of the “Opportunity Index” and other assumptions regarding the potential level of exploration, development and production activity as a result of a lease sale, it is unclear if the two alternatives, together with the Proposed Action and a No Action Alternative, represent a range of reasonable alternatives in the Draft EIS. The Final EIS should present a more thorough discussion of the decision criteria and the geophysical, biological and subsistence information that was used to develop the alternatives in order to demonstrate that a range of reasonable alternatives was considered.

FEIS at 013-002. EPA also suggested that BOEMRE “consider removal of additional areas with sensitive fish and wildlife, subsistence, and cultural resources, and at a minimum, deferring areas until further research and studies are conducted to ensure development can occur without significant impacts to critical resources.” FEIS at II-4. BOEMRE rejected these suggestions, in part because EPA did not provide specifics as to areas that should be considered for removal. *Id.* at II-5. EPA, of course, could not do so, given the lack of information in the Chukchi Sea. Absent adequate information, it is not possible to frame a meaningful range of alternatives for the decision-maker. Missing information that would allow the agency to frame alternatives that provide meaningful choices—namely information sufficient to identify “areas with sensitive fish

11

and gas activities. Thus, information can be obtained at later stages of the OCSLA process, when the agency is evaluating exploration or production plans.

As an initial matter, this rationale ignores the agency’s practice, which has been to conduct only abbreviated environmental assessments of exploration plans and to rely heavily in that review on the analyses the agency conducts at the lease sale stage. See MMS, Shell Gulf of Mexico, Inc., 2010 Exploration Drilling Program, Chukchi Sea OCS, Alaska, Environmental Assessment at 6-7 (December 2009); MMS, Shell Offshore Inc. 2010 OCS Exploration Plan, Camden Bay, Alaska, Environmental Assessment at 2-3 (October 2009). Under this practice, the need to gather information is always either pushed into the future or deemed unnecessary in light of past NEPA documents.

More fundamentally, BOEMRE’s excuses fail to recognize the importance of the decision being made at the lease sale. As described above, at the lease sale stage, BOEMRE makes the decision about whether to permit oil and gas activities in an area, and the existence of leases, once issued, considerably constrains the agency’s discretion to alter course. BOEMRE can, of course, deny lessees’ exploration and development plans, and it can suspend and even cancel leases after they are issued. But these actions may only be taken in compliance with the substantive and procedural constraints of OCSLA and its regulations. It is precisely at the lease sale stage—where the agency finds itself now—when it has full discretion to determine if, when, where, and how oil and gas activities may occur in a planning area, that information about the biological resources of an area and the effects of oil and gas activities on those resources is essential.

BOEMRE also misapprehend its obligation under NEPA in preparing the draft SEIS. The job of the SEIS is to inform the decision-maker and the public about the effects of the decision to offer oil and gas leases in the Chukchi Sea. To satisfy this obligation, BOEMRE must “prepare a ‘detailed statement’ covering the impact of particular actions on the environment, the environmental costs which might be avoided, and alternative measures which might alter the cost-benefit equation . . . to aid in the agencies’ own decision making process and to advise other interested agencies and the public of the environmental consequences of planned federal action.” *Calvert Cliffs’ Coordinating Comm., Inc. v. U. S. Atomic Energy Comm’n*, 449 F.2d 1109, 1114 (D.C. Cir. 1971). “[T]he purpose of an [EIS] is to . . . produce an informed estimate of the environmental consequences.” *Kern v. U.S. Bureau of Land Mgmt.*, 284 F.3d 1062, 1072 (9th Cir. 2002) (quotation and citation omitted), and give the decision-maker a “clear idea how to visualize the environmental harms” of the proposed action, *Mass. v. Watt*, 716 F.2d 946, 949 (1st Cir. 1983).

Similarly, BOEMRE states that, although large quantities of data are missing about the Chukchi Sea, there is enough information available now for informed management and decision-making. Draft SEIS at 11. This excuse is unsupported. In most instances, BOEMRE makes this statement without pointing to the information that it relies on to make its management decision notwithstanding important data gaps. For example, the original EIS states that there is not enough information to determine whether or not there will be significant effects to marine mammals from oil and gas activities under the lease sale. FEIS at V-32. Yet, in the draft SEIS, without disputing the fact that it is unable to determine whether there will or will not be significant effects to marine mammals from oil and gas activities in the Chukchi Sea and without

13

pointing to any specific information at all, BOEMRE concludes that there is nonetheless enough information now to make management decisions. Draft SEIS, App. A at 136 of 143. BOEMRE's statement boils down to a conclusion that it is not essential to the lease sale decision to know whether oil and gas activities that will result from the decision will or will not significantly affect Chukchi Sea marine mammals. This conclusion is not credible. It underscores the agency's abnegation of its NEPA duties to describe in detail the "the actual impact of proposed projects," *Earth Island Institute v. U.S. Forest Serv.*, 442 F.3d 1147, 1172 (9th Cir. 2006), in an EIS "to obviate the need for [] speculation by insuring that available data is gathered and analyzed prior to the implementation of the proposed action." *Found. for N. Am. Wild Sheep v. U.S. Dep't of Agric.*, 681 F.2d 1172, 1179 (9th Cir. 1982).

Relatedly, BOEMRE states that it need not obtain additional information because other environmental laws and regulations would preclude significant adverse effects on particular resources. Again, BOEMRE misapprehends its obligations under NEPA. An agency may not rely on the imposition of future mitigation measures to avoid analyzing the impacts of an activity in an EIS. See *S. Fork Band Council of W. Shoshone of Nev. v. U.S. Dep't of Interior*, 588 F.3d 718, 726 (9th Cir. 2009) (holding EIS violated NEPA because it failed to analyze a project's air quality impacts in reliance on separate Clean Air Act permitting process); see also *Neighbors of Cuddy Mountain v. U.S. Forest Serv.*, 137 F.3d 1372, 1381 (9th Cir. 1998) (holding EIS discussion of mitigation inadequate in part because it was "not clear whether any mitigation measures would be adopted"); *Nat'l Parks & Conservation Ass'n v. Babbitt*, 241 F.3d 722, 734-35 (9th Cir. 2001). Furthermore, where an EIS relies on mitigation measures to avoid discussing potential effects, the mitigation measures must "be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated." *Neighbors of Cuddy Mountain*, 137 F.3d at 1380-81 (EIS violated NEPA where it failed to discuss "how effective the mitigation measures would be"); *Nat'l Parks & Conservation Ass'n*, 241 F.3d at 735 ("the impact of the proposed mitigation measures must be studied as part of the preparation of an EIS"). Neither the original EIS nor the draft SEIS discusses the future mitigation BOEMRE claims excuses analysis in any meaningful detail.

BOEMRE also states that it need not obtain further information about adverse impacts because it has disclosed that significant adverse effects would occur under certain circumstances, such as an oil spill, and further description of those effects is not necessary. Draft SEIS at 11. This excuse, however, fails to recognize the agency's obligation to prepare a "detailed statement" that provides the decision-maker and public with a "clear idea how to visualize the environmental harms." For example, the original EIS said in the context of discrete populations of fish: "Given a lack of contemporary abundance and distribution information, large oil spill effects on rare or unique species (including potential extirpation) could occur, but would likely go unnoticed or undetected." FEIS at II-34. The draft SEIS responds to this statement as follows: "[i]t is well understood that the environmental impacts associated with a large oil spill could be quite severe. Rare species could be affected by such an event wherever [sic] they may occur throughout the lease sale area . . . the decision-maker already has sufficient information regarding the relative probability and various impacts of a large oil spill to allow a reasoned choice among lease sale alternatives." Draft SEIS, App. A at 2 of 134. Without information about what would happen in the event of an oil spill, including, for example, what species of fish might be extirpated, it is not possible for BOEMRE to create a detailed statement of the potential environmental harms that

14

The draft SEIS also failed to include essential information that has been developed about the Chukchi Sea between the completion of the original EIS in 2007 and the present. This information is also included in attachment B. One example of an important study that is already available and provides information essential to the lease sale decision but that BOEMRE has ignored is Quakenbush, L.T., Small, R.J., and Citta, J.J. 2010. Satellite tracking of western Arctic bowhead whales. Final Report. OCS study BOEMRE 2010-033. Bureau of Ocean Energy Management, Regulation and Enforcement. 65 pp plus appendices. The study pertains to the bowhead whale—an important marine mammal for the Inupiat along the Arctic slope, and a species afforded protection under the Marine Mammal Protection Act and the Endangered Species Act. The original EIS acknowledges that "[d]ata are limited on the bowhead whale fall migration through the Chukchi Sea before the whales move south into the Bering Sea," and that "[r]elevant data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available." FEIS at III-51, III-55. The Quakenbush study identified important corridors for migration and potentially important feeding areas in the Chukchi Sea, information BOEMRE admits is missing and admits is relevant to potentially significant impacts from leasing. Draft SEIS, App. A at 25 of 143. BOEMRE should consider the information provided by these and other studies, such as recent walrus tagging data from the United States Geological Survey, that are already available but that it has neglected to incorporate into its analysis of Lease Sale 193 effects.

E. BOEMRE should reassess its approach, obtain essential missing information, and reconsider the lease sale decision in light of the new information.

BOEMRE should not finalize the draft SEIS as currently written. It should take a new approach and undertake a meaningful assessment of whether missing information is essential to a reasoned choice among alternatives, obtain the information that is, assess whether the new information merits different alternatives, and fully reconsider the Chukchi Sea lease sale in light of that new information.²

The most effective way to respond to the Court's order and prepare for decisions about future industrial activities is to undertake comprehensive research and monitoring that would provide a fundamental understanding of the marine ecosystem. This information will allow managers to move from qualitative assertions (*i.e.*, educated guesses) to making quantitative assessments of potential impacts. Information will allow decision makers to weigh the costs and benefits of industrial activities and determine whether there are alternatives that could allow for development while protecting the ecosystem and subsistence way of life. Obtaining information

² In public meetings on the draft SEIS, BOEMRE repeatedly stated that it has been instructed by the Alaska Federal District Court to complete its remand analysis by January 21, 2011. This statement is misleading. Although the Court stated its opinion that a "reasonable goal" for completion of the remand analysis would be January 21 and directed the agency to make reasonable efforts to respond to the remand by that date, it was careful to state that it was not "imposing" rigid or arbitrary constraints on the Agency and explicitly "recognize[d] the Agency's expertise in the field." *Native Village of Point Hope*, Docket No. 171 at 1-2. Accordingly, the Court instructed the agency to file a report with the Court as to the agency's progress by January 21, 2011, if that date proves unrealistic to complete consideration of the issues on remand. BOEMRE should not use this date as an excuse to avoid conducting the analysis that is required under NEPA and Section 1502.22

16

could result from the lease sale and to provide the decision-maker and public with a clear picture of the potential impacts.

Finally, BOEMRE states that there is a "commonality" of effects among all action alternatives which "substantially reduced the utility of incomplete information to the decision-maker." Draft SEIS at 11. As an initial matter, and as discussed above, the statement is not true—the original EIS acknowledges that there are differences among alternatives. The problem is that data gaps prevent meaningful distinction among those alternatives. Part of the problem is that the lack of information has led managers to consider the environment as being basically homogenous, which would be unprecedented for a continental shelf region with varying currents and topography (*i.e.*, shoals and canyons). Regions are likely to vary in their importance for a number of species. For example walrus appear to congregate regularly in the region around Hanna Shoal within the lease area. See, USGS 2010. *Walrus tracking and telemetry data acquired from walruses instrumented on the Alaska shores of the Chukchi Sea in September 2009*. Radio-tagging field report. USGS Alaska Science Center, Walrus research project. http://alaska.usgs.gov/science/biology/walrus/pdfs/EC09_Radio_Tagging_Field_Report.pdf. If information is lacking to allow BOEMRE to determine whether oil and gas activities will have significant effects on marine mammals, for instance, there is no way to describe in any detail the effects of any one alternative, let alone describe differences among different alternatives. Additionally, the statement ignores the comparison that the decision-maker must make between the action alternatives and the no-action alternatives. It also begs the question whether, if it is true that effects are the same for all alternatives, the original EIS presented an adequate range of alternatives.

D. Other flaws in BOEMRE's analysis of missing information in the draft SEIS.

The draft SEIS suffers from a number of other flaws in its analysis of missing information. Exhibit 129 to the plaintiffs' opening brief in *Native Village of Point Hope*, upon which BOEMRE purports to rely at least in part for its identification of missing information in Appendix A to the draft SEIS, identifies missing information related to threatened spectacled and Steller's eiders. These identifications of missing data were contained in a biological evaluation that BOEMRE prepared in connection with its consultation with the Fish and Wildlife Service under Section 7 of the Endangered Species Act. BOEMRE relied on the analyses in that biological evaluation in the original EIS. Thus, these unknowns must be addressed here in the draft SEIS.

The draft SEIS fails to include essential information that has been developed about the Chukchi Sea that BOEMRE itself has developed. This information includes information collected from the BOEMRE Environmental Studies Program in Alaska. The listing is available at: http://alaska.boemre.gov/ess/2010_0604_AKPeerReview.pdf (last visited Nov. 21, 2010). For example, attachment A documents those references from peer reviewed literature produced under the auspices of the study program since 1990 that BOEMRE failed to consider. BOEMRE must consider these studies, as some of these studies may contain information relevant to unknowns about species and habitats as well as the fates and effects of oil and gas exploration and development on these species and habitats.

15

now would also ensure that, if leases were sold, there would not be an information gap later in the process, when the agency is called upon to analyze and approve exploration and development plans on those leases. We are attaching hereto, as attachment C, a draft research plan that sets forth one possible approach to obtaining missing information that would be true to the Administration's commitment to science-based decision-making.

Once it has obtained missing information and completed a meaningful reanalysis of the potential effects of Lease Sale 193, BOEMRE should, as it recognizes, Draft SEIS at 4 ("When the EIS process is completed the Secretary per the court's remand will affirm or change the department's previous Sale 193 decision."), make anew its decision whether to cancel, modify, or amend the decision to hold Lease Sale 193. To protect the integrity of the administrative process and avoid "bureaucratic rationalization and bureaucratic momentum," BOEMRE and the Department of Interior must not lend weight to the existence of outstanding leases in the Chukchi Sea—the prior decision to hold the lease sale must "count for nothing" in the present decision regarding Lease Sale 193. *Northern Cheyenne Tribe v. Hodel*, 851 F.2d 1152, 1157 (9th Cir. 1988).

II. ANALYSIS OF NATURAL GAS DEVELOPMENT

The draft SEIS's analysis of the effects of natural gas development also falls short in a number of respects. It fails to adequately take into account climate change, its scenario is unjustifiably limited, its dismissal of liquefied natural gas (LNG) tankering is unjustified, it fails to adequately analyze the impacts of pipelines, it fails to adequately analyze the effects of natural gas production on a number of species, and it fails to analyze the potential for activities to displace subsistence users.

A. The draft SEIS fails to adequately take into account climate change.

The draft SEIS, like the original Lease Sale 193 EIS, fails to assess adequately the lease sale's impacts in the context of Arctic climate change. It is essential that the final SEIS analyze the effects of gas development and production in light of Arctic climate change because the draft SEIS states that "the timeframe for all activities . . . could span 50 years," and assumes that gas-related activities will occur during the latter portion of that period. Draft SEIS at 65. The Arctic at the time natural gas will be developed according to BOEMRE's scenario will be a very different place than the Arctic of 2010.

The Arctic is undergoing rapid change. It is warming faster than any other place in the world. Among the most profound changes are the loss of sea ice, the melting of permafrost, and coastal erosion. As temperatures continue to rise and precipitation patterns change, species distributions will shift, and many species will experience increased stress and decreased chance of reproduction and survival. The listing of the polar bear due to warming-related habitat loss exemplifies the changing Arctic environment. Polar bears are spending more and more time on land and less time on ice where they hunt for prey, including seals. As a result, scientists predict that two-thirds of the world's polar bear population could disappear by the middle of the century. The future looks similarly grim for walrus. Walrus are benthic feeders that use the ice as a platform from which to dive for food. Without sea ice, food will become much more difficult to access, leading to malnutrition and increased energy expenditures in searching for food.

17

The original Lease Sale 193 EIS failed to adequately take into account climate change. The EIS analyzed the proposed action against a static baseline and ignored likely changes in the Arctic climate and environment. *See, e.g.*, FEIS at III-47-55 (establishing the baseline for bowheads without accounting for climate change). As a result, the EIS included an incomplete analysis of climate change impacts to a number of rare and declining species, including polar bears, walrus, seals, and other marine mammals. FEIS at IV-145 – IV-171.

The draft SEIS makes the same error. It acknowledges that climate change is occurring. Draft SEIS at 32-33. Also, it indicates that changes in climate are irregular, making accurate projections difficult, but adds that “[c]limate change in the Arctic is projected to be larger than in other areas of the globe” *Id.* at 33. It recognizes that “[t]he arctic sea ice is undergoing changes in extent, thickness, distribution, age, and melt duration” *Id.* at 34. However, the draft SEIS fails to analyze the effects of Arctic gas production and development in the context of a changed and likely stressed environment.

Scientists predict that over the 50-year time frame of the lease sale activities, the Arctic could warm by more than three degrees Celsius as compared to a 1981 – 2000 baseline. ACIA, Arctic Climate Impact Assessment 2005, Cambridge University Press at 122 (Table 4.3), available at <http://www.acia.uaf.edu/pages/scientific.html>. As described above, Arctic warming will dramatically affect the Arctic environment and Arctic species. BOEMRE cannot provide a complete analysis of the effects of gas development and production without considering these changes. Thus, the final SEIS must account for the fact that in future decades the Arctic will be much different than it is today. The final SEIS’s analyses of effects to Arctic species, including marine mammals, polar bears and walrus, terrestrial mammals, and birds, should account for factors like diminished habitat, food resources, or population levels, and increased competition from species expanding their ranges into the Arctic.

BOEMRE should also analyze the impact of natural gas development’s contribution to black carbon emissions, for example from increased vessel traffic and development infrastructure. Black carbon is generally regarded as the second most important contributor to Arctic warming after CO₂. It warms the environment by absorbing solar radiation and heating the atmosphere, and it darkens snow and ice after falling to earth, thus increasing absorption and reducing the reflection of sunlight and accelerating melting. EPA Ad Hoc Working Group, Current Policies, Emission Trends and Mitigation Options for Black Carbon in the Arctic Region at 7 (April 28, 2009), available at <http://iiasa.ac.at/rains/reports/DRAFTWhitePaper-BCArcticMitigation-280909.pdf>. Emissions of black carbon from sources in the Arctic itself are particularly troubling, as Arctic emissions are far more likely to come in contact with and accelerate melt of Arctic snow and ice. *See id.* at 20. One recent study indicates that Arctic black carbon emissions are 10 to 100 times more important with respect to contributing to Arctic black carbon radiative forcing than emissions outside of the Arctic. Hirdman et al., Source identification of short-lived air pollutants in the Arctic using statistical analysis of measurement data and particle dispersion model output, 10 Atmos. Chem. Phys. 669 (Jan. 2010), available at <http://www.atmos-chem-phys.net/10/669/2010/acp-10-669-2010.pdf>. BOEMRE should analyze these effects.

18

will end current conditions of oversupply and low price. *See* <http://www.alaskadispatch.com/dispatches/alaska-beat/88-alaska-beat/7471-ica-nat-gas-demand-to-rise-14-yearly-over-long-term>. Additionally, future attempts to mitigate climate change could further boost demand for natural gas because gas is a relatively clean fossil fuel when compared to oil.

Thus, it is reasonably foreseeable that natural gas leasing in the Chukchi Sea will result in additional exploration and development activities. BOEMRE’s failure to account for this in the draft SEIS is arbitrary, and the agency must remedy this omission in the final SEIS. The agency must consider the effects of additional exploration and development, such as noise disturbances to bowhead whales and walrus from increased seismic activities, drilling, and icebreaking, the increased risk of birds striking oil and gas structures, potential air and water discharges from natural gas drilling, and increased risk of a large oil spill occurring if natural gas development results in additional oil development.

C. BOEMRE’s dismissal of liquefied natural gas tankering is arbitrary.

As in the original Lease Sale 193 EIS, the draft SEIS arbitrarily fails to analyze the effects of LNG tankering. In the Lease Sale 193 EIS, BOEMRE refused to analyze the effects of LNG tankering by arguing that the method of bringing natural gas to market was not feasible or economically attractive, even though record evidence indicates that LNG tankering is not only feasible, but is also drawing industry interest. In the draft SEIS BOEMRE continues to ignore the record evidence indicating the potential for LNG tankering in the Chukchi Sea. Instead of grappling with this evidence, BOEMRE simply repeats its Lease Sale 193 EIS conclusion that LNG tankering is not feasible or economically attractive. Draft SEIS at 15.

BOEMRE should analyze the effects of LNG tankering. The record shows that LNG tankering, is a feasible option that BOEMRE has promoted and industry has shown an interest in. In the 2008 draft Multi-Sale EIS, BOEMRE stated that “LNG is a plausible . . . strategy to export gas from the Chukchi OCS.” Multi-Sale Draft EIS, App. E at E-6. In its presentations to the North Slope Borough on Lease Sale 193, BOEMRE indicated that LNG tankering was a possible development scenario. Chukchi Development Presentation at 5. Further, in commenting on [BOEMRE]’s Notice of Intent to prepare the EIS for Lease Sale 193, Shell recommended that in addition to effects of a gas pipeline, LNG tankering “should also be analyzed.” Shell E&P Company, Comments on Notice of Intent to Prepare an EIS on Proposed Chukchi Sea Lease Sale 193 at 2 (December 9, 2005).

An analysis of LNG tankering is essential because these activities could have substantial effects on the environment. The infrastructure and activities associated with LNG transport could affect large areas of the land and ocean. Facilities—including a major LNG plant—and activities on shore could disturb local species and destroy local habitat, including threatened and endangered birds. Also, LNG transport could significantly increase vessel traffic in the Chukchi and Bering seas. Increased noise from these vessels could harm pinnipeds and migrating bowhead whales, and disturbances of sea ice could have an impact on polar bears, walrus, and other species that depend on the ice for habitat.

20

B. The Draft SEIS arbitrarily assumes no additional seismic or exploration drilling will occur in the natural gas development scenario.

In the draft SEIS, BOEMRE arbitrarily assumes that gas development and production would entail no additional seismic surveying or exploration drilling. Draft SEIS at 65. The scenario forms the basis of the agency’s analysis in the EIS. Thus, an arbitrary scenario infects the entire analysis of effects throughout the EIS. In the draft SEIS, BOEMRE has projected Chukchi Sea gas development and production in a manner that ensures effects will be essentially no different than the effects of projected oil development and production in the original EIS. Draft SEIS at 65.

BOEMRE’s limited gas scenario is arbitrary. BOEMRE assumes that gas development will result in no additional exploration activities because gas development will remain much less financially attractive than oil development. Draft SEIS at 65. However, even if gas development remains less attractive than oil development, this does not justify BOEMRE’s assumption that gas activities would not involve additional seismic surveying or drilling. Indeed, this assumption is contrary to the agency’s past statements on the attractiveness and probability of gas development. In the 2008 Multi-Sale Draft EIS, BOEMRE stated that an operational gas pipeline would “encourage new exploration, development, and production of natural gas throughout northern Alaska, including the Arctic OCS.” MMS, Beaufort Sea and Chukchi Sea Planning Areas, Oil and Gas Lease Sales 209, 212, 217, and 221, Draft EIS, App. E at E-4 (November 2008) (Multi-Sale Draft EIS) (stated in the context of discussing Beaufort Sea gas). Also, in the administrative record for Lease Sale 193 BOEMRE recognized that some companies could be even more interested in gas than oil in the Chukchi Sea and the agency noted that billions of dollars in royalties and taxes could be lost if companies did not develop marginal gas projects. Email from James Craig, BOEMRE, to John Goll, Re: Chukchi PNOs at 3 (March 19, 2007). A BOEMRE evaluation of Chukchi Sea lease sale scenarios plainly stated that “including gas development in the scenario will greatly increase potential environmental impacts *because the number of wells and platforms will be greater . . .*” Email from James Craig, BOEMRE, to Rance Wall, Re: My response to Shell’s request to change the Chukchi scenario at 3 (Dec. 13, 2005).

A pipeline stretching from the Chukchi Sea to the main transport hub near Prudhoe Bay may also provide an incentive to gas companies to perform additional exploration. The Chukchi Sea could contain considerable natural gas reserves. Multi-Sale Draft EIS, App. E at E-5, E-3 (stating that undiscovered gas resources in the Chukchi Sea range from 10.3-209.5 Tcf, while such resources in the Beaufort Sea range from 0.6-72.2 Tcf). While the gas may presently be less valuable than oil, the presence of a pipeline to transport gas to market could make any Chukchi Sea gas field commercially viable. This could cause companies to develop more gas, as well as oil found in the ground with the gas. It is arbitrary for BOEMRE to ignore this incentive and the possibility that a gas pipeline could transform the value of developing a gas and oil field from marginally unprofitable to lucrative.

Moreover, it is arbitrary for BOEMRE to assume that accessible gas will remain relatively unattractive well into the future. The International Energy Agency predicts that global demand for natural gas will increase 44 percent between 2008 and 2035, and that this increase in demand

19

Vessels transporting the LNG to market through the Bering Sea could negatively affect the critically endangered North Pacific right whale, one of the most endangered whales in the world. It is essential that BOEMRE consider the possibility that boat strikes could result in mortality to right whales because the loss of any North Pacific right whale would be a significant effect.

Additionally, LNG tankering could greatly increase Arctic emissions of black carbon and contribute to Arctic warming. BOEMRE should analyze these effects.

Thus, given the feasibility of LNG tankering, MMS’s own promotion of the technology during the process leading to the original Lease Sale 193, industry interest in it, and the potentially significant impacts of LNG tankering, BOEMRE must include an analysis of the effects of LNG tankering in the final SEIS.

D. BOEMRE has not sufficiently analyzed the effects of the construction and operation of pipelines resulting from natural gas development.

The effects of a gas pipeline spanning from offshore in the Chukchi Sea to near Prudhoe Bay have never been analyzed. Neither the original Lease Sale 193 EIS nor the draft SEIS adequately analyzes the potential effects of a hundreds-mile long pipeline traversing diverse habitat for caribou and other species in across the National Petroleum Reserve—Alaska (NPR-A).

As an initial matter, the original Lease Sale 193 EIS’s analysis of an oil pipeline does not provide the necessary analysis of the effects of a gas pipeline. Even if the gas pipeline travels the same corridor as the oil pipeline discussed in the original EIS, the later time frame BOEMRE has identified for gas development will result in the construction of the gas pipeline at a later date. Also, a second pipeline and additional compression facilities and maintenance activities will result in other effects, both individually and cumulatively with oil-related activities.

The final SEIS for Lease Sale 193 must consider the effects that a gas pipeline and its associated facilities and activities could have, in conjunction with oil production and development activities, on the Arctic environment. However, the draft SEIS provides no more than a cursory and incomplete analysis of the effects of the construction and operation of a gas pipeline. Instead of providing a detailed analysis, the draft SEIS relies on later analyses and permitting processes to identify and prevent environmental harms. *See, e.g.*, Draft SEIS at 81-82 (noting that the construction and operation of a pipeline is noisy and can disturb threatened and endangered whales, but relying on later analyses and permitting to identify and prevent impacts). This does not satisfy NEPA; BOEMRE must take a hard look at the environmental effects of the lease sale before moving forward. Information about the biological resources of an area and the effects of oil and gas activities on those resources is essential at the lease sale stage because it is at this stage that the agency has discretion to determine if, when, where, and how oil and gas activities may occur in a planning area. Thus, only now can BOEMRE consider the entire scope of the lease sale and how the action as a whole could affect the Arctic environment and have that analysis inform the agency’s decision making. At later stages, the agency will already be invested in particular courses of action, and its discretion may be more constrained.

21

In particular, the draft SEIS does not sufficiently analyze the potential effect a gas pipeline over land could have on caribou. The agency provides only two sentences on this topic, concluding that an elevated pipeline will not prevent caribou movements and stating that “[p]ipelines without adjacent roads and vehicle traffic are not likely to affect caribou movements.” Draft SEIS at 89. BOEMRE should provide a more detailed analysis of the potential for onshore activities to disturb caribou, including a review of the potential for a natural gas pipeline to delay caribou movements and the effect that would have on caribou herds and individuals.

A large pipeline stretching across the NPR-A could have important adverse impacts. For example, the Bureau of Land Management (BLM) has considered the effects of smaller pipelines—ones stretching across only part of the NPR-A—in its EISs analyzing potential effects of different management strategies for the NPR-A. BLM, Northwest National Petroleum Reserve-Alaska, Final Integrated Activity Plan/Environmental Impact Statement (November 2003) (*available at* http://www.blm.gov/ak/st/en/prog/planning/npra_general/nw_npra/nw_npra_a_final_iap.html) (NW NPR-A IAA/EIS); BLM, Northeast National Petroleum Reserve-Alaska, Final Supplemental Integrated Activity Plan/Environmental Impact Statement (April 2008), *available at* http://www.blm.gov/ak/st/en/prog/planning/npra_general/ne_npra/northeast_npra_a_final.html) (NE NPR-A IAP/EIS). The BLM identified numerous potential adverse effects of even these much less extensive pipelines. The BLM indicates that onshore oil and gas activities, and especially roads, can displace caribou and reduce caribou densities for miles. NE NPR-A IAP/EIS at 4-161. Further, it states that “there could be reproductive consequences from extensive disruption of caribou [movement] during the insect-relief season.” *Id.* at 4-162. This is contrary to BOEMRE’s statement in the draft SEIS that caribou are tolerant of development and its conclusion that caribou are able to habituate to oil and gas activities. Draft SEIS at 90. The BLM has also identified particular problems with pipelines themselves. It states that snow drifts under a pipeline can block or interrupt caribou movements. NW NPR-A IAP/EIS at IV-193. It also indicated that parallel sets of pipelines can lengthen crossing delays, NE NPR-A IAP/EIS at 4-171, as can roads that are adjacent to a pipeline, especially when there is high traffic on the adjacent roads, NW NPR-A IAP/EIS at IV-193. In some cases, caribou “may be delayed in crossing a pipeline and road for several minutes or hours in period of heavy traffic.” *Id.* “[T]he energetic costs associated with such delays are unknown.” NW NPR-A IAP/EIS at IV-193.

Moreover, the final SEIS should provide a more comprehensive review of relevant research on the effects of oil and gas development on caribou. For example, in the draft SEIS, BOEMRE cites a study from 2000 indicating that onshore development and production have not resulted in population-level effects. Draft SEIS at 90. However, a later report from the National Research Council found that

[a]s a result of conflicts with industrial activity during calving and an interaction of disturbance with the stress of summer insect harassment, reproductive success of Central Arctic Herd female caribou in contact with oil development from 1988 through 2001 was lower than for undisturbed females, contributing to an overall reduction in herd productivity.

22

encounters. BOEMRE recognizes that human-bear interactions can result in harassment of the bear, but fails to sufficiently consider the cost of such disturbances to the bear. *Id.* at 83-84. Of particular concern is the potential for these interactions to endanger the life of a human or a bear. For instance, a human-bear encounter may lead to injuries or deaths to workers or an urgent need to protect a worker that results in the killing of a bear. The final SEIS should provide a comprehensive analysis of these and other relevant potential effects to polar bears, and should consider such impacts in light of the changing Arctic climate and environment.

The final SEIS should also provide additional analyses of effects to walrus. BOEMRE acknowledges that “the potential for serious adverse impacts to individual or groups of walrus does exist.” Draft SEIS at 88, and has noted that the population of Alaskan Pacific walrus is likely in decline, FEIS at III-74; however, the draft SEIS provides only a very brief analysis of potential impacts to walrus. Draft SEIS at 88. As with the EIS’s analysis for other species, it assumes that later permitting processes and mitigation measures will prevent harm. *Id.* However, even the short analysis BOEMRE has provided shows this to be arbitrary. The agency states that aircraft overflights can result in mortality from trampling and the separation of cow-calf pairs, but argues that “BOEM’s minimum altitude requirements would preclude adverse impacts to walrus, to the extent that human safety considerations permit flying at this altitude.” *Id.* Thus, BOEMRE’s own analysis shows that human safety considerations may result in aircraft flying at an altitude that can startle walrus and cause walrus mortalities. In fact, low-ceiling clouds in the Arctic prevent compliance with the minimum altitude requirements with some frequency. However, BOEMRE essentially ignores this potential harm and refuses to analyze whether resulting injuries or mortalities could result in population-level effects. BOEMRE also states that vessels can cause walrus to abandon haulouts, but does not address further the potential for vessels to disturb walrus. BOEMRE should provide an analysis of the potential for vessel disturbances to harm walrus. The draft SEIS does not consider any other potential disturbances to walrus. However, as discussed *supra*, gas production and development will require the construction of offshore pipelines and likely will result in additional exploration and development activity. BOEMRE must remedy these deficiencies by providing a complete analysis of potential effects to walrus in the final SEIS that includes a discussion of all relevant impacts.

BOEMRE also has not sufficiently analyzed the effects of gas development and production on birds. Gas development and production will require an onshore facility and onshore and offshore pipelines. Draft SEIS at 86, and “could entail relatively large-scale activity . . .” *Id.* at 87. BOEMRE attempts to avoid substantive analysis by stating that later analyses and permitting processes will prevent impacts to birds. The agency should analyze the effects that disturbance could have on specific species of bird, including threatened and endangered species, and should not simply rely on conclusory statements of no significant impact, as it has done in the draft SEIS. Also, the draft SEIS fails to consider how increased predation due to predator attraction to natural gas operations will affect bird species, even though it also acknowledges that development infrastructure can increase concentrations of arctic foxes, which prey on birds and bird eggs. Draft SEIS at 86-87, 91. The final SEIS should analyze potential effects of increased predation.

24

National Research Council, Cumulative Environmental Effects of Oil and Gas Activities on Alaska’s North Slope at 116 (2003).

BOEMRE also has not provided sufficient analysis of the effects the construction of a gas pipeline from offshore facility to shore would have on marine mammals. For instance, BOEMRE recognizes that noise from the construction of a gas pipeline can be quite loud, and as a result, can affect threatened and endangered whales. Draft SEIS at 81. The agency, however, states that because construction activities will be slow moving, the whales will be able to avoid the construction area and avoid harm. *Id.* The Draft SEIS also recognizes that noise from the construction of a pipeline can disturb seals, whales, and walrus, but provides only a minimal description of potential harm, and relies on later processes to prevent these harms. *Id.* at 87-88. This does not constitute the hard look NEPA requires. The agency mentions that harm may occur to these species, but fails to analyze the relevance of this harm. The agency states that whales will avoid pipeline construction, but does not discuss whether the construction will be excluding whales from important habitat and how this may affect individuals or the species. Similarly, while the agency presumes that harm to seals and walrus can be avoided, it fails completely to consider the potential for construction activities to occur near important habitat. In the final SEIS, BOEMRE should perform a complete analysis of the potential effects of the construction of a natural gas pipeline that takes into account the locations of important marine mammal habitat and the cost of excluding animals from that habitat.

E. BOEMRE fails to adequately analyze the effects of natural gas development on Arctic species.

BOEMRE has not adequately analyzed the effects gas development and production operations will have on various Arctic species. The review of the effects of these activities provides very little data or actual analysis to support the conclusions. BOEMRE in large part attempts to avoid the need to obtain data and to perform analyses by stating that analyses at later OCSLA stages can protect health, wildlife, and the Arctic environment. This is insufficient. BOEMRE must take a hard look at the impact gas operations will have on Arctic species, including birds, at the lease sale stage.

The draft SEIS fails to sufficiently consider impacts to polar bears. Significantly, the analysis fails to account for changes in the Arctic climate and ice extent and how this will affect polar bears. It states that “[d]uring the open-water season, most polar bears remain offshore on the pack ice.” Draft SEIS at 83 (quoting FWS 2009 Biological Opinion). The draft SEIS also assumes that vessel-bear interactions usually result in short-term behavior disturbances. *Id.* at 83. These assumptions ignore data showing that the disappearance of Arctic sea ice is forcing polar bears to spend increasing time in open water, and to travel farther to find prey species, such as seals. Vessels may encounter bears that are hungry and weak either on ice or in the open ocean; fleeing from a vessel may constitute a very harmful energetic cost to a weak polar bear, especially one that has already spent much time swimming in the open ocean. The draft SEIS’s analysis of disturbances to polar bears also fails to recognize that the melting ice is forcing bears to spend additional time on land, and that due to a lack of access to sea ice hunting habitat, many of these bears will be very hungry, and perhaps starving. Because oil and gas facilities can draw hungry bears, gas development and production could increase bear disturbances and human-bear

23

F. BOEMRE fails to adequately analyze the potential for gas development and production activities to displace subsistence users.

The final SEIS should consider the potential for gas development and production activities to displace subsistence activities. The draft SEIS’s analysis of effects to subsistence-harvest patterns is largely restricted to the potential for activities to restrict access to resources through reductions in the resources themselves or changes in the distribution of those resources. Draft SEIS at 95-98. As detailed elsewhere, BOEMRE’s consideration of effects to Arctic species—including subsistence species—is lacking. However, beyond those issues, BOEMRE has also failed to consider the potential for gas development to displace subsistence users. BLM detailed some relevant subsistence displacement concerns in its Northeast NPR-A Supplemental IAP/EIS. Subsistence users have identified numerous reasons why they might avoid areas in response to industrial development. These reasons include a lack of cultural privacy, belief that resource are contaminated, reduced resource productivity in an area, and physical obstacles. NE NPR-A IAP/EIS at 3-135. Natural gas development resulting from Lease Sale 193 has the potential to result in large scale and far reaching industrial activities that could displace subsistence users from vast expanses of subsistence lands as occurred during development of the Prudhoe Bay region. See Wernham, A. 2007. Inupiat health and proposed Alaskan oil development: Results of the first integrated Health Impact Assessment/Environmental Impact Statement for proposed oil development on Alaska’s North Slope. EcoHealth 4:500-513. In the final SEIS, BOEMRE should analyze the potential for gas development and production to have such an effect.

III. NEW INFORMATION FROM THE DEEPWATER HORIZON SPILL

BOEMRE states in the draft SEIS that it need not consider the *Deepwater Horizon* spill in the Gulf of Mexico because it is beyond the scope of the remand. Draft SEIS at 16. Alternatively, BOEMRE states that the Gulf spill need not be incorporated into the Chukchi Sea lease sale analysis because (i) it has not changed baseline conditions in the Chukchi Sea, since it occurred in the Gulf of Mexico, (ii) it occurred in deep water and the Chukchi Sea lease sale area is predominantly shallow water, and (iii) “any change in likelihood of an oil spill from a blowout during exploration drilling would not alter the potential effects of the oil spill already analyzed” in the original EIS. *Id.* These reasons are unavailing, and BOEMRE should analyze new information from the spill that is still being developed by, for example, the Presidential commission on the *Deepwater Horizon* spill.

NEPA compels supplementation of environmental impact analyses when “there are significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.” 40 C.F.R. § 1502.9(c)(1)(ii); *see also Idaho Sporting Cong., Inc. v. Alexander*, 222 F.3d 562, 566 n.2 (9th Cir. 2000). The events surrounding the *Deepwater Horizon* spill provide significant new information that requires BOEMRE to supplement its analysis of lease sale 193. *See, e.g.,* Council on Environmental Quality, Report Regarding the Minerals Management Service’s National Environmental Policy Act Policies, Practices, and Procedures as They Relate to Outer Continental Shelf Oil and Gas Exploration and Development (Aug. 16, 2010), *available at* <http://www.whitehouse.gov/sites/default/files/microsites/ceq/20100816-ceq-mms-ocs-nepa.pdf> (stating “The BP Oil Spill constitutes significant new information and circumstances that may

25

require reevaluation of some conclusions reached in prior NEPA reviews and other environmental analyses and studies"). Fundamentally, the oil spill in the Gulf shows that that large spills from exploration drilling can happen and that, even in the relatively benign conditions of the Gulf, they cannot be contained. These facts alone fundamentally undermine BOEMRE's assumptions about oil spills in the original EIS. In the original EIS, for instance, BOEMRE concludes that no oil spill would occur during exploration drilling. FEIS, App. A at A.1-1-A.1-2. Any oil spill would occur only during development and production. *Id.* The *Deepwater Horizon* spill shows that, even with the latest technology, oil spills do, in fact, occur during exploration. In addition, the spills analyzed in the original EIS—a 1,500 barrel oil spill from a production facility and a 4,600 barrel oil spill from a pipeline, FEIS at IV-19—are less than 1/1000 the size of the *Deepwater Horizon* spill—estimated by the Presidential commission investigating the *Deepwater Horizon* spill at close to 5,000,000 barrels of oil. See National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling, *The Amount and the Fate of the Oil*, Draft, Staff Working Paper No.3 at 16 (Oct. 6, 2010). The original EIS does not analyze a large blowout spill. In light of the *Deepwater Horizon*, BOEMRE cannot dismiss a blowout spill as not reasonably foreseeable. In addition, BOEMRE must supplement its analysis of oil spill prevention and containment to reflect the lessons being learned from the spill and its aftermath, including the effects of dispersants.

CONCLUSION

BOEMRE should not finalize the draft SEIS in its current. With respect to missing information, BOEMRE should reassess whether there is essential missing information, taking into consideration the ongoing United States Geological Survey analysis of Arctic data gaps. It should obtain information that is essential to a lease sale decision, most effectively by engaging in a comprehensive and integrated research program. It should then prepare a revised draft SEIS that analyzes Lease Sale 193 in light of this new information. With respect to its analysis of natural gas development, BOEMRE should revise its assumptions and improve its analysis as described above. Once it has prepared an adequate and informative draft SEIS, it should make the document available for public comment. Thereafter, the agency should consider anew in light of this new information whether to cancel, modify, or affirm its decision to hold Lease Sale 193.

Attachment B

List of recent studies that should be considered in the SEIS

Contents

Relevant to addressing essential unknowns about all stocks of marine mammals:	2
Relevant to addressing essential unknowns about walrus:.....	2
Relevant to addressing essential unknowns about ringed seals:	3
Relevant to addressing essential unknowns about Bearded seals:.....	3
Relevant to addressing essential unknowns about spotted seal:.....	3
Relevant to addressing essential unknowns about ribbon seal:	4
Relevant to addressing essential unknowns about narwhals:.....	4
Relevant to addressing essential unknowns about fin whales:.....	4
Relevant to addressing essential unknowns about gray whales:	4
Relevant to addressing essential unknowns about bowhead whales:.....	4
Relevant to addressing essential unknowns about seabirds:.....	6
Relevant to addressing essential unknowns about fish and invertebrates:.....	7
Relevant to addressing essential unknowns for lower trophic level species and communities:	7
Relevant to addressing essential unknowns for all ecosystem components:	7
Relevant to addressing essential unknowns about impacts to ecosystem and mammals because of climate change	8
Relevant to addressing essential unknowns about fate and effects of oil spill and effects on ecosystem components:.....	9
Relevant to addressing essential unknowns about Health Impact Assessment and NEPA:.....	11
Relevant to addressing essential unknowns using traditional knowledge:.....	11
Relevant to addressing essential unknowns from industry-based surveys:.....	13

Relevant to addressing essential unknowns about all stocks of marine mammals:

Angliss, R. P., and R. B. Outlaw. 2007. Alaska marine mammal stock assessments, 2006. U.S. Dep. Commer., NOAA Tech. Memo. NMFSAFSC-168, 244 p.

Angliss, R. P., and R. B. Outlaw. 2008. Alaska marine mammal stock assessments, 2007. U.S. Dep. Commer., NOAA Tech. Memo. NMFSAFSC-180, 252 p.

Angliss, R. P., and B. M. Allen. 2009. Alaska marine mammal stock assessments, 2008. U.S. Dep. Commer., NOAA Tech. Memo. NMFSAFSC-193, 258 p.

Allen, B. M., and R. P. Angliss. 2010. Alaska marine mammal stock assessments, 2009. U.S. Dep. Commer., NOAA Tech. Memo. NMFSAFSC-206, 276 p.

Attachment C

A Comprehensive, Integrated Approach to Arctic Science and Local and Traditional Knowledge for Offshore Oil and Gas Planning

Introduction

The United States is at a crossroads with respect to planning and decision-making for offshore oil and gas activities in the Chukchi and Beaufort seas. President Obama and the Department of the Interior (DOI) must decide whether to continue with plans and approvals that are based on inadequate science and have generated controversy, litigation, and—as the blowout in the Gulf of Mexico demonstrates—the potential for environmental and social disaster. This document and the attachments provide a path forward that would use a comprehensive, integrated scientific research and monitoring plan to fill the gaps identified by scientists and courts and provide the necessary baseline information from which to make effective decisions.

At the heart of the controversy about offshore drilling in the Arctic is the widely acknowledged lack of scientific information about the Arctic Ocean. While we do know that the Arctic Ocean is important to life in coastal communities, has regions of high productivity that support varied ecosystems with iconic species of wildlife, helps regulate the planet's weather and climate, and is changing rapidly, scientists know very little about how the Arctic Ocean functions or the ways in which it might respond to stresses from industrial activities. The lack of baseline information about the marine ecosystem was one of the bases for court decisions invalidating the 2007-12 Five-Year Leasing Program and Lease Sale 193 in the Chukchi Sea. Without this understanding, it is not possible to comply with statutory and regulatory mandates that were established to help ensure responsible stewardship of resources, including the Outer Continental Shelf Lands Act (OCSLA), National Environmental Policy Act (NEPA), Endangered Species Act (ESA), and Marine Mammal Protection Act (MMPA)

Moreover, the lack of baseline information creates a significant impediment to both effective planning and preparedness. The U.S. Commission on Ocean Policy stated as a principle tenet, "Ocean managers and policy makers need comprehensive scientific information about the ocean and its environment to make wise decisions."¹ The final recommendations of the Interagency Ocean Policy Task Force (OPTF) call for science-based decision making and a better understanding of our ocean ecosystems, including a special emphasis on the Arctic.² The Obama administration implemented the final OPTF recommendations and has both the opportunity and obligation to obtain the necessary science and use it to guide decisions about industrial activities.³ By deferring future leasing in the Chukchi and Beaufort seas, calling for the U.S. Geological Survey Arctic (USGS) gap analysis, committing to science in the NOAA Arctic Strategic Plan, and creating the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling, the Obama administration has taken important steps toward allowing for comprehensive science and planning. At the same time, the government is in the process of determining how to respond to the court-ordered re-evaluation of Lease Sale 193 and the 2007-12 Five-Year Leasing Program, and Congress is debating legislation that includes provisions for better science in the Arctic.

The most effective way to respond to the courts' orders and prepare for decisions about future industrial activities is to undertake comprehensive research and monitoring that would provide a fundamental understanding of the marine ecosystem. This research has not been done adequately before, and much of what has been done is decades out of date in a region that is changing rapidly. While it is true that DOI and industry have undertaken significant research, those efforts have been narrowly focused, applied

information about the rest of the ecosystem, including the clams, worms, sea stars and other species that are important prey for the more conspicuous species.

The lack of baseline science has also been highlighted by several other prominent local and federal agencies as well as international forums. In its comments on the Draft Proposed 2010-15 Five-Year Leasing Program, NOAA recommended using a precautionary approach to oil and gas activities for the Chukchi and Beaufort seas that prevents those activities until more information is available to support sustainable management.⁴ The Arctic Climate Impact Assessment, an international project of the Arctic Council and the International Arctic Science Committee, highlighted basic surveys and monitoring as well as ecosystem-based research as some of the highest priority research actions needed for Arctic marine waters.⁵ Further, the North Slope Borough has called for better baseline science to guide decisions, and Senator Begich has introduced legislation that calls for additional Arctic research and coordination.⁶

Moreover, where basic information about the marine ecosystem exists, much of it is old, spotty, and too sparse. For example, the Environmental Assessment for the Arctic Fishery Management Plan states that "data were scarce for estimating the abundance and biomass of fishes in the Alaskan Arctic."⁷ The review of potential data sources indicated that surveys for fish have occurred about every 15-20 years, but typically over different regions. Even if those surveys over the past 60 years were combined together (which would be inappropriate due to different sampling methodologies and other reasons), there are still major areas of the U.S. Arctic Ocean shelf region that have yet to be surveyed. These areas include those where commercial fisheries could reasonably be expected to develop and those within lease sale areas.

Additionally, the vast majority of existing studies have been conducted in summer months. We need a year-round understanding of the Arctic Ocean ecosystem. One stunning example of this is a seabird, the spectacled Eider. In the summer their population would be widely dispersed, but in the winter, the entire world's population gathers together in a small area of the northern Bering Sea. If studies on this bird were only conducted in the summer, it would result in erroneous conclusions about the impacts of activities on this species, especially if activities occurred at or near their winter gathering area.

In addition, the Lease Sale 193 (Chukchi) and 2003 Multi-Sale (Beaufort 186, 195, 202) environmental impact statements use the same primitive model to estimate how spilled oil might travel in the marine environment. This model, which was developed in 1982, forms the basis for the evaluation of potential impacts from a spill. Much of the environmental data input to the model is old; for example, current and wind information dates from 1979-1996. More sophisticated models are available and better information would allow for more effective analysis of the risks from spilled oil.⁸

While significant resources have been dedicated to studying particular Arctic animals and potential impacts to those animals from offshore oil and gas activities, we still lack critical baseline information about the ecosystem. The only studies designed to provide the comprehensive information and understanding of the health, biodiversity, and functioning of Arctic marine ecosystems and the potential impacts of industrial activities were conducted 30 years ago pursuant to the Outer Continental Shelf Environmental Assessment Program (OCSEAP). The information gained under that program did not initially cover the Chukchi Sea lease area and is so outdated as to be of very limited use in making decisions now for the Beaufort Sea.

⁴ See Letter from Jane Lubchenco, Ph.D. to S. Elizabeth Birnbaum, Re: Comments on the Interior Minerals Management Service Draft Proposed Outer Continental Shelf Oil and Gas Leasing Program for 2010-2015 (Sept. 9, 2009), at 5, available at http://www.peer.org/news/news_id.php?row_id=1265.

⁸ These problems are explained in more detail in Attachment 3 to this document.

studies designed to answer individual questions. Similarly, the National Science Foundation has funded significant cutting edge, hypothesis-driven basic research. While these efforts bolster our understanding of some processes in limited areas, they have not been conducted at the scale necessary to provide the holistic understanding of the ecosystem needed to make wise decisions about if and how industrial activities should proceed. Nor have they been conducted year-round—almost all of the existing studies focused solely on the summer months. The needed information is best obtained through year-round monitoring (including sampling for species distributions and abundance) and interdisciplinary research to elaborate trophic relationships, ecosystem structure and functioning, and other interactions.

Moving from uncoordinated studies to planned, integrated research would provide the necessary information, affordably, in a reasonable amount of time. In fact, the USGS gap analysis study, which has already started, could be the initial step. The results of that study—which should identify some of the largest and most pressing information gaps—should be used to help design the research program. The largest and most important information gaps almost certainly could be filled in 5-7 years for approximately \$20 million annually. Given the \$2.7 billion in revenue generated from Lease Sale 193 alone and the immense risks from oil and gas activities, this cost is neither exorbitant nor unwarranted. Such a comprehensive plan would provide many of the answers to the unknowns identified in the court proceedings relevant to Lease Sale 193 and the 2007-12 Five-Year Leasing Program and would provide the necessary information to make informed decision about whether to allow industrial activities and, if so, under what conditions.

State of Science About the Arctic Ocean

Very little is known about the Arctic Ocean, and in particular the Chukchi Sea. According to the U.S. Arctic Research Commission, the Arctic is "the least studied and most poorly understood area on Earth."⁹ In particular, "The Arctic Ocean is the least well known ocean on the planet. We know more about the topography of the planets Venus and Mars than we do about the bathymetry of the Arctic Ocean."¹⁰ Even our knowledge of what species inhabit the U.S. Arctic Ocean, either permanently or seasonally, is substantially incomplete. We recognize that the recent losses of sea ice during summer are fundamentally changing these ecosystems, but we still know little about the abundance and distribution of common species much less how the food webs work in this region.¹¹

As part of the Lease Sale 193 litigation, the plaintiffs compiled a 38-page appendix of quotations from the Environmental Impact Statement that recognize the lack of available information about the Chukchi Sea.¹² These citations are explicit recognitions by DOI and NOAA that there is significant missing information about even the most basic parameters for every one of the largest and most conspicuous animals in the ecosystem—all fish, marine mammals and birds—which in other regions are typically the most highly studied animals of an ecosystem. The missing information for these species includes abundance, distribution, and life history. This lack of basic information makes it difficult, if not impossible, to determine whether there will be significant impacts to the animals and the ecosystem. The state of information about the more charismatic animals in the ecosystem is further evidence of the lack of

(hereinafter "Arctic FMP EA").

¹² This appendix is Attachment 2 to this document.

Since the conclusion of the OCSEAP program, DOI's studies in the Arctic Ocean have not been guided by an overarching monitoring and research plan. Instead, research priorities over the past several decades have been guided by an assumption that enough was known about the basics. DOI, therefore, focused "on topical studies in smaller areas to answer specific questions and fill identified information needs."¹³ These applied research questions are important and have led to a better understanding of specific issues, such as the fall bowhead whale migration route through the Chukchi Sea. However, without continued monitoring of key parameters studied in OCSEAP it is now unclear if the base of information gained remains valid. Climate change has altered the region dramatically over the last 30 years and ecosystems have significant variability on yearly to decadal spans.

Thus, DOI stopped examining and monitoring the fundamentals and, instead focused on applied research without even tying those studies together in a framework or committing to update results. As a result, population and distribution data for several vulnerable species that play important roles in the marine ecosystem are either outdated or missing. For example, Arctic cod, which is potentially the most important fish species in this ecosystem, is indicated to be present throughout all of the U.S. EEZ, but no seasonal variation, concentration, or spawning area data are published at this time.¹⁴

The lack of comprehensive planning may account, at least in part, for conflicting statements made by DOI—first through the Bureau of Land Management then Minerals Management Service and now Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE)—about the state of science in the Arctic. On the one hand, DOI has acknowledged repeatedly both that it lacks basic scientific information and needs good information for decision making.¹⁵ On the other hand, the agency points to the fact that it has spent \$350 million on research since 1973 across Alaska's 15 OCS planning areas and, therefore, has a substantial understanding of the Arctic Ocean.¹⁶ The agency also has argued in court that the research undertaken gives it a sufficient basis for making decisions.¹⁷ The references in the Lease Sale 193 EIS discussed above about the lack of basic information for species runs directly counter to any assertions by DOI or BOEMRE that there is a broad base of information available for the Arctic from which to make decisions.

The National Science Foundation (NSF) also has funded important basic research in the Arctic Ocean. That research has been hypothesis-driven, meaning that it was designed to answer specific, cutting-edge scientific questions, including those about the specific impacts and feedbacks of climate change. While this cutting-edge research is important, it does not provide the basic, baseline information that is critical for making decisions, including what species live there, how many of them are there, and do those populations change from place to place and season to season. Much of that information simply is not available for the Arctic Ocean.

Similarly, industry has invested in significant scientific research, some of which may address important missing information. Currently, however, the results of those studies are not reliable because the data from industry studies are generally not made available publicly, and the degree to which other information about industry research is shared varies from study to study. Given the lack of transparency and the obvious conflict of interest for industry that would not want to share information that could potentially hinder development, there is a substantial risk of bias in the information that is shared. Unless

¹⁵ See <http://www.doi.gov/whatwedo/energy/ocs/AlaskaRegion.cfm> (stating that the Arctic Ocean requires "additional scientific, environmental, and spill risk analysis before new areas are offered for leasing."); see also Attachment 2 to this document detailing unknowns in Lease Sale 193 EIS.

¹⁶ See Alaska Annual Studies Plan Final FY 2011 at 1.

¹⁷ See *Native Village of Point Hope, et al. v. Salazar, et al.*, 1:08-cv-00004 (RRB), Fed. Def. Opp'n Br. at 12-17.

all data and methods for all research projects are made available to the public, it is impossible to give selective results credence in the decisions about oil and gas activities.

Ultimately, when considered with the long list of studies performed over the last 15 years, the 38-page index of recognized unknowns about the Lease Sale 193 area is indicative of a systemic problem with the way research is being conducted in the Arctic. As a result of the narrow focus on applied research questions, while baseline research and monitoring is ignored, large sums have been spent to provide information about specific issues without providing decision-makers the information needed to make informed decisions about Arctic resources. One or two specific studies will not solve this problem. Rather, a more holistic research program is needed to fill the important information gaps related to almost every aspect of the ecosystem.

An Interdisciplinary, Integrated Research and Monitoring Program for the U.S. Arctic Ocean

At this point, it is incontrovertible that there are: substantial information gaps about Arctic marine ecosystems, a laundry list of studies that have been conducted, ongoing processes at BOEMRE in response to court orders to supplement the Lease Sale 193 EIS to better account for missing science and to revise the environmental sensitivity analysis and 2007-12 Five-Year Leasing Program; and a commitment by the new administration to bring science back to decision-making. President Obama and his administration must establish a path forward that harmonizes this situation and provides the basic information required to protect the resources of the Arctic, including the subsistence way of life. The most efficient way to accomplish these goals is through another OCSEAP-type program limited to the Beaufort and Chukchi seas

To provide the basic information required to protect the resources of the Arctic, including the subsistence way of life, and to guide decisions about oil and gas and other industrial activities, a new comprehensive research and monitoring program should:

1. integrate existing information to give a more holistic picture of what is known and conduct an analysis of the gaps in information to determine the most pressing research and monitoring needs;
2. gain a more comprehensive catalogue of identified species, populations and habitats, including seasonal migrations;
3. track the physical forcing factors that modulate biological productivity, habitat occupancy and migration pathways;
4. secure a better understanding of trophic linkages, physical and biological processes affecting productivity and other facets of ecosystem structure and functioning, and effects of anthropogenic perturbations;
5. study potential ecological and sociological impacts; and
6. integrate these scientific data to identify Important Ecological Areas as well as processes and habitats that are sensitive and vulnerable to perturbation, and furnish a basis for marine spatial planning.

This program could easily be conducted in three simple phases over the next 5-7 years: 1) gap analysis and planning (2011-2012); 2) research and monitoring (2013-2016, with monitoring continuing into the future); and 3) integrating new and older information to provide decision-makers the basic understanding needed to make effective decisions (2016-2017). Each of these phases must be informed by local and traditional knowledge, including planning and peer-review.

Phase I: Gap Analysis and Planning

To develop a comprehensive, integrated research and monitoring program, scientists must first understand the existing information and gaps in knowledge. Based on that information, a research program can be devised, with public input, to fill the gaps.

New research and monitoring should build on what has been learned about the Arctic Ocean already. Thus, the first step in this process is to reconcile the large information gaps with the important research that has occurred. Existing information should be compiled and integrated, then an analysis conducted of the gaps that are left. This gap analysis would then drive creation of an integrated research and monitoring program. The USGS Arctic studies initiative is an important step in this direction, and should be followed by a more comprehensive analysis as called for in Senator Begich's Arctic Ocean Research and Science Policy Review Act of 2009.¹⁸

President Obama and Secretary Salazar have directed the USGS to assess "resources, risks, and environmental sensitivities in Arctic areas."¹⁹ The USGS will complete an initial review of Arctic science and issue a report in April 2011 that will "examine the effects of exploration activities on marine mammals; determine what research is needed for an effective and reliable oil spill response in ice-covered regions; evaluate what is known about the cumulative effects of energy extraction on ecosystems and other resources of interest; and review how future changes in climate conditions may either mitigate or compound the impacts from Arctic energy development."²⁰ That report should set the stage for a more comprehensive analysis that forms the basis for implementation of the necessary studies and monitoring.

The USGS study is an important initial effort to gather existing information and identify gaps in knowledge, but it is likely not to be sufficiently comprehensive and inclusive to form the basis of the necessary research and monitoring program. Thus far, DOI has insisted on keeping the study firmly and fully in the control of the USGS and BOEMRE. Despite the important knowledge and experience within those agencies, their expertise clearly does not encompass the broad interdisciplinary breadth inherent in the more comprehensive undertaking needed. Experts are needed from many fields, from climate and oceanographic sciences to population biology and community ecology as well as the social sciences to determine the breadth of potential impacts to local communities. Second, the guidance given by DOI to USGS mandates consideration of four particular subject areas, which focuses their study towards a narrower applied research path rather than the holistic picture of Arctic information needs. Lastly, a gap analysis and research and monitoring plan should be developed with opportunities for public input and a peer review process that helps ensure the study accurately describes the state of, and existing gaps in, Arctic information.

Based on a comprehensive gap analysis, government scientists, together with public input, should define a research and monitoring plan to fill information gaps. In the aftermath of the *Exxon Valdez* oil spill a similar analysis and development of a research plan was put together with the benefit of hindsight to address the shortcomings of knowledge in Prince William Sound and the Gulf of Alaska that became apparent after the spill. The Gulf of Alaska Ecosystem Monitoring and Research (GEM) plan was designed to provide critical information for both quantitatively predicting the potential impacts of another spill and determining the impacts from another spill. The GEM plan should serve as a modern model for the type of plan needed to guide research and monitoring in the Arctic. The research and monitoring plan put together for the U.S. Arctic Ocean should be developed with input from the public and evaluated by an independent panel of experts.²¹

Phase II: Research and Monitoring

Once the information gaps are identified and a research plan devised, the research and monitoring must be executed. As the known gaps in knowledge outlined above show, scientific research and monitoring should include:

¹⁸ S. 1562, 111th Cong. (2010).

²⁰ *Id.*

²¹ An outline for such a plan for the Arctic Ocean is included as Attachment 1.

1. Marine life assessment to provide a year-round picture of the species in each marine habitat and their population trends;
2. Environmental monitoring to measure atmospheric and physical ocean conditions, such as salinity and temperature, and biological factors, such as productivity and community richness and diversity;
3. Scientific process studies to understand the way in which the ecosystem functions and is likely to respond to stresses;
4. Studies designed to identify patterns of subsistence use and changes in well-being as well as potential impacts from industrial activities; and
5. Documentation of local and traditional knowledge.

This research and monitoring should be interdisciplinary, spanning from climate sciences to social impacts studies, and to the greatest extent possible, it should be conducted in an integrated fashion to better elucidate the processes that underlie the way in which the ecosystem functions.²² As demonstrated by the GEM plan, our understanding of how ecosystems work and the ways in which to study them has grown considerably since the original OCSEAP. Studies should be coordinated and integrated to measure multiple aspects of the ecosystem simultaneously, which will more effectively and efficiently elucidate many of the important drivers and links in the ecosystem.

Integrated research reveals relationships that are not apparent in focused single species or component studies. For example, scientists were able to determine that, as a result of climate change, productivity in the northern Bering Sea ecosystem was shifting from moving through seafloor communities to open water communities.²³ They were only able to do this by studying multiple aspects of the ecosystem simultaneously, including climate indices, sea ice concentration, water temperature, sedimentation, and seafloor biomass. In addition to providing better information, this type of integrated research and monitoring is more cost effective because more information is elucidated than would be from individual studies.

ConocoPhillips and Shell are conducting integrated research studies in the Chukchi Sea around two of their drilling prospects. They are simultaneously measuring physical, biological and chemical oceanographic parameters along with marine mammals, fish, birds and benthic invertebrates. While they are not sharing their data publicly, the results they present are intriguing.²⁴ Their work indicates that the Chukchi Sea is not a homogenous region, but instead potentially has a high degree of spatial complexity. The benthic topography of the Chukchi Sea appears to affect sea ice concentrations and ocean currents that in turn affect the distribution of productivity and how that productivity flows through the food web to invertebrates, fish, birds and marine mammals.

This example shows that integrated research can be—and, in fact, is being—conducted in the Arctic Ocean. ConocoPhillips's and Shell's research, however, is confined to areas around two of their drilling prospects during the open water season. With a concerted effort, this research could easily be expanded to the rest of the region and other seasons. Expanding this type of research and monitoring would provide decision-makers with the more complete picture needed to protect Arctic ecosystems and the subsistence way of life. The abundance and diversity of animals varies across this region, and decision-makers must understand that variability to determine which areas are most important and how to protect them from oil and gas and other industrial activities.

²² Integrated research seeks to provide information about multiple characteristics of the ecosystem and the ways in which they interact.

²³ J.M. Grebmeier, et al., *A major ecosystem shift in the northern Bering Sea*. 311 Science 1461-1464 (2006).

²⁴ See <http://doc.nprb.org/web/symposium/2010/2010%20AMSS%20Abstract%20Book.pdf> at 19-28.

Phase III: Data Integration

Once sufficient information is available from the research and monitoring outlined above, that information should be synthesized to demonstrate an understanding of ecosystem structure and functioning, including quantitative and robust models of the food web, and a determination of the important ecological areas of the region. Those models and information provide the basis from which to understand likely impacts of industrial activities and, accordingly, whether and how to allow them. Managers will be able to move from qualitative assertions (i.e., educated guesses) to making quantitative assessments of potential impacts and allow decision makers to weigh the costs and benefits of industrial activities and to find alternatives that could allow for development while protecting the ecosystem and subsistence way of life.

This new program would provide the answers to the unknowns identified in the Lease Sale 193 litigation by virtue of providing a basic understanding of the marine ecosystem. The missing information is broad in scope and covers major, fundamental components of the ecosystem. A comprehensive research and monitoring program, rather than ad hoc research will build this foundation of knowledge most efficiently.

In addition, having this basic information will avoid the problem that has arisen in the Gulf of Mexico, where development occurred with scant attention to the status of the ecosystem beforehand. As a result, we find ourselves wondering what was lost following development or an industrial accident because we did not evaluate what was there to begin with. Further, comprehensive, integrated research and monitoring could prevent that from happening in the Arctic, and a complete understanding of the ecosystem can drive response and restoration activities should an industrial accident occur.

Meeting Legal Requirements and Policy Goals

As explained above, an integrated, comprehensive research and monitoring program would be the most efficient way to provide the baseline necessary to make informed decisions about offshore oil and gas activities in the Arctic. Such a plan would build on the commitments to science already made by the administration and would be the most effective way to resolve the ongoing litigation and controversy.

Federal courts have invalidated the 2007-12 Five-Year Leasing Program and Environmental Impact Statement (EIS) for Lease Sale 193 in the Chukchi Sea. While the decisions rest on different grounds, the lack of scientific information about the Arctic Ocean. In the 2007-12 Five-Year Leasing Program that lack of scientific information resulted in an arbitrary analysis of the relative environmental sensitivity of marine areas. In the Lease Sale 193 context, the court found that the agency had not complied with a Council on Environmental Quality regulation, 40 C.F.R. § 1502.22, by failing to determine "whether missing information identified by the agency was relevant or essential" and then failing to determine "whether the cost of obtaining the missing information was exorbitant or the means of doing so unknown."

DOI has issued a draft proposed 2007-12 Five-Year Leasing Program and a Draft Supplemental EIS for Lease Sale 193. Neither document fully accounts for the missing information or makes an effort to put in place the necessary interdisciplinary, integrated research and monitoring. Both, however, are drafts, and DOI still has the opportunity to move forward in this way.

As explained above, there are 38 pages of references to scientific unknowns made by DOI and NOAA in planning for Lease Sale 193. The agency has an affirmative duty to get this information, including by performing research itself when necessary, if it is essential to its decision and not exorbitant in cost. Information is significant, essential, or important where without the information the agency cannot accurately assess the effects of various alternatives, the extent of certain problems, or the need for particular proposed actions.

Basic scientific information is essential at the lease sale stage. It is when BOEMRE evaluates alternatives about the size of the sale, deferral areas, and other limitations that may affect exploration and

development. Further, once the lease sale is held, companies have additional rights to conduct activities in the water that may affect sensitive species and habitats. Information that would be gathered by a comprehensive research and monitoring effort would allow for more effective consideration of alternatives and better evaluation of potential impacts.

Additionally, at the lease sale stage, BOEMRE should undertake a more detailed analysis than was conducted for the Five-Year Leasing Program, based on better information. This analysis is particularly important given the agency's current practice of preparing an environmental assessment, rather than full EIS to evaluate proposed exploration activities. If the agency prepares a programmatic-level analysis based on incomplete information at both the Leasing Program and Lease Sale stages, no detailed evaluation will be prepared until development is scheduled to occur. Neither OCSLA nor NEPA contemplate such a result.

Nor, as it appears to have done in the Draft SEIS for Lease Sale 193 should BOEMRE rely on analyses to be conducted by other agencies pursuant to other statutory mandates. Rather, the agency should abide Secretary Salazar's commitment to science and lead the way toward a better understanding of the ocean ecosystem by working with other expert agencies to put in place a comprehensive research and monitoring program.

The cost of this type of research and monitoring program is not exorbitant. The plan outlined in Attachment 1 could be carried out for approximately \$100 million over 5 years. By comparison, Lease Sale 193 alone generated \$2.7 billion in revenue to the federal government. At less than five percent of that revenue, the cost of the program is relatively small. Further, in considering whether the cost of obtaining additional data on the Chukchi Sea is exorbitant, BOEMRE must consider the risk and benefits of the governmental action at issue. Lease Sale 193 covers nearly thirty million acres of remote, undeveloped Arctic Ocean, and oil and gas activities would threaten the subsistence way of life, wildlife, habitat, and the marine ecosystem more generally. It may provide jobs and other economic benefit, but it also poses considerable risks, economic and otherwise, to the benefits provided by a healthy marine ecosystem.

These cost estimates are consistent with the other programs mentioned above. The GEM program was projected to cost \$120 million in 1999, and the OCSEAP program was estimated to cost \$25 million annually.

Conclusion

A careful, deliberate approach in the Arctic will allow for energy production if it can be done without harming the health of the marine ecosystem or opportunities for the subsistence way of life. The first step in such an approach is to develop and implement a comprehensive research and monitoring program like OCSEAP. We simply do not know enough now to make good decisions about stewardship for the oceans and clean energy. The first step toward resolving the ongoing controversy and litigation in the Arctic is to commit to obtaining basic science through an integrated, comprehensive research and monitoring plan that could help determine if industrial activities are appropriate; and if so, when, where and how such activities could be conducted.

Attachment 1

A Scientific Research and Monitoring Plan for the U.S. Arctic Ocean

Compared with other marine ecosystems, very little is known about the living marine resources in the U.S. Arctic Ocean. We recognize that the recent losses of sea ice during summer are fundamentally changing the ways these ecosystems function, but we still know little about how these food webs work. Even our knowledge of what species inhabit the U.S. Arctic Ocean, either permanently or seasonally, is substantially incomplete. Permitting large-scale industrial activities in the absence of even basic knowledge of the composition and functioning of the marine ecosystem sets the stage for inadvertent environmental degradation at best, and catastrophic interactions at worst. The risks of adverse interactions are exacerbated by the rapid rate of environmental change in the Arctic, and our limited knowledge of existing resources and conditions makes it difficult even to detect ecosystem responses to change. The following science plan is intended as a guide toward systematically improving our knowledge of Arctic marine ecosystem structure and function.

The geographic scope of this science plan includes the exclusive economic zone (EEZ) of the U.S. Arctic Ocean, extending from the northern Alaskan coastline to the continental shelf break to the north, from the Bering Strait in the west to the Canadian border to the east. Most of the plan should be completed within four years. In recognition of the great scientific value of long-term data sets, however, the monitoring should be continued indefinitely, with at least a multi-decade planning horizon.

The essential elements of the plan are grouped into six categories: gap analysis, resource assessment, environmental monitoring, scientific process studies and synthesis. These elements are intended to (1) define existing information and research needs; (2) gain a more comprehensive catalogue of identified species, populations and habitats, including seasonal migrations; (3) track the physical forcing factors that modulate biological productivity, habitat occupancy and migration pathways; (4) secure a better understanding of trophic linkages, physical and biological processes affecting productivity and other facets of ecosystem functioning, and effects of anthropogenic perturbations; (5) study sociological impacts, and (6) integrate these scientific data to identify processes and habitats that are sensitive and vulnerable to perturbation and furnish a basis for marine spatial planning. Each of these constituent efforts must be informed by local and traditional knowledge (LTK) at all stages, including planning and peer-review.

I. Gap Analysis

- A. Conduct a comprehensive gap analysis to determine what scientific research is currently being done and what additional information is needed.

II. Marine Life Assessment

- A. Conduct a comprehensive survey of species occupying each marine habitat, including communities in the benthic, pelagic and littoral zones, and ice-associated communities. Whenever feasible these surveys should be conducted seasonally to identify migrations and patterns of periodic habitat use.

- B. Conduct periodic population assessments for exploited and selected important species. These assessments should be spatially explicit, and include migratory species (birds, marine mammals and some fish). These assessments will provide crucial baselines for evaluating impacts of industrial development and ecosystem change.

III. Environmental Monitoring

- A. Establish a network of fixed monitoring stations to track physical forcings and local biological responses. This station network should be patterned along the lines of the National Science Foundation's Long Term Ecological Research Network (LTER) and NOAA's oceanographic buoys adapted to the US Arctic Ocean, with sampling stations allocated to both the Chukchi and Beaufort seas. These stations will measure physical factors in the ocean including temperature and salinity, acidity, alkalinity and nutrients as functions of seawater depth, along with current profilers at strategically chosen locations; atmospheric factors including surface temperature, wind speed and direction, insolation, gas composition, and particulate density and composition; and biological factors such as primary and secondary productivity, zooplankton abundance and composition, benthic species presence, community richness and diversity, and community assemblages associated with sea ice.
- B. Support remote monitoring by satellite and aircraft to track sea ice extent, surface albedo and ocean color in collaboration with NOAA, NASA and NSIDC.
- C. Establish a systematic process for incorporating LTK for early detection of unanticipated ecosystem change, and for review by LTK experts for accuracy and completeness.
- D. Periodically update the resource assessments identified in "II" above to track ecosystem responses to climate change and industrialization.
- E. Monitor detection of invasive species, including species displaced by warming seawater temperatures to the south, and exotic species introduced by industrial activities.

IV. Scientific Process Studies

- A. Identify processes strongly coupled with biological production, species' distribution and abundance, and support research that will improve understanding of them aimed at improving prediction of community responses to short- and long-term environmental stressors. This research should include identification of the species interactions that structure the biological community, which includes studies of the food web to determine linkages and energy flow through the ecosystem, as well investigations to determine the processes responsible for nutrient cycling.
- B. Prioritize research to initially emphasize known proximate sources of ecosystem stress, including processes strongly affected by transition from light limitation to nutrient limitation resulting from continued sea ice loss, effects of warmer water temperatures on growth and provisioning requirements of selected target species (especially young-of-the-year and juveniles), and sensitivity to acidification from increases in atmospheric carbon dioxide.

V. Sociological and Ecosystem Impact Studies

- A. Identify historical and current patterns of land and subsistence use, and conduct a survey of social and psychological well-being in North Slope communities to document current conditions in these communities.
- B. Monitor changes in patterns of land and subsistence use, and in measures of social and psychological well-being in North Slope communities affected by oil development.
- C. Conduct studies to determine potential impacts from industrial activities in the Arctic Ocean, such as research on the effects of noise on Bowhead whales, as well as the potential effects from produced waters, drilling muds, routine discharges, and other emissions on the ecosystem.

Intervenor-Defendants.)	

VI. Data Integration and Marine Spatial Planning

- A. Construct ecosystem models including a quantitative nutrient-phytoplankton-zooplankton (NPZ) model and an Ecopath model to evaluate how predicted ecosystem responses compare with data observed from the monitoring programs. Identified inadequacies will highlight areas requiring further research.
- B. Archive monitoring data in a publicly accessible database that is continuously maintained. Also, monitoring results should be periodically included in GIS maps to facilitate identification of Important Ecological Areas (IEAs) and important subsistence areas in the US Arctic Ocean and how they may change through time. Important Ecological Areas are geographically delineated areas with distinguishing characteristics that contribute disproportionately to an ecosystem's health or are particularly vulnerable to disturbance.
- C. Integrate the results of the monitoring and research described above with a marine spatial planning effort that identifies IEAs as well as all potential energy sources and their availability to markets to help minimize the likelihood of adverse consequences associated with industrialization.

DECLARATION OF COUNSEL

I, Erik Grafe, hereby declare:

- 1. I am one of the attorneys representing Plaintiffs Native Village of Point Hope, et al., in this action. I submit this declaration in support of Plaintiffs' opening brief.
- 2. Attached to this declaration as Attachment A is a compendium of statements made by the Minerals Management Service (MMS) in its Final Environmental Impact Statement

LACK OF INFORMATION ABOUT SPECIES/HABITAT

I. FISH

A. General

"Surveys of coastal and marine fish resources in the Chukchi and Beaufort seas are typically conducted during periods that ice cover is greatly reduced (late July, August, or September) and information concerning the distribution, abundance, habitat use, etc., of marine fishes outside this period is limited. Due to the lack of specific information for many species, it is necessary to discuss the biology and ecology at the family level." EIS at III-32.

"Despite these previous works, several data deficiencies remain. Information of current distribution and abundance (e.g., fish per square kilometer) estimates, age structure, population trends, or habitat use areas are not available for fish populations in the northeastern Chukchi Sea. Many fish studies reporting distribution and/or abundance are 20-30 years old. Other studies are still older. For example, the only survey of demersal fishes in the region is more than 20 years old. Fish assemblages and populations in other marine ecosystems of Alaska (e.g., Gulf of Alaska, Bering Sea) have undergone observable shifts in diversity, distribution, and abundance during the last 20-30 years; it is not known if the findings of Frost and Lowry (1983) still accurately portray the diversity and abundance of demersal fishes in the Alaskan Beaufort Sea. The same is true for other dated studies. It is possible that they no longer accurately and precisely reflect the current distribution, abundance, and habitat use patterns of fish resources in the northeastern Chukchi and western Beaufort seas. Such information could be stale, or in some cases, stagnant. If so, accurate information concerning the distribution, abundance, and habitat use patterns of fish resources is incomplete and/or unavailable from which to accurately and/or precisely assess environmental impacts from the Proposed Action." EIS at III-32.

"Another important data gap is the lack of information concerning discrete populations for arctic fishes. The literature abounds with casual references made of various fish populations without having delimited the population other than by perhaps using arbitrary boundaries of a study area, or presenting data without discriminating one discrete population unit from another. Additionally, a few marine species are regarded as widespread and/or abundant, yet distribution and density statistics for discrete populations are scarce, unknown, and therefore, incomplete. Several species are known only from a single specimen of each species; others are known from perhaps a handful of specimens collected years to decades ago. Population information is entirely lacking for such species." EIS at III-33.

"Fish resources of the northeastern Chukchi Sea were last surveyed 15-17 years ago. Additionally, other surveys over the years and area reflect a pattern of temporally and spatially irregular and disjunct sampling. Such disorganized sampling and data reporting greatly influences the information quality necessary to determine population trends and adjustments to environmental perturbations. Establishing a current, accurate, and precise baseline is critical to assessing potential changes to biotic resources. It is unknown if the distribution and abundance information gathered by the last surveys remains an accurate and precise description of arctic fish populations today. This is an important because the Chukchi and Bering seas are considered

Exhibit 129, Page 7 of 40

to be large marine ecosystems serving as principle bellwethers to climate change in North America and the Arctic Ocean.” EIS at III-40.

“Adjustments by one or more fish populations often require adjustments within or among large marine ecosystems, influencing the distribution and/or abundance of competitors, prey, and predators. Consequently, it appears reasonable to believe that the composition, distribution, and abundance of fish resources in the northwestern Chukchi Sea is changing and is now different from that measured in the surveys conducted 15-17 years ago or earlier. The magnitude of these differences is unknown.” EIS at III-41.

B. Individual Species and/or Species Assemblages

1. Primary Arctic Fish Assemblages

“Marine waters support the most diverse, although least well known, fishes of the Alaskan Beaufort Sea region. Studies of marine fishes in the region are very limited; most of the surveys/studies have been performed in coastal waters landward of the landward of 200-m isobath, with scant surveys having sampled deeper waters. . . . [R]obust population estimates or trends for marine fishes of the region are unavailable. Distribution or abundance data for marine fish species are known only generally at the coarsest grain of resolution (for example, common, uncommon, rare).... Detailed information generally is lacking concerning the spread, density, or patchiness of their distribution in the overall Chukchi Sea region. Data concerning habitat-related densities; growth, reproduction, or survival rates within regional or local habitats; or productivity rates by habitat, essentially are unknown for fishes inhabiting waters seaward of the nearshore, brackish-water ecotone.” EIS at III-34 (internal citations omitted).

2. Neritic-Demersal Assemblage

“Life-history data for many of the demersal species using neritic substrates is lacking (e.g., whitespotted greenling, twohorn sculpin, spinyhook sculpin, veteran poacher); consequently, assessing the species resilience to perturbations is not feasible until additional information becomes available.” EIS at III-35.

3. Neritic-Pelagic Assemblage

“No species of this assemblage are assessed as being of low resilience, because life-history data are lacking.” EIS at III-35.

4. The Cryopelagic Assemblage

“Arctic cod and Pacific sand lance are assumed to be of medium resilience to exploitation; polar cod and toothed cod are data deficient such that an assessment of resilience is not feasible with available information.” EIS at III-36.

5. Oceanic-Demersal Assemblage

“Life-history statistics for most species covered in this assemblage are data deficient, chiefly for lack of fish surveys and studies in oceanic waters of the Alaskan arctic.” EIS III-36.

6. Diadromous Fishes

“A number of diadromous species in the region have complicated life-history patterns that are not fully understood.” EIS at IV-61.

7. Salmon

“Little is known of the movements undertaken during the 18 months the [pink] salmon spend at sea.” EIS at III-39 (quoting Schmidt, McMillan, and Galloway (1983)).

“Chum salmon fry, like pink salmon, do not overwinter in streams but migrate (mostly at night) out of streams directly to sea shortly after emergence. The timing of outmigration in the arctic is unknown, but occurs between February and June (chiefly during April and May) in more southern waters.” EIS at III-40.

II. MARINE MAMMALS

A. Whales

1. Bowhead Whale

“There is scientific uncertainty about the population structure of bowheads that use the Arctic Ocean.” EIS at III-45.

“Recent data to evaluate bowhead use of the Chukchi Sea Planning Area, or adjacent areas to the south, are lacking.” EIS at III-45.

“No data are available indicating that, other than historic commercial whaling, any previous human activity has had a significant adverse impact on the current status of BCB Seas bowheads or their recovery.” EIS at III-45.

“Conservation concerns include: . . . uncertain potential impacts of climate warming. . . .” EIS at III-45.

“The uncertainty of the stock structure adds some uncertainty to summaries of the status of bowheads that may be impacted by the Proposed Action.” EIS at III-45.

“[I]f whales become more ‘skittish’ and more highly sensitized following a hunt, it may be that their subsequent reactions, over the short-term, to other forms of noise and disturbance are heightened by such activity. Data are not available that permit evaluation of this possible, speculative interaction.” EIS at III-46 (quoting NMFS’ Arctic Region Biological Opinion).

“There is little information regarding causes of natural mortality for BCB Seas bowhead whales.” EIS at III-49.

“Little is known about the effects of microbial or viral agents on natural mortality [of bowheads].” EIS at III-49.

“The amount of feeding [by the BCB Seas bowhead stock] in the Bering Sea in the winter is unknown as is the amount of feeding in the Bering Strait in the fall (Richardson and Thomson, 2002).” EIS at III-49.

“The MMS funded large-scale surveys in this [Chukchi Sea lease sale] area when there was oil and gas leasing and exploration, but while surveys in the Beaufort Sea have continued, the last surveys in the Chukchi Sea were about 15 years ago. These data were summarized by Mel’nikov, Zelensky, and Ainana (1997), Moore (1992), Moore and Clarke (1990), and Moore, DeMaster, and Dayton (2000). We have plotted counts of bowheads in the Chukchi Sea during those surveys (Fig. III.B-4), because they visually provide limited insight into areas where bowheads may be exposed to oil and gas activities should they occur in the Chukchi Sea Planning Area.

However, we caution against over-interpretation of these data out of context of survey effort and, because these data were collected between 1979 and 1991, they should not be interpreted as indicating current use of the Chukchi Sea by bowhead whales; they are the best data available.” EIS at III-50—51.

“Data are limited on the bowhead fall migration through the Chukchi Sea before the whales move south into the Bering Sea.” EIS at III-51.

“The amount of feeding in the Chukchi Sea and Bering Strait in the fall is unknown as is the amount of feeding in the Bering Sea in the winter (Richardson and Thomson, 2002). Richardson and Thomson (2002:xxxviii) concluded that: “. . .behavioral, aerial-survey, and stomach-content data, as well as certain energetics data. . .show that bowheads also feed widely across the eastern and central Beaufort Sea in summer and fall.” In mid- to late fall, at least some bowheads feed in the southwest Chukchi. Detailed feeding studies have not been conducted in the Bering Sea in the winter.” EIS at III-54.

“There are locations in the Beaufort Sea and the western Chukchi Sea where large numbers of bowheads have been observed feeding in many years. However, the significance of feeding in particular areas to the overall food requirements of the population or segments of the population is not clear.” EIS at III-55.

“Recent data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available.” EIS at III-55.

“[I]mportantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales.” EIS at IV-82.

“Bowheads are not randomly distributed throughout the Proposed Action area. The extent of use of particular habitats varies among years, sometimes considerably; therefore, it is difficult to predict, in advance of a given year, exactly how bowheads will use the entire area that is available to them. Some aspects of their habitat use are poorly understood. For example, current data are not available on which to typify the current summer use of the northern Chukchi Sea by bowheads. For example, in the Beaufort Sea in some years, large aggregations of bowheads near Smith Bay have been observed during MMS’ Bowhead Whale Aerial Survey Program (BWASP) surveys at the beginning of September. It is unclear if these animals are early migrants that have come from the east, if they summered in the northern portions of the Beaufort Sea and came south, or if they entered from the Chukchi Sea and never migrated east. . . . It is important to note that the Chukchi Sea data are not recent (1979-1991) and thus should not be interpreted as indicating current patterns of bowhead use of the Chukchi Sea.” EIS at IV-101.

“We note that the general location of the spring lead system in the Chukchi Sea (and Beaufort Sea) is based on relatively limited survey data and is not well defined.” EIS IV-102 (similarly at EIS at IV-105).

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

2. *Fin Whale*

"The NMFS has concluded that there is no reliable information about population-abundance trends, and that reliable estimates of current or historical abundance are not available, for the entire Northeast Pacific fin whale stock." EIS at III-46. *See also id.* at III-56 (similar).

"There are no recent data to confirm their use or lack of use of the Chukchi Sea Planning Area, or adjacent areas to the south." EIS at III-47.

"There is little information about natural causes of mortality (Perry, DeMaster, and Silber, 1999a). The NMFS summarized that 'There are no known habitat issues that are of particular concern for this stock' (Angliss and Lodge, 2002, 2005). Perry, DeMaster, and Silber (1999a:51) listed the possible influences of disease or predation as 'Unknown.'" EIS at III-56.

"The importance of specific feeding areas to populations or subpopulations of fin whales in the North Pacific is not understood." EIS at III-57.

"The possible influences of disease or predation and of overutilization [on fin whales] are listed [by NMFS] as 'Unknown.'" EIS at V-28.

3. *Humpback Whale*

"Available information does not indicate humpback whales inhabit the Chukchi Sea OCS project area. There are no recent data to confirm their lack of use of the Chukchi Sea OCS Planning Area, or adjacent areas to the south." EIS at III-47.

"There is 'no clear consensus' (Calambokidis et al., 1997:6) about the population stock structure of humpback whales in the North Pacific due to insufficient information (Angliss and Lodge, 2002) (see further discussion in USDOl, MMS,2003a,b)." EIS at III-58.

"Angliss and Outlaw (2005) stated that: 'There are no reliable estimates for the abundance of humpback whales at feeding areas for this stock' (the Western North Pacific Stock) 'because surveys of the known feeding areas are incomplete, and because not all feeding areas are known.' There are not conclusive or reliable data on current population trends for the western North Pacific stock (Perry, DeMaster, and Silber, 1999b; Angliss and Outlaw, 2005)." EIS at III-59.

"Causes of natural mortality in humpbacks in the North Pacific are relatively unknown, and rates have not been estimated." EIS at III-60.

Exhibit 129, Page 12 of 40

10

7. *Minke Whale*

"There are no reliable estimates for the Alaska stock of minke whales. A provisional estimate was made for the Bering Sea of 810 individuals; however, this is not used for the Alaska stock because the entire stock's range was not surveyed." EIS at III-78.

B. Other Marine Mammals

1. *Seals*

"Little is known about the biology or population dynamics of ice seals, and they have received little attention compared with other Bering/Chukchi Sea species known to be in decline. Accurate population estimates for ice seals are not available and are not easily attainable due to their wide distribution and problems associated with research in remote, ice-covered waters (Quakenbush and Sheffield, 2006). Although little is known about the population status of ice seals, there is cause for concern. Sea ice is changing in thickness, persistence, and distribution (Sec. III.A.4, Sea Ice), and evidence indicates that oceanographic conditions have been changing in the Bering Sea (Sec. III.A.3, Oceanography), which suggests that changes in the ecosystem may be occurring as well (Quakenbush and Sheffield, 2006)." EIS at III-71.

a. *Ringed Seal*

"No reliable estimate for the size of the Alaska ringed seal stock is available (Angliss and Outlaw, 2005) . . ." EIS at III-71.

b. *Spotted Seal*

"No reliable estimate for the size of the Alaska spotted seal stock is available (Angliss and Outlaw, 2005)." EIS at III-72.

c. *Ribbon Seal*

"Ribbon seals inhabit the North Pacific Ocean and the adjacent fringes of the Arctic Ocean. In Alaska, they range northward from Bristol Bay in the Bering Sea and into the Chukchi and western Beaufort seas. They are found in the open sea, on pack ice, and rarely on shorefast ice (Kelly, 1988). As the ice recedes in May to mid-July, they move farther north in the Bering Sea, hauling out on the receding ice edge and remnant ice (Burns, Shapiro, and Fay, 1981). Seal distribution throughout the rest of the year is largely unknown; however, recent information suggests that many ribbon seals migrate into the Chukchi Sea for the summer months (Kelly, 1988)." EIS at III-73.

"No reliable estimate for the size of the Alaska ribbon seal stock is available (Angliss and Outlaw, 2005)." EIS at III-73.

Exhibit 129, Page 14 of 40

12

"The threat of disease or predation [on humpbacks] as [sic] unknown." EIS at V-29.

4. *Gray Whale*

"[E]xisting information is insufficient to understand the dynamics of gray whales and offshore Chukchi Sea habitat relationships, quality and quantity dynamics and distribution of prey resources, or the capability of habitat to support (carrying capacity) long- and short-term whale use." EIS, Vol. II, AC 019-076.

"[T]he relationship between the expanding gray whale population to amphipod community dynamics is unknown but is of considerable interest." EIS at V-35.

5. *Beluga Whale*

"Understanding the distribution and timing of movements of belugas is important for planning lease sales in the Chukchi Sea and designing possible mitigation measures. Late-summer distribution and fall-migration patterns are poorly known, wintering areas effectively are unknown, and areas that are particularly important for feeding have not been identified (Suydam, Lowry, and Frost, 2005)." EIS at IV-163. *See also id.* at III-77 (second sentence same).

"Based on recent telemetry studies on eastern Chukchi belugas, it is likely that members from both stocks occur in similar places and at similar times during the fall migration although the significance of this is unknown (Suydam, Lowry, and Frost, 2005)." EIS at III-76.

"Winter food habits of belugas are largely unknown . . ." EIS at III-77.

"Belugas generally are associated with ice and relatively deep water throughout the summer and autumn, which may reflect their preference for feeding on ice-associated arctic cod (Moore et al., 2000). Late-summer distribution and fall-migration patterns are poorly known, wintering areas are effectively unknown, and areas that are particularly important for feeding have not been identified (Suydam, Lowry, and Frost, 2005)." EIS at III-77.

6. *Harbor Porpoise*

"The harbor porpoise inhabits shallow, coastal areas in temperate, subarctic, and arctic waters of the Northern Hemisphere (Read, 1999). In the North Pacific, harbor porpoises range from Point Barrow, Alaska to Point Conception, California (Gaskin, 1984). In Alaska, three separate stocks have been recommended, although there is insufficient biological data to support the designation at this time." EIS at III-78.

Exhibit 129, Page 13 of 40

11

d. *Bearded Seal*

"No reliable estimate for the size of the Alaska bearded seal stock currently is available (Angliss and Outlaw, 2005). Bengtson et al. (2005) conducted surveys in the eastern Chukchi Sea but could not estimate abundance from their data." EIS at III-74.

2. *Pacific Walrus*

"No reliable estimate is currently available for the size of the Alaskan stock of Pacific walrus (Angliss and Outlaw, 2005). However, available evidence indicates that the population is likely in decline (Kelly, Quakenbush, and Taras, 1999; Kochnev, 2004)." EIS at III-74. *See also id.* at EIS at III-76 (first sentence same).

"The population size has never been known with certainty; however, the most recent survey estimate was approximately 201,039 animals (Gilbert et al., 1992)." EIS at III-76.

3. *Polar Bear*

"A reliable estimate for the CBS stock of polar bears, which ranges into the southern Beaufort Sea, does not exist, and its current status is in question. In 2002, the IUCN/SSG Polar Bear Specialist Group estimated the size of the CBS population at 2000+ bears, though the certainty of this estimate was considered poor (Lunn, Schliebe, and Born, 2002)." EIS at III-84.

"Coastal areas provide important denning habitat for polar bears. Terrestrial denning areas for bears of the CBS polar bear stock are less well understood than those for the SBS polar bear stock." EIS at IV-166.

"The maximum reproductive age for polar bears is unknown, but is likely well into their 20's (Amstrup, 2003)." EIS at III-81.

"[W]ith the collapse of the Soviet empire in 1991, levels of illegal harvest dramatically increased in Chukotka in the Russian Far East (Amstrup, 2000; USDOl, FWS, 2003). While the magnitude of the Russian harvest from the CBS is not precisely known, some estimates place it as high as 400 bears per year, although the figure is more likely between 100 and 250 bears per year." EIS at III-84. *See also id.* at V-36 (same).

"[B]ecause of the unknown rate of illegal take currently taking place, in 2006 the IUCN/SSG Polar Bear Specialist Group designated the status of the CBS stock as "declining" from its previous estimate of 2000+ animals (IUCN/SSG Polar Bear Specialist Group, 2006)." EIS at III-84.

Exhibit 129, Page 15 of 40

13

III. MARINE AND COASTAL BIRDS

1. General

"Despite the importance [for marine and coastal birds] of [Kasegaluk Lagoon, Ledyard Bay, Peard Bay, barrier islands, the spring open-water lead system, and the seabird-nesting colonies at Cape Lisburne and Cape Thompson], as well as the entire Chukchi Sea within the proposed lease-sale area, little recent site-specific data are available on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data are between 15 and 30 years old, making accurate analysis difficult. Because of this long data gap, it is unknown if population abundance or distribution of many species have changed." EIS at IV-145.

2. Threatened Spectacled Eiders¹

"In general, population demography for this species and in particular breeding information (i.e., timing of pair formation and duration of pair bonds, timing of mating, male and female dispersal rates, sex-specific estimates for natal, breeding, and molt-site fidelity, breeding propensity, nonbreeding component, duckling/brood and first-year survival, etc.) is poorly understood due to a lack of long-term marking/monitoring programs and/or low resighting/recapture/recovery rates." BE at 23.

"Few data are available on the overall longevity of spectacled eiders, but if similar to other eiders, they would likely be long-lived." BE at 23.

"Recruitment rate of spectacled eiders is unknown (USFWS 1999)." BE at 25.

"Migration routes [of spectacled eiders] in the spring are not well known . . ." BE at 25.

"The summer range of non-breeding [spectacled] eiders is not known . . ." BE at 26.

"Food habits of spectacled eiders in the Ledyard Bay molting area remain unknown." BE at 27.

"The world population of spectacled eiders has declined substantially during the past 30 years, and may be continuing to decline (USFWS 1999, 2002b). Long-lived species like spectacled eiders typically do not have highly variable populations and unknown mortality factors may be undermining their ability to maintain a stable population. The causes of decline could be varied and are largely unknown . . ." BE at 28.

¹ From Minerals Management Service, Biological Evaluation of Spectacled Eider (*Somateria fischeri*), Steller's Eider (*Polysticta stelleri*), and Kittlitz's Murrelet (*Brachyramphus brevirostris*) for Chukchi Sea Lease Sale 193 (September 2006), incorporated by reference into the Lease Sale 193 EIS at III-61, IV-125, V-30.

"Variability in the abundance of the Alaska breeding population of spectacled eiders is not well understood (USFWS 1999)." BE at 28.

"The Alaskan and Russian populations of spectacled eider were listed as a threatened species on 9 June 1993 (USFWS 1993). Although the factors that caused these declines are unknown, a number of potential contributory factors have been identified. These, or other still-undiscovered threats, have increased mortality above the rate of reproductive replacements. No data are available to show whether similar trends have affected the breeding population in Russia where as many as 40,000 pairs traditionally nested." BE at 29.

3. Threatened Steller's Eiders²

"[T]he length of time that Steller's eiders remain paired is unknown." BE at 13.

"Many life history aspects of Steller's eiders (e.g., timing of pair formation, duration of pair bonds, dispersal rates, sex-specific seasonal site fidelity, first-year survival, etc.) are poorly understood." BE at 13.

"The reason for relatively low nesting success or failure to nest by the Alaska nesting population is unknown, but may be related to predators switching to alternate prey when lemmings are in low abundance (Quakenbush and Suydam 1999)." BE at 15.

"Steller's eider recruitment rates are unknown (USFWS 2002b)." BE at 15.

"Departure from the [Arctic Coastal Plain] to molting areas is poorly documented, but males probably begin departing as early as late June, followed by non- and failed nesting females presumably from late July – late August, and finally successful females and fledged young." BE at 16.

"The population of Steller's eiders molting and wintering along the Alaska Peninsula appears to be declining (USFWS 1999, 2002a). . . . The causes of decline could be varied and are largely unknown, but if the cause of the decline is within the marine environment, it is reasonable to conclude that the Alaska and Russia nesting populations are being affected similarly because a large portion of the Russian population winters with the Alaskan population." BE at 18.

"Variability in the abundance of the Alaskan breeding population of Steller's eiders is not well understood." BE at 18.

"Williamson et al. (1966) listed Steller's eiders as occurring in the Cape Thompson area 25 miles southeast Point Hope during surveys for Project Chariot at Ogotoruk Creek. Steller's eiders were listed as occupying marine littoral, lacustrine, and beach environments in order of affinity. In this

² See note 1.

study, marine littoral waters extended seaward 2 miles from shore. Steller's eiders were listed as present from June 1 through October 4 and uncommon, but possibly breeding in the area. It is not known if Steller's eiders still nest in this area." BE at 20-21.

4. Kittlitz's Murrelets³

"The Kittlitz's murrelet (*Brachyramphus brevirostris*) is one of the rarest and least understood seabirds in North America. There is limited life history information on the Kittlitz's murrelet (i.e., age at first breeding, nest success, hatching success, fledging success, first-year survival, survival to breeding age, proportion of breeding females, proportion of non-breeders, periodic non-breeding, etc.) and mechanisms of population regulation. The limited information available for this species and research on the closely-related marbled murrelet suggests a *K*-selected life history strategy." BE at 33.

"The longevity of the Kittlitz's murrelet is unknown . . ." BE at 33.

"Age to maturity in Kittlitz's murrelets is unknown . . ." BE at 33.

"Little is known about the reproductive strategy of Kittlitz's murrelet because nesting sites are difficult to find (Day et al. 1999)." BE at 33.

"Annual breeding effort is poorly understood, but is considered highly variable." BE at 33.

"Spring migration for Kittlitz's murrelets in the Chukchi Sea is unknown . . ." BE at 34.

"Little is known about Kittlitz's murrelet recruitment . . ." BE at 34.

"Annual adult survival has not been estimated . . ." BE at 34.

"Though there is some evidence for long-term population declines for *Brachyramphus* murrelets (van Vliet and McAllister 1994, Ralph et al. 1995, Kuletz et al. 2003), Day et al. (1999) argued that evidence for major population declines for the Kittlitz's murrelet was equivocal. In large part, their conclusion stems from the fact that historical population estimates are lacking (but see Isleib and Kessel 1973, Agler et al. 1998, Kendall and Agler 1998)." BE at 34.

"Fall migration in the Chukchi Sea population [of Kittlitz's murrelet] is unknown . . ." BE at 35.

"Post-breeding distribution [of Kittlitz's murrelet] is poorly understood, but is likely farther offshore than pre-breeding season." BE at 35.

"Winter distribution [of Kittlitz's murrelet] is poorly understood, but is probably pelagic." BE at 35.

³ See note 1.

"The diet of the Chukchi Sea summer residents is unknown . . ." BE at 35.

"Winter foods are unknown, but may consist mostly of pelagic euphausiids or other macroinvertebrates." BE at 35.

"Information regarding fidelity to nesting sites is not available (Day et al. 1999)." BE at 35.

"[C]auses for the declines [in Kittlitz's murrelets] are not well known, but likely include: habitat loss or degradation, increased adult and juvenile mortality, and low recruitment, and we believe that glacial retreat and oceanic regime shifts are the factors that are most likely causing population-level declines in this species." BE at 36 (citing USFWS status review, 2004).

5. Cliff-Nesting Seabirds

a. Murres

Noting "limited data." EIS III-62.

b. Puffins

"The current status of horned puffins in the Chukchi Sea is unknown." EIS III-62.

"The current status of the tufted puffin in the Chukchi Sea is also unknown." EIS III-62.

c. Black-Legged Kittiwake

"The current status of the black-legged kittiwake (*Rissa tridactyla*) in the Chukchi Sea is unknown." EIS at III-63.

"The portion of [Chukchi] population in the proposed lease sale area is unknown, but could be substantial late in the open-water season. Seasonal areas of concentration, if any, are unknown." EIS at III-63. See also *id.* at IV-142 (similar).

"Current population estimates at [Cape Thompson and Cape Lisburne] colonies are unknown." EIS at IV-143.

6. Bering Sea Breeders and Summer Residents

a. Northern Fulmar

"The current status of the northern fulmar (*Fulmarus glacialis*) is unknown." EIS at III-63.

b. Short-Tailed Shearwater

“The current status of the short-tailed shearwater (*Puffinus tenuirostris*) in the Chukchi Sea is unknown.” EIS at III-63.

c. Auklets

“The current status of parakeet (*Cyclorhynchus psittacula*), least (*Aethia pusilla*) and crested (*A. cristatella*) auklets in the Chukchi Sea is unknown.” EIS at III-63.

7. High Arctic-Associated Seabirds

a. Black Guillemot

“The current status of the black guillemot (*Cephus grylle*) in the Chukchi Sea is unknown.” EIS at III-63.

b. Ivory Gull

“The current status of the ivory gull (*Pagophila eburnea*) in the Chukchi Sea is unknown. Divoky (1987) reported that ivory gulls are closely associated with the ice edge throughout their lifecycle. Ivory gulls are considered uncommon to rare in pelagic waters of the Chukchi during summer, and small numbers migrate through in fall to wintering areas in the northern Bering Sea.” EIS at III-64.

c. Arctic Tern

“The current status of the Arctic tern (*Sterna paradisaea*) in the Chukchi Sea is unknown.” EIS at III-64.

8. Tundra-Breeding Migrants

a. Jaegers

“The current status of [all three species of] jaegers in the Chukchi Sea is unknown.” EIS at III-64.

b. Glaucous Gull

“The current status of the glaucous gull (*Larus hyperboreus*) in the Chukchi Sea is unknown.” EIS at III-64.

“The North American population of bar-tailed godwits (*Limosa lapponica baueri*) breeds in western and northern Alaska. Postbreeding bar-tailed godwits move to staging grounds along the Bering Sea Coast and then apparently fly nonstop 11,000 km to New Zealand. Recent counts conducted at both breeding and nonbreeding sites provide evidence of a serious and rapid population decline (McCaffrey et al., 2006), but the cause of the decline is unknown.” EIS at III-69.

9. Waterfowl

a. Yellow-Billed Loons

“Compared to what is known about yellow-billed loons near the Beaufort Sea coast, there is very little known about the coastal areas bordering the Chukchi Sea.” EIS at III-65.

“The [yellow-billed loon] is little studied and basic biological information (such as the seasonal distribution of immature and non-breeding yellow-billed loons) is unknown.” EIS at IV-140.

b. Common Eider

“During spring migration, the common eider (*Somateria mollissima*) typically migrates along the Chukchi Sea coast, using offshore open-water leads. Offshore migration distances are poorly understood for the Chukchi Sea, but in the Beaufort Sea they are usually found within 48 km (29 mi) of shore.” EIS at III-66.

c. Pacific Brant

“The current status of the Pacific brant along the Chukchi Sea is unknown.” EIS at III-68.

d. Greater White-Fronted Geese

“The current status of greater white-fronted geese along the Chukchi Sea coast is unknown.” EIS at III-68.

e. Lesser Snow Goose

“Ritchie et al. (2006) reported that the number of snow geese nesting on the Ikpikpuk River delta continued to increase substantially from numbers recorded prior to 1999. There are no comparable data for the Kukpowruk River delta colony.” EIS at III-68.

10. Shorebirds

a. Buff-Breasted Sandpiper (species of concern)

Noting “limited data.” EIS III-70.

b. Bar-Tailed Godwit (species of concern)

“The abundance and distribution of bar-tailed godwits in northern Alaska and coastal areas of the Chukchi Sea are not well understood.” EIS at III-69.

LACK OF INFORMATION ABOUT EFFECTS ON SPECIES

I. FISH

A. General

1. General effects of seismic on fish

“A review of available science and management literature shows that at present, there are no empirical data to document potential impacts from seismic surveys reaching a local population-level effect. The experiments conducted to date have not contained adequate controls to allow us to predict the nature of a change or that any change would occur.” EIS at II-33. See also *id.* at IV-51—52 (similar) and IV-74 (similar).

2. General effects of oil spills on fish

“Given a lack of contemporary abundance and distribution information, large oil spill effects on rare or unique species (including potential extirpation) could occur, but would likely go unnoticed or undetected.” EIS at II-34. See also EIS at IV-52 and IV-74 (similar).

“While small-spills are required to be reported, the number of unreported spills is unknown. Not all spills would be expected to receive a spill-response. Overall, it is unclear whether, over the long-term and in the absence of a monitoring program to assess effects, any negative impacts to fish resources from chronic small spills would be detected.” EIS at IV-72.

B. Effects on Marine Pelagic Species

“Effects on recruitment would be particularly difficult to assess, because very few studies of offshore fishes have been made.” EIS at IV-61.

C. Effects on Capelin

“Eggs deposited in the proximity of the contaminated substrate over a series of years likely would be exposed to oil (PAH’s) retained in the substrate, as PAH’s in weathered oil can be biologically available for long periods and very toxic to sensitive life stages, subsequently leading to lethal and sublethal effects to those offspring of successive generations. It is not known what such a behavioral response may have on the dynamics of the population; however, the spawning site likely would be unavailable for use for multiple generations, depending on the sensitivity of the capelin to detecting contaminated substrates and how long the oil persists in the localized habitat.” EIS at IV-60-61.

“Also unknown are the distribution and abundance of spawning sites used by capelin in the Alaskan Arctic.” EIS at IV-63.

D. Effects on Arctic Cod

“Although arctic cod can be extremely abundant in nearshore lagoonal areas, the importance of nearshore versus offshore environments to the lifecycle is not known (Craig et al., 1982). Although it is known that juvenile arctic cod associate with floating ice, it is unknown to what degree this association contributes to the development and survival of young fishes later recruiting to the breeding population. If early lifehistory stages of arctic cod were concentrated in nearshore environments, in patches in the open ocean, or under floating ice, they certainly would be more vulnerable to effects from an oil spill impacting such habitats.” EIS at IV-62.

Exhibit 129, Page 24 of 40

22

adverse impact on nonendangered and nonthreatened marine mammals in the Proposed Action area. Increasing vessel traffic in the Northwest Passage, defined as the marine route between the Pacific and Atlantic oceans through the Arctic Ocean across the top of North America, which includes the Proposed Action area, increases the risks of oil and fuel spills and vessel strikes of marine mammals.” EIS at IV-145—46.

“Because very little is known about the distributions, population sizes or habitat use of marine mammals in the Chukchi Sea, it is difficult to determine if significant impacts will or will not occur to marine mammals as a result of the proposed action.” EIS at V-32.

2. Effects of Seismic and Other Noise on Marine Mammals

“Because of the lack of data it is unknown if noise introduced into the environment from industrial activities, including drilling and seismic operations, will have an adverse impact on nonendangered and nonthreatened marine mammals in the Proposed Action area.” EIS at II-37. See also EIS IV-145—146 (similar).

“Despite the increasing concern and attention noted above, there still is uncertainty about the potential impacts of sound on marine mammals; on the factors that determine response and effects; and especially on the long-term, cumulative consequences of increasing noise in the world’s oceans from multiple sources (NRC, 2003, 2005). The NRC (2005) concluded that it is unknown how or in what cases responses of marine mammals to anthropogenic sound rise to the levels of biologically significant effects. This group also developed an approach of injury and behavioral “take equivalents”. These take equivalents use a severity index that estimates the fraction of a take experienced by an individual animal. This severity index is higher if the activity could be causing harassment at a critical location or during a critical time (e.g., calving habitat). Because we have uncertainty about exactly where and how much activity will occur, the recommendations from the NRC (2005) are qualitatively incorporated in MMSS analysis.” EIS at IV-86.

“Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown . . .” EIS IV-89.

“Although it is unlikely that airgun operations during most seismic surveys would cause [permanent threshold shift to hearing] in marine mammals, caution is warranted given the limited knowledge about noise-induced hearing damage in marine mammals.” EIS IV-147.

3. Effects of Oil Spills on Marine Mammals

“There are few post-spill studies with sufficient details to reach firm conclusions about the effects, especially the long-term effects, of an oil spill on free-ranging populations of marine mammals.” EIS at IV-115.

Exhibit 129, Page 26 of 40

24

II. MARINE MAMMALS

A. General

1. Effects on Marine Mammals in General

“Based on the paucity of information available on marine mammal ecology in the Chukchi Sea and on specific locations of future developments, we are unable to determine at this time if significant impacts will or will not occur.” EIS at II-37.

“[B]ecause of the lack of data on marine mammal distributions and habitat use in offshore areas of the Chukchi Sea, it is uncertain what the level of effects would be in offshore areas [regarding Alt. III]. EIS at II-42. See also *id.* at IV-269 (same) and EIS at II-45 (same, re: Alt. IV).

“Because there are no oil and gas production facilities in the Chukchi Sea, it is difficult to predict with certainty what potential impacts from such development would have on threatened and endangered marine mammals.” EIS at IV-111.

“Unfortunately, it has not been possible to predict the type and magnitude of marine mammal responses to the variety of disturbances caused by oil and gas operations and industrial developments in the Arctic. More importantly, it has not been possible to evaluate the potential effects on populations.” EIS at IV-152.

“In light of the uncertainty over the potential impacts of exploration and development activities, the earliest possible establishment of long-term monitoring programs for vulnerable species in the project area should be pursued. The design of long-term monitoring should take into account the likely size of any effect and the probability of detecting it within a reasonable time span (IWC, 2006).” EIS at IV-162—63.

“[W]ithout historical data on distribution and abundance, it is not possible to measure the impacts of an oil spill on marine mammals.” EIS at IV-156.

“Based on the paucity of information available on marine mammal ecology, and specifically on habitat use patterns, in the Chukchi Sea and based on the lack of specific information regarding the location of future developments, we are unable to determine at this time if significant impacts would or would not occur to marine mammal populations in the project area as a result of the Proposed Action.” EIS at IV-145.

“Careful mitigation can help reduce the effects of future industrial developments and their accumulation through time. However, the effects of full-scale industrial development of the waters of the Chukchi Sea likely would accumulate through displacement of marine mammals from their preferred habitats, increased mortality, and decreased reproductive success. Because of the lack of data on which to base informed decisions, it is unknown if noise introduced into the environment from industrial activities, including drilling and seismic operations, will have an

Exhibit 129, Page 25 of 40

23

B. Whales

1. General

“The need to rely on indirect methods of assessing the environmental impact of human activity on marine mammals is a recurring problem (Inglis and Gust, 2003). Impact assessments for cetaceans typically emphasize immediate behavioral responses to human activities (Samuels and Bejder, 2004), the biological relevance of which is rarely known (Corkeron, 2004).” EIS at IV-154.

“[M]onitoring plans typically emphasize readily obtainable, short-term behavioral measures that can be directly related to disturbance factors (Bejder et al., 2006). However, it is rarely known in what ways short-term responses translate to longer term changes in reproduction, survival, or population size (Gill, Norris, and Sutherland, 2001; Beale and Monaghan, 2004a), and it is seldom possible to infer biological significance based on short-term behavioral observations.” EIS at IV-154.

a. Effects from seismic/noise on whales in general

“[T]here is acknowledged . . . scientific uncertainty about the potential effects of noise, especially repeated exposure to loud noise, on baleen whales.” EIS at IV-82.

“There are very few, if any, data available about potential effects of . . . noise . . . on cetacean calves.” EIS at IV-82.

“[T] here are few instances where data are sufficient to evaluate the total energy exposure of a marine mammal from a given source. At present, we do not have the data necessary to make such a determination or understand how it might change our analysis.” EIS at IV-86.

“While there is some general information available, evaluation of the impacts of noise on marine mammal species, particularly on cetaceans, is greatly hampered by a considerable uncertainty about their hearing capabilities and the range of sounds used by the whales for different functions (Richardson et al., 1995a; Gordon et al., 1998; NRC, 2003, 2005). This is particularly true for baleen whales. Very little is known about the actual hearing capabilities of the large whales or the impacts of sound on them, especially on them physically. While research in this area is increasing, it is likely that we will continue to have great uncertainty about physiological effects on baleen whales because of the difficulties in studying them. Baleen whale hearing has not been studied directly. There are no specific data on sensitivity, frequency or intensity discrimination, or localization (Richardson et al., 1995a). Thus, predictions about probable impacts on baleen whales generally are based on assumptions about their hearing rather than actual studies of their hearing (Richardson et al., 1995a; Gordon et al., 1998; Ketten, 1998).” EIS IV-87.

“Based on indirect evidence, at least some baleen whales are quite sensitive to frequencies below 1,000 Hz but can hear sounds up to a considerably higher but unknown frequency.” EIS IV-87.

Exhibit 129, Page 27 of 40

25

“Repeated long exposures to intense sound or sudden onset of intense sounds generally characterize sounds that cause permanent threshold shift in humans. Ketten (1998) stated that age-related hearing loss in humans is related to the accumulation of permanent-threshold shift and TTS damage to the ear. Whether similar age-related damage occurs in cetaceans is unknown.” EIS at IV-88.

“There are no data on which to determine the kinds or intensities of sound that could cause a [temporary threshold shift, TTS] in a baleen whale.” EIS at IV-88.

“Little data are available about how, over the long term, most marine mammal species (especially large cetaceans) respond either behaviorally or physically to intense sound and to long-term increases in ambient noise levels. Large cetaceans cannot be easily examined after exposure to a particular sound source.” EIS at IV-88.

“Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown, and information about the hearing capabilities of large baleen whales is mostly lacking. As noted previously, the assumption is made that the area of greatest hearing sensitivity is at frequencies known to be used for intraspecific communication. However, because real knowledge of sound sensitivity is lacking, we believe it is prudent to assume in our analyses that sensitivities shown by one species of baleen whale also could apply to another. This reasonable approach provides the means to infer possible impacts on other species (such as the fin whale), especially when using studies on a species such as the humpback, which uses a large sound repertoire in intraspecific communication.” EIS at IV-89.

“It is not known whether (or which) marine mammals can . . . and do adapt their vocalizations to background noise.” EIS at IV-89 (internal citation omitted).

b. Effects from oil spills on whales in general

“There is uncertainty and controversy regarding the potential effects of oil spills on large cetaceans. There are very few, if any, data available about potential effects of . . . oil spills on cetacean calves.” EIS at IV-82.

“There are no data available to MMS that definitely link even a large oil spill [associated with seismic surveys] with a significant population-level effect on a species of large cetacean.” EIS at IV-103.

“Data are not available that would permit evaluation of the potential for long-term sublethal effects [from oil spills] on large cetaceans.” EIS at IV-115.

“[T]he potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from a large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects.” EIS at IV-115.

Exhibit 129, Page 28 of 40

26

repeated exposure to loud noise, on baleen whales. There is uncertainty and controversy regarding the potential effects of oil spills on large cetaceans. There are very few, if any, data available about potential effects of either noise or oil spills on cetacean calves. Lastly, and importantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales. Thus, it is difficult to predict exposure in some parts of the area where the action could occur and to understand fully the potential effects of any exposure.” EIS at IV-82.

a. Effects of seismic and other noise on bowhead whale

“Uncertainty exists about the potential effects of seismic surveys on bowhead whales (especially on calf survival and growth and female reproduction) in the Chukchi Sea due to a lack of current data about their use of the Proposed Action area during periods when seismic surveys could be occurring. What is known, however, is that the observed response of bowhead whales to seismic survey noise varies among studies. Some of the variability appears to be context specific (i.e. feeding versus migrating whales) and also may be related to the whales’ reproductive status and/or sex or age.” EIS at II-35.

“Bowheads respond to drilling noise at different distances depending on the types of platform from which the drilling is occurring. Data indicate that many whales can be expected to avoid an active drillship at 10- 20 km or possibly more.” EIS at II-36. *See also id.* at IV-194 (similar).

“The long-term response of bowheads to production facilities located at the southern end of the migration corridor is unknown.” EIS at II-36.

“The response of bowhead whales to construction in high-use areas is unknown and is expected to vary with the site and the type of facility being constructed. Similarly, the long-term response of bowheads to production facilities other than gravel islands located at the southern end of the migration corridor is unknown.” EIS at IV-194 (internal references omitted).

“There are multiple sources of uncertainty in our analyses. These include, but are not limited to uncertainty about the action: where seismic surveys will occur; how many surveys will occur; how much noise will be produced purposely by the firing of airguns; what the exact shape of related ancillary activities, such as support vessel type and activity will be; where exploration drilling could occur. . . .” EIS at IV-82.

“More important, there is acknowledged (NRC, 2003, 2005; minutes from meetings of the Marine Mammal Commission Sound Advisory Panel, 2004, 2005 from their web site) scientific uncertainty about the potential effects of noise, especially repeated exposure to loud noise, on baleen whales.” EIS at IV-82.

“Data are not sufficient to determine sex, age, or reproductive factors that may be involved in [bowhead] response to vessels. We are not aware of data that would allow us to determine whether females with calves tend to show avoidance and scattering at a greater, lesser, or at the same distances as other segments of the population.” EIS at IV-109.

Exhibit 129, Page 30 of 40

28

“With whales, even when unusual changes in abundance occur following an event such as the EVOS (as with the disappearance of relatively large numbers of killer whales from the AB pod in Prince William Sound) (Dahlheim and Matkin, 1994), interpretation of the data is uncertain or is often controversial due to the lack of supporting data, such as oiled bodies or observations of individuals in distress (and, in that case, the existence of a viable alternate explanation of the probable mortality). Thus, the potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from a large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects. EIS at IV-115. *See also id.* at IV-117 (latter two sentences similar).

“It is not clear how long crude oil would remain on a free-ranging cetacean’s skin once it was oiled.” EIS at IV-117.

“The potential effect of crude oil on the function of the cetacean blowhole is unknown.” EIS at IV-118. *See also id.* at IV-159.

“The effects of an oil spill on cetacean newborns or other calves and the potential effects of contact or detection of spilled oil by near-term, or post-partum females are not known.” EIS at IV-121.

“[T]he potential for long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from large oil spill on cetaceans is unknown. However, observations of cetaceans behaving in a lethargic fashion or having labored breathing has been documented in more than one species, including in gray whales after the EVOS, in which large numbers of individuals were subsequently found dead.” EIS at IV-158.

“The potential for there to be long-term sublethal (for example, reduced body condition, poorer health, reduced immune function, reduced reproduction or longer dependency periods) effects on large cetaceans from a large oil spill essentially is unknown. There are no data on large cetaceans adequate to evaluate the probability of sublethal effects. EIS at IV-160.

“The effects of a large oil spill and subsequent exposure of whales to fresh crude oil are uncertain, speculative, and controversial.” EIS at IV-161.

2. Bowhead Whale

“There are multiple sources of uncertainty in our analyses. These include, but are not limited to uncertainty about the action: where seismic surveys will occur; how many surveys will occur; how much noise will be produced purposely by the firing of airguns; what the exact shape of related ancillary activities, such as support vessel type and activity will be; where exploration drilling could occur; where leases will be let; where a spill could occur; where production platforms and pipelines may be based; etc. More important, there is acknowledged (NRC, 2003, 2005; minutes from meetings of the Marine Mammal Commission Sound Advisory Panel, 2004, 2005 from their web site) scientific uncertainty about the potential effects of noise, especially

Exhibit 129, Page 29 of 40

27

“The encounter rate of bowhead whales with vessels associated with exploration would be determined by what areas were being explored. Data are insufficient for us to accurately predict the average geographic zone of activity by the support vessels and thus, to predict the additional area that could be affected by the vessels.” EIS at IV-100.

“Data on reactions of bowheads to helicopters are limited.” EIS IV-100.

“While it is clear that seismic activity may overlap with bowhead use of the Chukchi Sea during fall migration, it is highly uncertain about the likely extent of overlap between seismic activity and bowhead whales in the summer.” EIS at IV-101.

“During fall migration, available, but dated, data indicate that overlap is likely to be greatest in the main migratory pathways, one heading nearly directly to the Bering Strait, and the other heading west from Barrow towards Wrangell Island.” EIS at IV-101—102.

“It is clear that if 2D/3D seismic surveys impacted areas of the spring lead and polynya system during the spring migration, impacts could potentially be biologically significant. We note that the general location of the spring lead system in the Chukchi Sea (and Beaufort Sea) is based on relatively limited survey data and is not well defined.” EIS at IV-102.

“The second situation for possibly larger than typical impacts exists in the Chukchi Sea in the autumn (e.g., late September on) as whales migrate both towards the Asian coast and toward the Bering Strait. Insufficient data exist to determine the current migration paths or the numbers of whales that might be deflected from those paths. Data are also not available to determine how intensively bowheads feed during the autumn migration in the Chukchi Sea or whether large aggregations exist in certain places due to prey resources.” EIS at IV-103.

“The factors associated with the variability [of bowhead responses to drillships and other noise] are not fully identified or understood.” EIS IV-105.

“There are few data on the noise [imposed on, e.g., bowheads] from conventional drilling platforms.” EIS at IV-105.

“Most observations of bowheads tolerating noise from stationary operations are based on opportunistic sightings of whales near ongoing oil industry operations, and it is not known whether more whales would have been present in the absence of those operations. Because other cetaceans seem to habituate somewhat to continuous or repeated noise exposure when the noise is not associated with a harmful event, this suggests that bowheads will habituate to certain noises that they learn are nonthreatening. Additionally, it is not known what components of the population were observed around the drillship (adult or juvenile males, adult females, etc.)” EIS IV-105.

“The response of bowhead whales to construction in high use areas is unknown and is expected to vary with the site and the type of facility being constructed. Similarly, the long-term response of bowheads to production facilities other than gravel islands located at the southern end of the migration corridor is unknown.” EIS at IV-123.

Exhibit 129, Page 31 of 40

29

"The response of bowhead whales to construction in high-use areas is unknown and is expected to vary with the site and the type of facility being constructed." EIS at IV-194.

"Noise associated with ships or other boats potentially could cause bowheads to alter their movement patterns or make other changes in habitat use. Clapham and Brownell (1999) summarized that "...effects of ship noise on whale behavior and ultimately on reproductive success are largely unknown." EIS at V-23.

"[R]ecent monitoring studies indicated that most fall migrating whales avoid an area with a radius about 20-30 km around a seismic vessel operating in nearshore waters; however, there are no data that indicate that such avoidance is long-lasting after cessation of the activity." EIS at V-25.

b. Effects of oil spill on bowhead whale

"There is uncertainty about the effects on bowheads (or any large cetacean) from the event of a large oil spill." EIS at II-36.

"The potential effects to bowheads of exposure to [polyaromatic compounds, PACs] through their food are unknown. Because of their extreme longevity, bowheads are vulnerable to incremental long-term accumulation of pollutants." EIS at IV-103. *See also id.* at IV-119 (same).

"In the Biological Opinion for Federal oil and gas leasing and exploration by the MMS within the Alaskan Beaufort Sea and its effects on the endangered bowhead whale, the NMFS (2001:51) stated that: 'It is difficult to accurately predict the effects of oil on bowhead whales (or any cetacean) because of a lack of data on the metabolism of this species and because of inconclusive results of examinations of baleen whales found dead after major oil releases.'" EIS at IV-103.

"There is great uncertainty about the potential effects of ingestion of spilled oil on bowheads, especially on bowhead calves. Decreased food assimilation could be particularly important in very young animals, those that seasonally feed, and those that need to put on high levels of fat to survive their environment." EIS at IV-118.

"It is not known if bowheads would leave a feeding area where prey was abundant following a spill." EIS at IV-118.

"The factors associated with the presence of [large aggregations of bowhead whales] are not yet clear. It is not known if they would leave the area heavily contaminated with crude oil." EIS at IV-121.

"Primarily because of the uniqueness of the bowhead and its apparently obligate use of spring lead and polynyas as its migratory path between wintering and summering grounds, MMS is uncertain of the potential severity of impact should a large oil spill occur within such a system, especially if spring migration were underway and hundreds of females were calving in or near those leads." EIS at IV-121.

Exhibit 129, Page 32 of 40

30

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

"In conclusion, there is uncertainty about effects on bowheads (or any large cetacean) in the event of a large oil spill. There are, in some years and in some locations, relatively large aggregations of feeding bowhead whales within the proposed lease-sale area. If a large amount of fresh oil contacted a significant portion of such an aggregation, effects potentially could be greater than typically would be assumed and we cannot rule out population-level effects if a large number of females and newborn or very young calves [so this would be in spring] were contacted by a very large amount of fresh crude oil." EIS at IV-125.

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

"It is unknown what effects an oil spill would have on bowhead whales, but it is likely that some whales would experience temporary, nonlethal effects from the oiling of skin, inhaling hydrocarbon vapors, ingesting oil contaminated prey, fouling of their baleen, losing their food source, and temporary displacement from some feeding areas." EIS at IV-216-217.

"Limited monitoring data prevent effective assessment of cumulative subsistence-resource damage; resource displacement; changes in hunter access to resources; increased competition; contamination levels in subsistence resources; harvest reductions; or increased effort, risk, and cost to hunters. Limited data also limit our assessment of the effectiveness of mitigation measures." EIS at V-46.

c. Effects of past activity on bowhead whale

"Available data . . . are inadequate to fully address issues about effects of past oil and gas activity specifically in the Chukchi Sea on bowhead behavior." EIS at V-25.

Also, "we cannot adequately assess potential effects on patterns or durations of bowhead habitat use. Because of the inadequacy of the data on activities, and because of the limitations inherent in studying large baleen whales, MMS was not able to assess whether there were any adverse health effects to individuals during the period of relatively intensive seismic survey activity in the 1980's." EIS at V-25.

"However, data are inadequate to fully evaluate potential impacts on whales during this period, including the duration of habitat use effects or numbers and types of individuals that did not use high-use areas because of the activities." EIS at V-27.

Exhibit 129, Page 33 of 40

31

d. Cumulative effects on bowhead whale

"[D]ata on other potential perturbations (e.g., past seismic surveys and oil spills) are not sufficient to clearly know the level of effects [on bowheads]." EIS at V-20.

"Whether there are long-lasting behavioral effects from [subsistence] activity are unknown, but overall habitat use appears to be relatively unaffected." EIS at V-20.

"There are not sufficient data about past human activities, including, but not limited to, past offshore oil and gas related seismic surveys, or ice-management activities, to address whether there are any long-term impacts on [bowhead] behavior from such activities in either evaluation area." EIS at V-20.

"There are insufficient data to make reliable predictions of the effects of Arctic climate change on bowhead whales." EIS at V-22 (quoting Angliss and Lodge (2002:174)).

"If climate changes occur, it is likely that shipping would increase throughout the range of the bowhead, especially in the southern portions of the Arctic Ocean. If commercial fisheries were to expand, bowhead whale death and or injury due to interactions with fishing gear, possibly injury and/or death due to incidental take in commercial fisheries, and temporary effects on behavior potentially could occur. There are, however, no data that would permit a quantitative prediction of the aforementioned possible effects." EIS at V-22.

"Data on other activities, such as hunting activity, barge traffic, and shipping noise are incomplete. Thus, while it is clear there have been multiple noise and disturbance sources in the Beaufort Sea over the past 30 years, because of the incompleteness of data, even for the 1990's, for many types of activities, we cannot evaluate the cumulative effects on bowhead whales resulting from multiple noise and disturbance sources (e.g., 2D seismic in State and Federal waters, drilling, ice management, high-resolution acoustic surveys, vessel traffic, construction, geotechnical borehole drilling, aircraft surveys, and hunting). Because data also are incomplete for the Chukchi Sea, we reach the same general conclusions." EIS at V-26.

3. Beluga Whale

"A large oil spill could have significant impacts to beluga prey species, including anadromous and coastal spawning species such as salmon (Sec. IV.C.1.d). If a significant impact to anadromous and coastal spawning species occurred, the effects on belugas would be detrimental, but the magnitude unknown." EIS at IV-161.

"Given the greater potential for anthropogenic-noise impacts on baleen whales, more research has been done to focus on potential effects on baleen whales than with toothed whales (although data is still considered limited)." EIS at IV-151.

Exhibit 129, Page 34 of 40

32

4. Humpback, Fin, and Other Baleen Whales

a. Effects of seismic and other noise on humpback, fin, and/or other baleen whales

"Given the greater potential for anthropogenic-noise impacts on baleen whales, more research has been done to focus on potential effects on baleen whales than with toothed whales (although data is still considered limited)." EIS at IV-151.

"No studies are available specific to the effects of seismic-survey noise on minke whales, but the potential for impacts would be considered within the range of other baleen whales. Also, no known long-term impacts have been documented on gray and minke whale behavior as a result of seismic activity." EIS at IV-151.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown, and information about the hearing capabilities of large baleen whales is mostly lacking." EIS at IV-89.

b. Effects of oil spills on humpback, fin, and/or other baleen whales

"[I]t is difficult to predict the impact of a large spill on either humpback whales or especially on fin whales. Based on literature on other mammals indicating severe adverse effects of inhalation of the toxic aromatic components of fresh oil, mortality of cetaceans could occur if they surfaced in large quantities of fresh oil. However, if such mortality occurred, it would be not be consistent with many, perhaps most, published findings of expected impacts of oil on cetaceans. The potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects." EIS at IV-122.

"There are no data available on which to evaluate the potential effect of a large or very large spill on baleen whale calves, on females who are very near term or who have just given birth, or on females accompanied by calves of any age." EIS at IV-161.

c. Cumulative impacts on humpback, fin, and/or other baleen whales

"There are no records of humpbacks killed or injured in the fisheries in which fishers self report (Angliss and Lodge, 2002), but the reliability of such data is unknown." EIS at V-29.

"The impacts of pollution and habitat degradation [on humpback whales] due to coastal development are not known." EIS at V-30.

Exhibit 129, Page 35 of 40

33

C. Other Marine Mammals

1. Seals

"It is uncertain how seismic surveys potentially might impact seal-food resources in the immediate vicinity of the survey." EIS at IV-147.

In the context of seals: "Although it is unlikely that airgun operations during most seismic surveys would cause [permanent threshold shift] in marine mammals, caution is warranted given the limited knowledge about noise-induced hearing damage in marine mammals." EIS at IV-147.

"Little information is known about oil-spill effects on seals although any large oil spill in nearshore marine or coastal riverine environments could cause injury or death to these sea mammals, potentially cause them to move off of their normal course, and make them unavailable for subsistence harvest." EIS at IV-217 (internal references omitted).

2. Walrus

a. Effects of seismic

There is "no data available to evaluate the potential response of walruses to seismic operations." EIS at IV-148.

"Quantitative research on the sensitivity of walruses to noise has been limited because no audiograms (a test to determine the range of frequencies and minimum hearing threshold) have been done on walruses." EIS IV-148.

"Although the hearing sensitivity of walruses is poorly known, source levels are thought to be high enough to cause temporary hearing loss in other species of pinnipeds." EIS at IV-148.

"Seismic operations are expected to create significantly more noise than general vessel and icebreaker traffic; however, there are no data available to evaluate the potential response of walruses to seismic operations." EIS IV-148.

3. Polar Bears

a. Effects from oil spills

"With the limited background information available regarding large oil spills in the offshore arctic environment, the outcome of a large oil spill is uncertain." EIS at IV-165.

Exhibit 129, Page 36 of 40

34

b. Cumulative effects

"Quantitative data are lacking that specifically addresses the potential cumulative impacts of development on polar bears and the effects of disturbance related to human activities on polar bear habitat use, as well as recruitment and survival (Perham, 2005). There also is a high degree of uncertainty regarding the spatial scope of potential Industry activities on the Alaskan OCS." EIS at V-36. *See also id.* at V-52 (same).

Exhibit 129, Page 37 of 40

35

III. MARINE AND COASTAL BIRDS

A. Impacts Generally

"Several areas historically documented to be important to marine and coastal birds in Sale 193 area, as well as the entire proposed lease sale area, lack site-specific data on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data is between 15 and 30 years old, making accurate analysis difficult. Overall, several species or species-groups have a high probability of experiencing substantial negative impacts. The risk that several regional bird populations could experience significant adverse impacts is high." EIS at II-37.

"The current distribution and abundance of [bird] predators along the Chukchi Sea coast are unknown." EIS at IV-132.

"Marine and coastal birds could be exposed to a variety of potential negative effects during seismic surveys, exploration drilling, and production including disturbances, collisions, habitat loss, petroleum exposure, and exposure to toxic contamination. The greatest potential for substantial adverse impacts typically would arise from collisions, aircraft disturbance, and large and chronic low-volume spills in important coastal bird habitats. These areas are Kasegaluk Lagoon, Ledyard Bay, Peard Bay, barrier islands, the spring open-water lead system, and the seabird-nesting colonies at Cape Lisburne and Cape Thompson. Despite the importance of these areas, as well as the entire Chukchi Sea within the proposed lease-sale area, little recent site-specific data are available on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data are between 15 and 30 years old, making accurate analysis difficult. Because of this long data gap, it is unknown if population abundance or distribution of many species have changed." EIS at IV-145.

1. Noise impacts on marine and coastal birds

"Seismic airgun pulses have the potential to physically harm or kill diving birds. The threshold for physiological damage, namely to the auditory system, for marine birds is unknown." EIS at IV-127.

"Few studies have assessed the effects of seismic surveys on marine birds and waterfowl." EIS at IV-127.

2. Oil impacts on marine and coastal birds

"There are several areas historically documented to be important to marine and coastal birds in the proposed lease sale area. These areas, as well as the entire proposed lease sale area, lack site-specific data on habitat use patterns, routes and timing to assess impacts. For many species, the most recent data is between 15 and 30 years old, making accurate analysis difficult." EIS IV-126.

Exhibit 129, Page 38 of 40

36

"It is unknown if exposed adult[birds] could become permanently sterilized [due to exposure to oil]." EIS at IV-133.

B. Impacts to Threatened Spectacled and Steller's Eiders⁴

"The behavioral response of eiders to aircraft overflights is unknown; some spectacled eiders nest and rear broods near the Deadhorse airport indicating that some individuals tolerate frequent aircraft noise. Individual tolerances are expected to vary, however, and the intensity of disturbance associated with the proposed action would, in most cases, be less than that experienced by birds at the Deadhorse airport. Some birds may be displaced, with unknown physiological and reproductive consequences." BE at 38 (emphases added).

"Collision-related mortality to eiders on the North Slope is not known and is difficult to estimate ..." BE at 44.

Ledyard Bay Critical Habitat Areas: "The loss of seafloor habitats due to exploration or delineation drilling cannot be quantified at this time, but could be in important staging or molt migration areas. The importance of these areas relative to the timing of molt, survival during the molting period, and condition after molting is unknown, however, the availability and quality of key resources in those areas during the prolonged migration period ultimately may influence the survival of the spectacled eiders (Petersen et al. 1999)." BE at 47.

"The disturbance radius from the drilling operation is unknown. Temporal and spatial use patterns for eiders within the Critical Habitat Area are also largely unknown." BE Addendum at 1.

C. Impacts to Kittlitz's Murrelets⁵

"Clearly, there is cause for concern regarding the long-term survival of the [Kittlitz's Murrelet] and the potential negative impacts of offshore oil and gas development; however, management decisions are difficult given the lack of available information." BE at 36-37.

"Though impacts of oil spills [on Kittlitz's murrelets] have been documented (van Vliet and McAllister 1994, Carter and Kuletz 1995), little is known of potential impacts of disturbance on courtship behavior, foraging ecology and feeding, or energetics (Day et al. 1999)." BE at 37.

⁴ See note 1.

⁵ See note 1.

Exhibit 129, Page 39 of 40

37

“Additional information on the response of diving birds to approaching seismic survey vessels is essential to verify assumptions that there is a low potential for seabirds, including Kittlitz’s murrelets, to be harmed by airgun noises.” BE at 41.

D. Impacts on Waterfowl

1. Impacts on Yellow-Billed Loons

“Yellow-billed loons in the Chukchi Sea are at particular risk [from environmental perturbations such as disturbance, habitat alterations, and oil spills] due to their low numbers and low reproductive rate. The species is little studied and basic biological information (such as the seasonal distribution of immature and non-breeding yellow-billed loons) is unknown. Additional research could improve our understanding of the vulnerabilities of the yellow-billed and other loons using nearshore areas of the Chukchi Sea and western Beaufort Sea.” EIS at IV-140-41.

2. Impacts on Common Eiders

“The number of [common eiders] that could be affected [by oil spill] at sea during spring or fall migration is unknown.” EIS at IV-142.

E. Impacts on Shorebirds

“Dunlins are another prominent species in Kasegaluk Lagoon and Peard Bay in late summer and fall. As with other species of shorebirds and waterfowl, a spill during periods of peak abundance could impact large numbers of dunlins. Less is known about the numbers, timing, and patterns of habitat use of Kasegaluk Lagoon and Peard Bay by bar-tailed godwits but, given their recent population declines, effects of an oil spill could be particularly important.” EIS at IV-144.

The Lease Sale 193 (Chukchi) and 2003 Multi-Sale (Beaufort 186, 195, 202) environmental impacts statements use the same primitive model to estimate how spilled oil might travel in the marine environment. This model, which was developed in 1982, forms the basis for the evaluation of potential impacts from a spill. Because the environmental assessments for the exploration drilling proposed for the Beaufort and Chukchi Seas in 2010 assume that no large spill will occur, they do not contain any additional modeling of, or evaluation of potential effects from, a spill. The model used in the environmental impact statements suffers from substantial deficiencies:

- The model assumes that spilled oil is a point—it does not account for spreading of spilled oil, for the possibility that different parcels of a spreading oil slick may travel along different trajectories, or that these parcels may re-converge at locations distant from the spill origin, all of which are important aspects of the behavior of actual oil spills.
- Much of the environmental data input to the model is old—particularly current and wind information, which is from 1979-1996. Much has changed in the Arctic since then, and better information should be available.
- The model cannot account for the presence of sea ice. It assumes that shorefast ice exists for part of the year and that the ice “masks” the shore, which means that no oil could reach the shore.
- The model divides the leased area into a series of quadrants. Within each quadrant, it predicts that a spill could occur from a number of locations. It treats a spill from each location as equally likely and then provides an estimate of likelihood that a spill from each quadrant would reach land. This method biases the calculation in two ways. Some of the locations are further from land than others, so the model understates the likelihood of spilled oil from one of the closer locations reaching shore. Also, a spill is not equally likely from each location—Shell only wants to drill at some of them.
- The SINTEF model used to evaluate weathering effects on spilled oil is independent of the model used to estimate trajectories, making it impossible to evaluate effects related to, for example, the increasing propensity of oil to sink as it weathers.
- The model does not consider interactions with suspended particulate matter, which is crucial for determining the propensity of spilled oil to sink, thereby affecting the benthic community which is especially important in Arctic coastal marine ecosystems.
- More sophisticated and appropriate models that address the defects listed above have been available for over a decade.

BOEMREAKPublicCommen@boemre.gov

Re: Chukchi Sea Lease Sale 193 Draft Supplemental Environmental Impact Statement

Dear Director Goll:

The Pew Environment Group appreciates the opportunity to comment on the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) draft Supplemental Environmental Impact Statement for Chukchi Sea Lease Sale 193 (draft SEIS). Unfortunately, the draft SEIS does not provide the “hard look” at the environmental impacts of Lease Sale 193 required by the National Environmental Policy Act (NEPA) because it fails to include necessary information regarding environmental consequences of oil and gas activities within the lease sale area. Thus, we request that BOEMRE prepare a revised draft SEIS that fully addresses the issues presented below.

The draft SEIS was prepared in response to a July 21, 2010 order of the Alaska federal district in *Native Village of Point Hope v. Salazar*. In that case, plaintiffs challenged the adequacy of the Final Environmental Impact Statement (FEIS) prepared by BOEMRE for the nearly 30 million acre Chukchi Sea Lease Sale 193. The court concluded that the FEIS analysis of environmental impacts of oil and gas activities in the Chukchi Sea lease sale area was deficient, and required the agency to rectify those flaws in a supplemental EIS. Specifically, the court ordered BOEMRE to (1) analyze the environmental impact of natural gas development; and (2) determine whether missing information identified by BOEMRE in the FEIS was essential or relevant to the agency’s decision making as required under NEPA regulation 40 CFR 1502.22; then (3) determine whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown. Our comments focus on the draft SEIS’ assessment of the relevance and need for information that was identified in the FEIS as missing or incomplete.

As an initial matter, we note that the analysis in the draft SEIS is not consistent with the Department of Interior’s offshore oil and gas program reforms that have been adopted in response to the *Deepwater Horizon* oil spill in the Gulf of Mexico. The Secretary of Interior has announced several changes to improve its analyses and decisions, most notably with respect to

PEW Environment Group Comment

NEPA compliance¹ and with respect to ensuring that decisions are based on sound science as detailed in the September 29, 2010, Secretarial Order No. 3305. In addition, the Department’s September 1, 2010 Outer Continental Shelf (OCS) Safety Oversight Board report provided recommendations to strengthen permitting and environmental stewardship. The report highlighted concerns with BOEMRE’s failure to fulfill its dual mandate to lease offshore lands, yet also to protect the environment and cultural resources. The Alaska Region must ensure these recommendations and reforms are implemented in all new decisions, including its draft SEIS for the Chukchi Sea. To date, the Alaska Regional office of BOEMRE has failed to do so.

NEPA and OCSLA Require Missing or Incomplete Information be Included in the SEIS

BOEMRE was ordered to supplement the FEIS it prepared for Lease Sale 193 by reassessing the extent and relevance to decision making of missing information about the environmental impacts of offshore oil and gas activities in the Chukchi Sea. In preparing the draft SEIS, BOEMRE must comply with NEPA’s obligation to take a “hard look” at environmental impacts, just as it must in preparing an initial FEIS. The draft SEIS fails to do so.

The draft SEIS purports to respond to the court’s order to meet the requirements of NEPA regulation 40 CFR 1502.22² by determining whether missing information in the FEIS is relevant to assessing potentially significant effects of oil and gas development in the Chukchi Sea, and whether the missing information is essential to a reasoned choice among the FEIS’ alternatives. The purpose of that regulation is to require agencies to gather all information necessary to make a decision, but to allow it to move forward in cases where information might not be relevant to the decision to be made or if the cost of obtaining the information is exorbitant. BOEMRE has not taken seriously its obligation to make a decision informed by science, and to gather whatever missing scientific information is needed, but has instead undertaken a paper exercise, simply cataloging the hundreds of statements in the FEIS regarding missing information and then concluding that the addition of any of this information is not necessary in the decision-making process.

BOEMRE’s primary rationale for its assertion that the information is not essential at the lease sale stage is that the decision is not a consequential commitment of the area to oil and gas activities and information can be obtained at later stages of the Outer Continental Shelf Lands Act (OCSLA) process, when the agency is evaluating exploration or production plans. This

¹ CEQ NEPA Guidance available at http://ceq.hss.doe.gov/current_developments/docs/CEQ_Report_Reviewing_MMS_OCS_NEPAImplementation.pdf

² Once incomplete or unavailable information regarding a foreseeable significant adverse effect is disclosed in an EIS, NEPA regulation 40 C.F.R. 1502.22 requires that: “If the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement.” Thus, the focus of the regulation is on obtaining that information and including it in the EIS.

PEW Environment Group Comment

reasoning misconstrues OCSLA, and also overlooks longstanding BOEMRE practice to conduct only abbreviated environmental assessments at the exploration plan stage and instead to rely heavily on the lease sale EIS analysis. This practice is necessitated by OCSLA, which requires the Secretary of the Interior to approve exploration plans within 30 days, constraining BOEMRE's ability to undertake an environmental review at that stage beyond the brief environmental assessment (EA) that, as a matter of practice, it prepares at the exploration stage.

More significantly, BOEMRE's reasoning ignores the nature of the decision to be made at each stage of oil and gas development under OCSLA. It is at the lease sale stage that the agency makes the decision about whether, where and how oil and gas activities will occur within a particular portion of the outer continental shelf. Once the leases are issued, the agency's ability to alter course is constrained. OCSLA authorizes the Secretary to suspend or cancel a lease or permit only if oil and gas activities threaten to cause serious harm or damage to life, property, the environment, or national security or defense. At the exploration plan stage, the decision is whether to approve a plan that outlines the exact location, timing and equipment to be used to explore for productive deposits of oil and gas. The decision at the development and production stage is similar. In other words, while OCSLA establishes stages for development of oil and gas resources in the outer continental shelf, the decision about whether to allow that activity to go forward occurs at the lease sale stage; the decisions at later stages are simply refinements of the lease decision and BOEMRE cannot change the decision about whether to authorize oil and gas activity absent unusual circumstances. Thus, BOEMRE must have complete information about the environmental effects at the lease sale stage *before* it decides whether to authorize oil and gas activities. This thorough understanding of the existing environment and the environmental consequences of development within that environment is essential not only to determining whether to authorize oil and gas activities but also to identify any mitigation measures to minimize potential environmental impacts.

PEW Environment Group Comment

across the Chukchi Sea, and this lack of information has been widely acknowledged (e.g., CRRS 2010, MBC 2007). Table 1 depicts by category the types of essential missing basic data about the Chukchi Sea ecosystem.

Type of Essential Need (or gap in knowledge)	Explanation	Example of Essential Need or gap in knowledge
Topic	Some resources have not been studied in the Arctic or have very little information.	Zooplankton, benthic organisms, fish
Abundance	For many species or species groups, there is little or no information on population size and/or relative abundance.	Zooplankton, Opilio crab, fish, ice seals, Chukchi polar bear population, Kittlitz's Murrelet
Spatial coverage	Many resources studied in depth still lack complete coverage over the Beaufort and Chukchi seas within the U.S. EEZ.	Benthic biomass, fish, Steller's Eider, Arctic fox
Type of Essential Need (or gap in knowledge)	Explanation	Example of Essential Need or gap in knowledge
Temporal coverage	Outside of remotely sensed satellite information (temperature, chlorophyll-a, etc.), no resource in the Arctic has adequate data to detect temporal change over annual or decadal time periods for the Beaufort and Chukchi seas.	Invertebrates, fish, birds (surveyed in nearshore areas only), and marine mammals (surveyed in Beaufort only)
Seasonal coverage	Most surveys occur in July and August when weather, sea ice, and snow are in optimal condition; direct observation is difficult to impossible at other times of the year. Most species are lacking adequate seasonal distribution data.	Invertebrates, benthic organisms, fish, polar bear, ribbon seal
Spatial scale	Very broad-scale information covering the Beaufort and Chukchi seas is available for many species. Similarly, fine scale survey data in disjunct development areas also exist. Mid-scale data with full spatial coverage are needed to make reasoned landscape-scale management decisions.	The Outer Continental Shelf Environmental Assessment Program (OCSEAP) which occurred in the 1970-1980s is a good mid-scale survey that has not occurred in recent years.

PEW Environment Group Comment

BOEMRE also asserts that it can defer gathering missing information at the lease sale stage because tiering of NEPA analyses is allowed within OCSLA. However, BOEMRE's approach is a misapplication of "tiering" within NEPA. Tiering is a means to allow an agency to avoid repetitive analysis in subsequent, more site-specific phases of a project. Thus, if a complete EIS is prepared at the first stage in which potential significant effects are identified, subsequent decisions can often be accompanied by a shorter EA/FONSI or an EIS that incorporates and follows from the analysis in the prior EIS. The key is that tiering allows for *subsequent* NEPA analysis to build on a thorough EIS prepared at an earlier stage. By assuming that it can defer gathering information until a later stage, BOEMRE is in essence committing itself to undertaking an EIS later, turning tiering on its head. In light of the fact that BOEMRE's decisions regarding approvals for oil and gas activity continue to be challenged, it makes no sense to pursue a status quo approach that satisfies no one. In its August 16, 2010 report and recommendations to BOEMRE regarding NEPA implementation, the Council on Environmental Quality (CEQ) clarified the purpose and implementation of tiering.³ The practical reality is that in order to fully comply with NEPA within the structure of OCSLA, the agency must prepare a full assessment of potential impacts and the site-specific details and impacts can then easily be addressed within the compressed approval time period for an exploration plan.

It bears mentioning that the task of gathering the vast amount of incomplete and missing information necessary to conduct a thorough analysis of the environmental impacts of oil and gas activity within Lease Sale 193 is a consequence of BOEMRE's decision to offer for lease an area approximately the size of Colorado.⁴ It would be daunting in the best of circumstances to gather and analyze the necessary information for an area of this huge scope. Nonetheless, BOEMRE cannot use its decision to offer for lease such a huge area to then treat the lease sale decision as a programmatic rather than site specific decision or as an excuse to not fully analyze the environmental impacts of oil and gas activity within that area on the grounds that it is too big with too many unknowns.

Information Identified as Missing or Incomplete in the FEIS and draft SEIS is Essential to Making Decisions Regarding the Lease Sale

BOEMRE also concludes that missing information is not relevant or essential to a choice among alternatives because the impacts under all of its alternatives are essentially the same. This rationale does nothing to support its position but instead suggests that its range of alternatives is inadequate, further compounding the flaws in the FEIS. Much of the missing information identified by BOEMRE in the original Lease Sale 193 EIS is essential to a reasoned choice about whether, where, and under what conditions to offer oil and gas leases in the Chukchi Sea. Gaps in data about the Chukchi Sea include missing basic information about species that inhabit the region and their habitat needs over both time and space. These types of gaps are widespread

³ CEQ NEPA Guidance at 22-24, available at http://ceq.hqs.gov/current_developments/docs/CEQ_Report_Reviewing_MMS_OCS_NEPAImplementation.pdf
⁴ Under OCSLA, leases are to be for tracts "consisting of a compact area not exceeding five thousand seven hundred and sixty acres, as the Secretary may determine, unless the Secretary finds that a larger area is necessary to comprise a reasonable economic production unit." 43 U.S.C. Sec. 1337(6)(b).

PEW Environment Group Comment

Another type of missing information is data about the effects of oil and gas exploration and development on species and habitats in the Chukchi Sea. One of the lessons we have learned from the *Deepwater Horizon* Gulf of Mexico oil spill is that BOEMRE must conduct meaningful environmental review, including a full analysis of impacts, before offshore oil and gas activities occur (Nuka 2010). For example, to prevent and prepare for oil spills in the Arctic Ocean, BOEMRE needs information on the physical environment and the unique challenges it poses to offshore oil and gas drilling. It also needs to understand the effect of drilling and oil spills on marine ecosystems. A prediction of the impacts of spilled oil in Arctic waters must take into account the behavior of oil in an environment with sea ice, the varying characteristics of sea ice throughout the year, Arctic weather conditions, the long-term fate of oil in cold water and the specific vulnerabilities of Arctic marine species and ecosystems. BOEMRE has not endeavored to obtain this information for the draft SEIS.

BOEMRE Failed to Include in the FEIS and draft SEIS Available Analyses and Studies

BOEMRE completed this draft SEIS without obtaining and incorporating information from relevant Department of Interior Arctic Ocean science initiatives. Those efforts, though not currently complete, would contribute to a more thorough analysis of environmental impacts in the draft SEIS. Specifically, BOEMRE failed to take advantage of - or even acknowledge - the ongoing analysis by the U.S. Geological Survey (USGS) to identify information gaps in the Arctic Ocean as related to decisions about OCS activity that was ordered by the Secretary of Interior on March 31, 2010. That analysis will be completed in April 2011. The draft SEIS also appears to have been developed in isolation from an assessment BOEMRE is undertaking specifically to address missing information about the Chukchi Sea (MBC 2007). This Chukchi Offshore Monitoring in Drilling Area (COMIDA) effort by BOEMRE is intended to "characterize the Chukchi Sea ecosystem in order to detect and distinguish future changes resulting from oil industry activities, natural variability, and other anthropogenic effects...prior to oil and gas exploration activities" (MBC 2007). The COMIDA effort is supposed to look at data needs and provide monitoring recommendations from an ecosystem perspective, and to obtain baseline data before oil and gas activity, including exploration begins in the Chukchi Sea. While COMIDA has a promise of providing sufficient information to assist the agency in making informed decisions, the agency is not using the information gained from this research effort to inform its decisions regarding if, when, where and how oil and gas activities might occur in the Chukchi Sea.

Moreover, BOEMRE could have - and should have - included additional information in the draft SEIS that has become available in the two years since the FEIS was completed. Attachment 1 is a list of references that include relevant and essential information that should be incorporated into a revised draft SEIS.

One example pertains to the bowhead whale - an important marine mammal for the Inupiat along the Arctic slope, and a species afforded protection under the Marine Mammal Protection Act and the Endangered Species Act. The FEIS acknowledges "data are limited on the bowhead whale fall migration through the Chukchi Sea before the whales move south into the Bering Sea." And that "recent data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available." In the draft SEIS (Appendix A) BOEMRE

responded that: “While there will always be some lag between environmental change and available data that reflects that change, BOEM (formerly MMS) has conducted or commissioned extensive study bowhead use of the Chukchi Sea, and a general understanding of the bowhead distribution, abundance, and habitat use is known.” The important and very pertinent research to which the agency refers was finalized in July of this year, and made publicly available on their website during the fall of 2010 (Quakenbush et al. 2010). The draft SEIS goes on to say “Existing information is sufficient to support sound scientific judgments and reasoned managerial decisions, especially during the earlier stages of OCSLA review, which are necessarily more programmatic in nature. Furthermore, the missing information pertains to potential impacts equally applicable to each action alternatives, meaning that additional information on this subject is not likely to be useful to decision making at this stage. Overall, this incomplete information is not essential to a reasoned choice among alternatives.” However, this is not necessarily the case, as Quakenbush et al. (2010) identified important corridors for migration and important feeding areas that should be excluded from the lease sale or at least considered essential information.

The alternatives considered by BOEMRE in the draft SEIS all have the same impacts, with the exception of no action – indicating that the range of alternatives is too narrow. Ecologically sensitive areas must be identified and protected. Areas within an ecosystem are not equal in biological and ecological terms; some areas are more important than others to the ecosystem or human populations. Identification of important ecological areas based on essential habitats and functions in the Arctic ecosystem along with traditional cultural activities, can be an important step toward ensuring ecosystem functionality. The ecologically and culturally sensitive areas in the Arctic Ocean should be removed from the leasing process.

The draft SEIS also fails to include all of the relevant and related information collected from the BOEMRE Environmental Studies Program in Alaska. For example, Attachment 2 documents peer reviewed literature produced by the Environmental Studies Program since 1990⁵ that was not considered, but relevant to the FEIS and subsequent draft SEIS. The Alaska Annual Studies Plan Final FY 2011 notes that since the conception of the Environmental Studies Program in 1973 more than \$350 million has funded studies in Alaska across 15 planning areas (BOEMRE 2010). Since much time and effort was put into these studies, it is for BOEMRE’ responsibility to consider the results and implications of these study results, particularly as they may contribute to some of the essential unknown information about species and habitats as well as the effects of oil and gas exploration and development on these species and habitats.

Traditional Knowledge Can Be Used to Fill Gaps in Information

Some of the information that was identified in the FEIS and draft SEIS as missing or incomplete could be satisfied in part by incorporating local and traditional knowledge. Local and traditional knowledge, a different but equally valid knowledge system will help expand our understanding of the Arctic and can supplement and enhance existing knowledge. Indigenous peoples who have lived in the Arctic Ocean region for millennia have developed a wealth of knowledge about

⁵ BOEMRE provides a listing of all peer-reviewed ESP studies at: http://alaska.boemre.gov/ess/2010_0604_AKPeerReview.pdf (last accessed 21 November 2010)

BOEMRE has used the same flawed segregated approach that it uses in its research to its assessment of missing information in the draft SEIS. The agency has reached the conclusion that none of the missing information is essential to decision making by addressing each statement regarding missing information in isolation without looking at the entire set of research needs for particular species or other environmental parameters. However, a more holistic approach, would likely lead to a different conclusion. It is possible to conclude that each piece of missing information might not be relevant to the decision to be made, but taken together, all of the missing information for a particular species certainly is important. This type of piecemeal approach to scientific research is pervasive in all of BOEMRE research study programs and ensures that scientific research produces little useable information to advance knowledge about the Arctic Ocean.

What is needed instead is a comprehensive, integrated research and monitoring plan for the U.S. Arctic to improve our understanding of Arctic marine ecosystem structure and functioning and to avoid adverse impacts on the Arctic environment and subsistence way of life. Such a plan should (1) define existing information and research needs such as in a gap analysis (this is currently undertaken by the USGS) (2) gain a more comprehensive catalog of species, populations and habitats (including seasonal migrations) in a marine life assessment (3) track the physical factors that influence and determine biological productivity, habitat preference and migration pathways in an integrated, comprehensive environmental monitoring program (4) secure a better understanding of ecosystem interactions and trophic linkages and the effects of human activity and (5) integrate scientific data to identify processes and habitats that are sensitive and vulnerable to disruption. Such work is critical to the development of a comprehensive, collaborative program of research, monitoring, data collection, mapping, and documentation of local and traditional knowledge in the Arctic Ocean. This science plan would provide the framework for all development activity in the Arctic, and approval of oil and gas development activity would have to be consistent with the plan’s ecological science, monitoring, and assessments.

BOEMRE Must Prepare a Revised SEIS

BOEMRE’s draft SEIS fails to adequately address the district court’s order and fails to satisfy NEPA’s requirements. The draft SEIS also fails to incorporate the offshore oil and gas program reforms initiated by Department of Interior in the face of the worst environmental disaster in our nation’s history. BOEMRE should prepare a revised draft SEIS only after it has gathered missing information and drawn on the work of other agencies.

Sincerely,

Marilyn Heiman
Director, U.S. Arctic Program
PEW Environment Group

Eleanor Huffines
Manager, U.S. Arctic Program
PEW Environment Group

the region. They depend on local plants and animals for food, clothing and shelter, and have learned a great deal about the species they use and see. In recent years, a substantial amount of research has focused on traditional knowledge in the Arctic. Major projects such as the Arctic Council’s Arctic Climate Impact Assessment (ACIA 2004) have incorporated traditional knowledge in efforts to understand what is taking place in the region. Nonetheless, there is much more to be done to make the knowledge of Arctic peoples more widely available, such as incorporating traditional knowledge in management processes that directly impact people, including in this EIS process. Co-management organizations and institutes of public governance are one means of incorporating not just knowledge but the holders of that knowledge in the decision-making process. Greater involvement by Arctic peoples in the governance of their regions and communities allows their knowledge to benefit modern institutions. These approaches can help in the development of long-term solutions to economic and environmental challenges in the Arctic.

Documenting knowledge in a report, however, is just one step towards fully incorporating what Arctic peoples have learned over generations. A report about traditional knowledge may put certain facts and observations before a larger audience but using that knowledge appropriately entails the wisdom than many people associate with traditional perspectives. We have attached a bibliography with selected references that should help provide guidance and provide examples of situations where traditional knowledge has been effectively utilized (Attachment 3). Traditional knowledge can help fill some of the gaps in the draft SEIS as well as guide future efforts to collect necessary information.

BOEMRE Must Employ a Holistic Ecosystem-Based Approach to Research

We recognize and acknowledge that research has been and is currently being conducted in the Chukchi Sea by various U.S. government agencies, and by industry (e.g., BOEMRE 2010, Funk et al. 2007). These studies are important and contribute to our baseline knowledge and understanding of the Chukchi Sea ecosystem. However, the existence of such research does not necessarily mean that it is relevant or complete to sufficiently inform the decisions about whether, where, when, and how oil and gas activity should occur in the Chukchi Sea. A large quantity of research cannot substitute for relevant research.

Existing scientific studies have been undertaken in an uncoordinated basis without an overarching purpose for the information or a clearly identified goal to advance knowledge of Chukchi Sea ecosystems. Specifically, many of the current scientific studies are focused on specific drilling lease sites that are of interest to industry. They provide information about physical and biological aspects (e.g., species) for a small area within a larger ecosystem for a limited time period. To be useful to leasing decisions, longer-term studies must be undertaken in order to provide an understanding of the variability of species over time. Moreover, the current piecemeal approach to science currently practiced by BOEMRE in its Environmental Studies Program Annual Study Plan, is not adequate. Narrow studies are undertaken by contractors responding to a request for proposal (RFP) with no coordinated analysis and synthesis of that information. Without an overarching purpose and scientific plan to guide and tie the research together, the individual studies do little to advance knowledge of the Chukchi Sea.

Re: Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (OCS EIS/EA BOEMRE 2010-034)

Dear Regional Director Goll:

Thank you for the opportunity to provide comments on the Draft Chukchi Sea Lease Sale 193 Supplemental Environmental Impact Statement (draft SEIS) prepared by the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) pursuant to the National Environmental Policy Act. As discussed in the October 15, 2010 *Federal Register* notice, "The purpose of this SEIS (OCS EIS/EA BOEMRE 2010-034) is to provide new analysis in accordance with the United States (U.S.) District Court for the District of Alaska Order remanding the BOEMRE's Chukchi Sea Lease Sale 193 Final EIS (FEIS) (OCSEIS/EA MMS 2007-0026)" (75 FR 63504). The draft SEIS is dated September 2010, only a few weeks after the District Court's decision, so it appears that little new analysis was performed by BOEMRE despite the Court's mandate.

The Wilderness Society (TWS) contributed to and supports the comments submitted by Alaska Wilderness League, *et al.*, however we are submitting these comments to highlight additional items we would like BOEMRE to address. As for my background, I have over 25 years of engineering experience in the private, governmental, and non-profit sectors, and I am a licensed professional engineer in both Alaska and Maryland. I have presented invited testimony to Congress on numerous occasions on oil and gas issues, and I served as a technical advisor on the Department of the Interior's report to the President delivered on May 27, 2010, containing recommendations for BOEMRE following the *Deepwater Horizon* spill.

TWS's mission is to protect wilderness and to inspire Americans to care for our wild places. Since 1935, TWS has led the conservation movement in wilderness protection, writing and passing the landmark Wilderness Act and winning lasting protections for 109 million acres of wilderness including 56 million acres of spectacular and ecologically important lands in Alaska. TWS has approximately 225,000 members nationwide and over 750 members in Alaska who share an interest in how the Arctic Ocean is managed because of its inherent value and because decisions involving the Arctic Ocean could affect wild lands in northern Alaska. TWS has a strong concern for the sound management and the well-being of the largest public land management unit in the U.S., the National Petroleum Reserve – Alaska, with a good portion of its coastline located adjacent to the Chukchi Sea.

705 Christensen Drive, Anchorage AK 99501 | ph 907 272-9453 | wilderness.org

The Wilderness Society Comment

2

TWS' Position on Offshore Drilling in the Chukchi Sea

TWS opposes platform-based offshore drilling in the Arctic Ocean including the Chukchi Sea at this time. It is premature to move forward with offshore drilling without:

1. Adequate scientific information on marine and potentially affected coastal resources (baseline data).
2. The baseline data needed for marine and coastal spatial planning.
3. Sufficient spill cleanup capabilities and infrastructure in place, and
4. BOEMRE promulgating needed regulations and ensuring sufficient drilling oversight via adequate enforcement resources, governmental accountability and transparency, and other measures.

Each of these points is discussed below. TWS believes the stakes are high regarding offshore drilling in the Chukchi at this time. Should there be a spill on the scale of the *Deepwater Horizon* tragedy, globally important marine food webs, habitat for iconic species like polar bears, and social and economic values sustaining vibrant indigenous communities likely would be adversely affected.

Baseline Data: The Arctic Ocean is one of the least studied and most poorly understood ecosystems in the world. Baseline data on Arctic Ocean ecology are critical because they allow decision-makers and the public to decide whether or not to put particular resources at risk and, if there is a major spill, to quantify damages to those resources. Without such data, decision-makers and the public cannot make informed choices about offshore drilling as they do not know the likely risks or true sensitivities of the area.

The non-profit organization [Oceana](http://oceana.org) has done an excellent job describing the scientific and policy rationales for more baseline data on the Chukchi Sea, including the relatively small cost of collecting these data, in its October 20, 2010 DRAFT document entitled *A Comprehensive, Integrated Approach to Arctic Science and Local and Traditional Knowledge for Offshore Oil and Gas Planning* (see Appendix 1). This draft includes the following important and relevant paragraph:

The cost of this type of research and monitoring program is not exorbitant. The plan outlined in Attachment 1 could be carried out for approximately \$100 million over 5 years. By comparison, Lease Sale 193 alone generated \$2.7 billion in revenue to the federal government. At less than five percent of that revenue, the cost of the program is relatively small. Further, in considering whether the cost of obtaining additional data on the Chukchi Sea is exorbitant, BOEMRE must consider the risk and benefits of the governmental action at issue. Lease Sale 193 covers nearly thirty million acres of remote, undeveloped Arctic Ocean, and oil and gas activities would threaten the subsistence way of life, wildlife, habitat, and the marine ecosystem more generally. It may provide jobs and other economic benefit, but it also poses considerable risks, economic and otherwise, to the benefits provided by a healthy marine ecosystem. (p. 9)

The data needs identified by Oceana regarding the Chukchi are essential for the science-based decision-making embraced by the Obama Administration. These needs clearly are not exorbitant in cost, particularly in light of the scale of potential oil and gas development in the Chukchi.

Unfortunately, the authors of BOEMRE's draft SEIS have taken an extremely narrow view of data needs. In Appendix A of the draft SEIS entitled "Analysis of Incomplete or Missing Information," BOEMRE lists the numerous statements from the 193 FEIS containing "incomplete or unavailable" information on marine and potentially affected coastal resources. BOEMRE states, however, that

The Wilderness Society Comment

3

despite the large amount of incomplete or unavailable information its "analysts were generally able to complete thorough analyses and draw informed conclusions from the information available." How is this possible? It is only possible by accepting BOEMRE's conclusion that the incomplete or unavailable information was not "essential to a reasoned choice among alternatives" (Draft SEIS Appendix A, p. 1, emphasis in original). If one accepts BOEMRE's position that the alternatives in the FEIS are unalterable and largely indistinguishable with respect to potentially affected resources which TWS does not, then more ecological data likely would not change BOEMRE's conclusions. If, on the other hand, more data on whale presence or rare fish species in particular areas would alter the alternatives in the FEIS and the SEIS for example, that type of information absolutely would be relevant to decision-makers and the public.

While TWS agrees that not all impacts of development can be definitively known, it makes no sense to not evaluate those we can assess. In the draft SEIS, BOEMRE has made an unjustifiable choice to not research information gaps that might be relatively inexpensive and/or easy to remedy, including not utilizing any or all the relevant studies completed since the FEIS. As BOEMRE knows, the U.S. Geological Survey will complete a study early next year of scientific gaps in Chukchi Sea data – at a minimum, BOEMRE should wait until this study is out to see which types of data needs can be filled at a non-exorbitant cost before finalizing its SEIS.

Marine and Coastal Spatial Planning: Currently, public lands undergo planning processes which identify appropriate uses for all or portions of protected lands while our oceans undergo no such processes. The *Final Recommendations of The Interagency Ocean Policy Task Force report*, July 19, 2010, are a first step toward remedying that deficiency which results in inadequate environmental protection of the nation's oceans. The baseline data that would be collected for the Chukchi under Oceana's proposal could be used, among other things, to identify marine and coastal ecological "hotspots" (i.e., areas of high biological productivity or importance, including areas of cultural importance) which should be provided with increased protections from industrial and other activities that could harm them.

Among the Task Force's National Priority Objectives are two that are extremely relevant to the Chukchi: "2. **Coastal and Marine Spatial Planning:** Implement comprehensive, integrated, ecosystem based coastal and marine spatial planning and management in the United States" and "8. **Changing Conditions in the Arctic:** Address environmental stewardship needs in the Arctic Ocean and adjacent coastal areas in the face of climate-induced and other environmental changes" (p. 6). Pages 7-8 of the Task Force report provide details on a proposed implementation framework for marine and coastal spatial planning, including the Task Force's goal to have all plans completed by 2015.

Spill Cleanup Capability and Infrastructure: The *Deepwater Horizon* spill and its ongoing investigations demonstrate incontrovertibly that major oil spills from offshore drilling occur (even among the most well-funded operators), that some spills cannot be prevented as there is no failsafe mechanism for every situation, and that cleanup of more than a minimal amount of oil once it is in the ocean or onshore is difficult if not impossible. And those problems existed in a temperate environment with lots of infrastructure. The Arctic, in contrast, has extremely adverse weather and light conditions outside of summer and virtually no shore-based infrastructure currently including no Coast Guard facilities, no roads to communities so everything would arrive by air or boat, little housing for cleanup workers, etc.

On November 10, 2010, The Pew Environment Group published a peer-reviewed technical report entitled *Oil Spill Prevention and Response in the U.S. Arctic Ocean: Unexamined Risks, Unacceptable Consequences*. This well-researched [report](http://www.pewenvironment.org) describes the numerous difficulties of Arctic spill response including the need for:

- Arctic oil spill trajectory modeling when ice is present.

- Testing of spill response technologies in Arctic conditions; likewise, the need to develop a “response gap” analysis for the percent of time that Arctic environmental conditions prevent the use of oil spill cleanup equipment (e.g., waves preventing boom use, ice preventing mechanical recovery, etc.).
- Infrastructure gaps to be assessed and addressed, and
- Credible worst-case scenario analyses, especially following what we know from the *Deepwater Horizon* spill (i.e., prior to that spill, BOEMRE considered blowouts unlikely which is no longer a credible position).

TWS supports the recommendations in the Pew report and its associated Policy Recommendations [report](#) and asks BOEMRE to address these recommendations in its response to comments for the draft SEIS.

Needed Regulations and Oversight. Without an adequate regulatory framework and effective enforcement and public transparency, BOEMRE is a toothless overseer of drilling operations and cannot prevent major oil spills. According to the FEIS:

Over the life of the hypothetical development and production that could follow from the lease sale, other effects are possible from events, such as a large, accidental oil spill or natural gas release. We estimate the chance of a large spill greater than or equal to 1,000 bbl occurring and entering offshore waters is within a range of 33-51%. (p. ES-4)

A 33-51% likelihood of a major oil spill shows that both the industry and its regulators currently tolerate a very high level of risk – imagine if there was that high a likelihood of a crash during the lifetime of an airplane. If so, would anyone fly?

During the one-month period following the *Deepwater Horizon* spill, I helped formulated the recommendations to the President issued in the DOI report entitled *Increased Safety Measures for Energy Development on the Outer Continental Shelf*. These recommendations for regulatory upgrades are only a beginning; it’s likely that the investigations and research following the spill will present additional statutory, regulatory, and oversight recommendations. As many of the regulatory recommendations will require research and public notice and comment, it likely will take several years – perhaps as long as 5-10 years – until they are all fully enacted (and by then, changes in the industry might require additional regulatory measures...). Additionally, BOEMRE needs to obtain the funds from Congress for adequate inspectors and enforcement personnel – it could take several years before BOEMRE has sufficient staffing.

As someone who has worked on pipeline safety issues for approximately 15 years, I know that government accountability and transparency is essential to ensure good performance by regulatory agencies. Thus, it will be important for BOEMRE in future years to post extensive user-friendly and sortable information on releases and their causes as well as information on its inspections, its enforcement actions, and its real-time monitoring of offshore operations. Of course, these activities also will take years to implement fully.

Chukchi Sea Spill Modeling and the Risk of Blowouts

According to the FEIS, “For purposes of analysis, we model one large spill of either 1,500 bbl (platform spill) or 4,600 bbl (pipeline spill)” (p. ES-4). While this information is not addressed in the draft SEIS, it should be because we now know as a result of the *Deepwater Horizon* spill that blowouts are not unlikely. And we know as a result of the 2009 Montara oil platform blowout off the coast of Australia, the 1979 Ixtoc oil platform blowout in the Gulf of Mexico, and the 1985 and 1987 gas blowouts in Cook Inlet discussed in my draft SEIS oral testimony (see Appendix 2) that blowouts can occur under shallow water conditions.

705 Christensen Drive, Anchorage AK 99501 | ph 907 272-9453 | wilderness.org

Pat Pourchot, DOI Special Assistant to the Secretary for Alaska Affairs

TWS requests that a new SEIS contain a realistic large spill discharge, and that BOEMRE model the spill’s impacts on marine and coastal resources.

The Need to Differentiate Arctic Offshore Drilling from Lower 48 Offshore Drilling

While offshore drilling technologies are similar wherever they may be used, there are several key reasons why BOEMRE needs to treat Arctic drilling differently than Gulf of Mexico drilling and drilling elsewhere in the Lower 48. As discussed above, there is inadequate baseline data in the Chukchi and the conditions for cleanup are far tougher than in the Gulf, including the current inability of operators to provide effective cleanup in broken ice conditions. Moreover, the long periods of cold and darkness in the Arctic can result in increased worker safety concerns from fatigue and other causes. The Oil Spill Commission learned that in the case of the *Deepwater Horizon* certain critical supplies were not ordered as they would take too long to arrive – the supply situation would be much worse in the Arctic, likely increasing the drilling risks.

Additionally, the Arctic is more pristine and its resources seemingly more critical to coastal community residents since those in Arctic Slope villages have fewer alternatives for supplies than those living in Gulf communities. For all these reasons, there is a greater need for precautionary decision-making before allowing drilling in the Arctic as compared to drilling in the Gulf.

Problems with the Draft SEIS Public Hearing Process

Finally, TWS would like to express its concerns with the draft SEIS public hearing process. In addition to hearings in Arctic communities taking place immediately prior to and on election day which should not have been the case as it limited the participation of the interested public, the Anchorage public hearing on November 9 had a number of problems. The hearing room was too small to accommodate the crowd, and many people were forced to stand. There was no microphone, thus making it very difficult to hear those who testified. Indeed, BOEMRE asked those who testified to face the audience rather than the agency officials present at the meeting. BOEMRE did not allocate time equally among those who testified – some speakers were permitted to testify for much longer than their allotted two minutes while others were cut off after that time. Last, BOEMRE did not provide all those who signed up to testify an opportunity to speak, shutting the meeting down at exactly ten o’clock. BOEMRE needs to meaningfully and respectfully engage and hear testimony from the interested public at its hearings in the future.

In conclusion, the quick development of the draft SEIS document and its lack of new analysis – as requested by the Court – greatly concerns TWS. We continue to hope that BOEMRE will differentiate itself from its predecessor agency MMS and choose a more thoughtful, science-based approach to drilling in the Chukchi, an approach that recognizes and addresses the many current problems with offshore drilling in the Arctic. Thank you very much for your consideration of these comments.

Respectfully submitted,

Lois N. Epstein, P.E.
Engineer and Arctic Program Director
The Wilderness Society

A Comprehensive, Integrated Approach to Arctic Science and Local and Traditional Knowledge for Offshore Oil and Gas Planning

Introduction

The United States is at a crossroads with respect to planning and decision-making for offshore oil and gas activities in the Chukchi and Beaufort seas. President Obama and the Department of the Interior (DOI) must decide whether to continue with plans and approvals that are based on inadequate science and have generated controversy, litigation, and—as the blowout in the Gulf of Mexico demonstrates—the potential for environmental and social disaster. This document and the attachments provide a path forward that would use a comprehensive, integrated scientific research and monitoring plan to fill the gaps identified by scientists and courts and provide the necessary baseline information from which to make effective decisions.

At the heart of the controversy about offshore drilling in the Arctic is the widely acknowledged lack of scientific information about the Arctic Ocean. While we do know that the Arctic Ocean is important to life in coastal communities, has regions of high productivity that support varied ecosystems with iconic species of wildlife, helps regulate the planet’s weather and climate, and is changing rapidly, scientists know very little about how the Arctic Ocean functions or the ways in which it might respond to stresses from industrial activities. The lack of baseline information about the marine ecosystem was one of the bases for court decisions invalidating the 2007-12 Five-Year Leasing Program and Lease Sale 193 in the Chukchi Sea. Without this understanding, it is not possible to comply with statutory and regulatory mandates that were established to help ensure responsible stewardship of resources, including the Outer Continental Shelf Lands Act (OCSLA), National Environmental Policy Act (NEPA), Endangered Species Act (ESA), and Marine Mammal Protection Act (MMPA)

Moreover, the lack of baseline information creates a significant impediment to both effective planning and preparedness. The U.S. Commission on Ocean Policy stated as a principle tenet, “Ocean managers and policy makers need comprehensive scientific information about the ocean and its environment to make wise decisions.”¹ The final recommendations of the Interagency Ocean Policy Task Force (OPTF) call for science-based decision making and a better understanding of our ocean ecosystems, including a special emphasis on the Arctic.² The Obama administration implemented the final OPTF recommendations and has both the opportunity and obligation to obtain the necessary science and use it to guide decisions about industrial activities.³ By deferring future leasing in the Chukchi and Beaufort seas, calling for the U.S. Geological Survey Arctic (USGS) gap analysis, committing to science in the NOAA Arctic Strategic Plan, and creating the National Commission on the BP Deepwater Horizon Oil Spill and Offshore Drilling, the Obama administration has taken important steps toward allowing for comprehensive science and planning. At the same time, the government is in the process of determining how to respond to the court-ordered re-evaluation of Lease Sale 193 and the 2007-12 Five-Year Leasing Program, and Congress is debating legislation that includes provisions for better science in the Arctic.

The most effective way to respond to the courts’ orders and prepare for decisions about future industrial activities is to undertake comprehensive research and monitoring that would provide a fundamental understanding of the marine ecosystem. This research has not been done adequately before, and much of what has been done is decades out of date in a region that is changing rapidly. While it is true that DOI and industry have undertaken significant research, those efforts have been narrowly focused, applied

studies designed to answer individual questions. Similarly, the National Science Foundation has funded significant cutting edge, hypothesis-driven basic research. While these efforts bolster our understanding of some processes in limited areas, they have not been conducted at the scale necessary to provide the holistic understanding of the ecosystem needed to make wise decisions about if and how industrial activities should proceed. Nor have they been conducted year-round—almost all of the existing studies focused solely on the summer months. The needed information is best obtained through year-round monitoring (including sampling for species distributions and abundance) and interdisciplinary research to elaborate trophic relationships, ecosystem structure and functioning, and other interactions.

Moving from uncoordinated studies to planned, integrated research would provide the necessary information, affordably, in a reasonable amount of time. In fact, the USGS gap analysis study, which has already started, could be the initial step. The results of that study—which should identify some of the largest and most pressing information gaps—should be used to help design the research program. The largest and most important information gaps almost certainly could be filled in 5-7 years for approximately \$20 million annually. Given the \$2.7 billion in revenue generated from Lease Sale 193 alone and the immense risks from oil and gas activities, this cost is neither exorbitant nor unwarranted. Such a comprehensive plan would provide many of the answers to the unknowns identified in the court proceedings relevant to Lease Sale 193 and the 2007-12 Five-Year Leasing Program and would provide the necessary information to make informed decision about whether to allow industrial activities and, if so, under what conditions.

State of Science About the Arctic Ocean

Very little is known about the Arctic Ocean, and in particular the Chukchi Sea. According to the U.S. Arctic Research Commission, the Arctic is “the least studied and most poorly understood area on Earth.”⁴ In particular, “The Arctic Ocean is the least well known ocean on the planet. We know more about the topography of the planets Venus and Mars than we do about the bathymetry of the Arctic Ocean.”⁵ Even our knowledge of what species inhabit the U.S. Arctic Ocean, either permanently or seasonally, is substantially incomplete. We recognize that the recent losses of sea ice during summer are fundamentally changing these ecosystems, but we still know little about the abundance and distribution of common species much less how the food webs work in this region.⁶

As part of the Lease Sale 193 litigation, the plaintiffs compiled a 38-page appendix of quotations from the Environmental Impact Statement that recognize the lack of available information about the Chukchi Sea.⁷ These citations are explicit recognitions by DOI and NOAA that there is significant missing information about even the most basic parameters for every one of the largest and most conspicuous animals in the ecosystem—all fish, marine mammals and birds—which in other regions are typically the most highly studied animals of an ecosystem. The missing information for these species includes abundance, distribution, and life history. This lack of basic information makes it difficult, if not impossible, to determine whether there will be significant impacts to the animals and the ecosystem. The state of information about the more charismatic animals in the ecosystem is further evidence of the lack of

(hereinafter “Arctic FMP EA”).

⁷ This appendix is Attachment 2 to this document.

Since the conclusion of the OCSEAP program, DOI’s studies in the Arctic Ocean have not been guided by an overarching monitoring and research plan. Instead, research priorities over the past several decades have been guided by an assumption that enough was known about the basics. DOI, therefore, focused “on topical studies in smaller areas to answer specific questions and fill identified information needs.”¹³ These applied research questions are important and have led to a better understanding of specific issues, such as the fall bowhead whale migration route through the Chukchi Sea. However, without continued monitoring of key parameters studied in OCSEAP it is now unclear if the base of information gained remains valid. Climate change has altered the region dramatically over the last 30 years and ecosystems have significant variability on yearly to decadal spans.

Thus, DOI stopped examining and monitoring the fundamentals and, instead focused on applied research without even tying those studies together in a framework or committing to update results. As a result, population and distribution data for several vulnerable species that play important roles in the marine ecosystem are either outdated or missing. For example, Arctic cod, which is potentially the most important fish species in this ecosystem, is indicated to be present throughout all of the U.S. EEZ, but no seasonal variation, concentration, or spawning area data are published at this time.¹⁴

The lack of comprehensive planning may account, at least in part, for conflicting statements made by DOI—first through the Bureau of Land Management then Minerals Management Service and now Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE)—about the state of science in the Arctic. On the one hand, DOI has acknowledged repeatedly both that it lacks basic scientific information and needs good information for decision making.¹⁵ On the other hand, the agency points to the fact that it has spent \$350 million on research since 1973 across Alaska’s 15 OCS planning areas and, therefore, has a substantial understanding of the Arctic Ocean.¹⁶ The agency also has argued in court that the research undertaken gives it a sufficient basis for making decisions.¹⁷ The references in the Lease Sale 193 EIS discussed above about the lack of basic information for species runs directly counter to any assertions by DOI or BOEMRE that there is a broad base of information available for the Arctic from which to make decisions.

The National Science Foundation (NSF) also has funded important basic research in the Arctic Ocean. That research has been hypothesis-driven, meaning that it was designed to answer specific, cutting-edge scientific questions, including those about the specific impacts and feedbacks of climate change. While this cutting-edge research is important, it does not provide the basic, baseline information that is critical for making decisions, including what species live there, how many of them are there, and do those populations change from place to place and season to season. Much of that information simply is not available for the Arctic Ocean.

Similarly, industry has invested in significant scientific research, some of which may address important missing information. Currently, however, the results of those studies are not reliable because the data from industry studies are generally not made available publicly, and the degree to which other information about industry research is shared varies from study to study. Given the lack of transparency and the obvious conflict of interest for industry that would not want to share information that could potentially hinder development, there is a substantial risk of bias in the information that is shared. Unless

information about the rest of the ecosystem, including the clams, worms, sea stars and other species that are important prey for the more conspicuous species.

The lack of baseline science has also been highlighted by several other prominent local and federal agencies as well as international forums. In its comments on the Draft Proposed 2010-15 Five-Year Leasing Program, NOAA recommended using a precautionary approach to oil and gas activities for the Chukchi and Beaufort seas that prevents those activities until more information is available to support sustainable management.⁸ The Arctic Climate Impact Assessment, an international project of the Arctic Council and the International Arctic Science Committee, highlighted basic surveys and monitoring as well as ecosystem-based research as some of the highest priority research actions needed for Arctic marine waters.⁹ Further, the North Slope Borough has called for better baseline science to guide decisions, and Senator Begich has introduced legislation that calls for additional Arctic research and coordination.¹⁰

Moreover, where basic information about the marine ecosystem exists, much of it is old, spotty, and too sparse. For example, the Environmental Assessment for the Arctic Fishery Management Plan states that “data were scarce for estimating the abundance and biomass of fishes in the Alaskan Arctic.”¹¹ The review of potential data sources indicated that surveys for fish have occurred about every 15-20 years, but typically over different regions. Even if those surveys over the past 60 years were combined together (which would be inappropriate due to different sampling methodologies and other reasons), there are still major areas of the U.S. Arctic Ocean shelf region that have yet to be surveyed. These areas include those where commercial fisheries could reasonably be expected to develop and those within lease sale areas.

Additionally, the vast majority of existing studies have been conducted in summer months. We need a year-round understanding of the Arctic Ocean ecosystem. One stunning example of this is a seabird, the spectacled Eider. In the summer their population would be widely dispersed, but in the winter, the entire world’s population gathers together in a small area of the northern Bering Sea. If studies on this bird were only conducted in the summer, it would result in erroneous conclusions about the impacts of activities on this species, especially if activities occurred at or near their winter gathering area.

In addition, the Lease Sale 193 (Chukchi) and 2003 Multi-Sale (Beaufort 186, 195, 202) environmental impact statements use the same primitive model to estimate how spilled oil might travel in the marine environment. This model, which was developed in 1982, forms the basis for the evaluation of potential impacts from a spill. Much of the environmental data input to the model is old; for example, current and wind information dates from 1979-1996. More sophisticated models are available and better information would allow for more effective analysis of the risks from spilled oil.¹²

While significant resources have been dedicated to studying particular Arctic animals and potential impacts to those animals from offshore oil and gas activities, we still lack critical baseline information about the ecosystem. The only studies designed to provide the comprehensive information and understanding of the health, biodiversity, and functioning of Arctic marine ecosystems and the potential impacts of industrial activities were conducted 30 years ago pursuant to the Outer Continental Shelf Environmental Assessment Program (OCSEAP). The information gained under that program did not initially cover the Chukchi Sea lease area and is so outdated as to be of very limited use in making decisions now for the Beaufort Sea.

⁸ See Letter from Jane Lubchenco, Ph.D. to S. Elizabeth Birnbaum, Re: Comments on the Interior Minerals Management Service Draft Proposed Outer Continental Shelf Oil and Gas Leasing Program for 2010-2015 (Sept. 9, 2009), at 5, available at http://www.peer.org/news/news_id.php?row_id=1265.

¹⁰ See S. 1562, 111th Cong. (2010).

¹¹ Arctic FMP EA at 99.

¹² These problems are explained in more detail in Attachment 3 to this document.

all data and methods for all research projects are made available to the public, it is impossible to give selective results credence in the decisions about oil and gas activities.

Ultimately, when considered with the long list of studies performed over the last 15 years, the 38-page index of recognized unknowns about the Lease Sale 193 area is indicative of a systemic problem with the way research is being conducted in the Arctic. As a result of the narrow focus on applied research questions, while baseline research and monitoring is ignored, large sums have been spent to provide information about specific issues without providing decision-makers the information needed to make informed decisions about Arctic resources. One or two specific studies will not solve this problem. Rather, a more holistic research program is needed to fill the important information gaps related to almost every aspect of the ecosystem.

An Interdisciplinary, Integrated Research and Monitoring Program for the U.S. Arctic Ocean

At this point, it is incontrovertible that there are: substantial information gaps about Arctic marine ecosystems, a laundry list of studies that have been conducted, ongoing processes at BOEMRE in response to court orders to supplement the Lease Sale 193 EIS to better account for missing science and to revise the environmental sensitivity analysis and 2007-12 Five-Year Leasing Program; and a commitment by the new administration to bring science back to decision-making. President Obama and his administration must establish a path forward that harmonizes this situation and provides the basic information required to protect the resources of the Arctic, including the subsistence way of life. The most efficient way to accomplish these goals is through another OCSEAP-type program limited to the Beaufort and Chukchi seas.

To provide the basic information required to protect the resources of the Arctic, including the subsistence way of life, and to guide decisions about oil and gas and other industrial activities, a new comprehensive research and monitoring program should:

1. integrate existing information to give a more holistic picture of what is known and conduct an analysis of the gaps in information to determine the most pressing research and monitoring needs;
2. gain a more comprehensive catalogue of identified species, populations and habitats, including seasonal migrations;
3. track the physical forcing factors that modulate biological productivity, habitat occupancy and migration pathways;
4. secure a better understanding of trophic linkages, physical and biological processes affecting productivity and other facets of ecosystem structure and functioning, and effects of anthropogenic perturbations;
5. study potential ecological and sociological impacts; and
6. integrate these scientific data to identify Important Ecological Areas as well as processes and habitats that are sensitive and vulnerable to perturbation, and furnish a basis for marine spatial planning.

This program could easily be conducted in three simple phases over the next 5-7 years: 1) gap analysis and planning (2011-2012); 2) research and monitoring (2013-2016, with monitoring continuing into the future); and 3) integrating new and older information to provide decision-makers the basic understanding needed to make effective decisions (2016-2017). Each of these phases must be informed by local and traditional knowledge, including planning and peer-review.

Phase I: Gap Analysis and Planning

To develop a comprehensive, integrated research and monitoring program, scientists must first understand the existing information and gaps in knowledge. Based on that information, a research program can be devised, with public input, to fill the gaps.

New research and monitoring should build on what has been learned about the Arctic Ocean already. Thus, the first step in this process is to reconcile the large information gaps with the important research that has occurred. Existing information should be compiled and integrated, then an analysis conducted of the gaps that are left. This gap analysis would then drive creation of an integrated research and monitoring program. The USGS Arctic studies initiative is an important step in this direction, and should be followed by a more comprehensive analysis as called for in Senator Begich's Arctic Ocean Research and Science Policy Review Act of 2009.¹⁸

President Obama and Secretary Salazar have directed the USGS to assess "resources, risks, and environmental sensitivities in Arctic areas."¹⁹ The USGS will complete an initial review of Arctic science and issue a report in April 2011 that will "examine the effects of exploration activities on marine mammals; determine what research is needed for an effective and reliable oil spill response in ice-covered regions; evaluate what is known about the cumulative effects of energy extraction on ecosystems and other resources of interest; and review how future changes in climate conditions may either mitigate or compound the impacts from Arctic energy development."²⁰ That report should set the stage for a more comprehensive analysis that forms the basis for implementation of the necessary studies and monitoring.

The USGS study is an important initial effort to gather existing information and identify gaps in knowledge, but it is likely not to be sufficiently comprehensive and inclusive to form the basis of the necessary research and monitoring program. Thus far, DOI has insisted on keeping the study firmly and fully in the control of the USGS and BOEMRE. Despite the important knowledge and experience within those agencies, their expertise clearly does not encompass the broad interdisciplinary breadth inherent in the more comprehensive undertaking needed. Experts are needed from many fields, from climate and oceanographic sciences to population biology and community ecology as well as the social sciences to determine the breadth of potential impacts to local communities. Second, the guidance given by DOI to USGS mandates consideration of four particular subject areas, which focuses their study towards a narrower applied research path rather than the holistic picture of Arctic information needs. Lastly, a gap analysis and research and monitoring plan should be developed with opportunities for public input and a peer review process that helps ensure the study accurately describes the state of, and existing gaps in, Arctic information.

Based on a comprehensive gap analysis, government scientists, together with public input, should define a research and monitoring plan to fill information gaps. In the aftermath of the *Exxon Valdez* oil spill a similar analysis and development of a research plan was put together with the benefit of hindsight to address the shortcomings of knowledge in Prince William Sound and the Gulf of Alaska that became apparent after the spill. The Gulf of Alaska Ecosystem Monitoring and Research (GEM) plan was designed to provide critical information for both quantitatively predicting the potential impacts of another spill and determining the impacts from another spill. The GEM plan should serve as a modern model for the type of plan needed to guide research and monitoring in the Arctic. The research and monitoring plan put together for the U.S. Arctic Ocean should be developed with input from the public and evaluated by an independent panel of experts.²¹

Phase II: Research and Monitoring

Once the information gaps are identified and a research plan devised, the research and monitoring must be executed. As the known gaps in knowledge outlined above show, scientific research and monitoring should include:

¹⁸ S. 1562, 111th Cong. (2010).

¹⁹ See Secretary Salazar Unveils Arctic Studies Initiative that will Inform Oil and Gas Decisions for Beaufort and Chukchi Seas, available at http://www.doi.gov/news/pressreleases/2010_04_13_releaseA.cfm.

²⁰ *Id.*

²¹ An outline for such a plan for the Arctic Ocean is included as Attachment I.

Phase III: Data Integration

Once sufficient information is available from the research and monitoring outlined above, that information should be synthesized to demonstrate an understanding of ecosystem structure and functioning, including quantitative and robust models of the food web, and a determination of the important ecological areas of the region. Those models and information provide the basis from which to understand likely impacts of industrial activities and, accordingly, whether and how to allow them. Managers will be able to move from qualitative assertions (i.e., educated guesses) to making quantitative assessments of potential impacts and allow decision makers to weigh the costs and benefits of industrial activities and to find alternatives that could allow for development while protecting the ecosystem and subsistence way of life.

This new program would provide the answers to the unknowns identified in the Lease Sale 193 litigation by virtue of providing a basic understanding of the marine ecosystem. The missing information is broad in scope and covers major, fundamental components of the ecosystem. A comprehensive research and monitoring program, rather than ad hoc research will build this foundation of knowledge most efficiently.

In addition, having this basic information will avoid the problem that has arisen in the Gulf of Mexico, where development occurred with scant attention to the status of the ecosystem beforehand. As a result, we find ourselves wondering what was lost following development or an industrial accident because we did not evaluate what was there to begin with. Further, comprehensive, integrated research and monitoring could prevent that from happening in the Arctic, and a complete understanding of the ecosystem can drive response and restoration activities should an industrial accident occur.

Meeting Legal Requirements and Policy Goals

As explained above, an integrated, comprehensive research and monitoring program would be the most efficient way to provide the baseline necessary to make informed decisions about offshore oil and gas activities in the Arctic. Such a plan would build on the commitments to science already made by the administration and would be the most effective way to resolve the ongoing litigation and controversy.

Federal courts have invalidated the 2007-12 Five-Year Leasing Program and Environmental Impact Statement (EIS) for Lease Sale 193 in the Chukchi Sea. While the decisions rest on different grounds, the lack of scientific information about the Arctic Ocean. In the 2007-12 Five-Year Leasing Program that lack of scientific information resulted in an arbitrary analysis of the relative environmental sensitivity of marine areas. In the Lease Sale 193 context, the court found that the agency had not complied with a Council on Environmental Quality regulation, 40 C.F.R. § 1502.22, by failing to determine "whether missing information identified by the agency was relevant or essential" and then failing to determine "whether the cost of obtaining the missing information was exorbitant or the means of doing so unknown."

DOI has issued a draft proposed 2007-12 Five-Year Leasing Program and a Draft Supplemental EIS for Lease Sale 193. Neither document fully accounts for the missing information or makes an effort to put in place the necessary interdisciplinary, integrated research and monitoring. Both, however, are drafts, and DOI still has the opportunity to move forward in this way.

As explained above, there are 38 pages of references to scientific unknowns made by DOI and NOAA in planning for Lease Sale 193. The agency has an affirmative duty to get this information, including by performing research itself when necessary, if it is essential to its decision and not exorbitant in cost. Information is significant, essential, or important where without the information the agency cannot accurately assess the effects of various alternatives, the extent of certain problems, or the need for particular proposed actions.

Basic scientific information is essential at the lease sale stage. It is when BOEMRE evaluates alternatives about the size of the sale, deferral areas, and other limitations that may affect exploration and

1. Marine life assessment to provide a year-round picture of the species in each marine habitat and their population trends;
2. Environmental monitoring to measure atmospheric and physical ocean conditions, such as salinity and temperature, and biological factors, such as productivity and community richness and diversity;
3. Scientific process studies to understand the way in which the ecosystem functions and is likely to respond to stresses;
4. Studies designed to identify patterns of subsistence use and changes in well-being as well as potential impacts from industrial activities; and
5. Documentation of local and traditional knowledge.

This research and monitoring should be interdisciplinary, spanning from climate sciences to social impacts studies, and to the greatest extent possible, it should be conducted in an integrated fashion to better elucidate the processes that underlie the way in which the ecosystem functions.²² As demonstrated by the GEM plan, our understanding of how ecosystems work and the ways in which to study them has grown considerably since the original OCSEAP. Studies should be coordinated and integrated to measure multiple aspects of the ecosystem simultaneously, which will more effectively and efficiently elucidate many of the important drivers and links in the ecosystem.

Integrated research reveals relationships that are not apparent in focused single species or component studies. For example, scientists were able to determine that, as a result of climate change, productivity in the northern Bering Sea ecosystem was shifting from moving through seafloor communities to open water communities.²³ They were only able to do this by studying multiple aspects of the ecosystem simultaneously, including climate indices, sea ice concentration, water temperature, sedimentation, and seafloor biomass. In addition to providing better information, this type of integrated research and monitoring is more cost effective because more information is elucidated than would be from individual studies.

ConocoPhillips and Shell are conducting integrated research studies in the Chukchi Sea around two of their drilling prospects. They are simultaneously measuring physical, biological and chemical oceanographic parameters along with marine mammals, fish, birds and benthic invertebrates. While they are not sharing their data publicly, the results they present are intriguing.²⁴ Their work indicates that the Chukchi Sea is not a homogenous region, but instead potentially has a high degree of spatial complexity. The benthic topography of the Chukchi Sea appears to affect sea ice concentrations and ocean currents that in turn affect the distribution of productivity and how that productivity flows through the food web to invertebrates, fish, birds and marine mammals.

This example shows that integrated research can be—and, in fact, is being—conducted in the Arctic Ocean. ConocoPhillips' and Shell's research, however, is confined to areas around two of their drilling prospects during the open water season. With a concerted effort, this research could easily be expanded to the rest of the region and other seasons. Expanding this type of research and monitoring would provide decision-makers with the more complete picture needed to protect Arctic ecosystems and the subsistence way of life. The abundance and diversity of animals varies across this region, and decision-makers must understand that variability to determine which areas are most important and how to protect them from oil and gas and other industrial activities.

²² Integrated research seeks to provide information about multiple characteristics of the ecosystem and the ways in which they interact.

²³ J.M. Grebmeier, et al., *A major ecosystem shift in the northern Bering Sea*. 311 Science 1461-1464 (2006).

development. Further, once the lease sale is held, companies have additional rights to conduct activities in the water that may affect sensitive species and habitats. Information that would be gathered by a comprehensive research and monitoring effort would allow for more effective consideration of alternatives and better evaluation of potential impacts.

Additionally, at the lease sale stage, BOEMRE should undertake a more detailed analysis than was conducted for the Five-Year Leasing Program, based on better information. This analysis is particularly important given the agency's current practice of preparing an environmental assessment, rather than full EIS to evaluate proposed exploration activities. If the agency prepares a programmatic-level analysis based on incomplete information at both the Leasing Program and Lease Sale stages, no detailed evaluation will be prepared until development is scheduled to occur. Neither OCSLA nor NEPA contemplate such a result.

Nor, as it appears to have done in the Draft SEIS for Lease Sale 193 should BOEMRE rely on analyses to be conducted by other agencies pursuant to other statutory mandates. Rather, the agency should abide Secretary Salazar's commitment to science and lead the way toward a better understanding of the ocean ecosystem by working with other expert agencies to put in place a comprehensive research and monitoring program.

The cost of this type of research and monitoring program is not exorbitant. The plan outlined in Attachment 1 could be carried out for approximately \$100 million over 5 years. By comparison, Lease Sale 193 alone generated \$2.7 billion in revenue to the federal government. At less than five percent of that revenue, the cost of the program is relatively small. Further, in considering whether the cost of obtaining additional data on the Chukchi Sea is exorbitant, BOEMRE must consider the risk and benefits of the governmental action at issue. Lease Sale 193 covers nearly thirty million acres of remote, undeveloped Arctic Ocean, and oil and gas activities would threaten the subsistence way of life, wildlife, habitat, and the marine ecosystem more generally. It may provide jobs and other economic benefit, but it also poses considerable risks, economic and otherwise, to the benefits provided by a healthy marine ecosystem.

These cost estimates are consistent with the other programs mentioned above. The GEM program was projected to cost \$120 million in 1999, and the OCSEAP program was estimated to cost \$25 million annually.

Conclusion

A careful, deliberate approach in the Arctic will allow for energy production if it can be done without harming the health of the marine ecosystem or opportunities for the subsistence way of life. The first step in such an approach is to develop and implement a comprehensive research and monitoring program like OCSEAP. We simply do not know enough now to make good decisions about stewardship for the oceans and clean energy. The first step toward resolving the ongoing controversy and litigation in the Arctic is to commit to obtaining basic science through an integrated, comprehensive research and monitoring plan that could help determine if industrial activities are appropriate; and if so, when, where and how such activities could be conducted.

3	Major Problems With Oil Spill Models (October 2010 Draft).

- B. Conduct periodic population assessments for exploited and selected important species. These assessments should be spatially explicit, and include migratory species (birds, marine mammals and some fish). These assessments will provide crucial baselines for evaluating impacts of industrial development and ecosystem change.

III. Environmental Monitoring

- A. Establish a network of fixed monitoring stations to track physical forcings and local biological responses. This station network should be patterned along the lines of the National Science Foundation’s Long Term Ecological Research Network (LTER) and NOAA’s oceanographic buoys adapted to the US Arctic Ocean, with sampling stations allocated to both the Chukchi and Beaufort seas. These stations will measure physical factors in the ocean including temperature and salinity, acidity, alkalinity and nutrients as functions of seawater depth, along with current profilers at strategically chosen locations; atmospheric factors including surface temperature, wind speed and direction, insolation, gas composition, and particulate density and composition; and biological factors such as primary and secondary productivity, zooplankton abundance and composition, benthic species presence, community richness and diversity, and community assemblages associated with sea ice.
- B. Support remote monitoring by satellite and aircraft to track sea ice extent, surface albedo and ocean color in collaboration with NOAA, NASA and NSIDC.
- C. Establish a systematic process for incorporating LTK for early detection of unanticipated ecosystem change, and for review by LTK experts for accuracy and completeness.
- D. Periodically update the resource assessments identified in “II” above to track ecosystem responses to climate change and industrialization.
- E. Monitor detection of invasive species, including species displaced by warming seawater temperatures to the south, and exotic species introduced by industrial activities.

IV. Scientific Process Studies

- A. Identify processes strongly coupled with biological production, species’ distribution and abundance, and support research that will improve understanding of them aimed at improving prediction of community responses to short- and long-term environmental stressors. This research should include identification of the species interactions that structure the biological community, which includes studies of the food web to determine linkages and energy flow through the ecosystem, as well investigations to determine the processes responsible for nutrient cycling.
- B. Prioritize research to initially emphasize known proximate sources of ecosystem stress, including processes strongly affected by transition from light limitation to nutrient limitation resulting from continued sea ice loss, effects of warmer water temperatures on growth and provisioning requirements of selected target species (especially young-of-the-year and juveniles), and sensitivity to acidification from increases in atmospheric carbon dioxide.

Attachment 1
A Scientific Research and Monitoring Plan for the U.S. Arctic Ocean

Compared with other marine ecosystems, very little is known about the living marine resources in the U.S. Arctic Ocean. We recognize that the recent losses of sea ice during summer are fundamentally changing the ways these ecosystems function, but we still know little about how these food webs work. Even our knowledge of what species inhabit the U.S. Arctic Ocean, either permanently or seasonally, is substantially incomplete. Permitting large-scale industrial activities in the absence of even basic knowledge of the composition and functioning of the marine ecosystem sets the stage for inadvertent environmental degradation at best, and catastrophic interactions at worst. The risks of adverse interactions are exacerbated by the rapid rate of environmental change in the Arctic, and our limited knowledge of existing resources and conditions makes it difficult even to detect ecosystem responses to change. The following science plan is intended as a guide toward systematically improving our knowledge of Arctic marine ecosystem structure and function.

The geographic scope of this science plan includes the exclusive economic zone (EEZ) of the U.S. Arctic Ocean, extending from the northern Alaskan coastline to the continental shelf break to the north, from the Bering Strait in the west to the Canadian border to the east. Most of the plan should be completed within four years. In recognition of the great scientific value of long-term data sets, however, the monitoring should be continued indefinitely, with at least a multi-decade planning horizon.

The essential elements of the plan are grouped into six categories: gap analysis, resource assessment, environmental monitoring, scientific process studies and synthesis. These elements are intended to (1) define existing information and research needs; (2) gain a more comprehensive catalogue of identified species, populations and habitats, including seasonal migrations, (3) track the physical forcing factors that modulate biological productivity, habitat occupancy and migration pathways; (4) secure a better understanding of trophic linkages, physical and biological processes affecting productivity and other facets of ecosystem functioning, and effects of anthropogenic perturbations; (5) study sociological impacts, and (6) integrate these scientific data to identify processes and habitats that are sensitive and vulnerable to perturbation and furnish a basis for marine spatial planning. Each of these constituent efforts must be informed by local and traditional knowledge (LTK) at all stages, including planning and peer-review.

I. Gap Analysis

- A. Conduct a comprehensive gap analysis to determine what scientific research is currently being done and what additional information is needed.

II. Marine Life Assessment

- A. Conduct a comprehensive survey of species occupying each marine habitat, including communities in the benthic, pelagic and littoral zones, and ice-associated communities. Whenever feasible these surveys should be conducted seasonally to identify migrations and patterns of periodic habitat use.

V. Sociological and Ecosystem Impact Studies

- A. Identify historical and current patterns of land and subsistence use, and conduct a survey of social and psychological well-being in North Slope communities to document current conditions in these communities.
- B. Monitor changes in patterns of land and subsistence use, and in measures of social and psychological well-being in North Slope communities affected by oil development.
- C. Conduct studies to determine potential impacts from industrial activities in the Arctic Ocean, such as research on the effects of noise on Bowhead whales, as well as the potential effects from produced waters, drilling muds, routine discharges, and other emissions on the ecosystem.

VI. Data Integration and Marine Spatial Planning

- A. Construct ecosystem models including a quantitative nutrient-phytoplankton-zooplankton (NPZ) model and an Ecopath model to evaluate how predicted ecosystem responses compare with data observed from the monitoring programs. Identified inadequacies will highlight areas requiring further research.
- B. Archive monitoring data in a publicly accessible database that is continuously maintained. Also, monitoring results should be periodically included in GIS maps to facilitate identification of Important Ecological Areas (IEAs) and important subsistence areas in the US Arctic Ocean and how they may change through time. Important Ecological Areas are geographically delineated areas with distinguishing characteristics that contribute disproportionately to an ecosystem’s health or are particularly vulnerable to disturbance.
- C. Integrate the results of the monitoring and research described above with a marine spatial planning effort that identifies IEAs as well as all potential energy sources and their availability to markets to help minimize the likelihood of adverse consequences associated with industrialization.

Attorneys for Plaintiffs

IN THE UNITED STATES DISTRICT COURT
FOR THE DISTRICT OF ALASKA

NATIVE VILLAGE OF POINT HOPE, et al.,
Plaintiffs,
v.
DIRK KEMPTHORNE, Secretary of the Interior, et al.,
Defendants,
and
SHELL GULF OF MEXICO, INC., and
CONOCOPHILLIPS COMPANY,
Intervenor-Defendants.

(EIS) for the Oil and Gas Lease Sale 193 and Seismic Surveying Activities in the Chukchi Sea (OCS EIS/EA MMS 2007-026) (May 2007). This contains statements in the EIS acknowledging missing information about the Chukchi Sea environment and the potential effects of the lease sale 193 on wildlife and subsistence. This declaration was compiled by an Earthjustice staff member under my direct supervision and reviewed by me.

I declare under penalty of perjury that the foregoing is true and correct.

Dated this 29th day of January, 2009.

s/ Erik Grafe
ERIK GRAFE

DECLARATION OF COUNSEL

I, Erik Grafe, hereby declare:

- 1. I am one of the attorneys representing Plaintiffs Native Village of Point Hope, et al., in this action. I submit this declaration in support of Plaintiffs' opening brief.
2. Attached to this declaration as Attachment A is a compendium of statements made by the Minerals Management Service (MMS) in its Final Environmental Impact Statement

LACK OF INFORMATION ABOUT SPECIES/HABITAT

I. FISH

A. General

“Surveys of coastal and marine fish resources in the Chukchi and Beaufort seas are typically conducted during periods that ice cover is greatly reduced (late July, August, or September) and information concerning the distribution, abundance, habitat use, etc., of marine fishes outside this period is limited. Due to the lack of specific information for many species, it is necessary to discuss the biology and ecology at the family level.” EIS at III-32.

“Despite these previous works, several data deficiencies remain. Information of current distribution and abundance (e.g., fish per square kilometer) estimates, age structure, population trends, or habitat use areas are not available for fish populations in the northeastern Chukchi Sea. Many fish studies reporting distribution and/or abundance are 20-30 years old. Other studies are still older. For example, the only survey of demersal fishes in the region is more than 20 years old. Fish assemblages and populations in other marine ecosystems of Alaska (e.g., Gulf of Alaska, Bering Sea) have undergone observable shifts in diversity, distribution, and abundance during the last 20-30 years; it is not known if the findings of Frost and Lowry (1983) still accurately portray the diversity and abundance of demersal fishes in the Alaskan Beaufort Sea. The same is true for other dated studies. It is possible that they no longer accurately and precisely reflect the current distribution, abundance, and habitat use patterns of fish resources in the northeastern Chukchi and western Beaufort seas. Such information could be stale, or in some cases, stagnant. If so, accurate information concerning the distribution, abundance, and habitat use patterns of fish resources is incomplete and/or unavailable from which to accurately and/or precisely assess environmental impacts from the Proposed Action.” EIS at III-32.

“Another important data gap is the lack of information concerning discrete populations for arctic fishes. The literature abounds with casual references made of various fish populations without having delimited the population other than by perhaps using arbitrary boundaries of a study area, or presenting data without discriminating one discrete population unit from another. Additionally, a few marine species are regarded as widespread and/or abundant, yet distribution and density statistics for discrete populations are scarce, unknown, and therefore, incomplete. Several species are known only from a single specimen of each species; others are known from perhaps a handful of specimens collected years to decades ago. Population information is entirely lacking for such species.” EIS at III-33.

“Fish resources of the northeastern Chukchi Sea were last surveyed 15-17 years ago. Additionally, other surveys over the years and area reflect a pattern of temporally and spatially irregular and disjunct sampling. Such disorganized sampling and data reporting greatly influences the information quality necessary to determine population trends and adjustments to environmental perturbations. Establishing a current, accurate, and precise baseline is critical to assessing potential changes to biotic resources. It is unknown if the distribution and abundance information gathered by the last surveys remains an accurate and precise description of arctic fish populations today. This is an important because the Chukchi and Bering seas are considered

to be large marine ecosystems serving as principle bellwethers to climate change in North America and the Arctic Ocean.” EIS at III-40.

“Adjustments by one or more fish populations often require adjustments within or among large marine ecosystems, influencing the distribution and/or abundance of competitors, prey, and predators. Consequently, it appears reasonable to believe that the composition, distribution, and abundance of fish resources in the northwestern Chukchi Sea is changing and is now different from that measured in the surveys conducted 15-17 years ago or earlier. The magnitude of these differences is unknown.” EIS at III-41.

B. Individual Species and/or Species Assemblages

1. Primary Arctic Fish Assemblages

“Marine waters support the most diverse, although least well known, fishes of the Alaskan Beaufort Sea region. Studies of marine fishes in the region are very limited; most of the surveys/studies have been performed in coastal waters landward of the landward of 200-m isobath, with scant surveys having sampled deeper waters. . . . [R]obust population estimates or trends for marine fishes of the region are unavailable. Distribution or abundance data for marine fish species are known only generally at the coarsest grain of resolution (for example, common, uncommon, rare). . . . Detailed information generally is lacking concerning the spread, density, or patchiness of their distribution in the overall Chukchi Sea region. Data concerning habitat-related densities; growth, reproduction, or survival rates within regional or local habitats; or productivity rates by habitat, essentially are unknown for fishes inhabiting waters seaward of the nearshore, brackish-water ecotone.” EIS at III-34 (internal citations omitted).

2. Neritic-Demersal Assemblage

“Life-history data for many of the demersal species using neritic substrates is lacking (e.g., whitespotted greenling, twohorn sculpin, spinyhook sculpin, veteran poacher); consequently, assessing the species resilience to perturbations is not feasible until additional information becomes available.” EIS at III-35.

3. Neritic-Pelagic Assemblage

“No species of this assemblage are assessed as being of low resilience, because life-history data are lacking.” EIS at III-35.

4. The Cryopelagic Assemblage

“Arctic cod and Pacific sand lance are assumed to be of medium resilience to exploitation; polar cod and toothed cod are data deficient such that an assessment of resilience is not feasible with available information.” EIS at III-36.

5. *Oceanic-Demersal Assemblage*

"Life-history statistics for most species covered in this assemblage are data deficient, chiefly for lack of fish surveys and studies in oceanic waters of the Alaskan arctic." EIS III-36.

6. *Diadromous Fishes*

"A number of diadromous species in the region have complicated life-history patterns that are not fully understood." EIS at IV-61.

7. *Salmon*

"Little is known of the movements undertaken during the 18 months the [pink] salmon spend at sea." EIS at III-39 (quoting Schmidt, McMillan, and Gallaway (1983)).

"Chum salmon fry, like pink salmon, do not overwinter in streams but migrate (mostly at night) out of streams directly to sea shortly after emergence. The timing of outmigration in the arctic is unknown, but occurs between February and June (chiefly during April and May) in more southern waters." EIS at III-40.

II. MARINE MAMMALS

A. Whales

1. *Bowhead Whale*

"There is scientific uncertainty about the population structure of bowheads that use the Arctic Ocean." EIS at III-45.

"Recent data to evaluate bowhead use of the Chukchi Sea Planning Area, or adjacent areas to the south, are lacking." EIS at III-45.

"No data are available indicating that, other than historic commercial whaling, any previous human activity has had a significant adverse impact on the current status of BCB Seas bowheads or their recovery." EIS at III-45.

"Conservation concerns include: . . . uncertain potential impacts of climate warming. . ." EIS at III-45.

"The uncertainty of the stock structure adds some uncertainty to summaries of the status of bowheads that may be impacted by the Proposed Action." EIS at III-45.

"[I]f whales become more 'skittish' and more highly sensitized following a hunt, it may be that their subsequent reactions, over the short-term, to other forms of noise and disturbance are heightened by such activity. Data are not available that permit evaluation of this possible, speculative interaction." EIS at III-46 (quoting NMFS' Arctic Region Biological Opinion).

"There is little information regarding causes of natural mortality for BCB Seas bowhead whales." EIS at III-49.

"Little is known about the effects of microbial or viral agents on natural mortality [of bowheads]." EIS at III-49.

"The amount of feeding [by the BCB Seas bowhead stock] in the Bering Sea in the winter is unknown as is the amount of feeding in the Bering Strait in the fall (Richardson and Thomson, 2002)." EIS at III-49.

"The MMS funded large-scale surveys in this [Chukchi Sea lease sale] area when there was oil and gas leasing and exploration, but while surveys in the Beaufort Sea have continued, the last surveys in the Chukchi Sea were about 15 years ago. These data were summarized by Mel'nikov, Zelensky, and Ainana (1997), Moore (1992), Moore and Clarke (1990), and Moore, DeMaster, and Dayton (2000). We have plotted counts of bowheads in the Chukchi Sea during those surveys (Fig. III.B-4), because they visually provide limited insight into areas where bowheads may be exposed to oil and gas activities should they occur in the Chukchi Sea Planning Area.

However, we caution against over-interpretation of these data out of context of survey effort and, because these data were collected between 1979 and 1991, they should not be interpreted as indicating current use of the Chukchi Sea by bowhead whales; they are the best data available." EIS at III-50—51.

"Data are limited on the bowhead fall migration through the Chukchi Sea before the whales move south into the Bering Sea." EIS at III-51.

"The amount of feeding in the Chukchi Sea and Bering Strait in the fall is unknown as is the amount of feeding in the Bering Sea in the winter (Richardson and Thomson, 2002). Richardson and Thomson (2002:xxxviii) concluded that: "...behavioral, aerial-survey, and stomach-content data, as well as certain energetics data...show that bowheads also feed widely across the eastern and central Beaufort Sea in summer and fall." In mid- to late fall, at least some bowheads feed in the southwest Chukchi. Detailed feeding studies have not been conducted in the Bering Sea in the winter." EIS at III-54.

"There are locations in the Beaufort Sea and the western Chukchi Sea where large numbers of bowheads have been observed feeding in many years. However, the significance of feeding in particular areas to the overall food requirements of the population or segments of the population is not clear." EIS at III-55.

"Recent data on distribution, abundance, or habitat use [by bowheads] in the Chukchi Sea Planning Area are not available." EIS at III-55.

"[I]mportantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales." EIS at IV-82.

"Bowheads are not randomly distributed throughout the Proposed Action area. The extent of use of particular habitats varies among years, sometimes considerably; therefore, it is difficult to predict, in advance of a given year, exactly how bowheads will use the entire area that is available to them. Some aspects of their habitat use are poorly understood. For example, current data are not available on which to typify the current summer use of the northern Chukchi Sea by bowheads. For example, in the Beaufort Sea in some years, large aggregations of bowheads near Smith Bay have been observed during MMS' Bowhead Whale Aerial Survey Program (BWASP) surveys at the beginning of September. It is unclear if these animals are early migrants that have come from the east, if they summered in the northern portions of the Beaufort Sea and came south, or if they entered from the Chukchi Sea and never migrated east. . . . It is important to note that the Chukchi Sea data are not recent (1979-1991) and thus should not be interpreted as indicating current patterns of bowhead use of the Chukchi Sea." EIS at IV-101.

"We note that the general location of the spring lead system in the Chukchi Sea (and Beaufort Sea) is based on relatively limited survey data and is not well defined." EIS IV-102 (similarly at EIS at IV-105).

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

2. *Fin Whale*

"The NMFS has concluded that there is no reliable information about population-abundance trends, and that reliable estimates of current or historical abundance are not available, for the entire Northeast Pacific fin whale stock." EIS at III-46. *See also id.* at III-56 (similar).

"There are no recent data to confirm their use or lack of use of the Chukchi Sea Planning Area, or adjacent areas to the south." EIS at III-47.

"There is little information about natural causes of mortality (Perry, DeMaster, and Silber, 1999a). The NMFS summarized that 'There are no known habitat issues that are of particular concern for this stock' (Angliss and Lodge, 2002, 2005). Perry, DeMaster, and Silber (1999a:51) listed the possible influences of disease or predation as 'Unknown.'" EIS at III-56.

"The importance of specific feeding areas to populations or subpopulations of fin whales in the North Pacific is not understood." EIS at III-57.

"The possible influences of disease or predation and of overutilization [on fin whales] are listed [by NMFS] as 'Unknown.'" EIS at V-28.

3. *Humpback Whale*

"Available information does not indicate humpback whales inhabit the Chukchi Sea OCS project area. There are no recent data to confirm their lack of use of the Chukchi Sea OCS Planning Area, or adjacent areas to the south." EIS at III-47.

"There is 'no clear consensus' (Calambokidis et al., 1997:6) about the population stock structure of humpback whales in the North Pacific due to insufficient information (Angliss and Lodge, 2002) (see further discussion in USDOL, MMS,2003a,b)." EIS at III-58.

"Angliss and Outlaw (2005) stated that: 'There are no reliable estimates for the abundance of humpback whales at feeding areas for this stock' (the Western North Pacific Stock) 'because surveys of the known feeding areas are incomplete, and because not all feeding areas are known.' There are not conclusive or reliable data on current population trends for the western North Pacific stock (Perry, DeMaster, and Silber, 1999b; Angliss and Outlaw, 2005)." EIS at III-59.

"Causes of natural mortality in humpbacks in the North Pacific are relatively unknown, and rates have not been estimated." EIS at III-60.

"The threat of disease or predation [on humpbacks] as [sic] unknown." EIS at V-29.

4. Gray Whale

"[E]xisting information is insufficient to understand the dynamics of gray whales and offshore Chukchi Sea habitat relationships, quality and quantity dynamics and distribution of prey resources, or the capability of habitat to support (carrying capacity) long- and short-term whale use." EIS, Vol. II, AC 019-076.

"[T]he relationship between the expanding gray whale population to amphipod community dynamics is unknown but is of considerable interest." EIS at V-35.

5. Beluga Whale

"Understanding the distribution and timing of movements of belugas is important for planning lease sales in the Chukchi Sea and designing possible mitigation measures. Late-summer distribution and fall-migration patterns are poorly known, wintering areas effectively are unknown, and areas that are particularly important for feeding have not been identified (Suydam, Lowry, and Frost, 2005)." EIS at IV-163. *See also id.* at III-77 (second sentence same).

"Based on recent telemetry studies on eastern Chukchi belugas, it is likely that members from both stocks occur in similar places and at similar times during the fall migration although the significance of this is unknown (Suydam, Lowry, and Frost, 2005)." EIS at III-76.

"Winter food habits of belugas are largely unknown . . ." EIS at III-77.

"Belugas generally are associated with ice and relatively deep water throughout the summer and autumn, which may reflect their preference for feeding on ice-associated arctic cod (Moore et al., 2000). Late-summer distribution and fall-migration patterns are poorly known, wintering areas are effectively unknown, and areas that are particularly important for feeding have not been identified (Suydam, Lowry, and Frost, 2005)." EIS at III-77.

6. Harbor Porpoise

"The harbor porpoise inhabits shallow, coastal areas in temperate, subarctic, and arctic waters of the Northern Hemisphere (Read, 1999). In the North Pacific, harbor porpoises range from Point Barrow, Alaska to Point Conception, California (Gaskin, 1984). In Alaska, three separate stocks have been recommended, although there is insufficient biological data to support the designation at this time." EIS at III-78.

Exhibit 129, Page 13 of 40

11

7. Minke Whale

"There are no reliable estimates for the Alaska stock of minke whales. A provisional estimate was made for the Bering Sea of 810 individuals; however, this is not used for the Alaska stock because the entire stock's range was not surveyed." EIS at III-78.

B. Other Marine Mammals

I. Seals

"Little is known about the biology or population dynamics of ice seals, and they have received little attention compared with other Bering/Chukchi Sea species known to be in decline. Accurate population estimates for ice seals are not available and are not easily attainable due to their wide distribution and problems associated with research in remote, ice-covered waters (Quakenbush and Sheffield, 2006). Although little is known about the population status of ice seals, there is cause for concern. Sea ice is changing in thickness, persistence, and distribution (Sec. III.A.4, Sea Ice), and evidence indicates that oceanographic conditions have been changing in the Bering Sea (Sec. III.A.3, Oceanography), which suggests that changes in the ecosystem may be occurring as well (Quakenbush and Sheffield, 2006)." EIS at III-71.

a. Ringed Seal

"No reliable estimate for the size of the Alaska ringed seal stock is available (Angliss and Outlaw, 2005) . . ." EIS at III-71.

b. Spotted Seal

"No reliable estimate for the size of the Alaska spotted seal stock is available (Angliss and Outlaw, 2005)." EIS at III-72.

c. Ribbon Seal

"Ribbon seals inhabit the North Pacific Ocean and the adjacent fringes of the Arctic Ocean. In Alaska, they range northward from Bristol Bay in the Bering Sea and into the Chukchi and western Beaufort seas. They are found in the open sea, on pack ice, and rarely on shorefast ice (Kelly, 1988). As the ice recedes in May to mid-July, they move farther north in the Bering Sea, hauling out on the receding ice edge and remnant ice (Burns, Shapiro, and Fay, 1981). Seal distribution throughout the rest of the year is largely unknown; however, recent information suggests that many ribbon seals migrate into the Chukchi Sea for the summer months (Kelly, 1988)." EIS at III-73.

"No reliable estimate for the size of the Alaska ribbon seal stock is available (Angliss and Outlaw, 2005)." EIS at III-73.

Exhibit 129, Page 14 of 40

12

d. Bearded Seal

"No reliable estimate for the size of the Alaska bearded seal stock currently is available (Angliss and Outlaw, 2005). Bengtson et al. (2005) conducted surveys in the eastern Chukchi Sea but could not estimate abundance from their data." EIS at III-74.

2. Pacific Walrus

"No reliable estimate is currently available for the size of the Alaskan stock of Pacific walrus (Angliss and Outlaw, 2005). However, available evidence indicates that the population is likely in decline (Kelly, Quakenbush, and Taras, 1999; Kochnev, 2004)." EIS at III-74. *See also id.* at EIS at III-76 (first sentence same).

"The population size has never been known with certainty; however, the most recent survey estimate was approximately 201,039 animals (Gilbert et al., 1992)." EIS at III-76.

3. Polar Bear

"A reliable estimate for the CBS stock of polar bears, which ranges into the southern Beaufort Sea, does not exist, and its current status is in question. In 2002, the IUCN/SSG Polar Bear Specialist Group estimated the size of the CBS population at 2000+ bears, though the certainty of this estimate was considered poor (Lunn, Schliebe, and Born, 2002)." EIS at III-84.

"Coastal areas provide important denning habitat for polar bears. Terrestrial denning areas for bears of the CBS polar bear stock are less well understood than those for the SBS polar bear stock." EIS at IV-166.

"The maximum reproductive age for polar bears is unknown, but is likely well into their 20's (Amstrup, 2003)." EIS at III-81.

"[W]ith the collapse of the Soviet empire in 1991, levels of illegal harvest dramatically increased in Chukotka in the Russian Far East (Amstrup, 2000; USDOI, FWS, 2003). While the magnitude of the Russian harvest from the CBS is not precisely known, some estimates place it as high as 400 bears per year, although the figure is more likely between 100 and 250 bears per year." EIS at III-84. *See also id.* at V-36 (same).

"[B]ecause of the unknown rate of illegal take currently taking place, in 2006 the IUCN/SSG Polar Bear Specialist Group designated the status of the CBS stock as "declining" from its previous estimate of 2000+ animals (IUCN/SSG Polar Bear Specialist Group, 2006)." EIS at III-84.

Exhibit 129, Page 1 of 40

13

III. MARINE AND COASTAL BIRDS

I. General

"Despite the importance [for marine and coastal birds] of [Kasegaluk Lagoon, Ledyard Bay, Peard Bay, barrier islands, the spring open-water lead system, and the seabird-nesting colonies at Cape Lisburne and Cape Thompson], as well as the entire Chukchi Sea within the proposed lease-sale area, little recent site-specific data are available on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data are between 15 and 30 years old, making accurate analysis difficult. Because of this long data gap, it is unknown if population abundance or distribution of many species have changed." EIS at IV-145.

2. Threatened Spectacled Eiders¹

"In general, population demography for this species and in particular breeding information (i.e., timing of pair formation and duration of pair bonds, timing of mating, male and female dispersal rates, sex-specific estimates for natal, breeding, and molt-site fidelity, breeding propensity, nonbreeding component, duckling/brood and first-year survival, etc.) is poorly understood due to a lack of long-term marking/monitoring programs and/or low resighting/recapture/recovery rates." BE at 23.

"Few data are available on the overall longevity of spectacled eiders, but if similar to other eiders, they would likely be long-lived." BE at 23.

"Recruitment rate of spectacled eiders is unknown (USFWS 1999)." BE at 25.

"Migration routes [of spectacled eiders] in the spring are not well known . . ." BE at 25.

"The summer range of non-breeding [spectacled] eiders is not known . . ." BE at 26.

"Food habits of spectacled eiders in the Ledyard Bay molting area remain unknown." BE at 27.

"The world population of spectacled eiders has declined substantially during the past 30 years, and may be continuing to decline (USFWS 1999, 2002b). Long-lived species like spectacled eiders typically do not have highly variable populations and unknown mortality factors may be undermining their ability to maintain a stable population. The causes of decline could be varied and are largely unknown . . ." BE at 28.

¹ From Minerals Management Service, Biological Evaluation of Spectacled Eider (*Somateria fischeri*), Steller's Eider (*Polysticta stelleri*), and Kittlitz's Murrelet (*Brachyramphus brevirostris*) for Chukchi Sea Lease Sale 193 (September 2006), incorporated by reference into the Lease Sale 193 EIS at III-61, IV-125, V-30.

Exhibit 129, Page 1 of 40

14

"Variability in the abundance of the Alaska breeding population of spectacled eiders is not well understood (USFWS 1999)." BE at 28.

"The Alaskan and Russian populations of spectacled eider were listed as a threatened species on 9 June 1993 (USFWS 1993). Although the factors that caused these declines are unknown, a number of potential contributory factors have been identified. These, or other still-undiscovered threats, have increased mortality above the rate of reproductive replacements. No data are available to show whether similar trends have affected the breeding population in Russia where as many as 40,000 pairs traditionally nested." BE at 29.

3. Threatened Steller's Eiders²

"[T]he length of time that Steller's eiders remain paired is unknown." BE at 13.

"Many life history aspects of Steller's eiders (e.g., timing of pair formation, duration of pair bonds, dispersal rates, sex-specific seasonal site fidelity, first-year survival, etc.) are poorly understood." BE at 13.

"The reason for relatively low nesting success or failure to nest by the Alaska nesting population is unknown, but may be related to predators switching to alternate prey when lemmings are in low abundance (Quakenbush and Suydam 1999)." BE at 15.

"Steller's eider recruitment rates are unknown (USFWS 2002b)." BE at 15.

"Departure from the [Arctic Coastal Plain] to molting areas is poorly documented, but males probably begin departing as early as late June, followed by non- and failed nesting females presumably from late July – late August, and finally successful females and fledged young." BE at 16.

"The population of Steller's eiders molting and wintering along the Alaska Peninsula appears to be declining (USFWS 1999, 2002a). . . . The causes of decline could be varied and are largely unknown, but if the cause of the decline is within the marine environment, it is reasonable to conclude that the Alaska and Russia nesting populations are being affected similarly because a large portion of the Russian population winters with the Alaskan population." BE at 18.

"Variability in the abundance of the Alaskan breeding population of Steller's eiders is not well understood." BE at 18.

"Williamson et al. (1966) listed Steller's eiders as occurring in the Cape Thompson area 25 miles southeast Point Hope during surveys for Project Chariot at Ogotoruk Creek. Steller's eiders were listed as occupying marine littoral, lacustrine, and beach environments in order of affinity. In this

² See note 1.

Exhibit 129, Page 1 of 40

15

study, marine littoral waters extended seaward 2 miles from shore. Steller's eiders were listed as present from June 1 through October 4 and uncommon, but possibly breeding in the area. It is not known if Steller's eiders still nest in this area." BE at 20-21.

4. Kittlitz's Murrelets³

"The Kittlitz's murrelet (*Brachyramphus brevirostris*) is one of the rarest and least understood seabirds in North America. There is limited life history information on the Kittlitz's murrelet (i.e., age at first breeding, nest success, hatching success, fledging success, first-year survival, survival to breeding age, proportion of breeding females, proportion of non-breeders, periodic non-breeding, etc.) and mechanisms of population regulation. The limited information available for this species and research on the closely-related marbled murrelet suggests a K-selected life history strategy." BE at 33.

"The longevity of the Kittlitz's murrelet is unknown . . ." BE at 33.

"Age to maturity in Kittlitz's murrelets is unknown . . ." BE at 33.

"Little is known about the reproductive strategy of Kittlitz's murrelet because nesting sites are difficult to find (Day et al. 1999)." BE at 33.

"Annual breeding effort is poorly understood, but is considered highly variable." BE at 33.

"Spring migration for Kittlitz's murrelets in the Chukchi Sea is unknown . . ." BE at 34.

"Little is known about Kittlitz's murrelet recruitment . . ." BE at 34.

"Annual adult survival has not been estimated . . ." BE at 34.

"Though there is some evidence for long-term population declines for *Brachyramphus* murrelets (van Vliet and McAllister 1994, Ralph et al. 1995, Kuletz et al. 2003), Day et al. (1999) argued that evidence for major population declines for the Kittlitz's murrelet was equivocal. In large part, their conclusion stems from the fact that historical population estimates are lacking (but see Isleib and Kessel 1973, Agler et al. 1998, Kendall and Agler 1998)." BE at 34.

"Fall migration in the Chukchi Sea population [of Kittlitz's murrelet] is unknown . . ." BE at 35.

"Post-breeding distribution [of Kittlitz's murrelet] is poorly understood, but is likely farther offshore than pre-breeding season." BE at 35.

"Winter distribution [of Kittlitz's murrelet] is poorly understood, but is probably pelagic." BE at 35.

³ See note 1.

Exhibit 129, Page 1 of 40

16

"The diet of the Chukchi Sea summer residents is unknown . . ." BE at 35.

"Winter foods are unknown, but may consist mostly of pelagic euphausiids or other macroinvertebrates." BE at 35.

"Information regarding fidelity to nesting sites is not available (Day et al. 1999)." BE at 35.

"[C]auses for the declines [in Kittlitz's murrelets] are not well known, but likely include: habitat loss or degradation, increased adult and juvenile mortality, and low recruitment, and we believe that glacial retreat and oceanic regime shifts are the factors that are most likely causing population-level declines in this species." BE at 36 (citing USFWS status review, 2004).

5. Cliff-Nesting Seabirds

a. Murres

Noting "limited data." EIS III-62.

b. Puffins

"The current status of horned puffins in the Chukchi Sea is unknown." EIS III-62.

"The current status of the tufted puffin in the Chukchi Sea is also unknown." EIS III-62.

c. Black-Legged Kittiwake

"The current status of the black-legged kittiwake (*Rissa tridactyla*) in the Chukchi Sea is unknown." EIS at III-63.

"The portion of [Chukchi] population in the proposed lease sale area is unknown, but could be substantial late in the open-water season. Seasonal areas of concentration, if any, are unknown." EIS at III-63. See also *id.* at IV-142 (similar).

"Current population estimates at [Cape Thompson and Cape Lisburne] colonies are unknown." EIS at IV-143.

6. Bering Sea Breeders and Summer Residents

a. Northern Fulmar

"The current status of the northern fulmar (*Fulmarus glacialis*) is unknown." EIS at III-63.

b. Short-Tailed Shearwater

"The current status of the short-tailed shearwater (*Puffinus tenuirostris*) in the Chukchi Sea is unknown." EIS at III-63.

c. Auklets

"The current status of parakeet (*Cyclorhynchus psittacula*), least (*Aethia pusilla*) and crested (*A. cristatella*) auklets in the Chukchi Sea is unknown." EIS at III-63.

7. High Arctic-Associated Seabirds

a. Black Guillemot

"The current status of the black guillemot (*Cephus grylle*) in the Chukchi Sea is unknown." EIS at III-63.

b. Ivory Gull

"The current status of the ivory gull (*Pagophila eburnea*) in the Chukchi Sea is unknown. Divoky (1987) reported that ivory gulls are closely associated with the ice edge throughout their lifecycle. Ivory gulls are considered uncommon to rare in pelagic waters of the Chukchi during summer, and small numbers migrate through in fall to wintering areas in the northern Bering Sea." EIS at III-64.

c. Arctic Tern

"The current status of the Arctic tern (*Sterna paradisaea*) in the Chukchi Sea is unknown." EIS at III-64.

8. Tundra-Breeding Migrants

a. Jaegers

"The current status of [all three species of] jaegers in the Chukchi Sea is unknown." EIS at III-64.

b. Glaucous Gull

"The current status of the glaucous gull (*Larus hyperboreus*) in the Chukchi Sea is unknown." EIS at III-64.

Exhibit 129, Page 19 of 40

17

Exhibit 129, Page 20 of 40

18

9. Waterfowla. Yellow-Billed Loons

"Compared to what is known about yellow-billed loons near the Beaufort Sea coast, there is very little known about the coastal areas bordering the Chukchi Sea." EIS at III-65.

"The [yellow-billed loon] is little studied and basic biological information (such as the seasonal distribution of immature and non-breeding yellow-billed loons) is unknown." EIS at IV-140.

b. Common Eider

"During spring migration, the common eider (*Somateria mollissima*) typically migrates along the Chukchi Sea coast, using offshore open-water leads. Offshore migration distances are poorly understood for the Chukchi Sea, but in the Beaufort Sea they are usually found within 48 km (29 mi) of shore." EIS at III-66.

c. Pacific Brant

"The current status of the Pacific brant along the Chukchi Sea is unknown." EIS at III-68.

d. Greater White-Fronted Geese

"The current status of greater white-fronted geese along the Chukchi Sea coast is unknown." EIS at III-68.

e. Lesser Snow Goose

"Ritchie et al. (2006) reported that the number of snow geese nesting on the Ikpiqruk River delta continued to increase substantially from numbers recorded prior to 1999. There are no comparable data for the Kukpowruk River delta colony." EIS at III-68.

10. Shorebirdsa. Buff-Breasted Sandpiper (species of concern)

Noting "limited data." EIS III-70.

b. Bar-Tailed Godwit (species of concern)

"The abundance and distribution of bar-tailed godwits in northern Alaska and coastal areas of the Chukchi Sea are not well understood." EIS at III-69.

Exhibit 129, Page 21 of 40

19

"The North American population of bar-tailed godwits (*Limosa lapponica baueri*) breeds in western and northern Alaska. Postbreeding bar-tailed godwits move to staging grounds along the Bering Sea Coast and then apparently fly nonstop 11,000 km to New Zealand. Recent counts conducted at both breeding and nonbreeding sites provide evidence of a serious and rapid population decline (McCaffrey et al., 2006), but the cause of the decline is unknown." EIS at III-69.

Exhibit 129, Page 22 of 40

20

LACK OF INFORMATION ABOUT EFFECTS ON SPECIESI. FISHA. General1. General effects of seismic on fish

"A review of available science and management literature shows that at present, there are no empirical data to document potential impacts from seismic surveys reaching a local population-level effect. The experiments conducted to date have not contained adequate controls to allow us to predict the nature of a change or that any change would occur." EIS at II-33. *See also id.* at IV-51—52 (similar) and IV-74 (similar).

2. General effects of oil spills on fish

"Given a lack of contemporary abundance and distribution information, large oil spill effects on rare or unique species (including potential extirpation) could occur, but would likely go unnoticed or undetected." EIS at II-34. *See also* EIS at IV-52 and IV-74 (similar).

"While small-spills are required to be reported, the number of unreported spills is unknown. Not all spills would be expected to receive a spill-response. Overall, it is unclear whether, over the long-term and in the absence of a monitoring program to assess effects, any negative impacts to fish resources from chronic small spills would be detected." EIS at IV-72.

B. Effects on Marine Pelagic Species

"Effects on recruitment would be particularly difficult to assess, because very few studies of offshore fishes have been made." EIS at IV-61.

C. Effects on Capelin

"Eggs deposited in the proximity of the contaminated substrate over a series of years likely would be exposed to oil (PAH's) retained in the substrate, as PAH's in weathered oil can be biologically available for long periods and very toxic to sensitive life stages, subsequently leading to lethal and sublethal effects to those offspring of successive generations. It is not known what such a behavioral response may have on the dynamics of the population; however, the spawning site likely would be unavailable for use for multiple generations, depending on the sensitivity of the capelin to detecting contaminated substrates and how long the oil persists in the localized habitat." EIS at IV-60-61.

Exhibit 129, Page 23 of 40

21

"Also unknown are the distribution and abundance of spawning sites used by capelin in the Alaskan Arctic." EIS at IV-63.

D. Effects on Arctic Cod

"Although arctic cod can be extremely abundant in nearshore lagoonal areas, the importance of nearshore versus offshore environments to the lifecycle is not known (Craig et al., 1982). Although it is known that juvenile arctic cod associate with floating ice, it is unknown to what degree this association contributes to the development and survival of young fishes later recruiting to the breeding population. If early life history stages of arctic cod were concentrated in nearshore environments, in patches in the open ocean, or under floating ice, they certainly would be more vulnerable to effects from an oil spill impacting such habitats." EIS at IV-62.

Exhibit 129, Page 24 of 40

22

II. MARINE MAMMALS

A. General1. *Effects on Marine Mammals in General*

"Based on the paucity of information available on marine mammal ecology in the Chukchi Sea and on specific locations of future developments, we are unable to determine at this time if significant impacts will or will not occur." EIS at II-37.

"[B]ecause of the lack of data on marine mammal distributions and habitat use in offshore areas of the Chukchi Sea, it is uncertain what the level of effects would be in offshore areas [regarding Alt. III]. EIS at II-42. See also *id.* at IV-269 (same) and EIS at II-45 (same, re: Alt. IV).

"Because there are no oil and gas production facilities in the Chukchi Sea, it is difficult to predict with certainty what potential impacts from such development would have on threatened and endangered marine mammals." EIS at IV-111.

"Unfortunately, it has not been possible to predict the type and magnitude of marine mammal responses to the variety of disturbances caused by oil and gas operations and industrial developments in the Arctic. More importantly, it has not been possible to evaluate the potential effects on populations." EIS at IV-152.

"In light of the uncertainty over the potential impacts of exploration and development activities, the earliest possible establishment of long-term monitoring programs for vulnerable species in the project area should be pursued. The design of long-term monitoring should take into account the likely size of any effect and the probability of detecting it within a reasonable time span (IWC, 2006)." EIS at IV-162--63.

"[W]ithout historical data on distribution and abundance, it is not possible to measure the impacts of an oil spill on marine mammals." EIS at IV-156.

"Based on the paucity of information available on marine mammal ecology, and specifically on habitat use patterns, in the Chukchi Sea and based on the lack of specific information regarding the location of future developments, we are unable to determine at this time if significant impacts would or would not occur to marine mammal populations in the project area as a result of the Proposed Action." EIS at IV-145.

"Careful mitigation can help reduce the effects of future industrial developments and their accumulation through time. However, the effects of full-scale industrial development of the waters of the Chukchi Sea likely would accumulate through displacement of marine mammals from their preferred habitats, increased mortality, and decreased reproductive success. Because of the lack of data on which to base informed decisions, it is unknown if noise introduced into the environment from industrial activities, including drilling and seismic operations, will have an

Exhibit 129, Page 2 of 40

23

B. Whales1. *General*

"The need to rely on indirect methods of assessing the environmental impact of human activity on marine mammals is a recurring problem (Inglis and Gust, 2003). Impact assessments for cetaceans typically emphasize immediate behavioral responses to human activities (Samuels and Bejder, 2004), the biological relevance of which is rarely known (Corkeron, 2004)." EIS at IV-154.

"[M]onitoring plans typically emphasize readily obtainable, short-term behavioral measures that can be directly related to disturbance factors (Bejder et al., 2006). However, it is rarely known in what ways short-term responses translate to longer term changes in reproduction, survival, or population size (Gill, Norris, and Sutherland, 2001; Beale and Monaghan, 2004a), and it is seldom possible to infer biological significance based on short-term behavioral observations." EIS at IV-154.

a. *Effects from seismic/noise on whales in general*

"[T]here is acknowledged . . . scientific uncertainty about the potential effects of noise, especially repeated exposure to loud noise, on baleen whales." EIS at IV-82.

"There are very few, if any, data available about potential effects of . . . noise . . . on cetacean calves." EIS at IV-82.

"[T] here are few instances where data are sufficient to evaluate the total energy exposure of a marine mammal from a given source. At present, we do not have the data necessary to make such a determination or understand how it might change our analysis." EIS at IV-86.

"While there is some general information available, evaluation of the impacts of noise on marine mammal species, particularly on cetaceans, is greatly hampered by a considerable uncertainty about their hearing capabilities and the range of sounds used by the whales for different functions (Richardson et al., 1995a; Gordon et al., 1998; NRC, 2003, 2005). This is particularly true for baleen whales. Very little is known about the actual hearing capabilities of the large whales or the impacts of sound on them, especially on them physically. While research in this area is increasing, it is likely that we will continue to have great uncertainty about physiological effects on baleen whales because of the difficulties in studying them. Baleen whale hearing has not been studied directly. There are no specific data on sensitivity, frequency or intensity discrimination, or localization (Richardson et al., 1995a). Thus, predictions about probable impacts on baleen whales generally are based on assumptions about their hearing rather than actual studies of their hearing (Richardson et al., 1995a; Gordon et al., 1998; Ketten, 1998)." EIS IV-87.

"Based on indirect evidence, at least some baleen whales are quite sensitive to frequencies below 1,000 Hz but can hear sounds up to a considerably higher but unknown frequency." EIS IV-87.

Exhibit 129, Page 2 of 40

25

adverse impact on nonendangered and nonthreatened marine mammals in the Proposed Action area. Increasing vessel traffic in the Northwest Passage, defined as the marine route between the Pacific and Atlantic oceans through the Arctic Ocean across the top of North America, which includes the Proposed Action area, increases the risks of oil and fuel spills and vessel strikes of marine mammals." EIS at IV-145--46.

"Because very little is known about the distributions, population sizes or habitat use of marine mammals in the Chukchi Sea, it is difficult to determine if significant impacts will or will not occur to marine mammals as a result of the proposed action." EIS at V-32.

2. *Effects of Seismic and Other Noise on Marine Mammals*

"Because of the lack of data it is unknown if noise introduced into the environment from industrial activities, including drilling and seismic operations, will have an adverse impact on nonendangered and nonthreatened marine mammals in the Proposed Action area." EIS at II-37. See also EIS IV-145--146 (similar).

"Despite the increasing concern and attention noted above, there still is uncertainty about the potential impacts of sound on marine mammals; on the factors that determine response and effects; and especially on the long-term, cumulative consequences of increasing noise in the world's oceans from multiple sources (NRC, 2003, 2005). The NRC (2005) concluded that it is unknown how or in what cases responses of marine mammals to anthropogenic sound rise to the levels of biologically significant effects. This group also developed an approach of injury and behavioral "take equivalents". These take equivalents use a severity index that estimates the fraction of a take experienced by an individual animal. This severity index is higher if the activity could be causing harassment at a critical location or during a critical time (e.g., calving habitat). Because we have uncertainty about exactly where and how much activity will occur, the recommendations from the NRC (2005) are qualitatively incorporated in MMS analysis." EIS at IV-86.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown . . ." EIS IV-89.

"Although it is unlikely that airgun operations during most seismic surveys would cause [permanent threshold shift to hearing] in marine mammals, caution is warranted given the limited knowledge about noise-induced hearing damage in marine mammals." EIS IV-147.

3. *Effects of Oil Spills on Marine Mammals*

"There are few post-spill studies with sufficient details to reach firm conclusions about the effects, especially the long-term effects, of an oil spill on free-ranging populations of marine mammals." EIS at IV-115.

Exhibit 129, Page 2 of 40

24

"Repeated long exposures to intense sound or sudden onset of intense sounds generally characterize sounds that cause permanent threshold shift in humans. Ketten (1998) stated that age-related hearing loss in humans is related to the accumulation of permanent-threshold shift and TTS damage to the ear. Whether similar age-related damage occurs in cetaceans is unknown." EIS at IV-88.

"There are no data on which to determine the kinds or intensities of sound that could cause a [temporary threshold shift, TTS] in a baleen whale." EIS at IV-88.

"Little data are available about how, over the long term, most marine mammal species (especially large cetaceans) respond either behaviorally or physically to intense sound and to long-term increases in ambient noise levels. Large cetaceans cannot be easily examined after exposure to a particular sound source." EIS at IV-88.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown, and information about the hearing capabilities of large baleen whales is mostly lacking. As noted previously, the assumption is made that the area of greatest hearing sensitivity is at frequencies known to be used for intraspecific communication. However, because real knowledge of sound sensitivity is lacking, we believe it is prudent to assume in our analyses that sensitivities shown by one species of baleen whale also could apply to another. This reasonable approach provides the means to infer possible impacts on other species (such as the fin whale), especially when using studies on a species such as the humpback, which uses a large sound repertoire in intraspecific communication." EIS at IV-89.

"It is not known whether (or which) marine mammals can . . . and do adapt their vocalizations to background noise." EIS at IV-89 (internal citation omitted).

b. *Effects from oil spills on whales in general*

"There is uncertainty and controversy regarding the potential effects of oil spills on large cetaceans. There are very few, if any, data available about potential effects of . . . oil spills on cetacean calves." EIS at IV-82.

"There are no data available to MMS that definitely link even a large oil spill [associated with seismic surveys] with a significant population-level effect on a species of large cetacean." EIS at IV-103.

"Data are not available that would permit evaluation of the potential for long-term sublethal effects [from oil spills] on large cetaceans." EIS at IV-115.

"[T]he potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from a large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects." EIS at IV-115.

Exhibit 129, Page 2 of 40

26

"With whales, even when unusual changes in abundance occur following an event such as the EVOS (as with the disappearance of relatively large numbers of killer whales from the AB pod in Prince William Sound) (Dahlheim and Matkin, 1994), interpretation of the data is uncertain and is often controversial due to the lack of supporting data, such as oiled bodies or observations of individuals in distress (and, in that case, the existence of a viable alternate explanation of the probable mortality). Thus, the potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from a large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects. EIS at IV-115. *See also id.* at IV-117 (latter two sentences similar).

"It is not clear how long crude oil would remain on a free-ranging cetacean's skin once it was oiled." EIS at IV-117.

"The potential effect of crude oil on the function of the cetacean blowhole is unknown." EIS at IV-118. *See also id.* at IV-159.

"The effects of an oil spill on cetacean newborns or other calves and the potential effects of contact or detection of spilled oil by near-term, or post-partum females are not known." EIS at IV-121.

"[T]he potential for long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from large oil spill on cetaceans is unknown. However, observations of cetaceans behaving in a lethargic fashion or having labored breathing has been documented in more than one species, including in gray whales after the EVOS, in which large numbers of individuals were subsequently found dead." EIS at IV-158.

"The potential for there to be long-term sublethal (for example, reduced body condition, poorer health, reduced immune function, reduced reproduction or longer dependency periods) effects on large cetaceans from a large oil spill essentially is unknown. There are no data on large cetaceans adequate to evaluate the probability of sublethal effects. EIS at IV-160.

"The effects of a large oil spill and subsequent exposure of whales to fresh crude oil are uncertain, speculative, and controversial." EIS at IV-161.

2. Bowhead Whale

"There are multiple sources of uncertainty in our analyses. These include, but are not limited to uncertainty about the action: where seismic surveys will occur; how many surveys will occur; how much noise will be produced purposely by the firing of airguns; what the exact shape of related ancillary activities, such as support vessel type and activity will be; where exploration drilling could occur; where leases will be let; where a spill could occur; where production platforms and pipelines may be based; etc. More important, there is acknowledged (NRC, 2003, 2005; minutes from meetings of the Marine Mammal Commission Sound Advisory Panel, 2004, 2005 from their web site) scientific uncertainty about the potential effects of noise, especially

Exhibit 129, Page 29 of 40

27

repeated exposure to loud noise, on baleen whales. There is uncertainty and controversy regarding the potential effects of oil spills on large cetaceans. There are very few, if any, data available about potential effects of either noise or oil spills on cetacean calves. Lastly, and importantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales. Thus, it is difficult to predict exposure in some parts of the area where the action could occur and to understand fully the potential effects of any exposure." EIS at IV-82.

a. Effects of seismic and other noise on bowhead whale

"Uncertainty exists about the potential effects of seismic surveys on bowhead whales (especially on calf survival and growth and female reproduction) in the Chukchi Sea due to a lack of current data about their use of the Proposed Action area during periods when seismic surveys could be occurring. What is known, however, is that the observed response of bowhead whales to seismic survey noise varies among studies. Some of the variability appears to be context specific (i.e. feeding versus migrating whales) and also may be related to the whales' reproductive status and/or sex or age." EIS at II-35.

"Bowheads respond to drilling noise at different distances depending on the types of platform from which the drilling is occurring. Data indicate that many whales can be expected to avoid an active drillship at 10- 20 km or possibly more." EIS at II-36. *See also id.* at IV-194 (similar).

"The long-term response of bowheads to production facilities located at the southern end of the migration corridor is unknown." EIS at II-36.

"The response of bowhead whales to construction in high-use areas is unknown and is expected to vary with the site and the type of facility being constructed. Similarly, the long-term response of bowheads to production facilities other than gravel islands located at the southern end of the migration corridor is unknown." EIS at IV-194 (internal references omitted).

"There are multiple sources of uncertainty in our analyses. These include, but are not limited to uncertainty about the action: where seismic surveys will occur; how many surveys will occur; how much noise will be produced purposely by the firing of airguns; what the exact shape of related ancillary activities, such as support vessel type and activity will be; where exploration drilling could occur. . . ." EIS at IV-82.

"More important, there is acknowledged (NRC, 2003, 2005; minutes from meetings of the Marine Mammal Commission Sound Advisory Panel, 2004, 2005 from their web site) scientific uncertainty about the potential effects of noise, especially repeated exposure to loud noise, on baleen whales." EIS at IV-82.

"Data are not sufficient to determine sex, age, or reproductive factors that may be involved in [bowhead] response to vessels. We are not aware of data that would allow us to determine whether females with calves tend to show avoidance and scattering at a greater, lesser, or at the same distances as other segments of the population." EIS at IV-109.

Exhibit 129, Page 30 of 40

28

"The encounter rate of bowhead whales with vessels associated with exploration would be determined by what areas were being explored. Data are insufficient for us to accurately predict the average geographic zone of activity by the support vessels and thus, to predict the additional area that could be affected by the vessels." EIS at IV-100.

"Data on reactions of bowheads to helicopters are limited." EIS IV-100.

"While it is clear that seismic activity may overlap with bowhead use of the Chukchi Sea during fall migration, it is highly uncertain about the likely extent of overlap between seismic activity and bowhead whales in the summer." EIS at IV-101.

"During fall migration, available, but dated, data indicate that overlap is likely to be greatest in the main migratory pathways, one heading nearly directly to the Bering Strait, and the other heading west from Barrow towards Wrangell Island." EIS at IV-101—102.

"It is clear that if 2D/3D seismic surveys impacted areas of the spring lead and polynya system during the spring migration, impacts could potentially be biologically significant. We note that the general location of the spring lead system in the Chukchi Sea (and Beaufort Sea) is based on relatively limited survey data and is not well defined." EIS at IV-102.

"The second situation for possibly larger than typical impacts exists in the Chukchi Sea in the autumn (e.g., late September on) as whales migrate both towards the Asian coast and toward the Bering Strait. Insufficient data exist to determine the current migration paths or the numbers of whales that might be deflected from those paths. Data are also not available to determine how intensively bowheads feed during the autumn migration in the Chukchi Sea or whether large aggregations exist in certain places due to prey resources." EIS at IV-103.

"The factors associated with the variability [of bowhead responses to drills and other noise] are not fully identified or understood." EIS IV-105.

"There are few data on the noise [imposed on, e.g., bowheads] from conventional drilling platforms." EIS at IV-105.

"Most observations of bowheads tolerating noise from stationary operations are based on opportunistic sightings of whales near ongoing oil industry operations, and it is not known whether more whales would have been present in the absence of those operations. Because other cetaceans seem to habituate somewhat to continuous or repeated noise exposure when the noise is not associated with a harmful event, this suggests that bowheads will habituate to certain noises that they learn are nonthreatening. Additionally, it is not known what components of the population were observed around the drillship (adult or juvenile males, adult females, etc.)." EIS IV-105.

"The response of bowhead whales to construction in high use areas is unknown and is expected to vary with the site and the type of facility being constructed. Similarly, the long-term response of bowheads to production facilities other than gravel islands located at the southern end of the migration corridor is unknown." EIS at IV-123.

Exhibit 129, Page 31 of 40

29

"The response of bowhead whales to construction in high-use areas is unknown and is expected to vary with the site and the type of facility being constructed. EIS at IV-194.

"Noise associated with ships or other boats potentially could cause bowheads to alter their movement patterns or make other changes in habitat use. Clapham and Brownell (1999) summarized that "...effects of ship noise on whale behavior and ultimately on reproductive success are largely unknown." EIS at V-23.

"[R]ecent monitoring studies indicated that most fall migrating whales avoid an area with a radius about 20-30 km around a seismic vessel operating in nearshore waters; however, there are no data that indicate that such avoidance is long-lasting after cessation of the activity." EIS at V-25.

b. Effects of oil spill on bowhead whale

"There is uncertainty about the effects on bowheads (or any large cetacean) from the event of a large oil spill." EIS at II-36.

"The potential effects to bowheads of exposure to [polycyclic aromatic hydrocarbons, PACs] through their food are unknown. Because of their extreme longevity, bowheads are vulnerable to incremental long-term accumulation of pollutants." EIS at IV-103. *See also id.* at IV-119 (same).

"In the Biological Opinion for Federal oil and gas leasing and exploration by the MMS within the Alaskan Beaufort Sea and its effects on the endangered bowhead whale, the NMFS (2001:51) stated that: 'It is difficult to accurately predict the effects of oil on bowhead whales (or any cetacean) because of a lack of data on the metabolism of this species and because of inconclusive results of examinations of baleen whales found dead after major oil releases.'" EIS at IV-103.

"There is great uncertainty about the potential effects of ingestion of spilled oil on bowheads, especially on bowhead calves. Decreased food assimilation could be particularly important in very young animals, those that seasonally feed, and those that need to put on high levels of fat to survive their environment." EIS at IV-118.

"It is not known if bowheads would leave a feeding area where prey was abundant following a spill." EIS at IV-118.

"The factors associated with the presence of [large aggregations of bowhead whales] are not yet clear. It is not known if they would leave the area heavily contaminated with crude oil." EIS at IV-121.

"Primarily because of the uniqueness of the bowhead and its apparently obligate use of spring lead and polynyas as its migratory path between wintering and summering grounds, MMS is uncertain of the potential severity of impact should a large oil spill occur within such a system, especially if spring migration were underway and hundreds of females were calving in or near those leads." EIS at IV-121.

Exhibit 129, Page 32 of 40

30

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

"In conclusion, there is uncertainty about effects on bowheads (or any large cetacean) in the event of a large oil spill. There are, in some years and in some locations, relatively large aggregations of feeding bowhead whales within the proposed lease-sale area. If a large amount of fresh oil contacted a significant portion of such an aggregation, effects potentially could be greater than typically would be assumed and we cannot rule out population-level effects if a large number of females and newborn or very young calves [so this would be in spring] were contacted by a very large amount of fresh crude oil." EIS at IV-125.

"Variability in the distribution of bowhead whales in the Beaufort Sea over time and among years, and lack of recent data on bowhead seasonal distribution and abundance in the Chukchi Sea makes attempts to quantitatively model the numbers of whales that might be contacted by oil problematic." EIS at IV-121.

"It is unknown what effects an oil spill would have on bowhead whales, but it is likely that some whales would experience temporary, nonlethal effects from the oiling of skin, inhaling hydrocarbon vapors, ingesting oil contaminated prey, fouling of their baleen, losing their food source, and temporary displacement from some feeding areas." EIS at IV-216-217.

"Limited monitoring data prevent effective assessment of cumulative subsistence-resource damage; resource displacement; changes in hunter access to resources; increased competition; contamination levels in subsistence resources; harvest reductions; or increased effort, risk, and cost to hunters. Limited data also limit our assessment of the effectiveness of mitigation measures." EIS at V-46.

c. Effects of past activity on bowhead whale

"Available data . . . are inadequate to fully address issues about effects of past oil and gas activity specifically in the Chukchi Sea on bowhead behavior." EIS at V-25.

Also, "we cannot adequately assess potential effects on patterns or durations of bowhead habitat use. Because of the inadequacy of the data on activities, and because of the limitations inherent in studying large baleen whales, MMS was not able to assess whether there were any adverse health effects to individuals during the period of relatively intensive seismic survey activity in the 1980's." EIS at V-25.

"However, data are inadequate to fully evaluate potential impacts on whales during this period, including the duration of habitat use effects or numbers and types of individuals that did not use high-use areas because of the activities." EIS at V-27.

Exhibit 129, Page 33 of 40

31

4. *Humpback, Fin, and Other Baleen Whales*

a. Effects of seismic and other noise on humpback, fin, and/or other baleen whales

"Given the greater potential for anthropogenic-noise impacts on baleen whales, more research has been done to focus on potential effects on baleen whales than with toothed whales (although data is still considered limited)." EIS at IV-151.

"No studies are available specific to the effects of seismic-survey noise on minke whales, but the potential for impacts would be considered within the range of other baleen whales. Also, no known long-term impacts have been documented on gray and minke whale behavior as a result of seismic activity." EIS at IV-151.

"Long-term impacts of OCS seismic-survey noise on the hearing abilities of individual marine mammals are unknown, and information about the hearing capabilities of large baleen whales is mostly lacking." EIS at IV-89.

b. Effects of oil spills on humpback, fin, and/or other baleen whales

"[I]t is difficult to predict the impact of a large spill on either humpback whales or especially on fin whales. Based on literature on other mammals indicating severe adverse effects of inhalation of the toxic aromatic components of fresh oil, mortality of cetaceans could occur if they surfaced in large quantities of fresh oil. However, if such mortality occurred, it would be not be consistent with many, perhaps most, published findings of expected impacts of oil on cetaceans. The potential for there to be long-term sublethal (for example, reduced body condition, poorer health, or longer dependency periods), or lethal effects from large oil spill on cetaceans essentially is unknown. There are no data on cetaceans adequate to evaluate the probability of such effects." EIS at IV-122.

"There are no data available on which to evaluate the potential effect of a large or very large spill on baleen whale calves, on females who are very near term or who have just given birth, or on females accompanied by calves of any age." EIS at IV-161.

c. Cumulative impacts on humpback, fin, and/or other baleen whales

"There are no records of humpbacks killed or injured in the fisheries in which fishers self report (Angliss and Lodge, 2002), but the reliability of such data is unknown." EIS at V-29.

"The impacts of pollution and habitat degradation [on humpback whales] due to coastal development are not known." EIS at V-30.

Exhibit 129, Page 33 of 40

33

d. Cumulative effects on bowhead whale

"[D]ata on other potential perturbations (e.g., past seismic surveys and oil spills) are not sufficient to clearly know the level of effects [on bowheads]." EIS at V-20.

"Whether there are long-lasting behavioral effects from [subsistence] activity are unknown, but overall habitat use appears to be relatively unaffected." EIS at V-20.

"There are not sufficient data about past human activities, including, but not limited to, past offshore oil and gas related seismic surveys, or ice-management activities, to address whether there are any long-term impacts on [bowhead] behavior from such activities in either evaluation area." EIS at V-20.

"There are insufficient data to make reliable predictions of the effects of Arctic climate change on bowhead whales." EIS at V-22 (quoting Angliss and Lodge (2002:174)).

"If climate changes occur, it is likely that shipping would increase throughout the range of the bowhead, especially in the southern portions of the Arctic Ocean. If commercial fisheries were to expand, bowhead whale death and/or injury due to interactions with fishing gear, possibly injury and/or death due to incidental take in commercial fisheries, and temporary effects on behavior potentially could occur. There are, however, no data that would permit a quantitative prediction of the aforementioned possible effects." EIS at V-22.

"Data on other activities, such as hunting activity, barge traffic, and shipping noise are incomplete. Thus, while it is clear there have been multiple noise and disturbance sources in the Beaufort Sea over the past 30 years, because of the incompleteness of data, even for the 1990's, for many types of activities, we cannot evaluate the cumulative effects on bowhead whales resulting from multiple noise and disturbance sources (e.g., 2D seismic in State and Federal waters, drilling, ice management, high-resolution acoustic surveys, vessel traffic, construction, geotechnical borehole drilling, aircraft surveys, and hunting). Because data also are incomplete for the Chukchi Sea, we reach the same general conclusions." EIS at V-26.

3. *Beluga Whale*

"A large oil spill could have significant impacts to beluga prey species, including anadromous and coastal spawning species such as salmon (Sec. IV.C.1.d). If a significant impact to anadromous and coastal spawning species occurred, the effects on belugas would be detrimental, but the magnitude unknown." EIS at IV-161.

"Given the greater potential for anthropogenic-noise impacts on baleen whales, more research has been done to focus on potential effects on baleen whales than with toothed whales (although data is still considered limited)." EIS at IV-151.

Exhibit 129, Page 34 of 40

32

C. *Other Marine Mammals*

1. *Seals*

"It is uncertain how seismic surveys potentially might impact seal-food resources in the immediate vicinity of the survey." EIS at IV-147.

In the context of seals: "Although it is unlikely that airgun operations during most seismic surveys would cause [permanent threshold shift] in marine mammals, caution is warranted given the limited knowledge about noise-induced hearing damage in marine mammals." EIS at IV-147.

"Little information is known about oil-spill effects on seals although any large oil spill in nearshore marine or coastal riverine environments could cause injury or death to these sea mammals, potentially cause them to move off of their normal course, and make them unavailable for subsistence harvest." EIS at IV-217 (internal references omitted).

2. *Walrus*

a. Effects of seismic

There is "no data available to evaluate the potential response of walrus to seismic operations." EIS at IV-148.

"Quantitative research on the sensitivity of walrus to noise has been limited because no audiograms (a test to determine the range of frequencies and minimum hearing threshold) have been done on walrus." EIS IV-148.

"Although the hearing sensitivity of walrus is poorly known, source levels are thought to be high enough to cause temporary hearing loss in other species of pinnipeds." EIS at IV-148.

"Seismic operations are expected to create significantly more noise than general vessel and icebreaker traffic; however, there are no data available to evaluate the potential response of walrus to seismic operations." EIS IV-148.

3. *Polar Bears*

a. Effects from oil spills

"With the limited background information available regarding large oil spills in the offshore arctic environment, the outcome of a large oil spill is uncertain." EIS at IV-165.

Exhibit 129, Page 34 of 40

34

b. Cumulative effects

"Quantitative data are lacking that specifically addresses the potential cumulative impacts of development on polar bears and the effects of disturbance related to human activities on polar bear habitat use, as well as recruitment and survival (Perham, 2005). There also is a high degree of uncertainty regarding the spatial scope of potential Industry activities on the Alaskan OCS." EIS at V-36. *See also id.* at V-52 (same).

Exhibit 129, Page 3 of 40

35

"It is unknown if exposed adult[birds] could become permanently sterilized [due to exposure to oil]." EIS at IV-133.

B. Impacts to Threatened Spectacled and Steller's Eiders⁴

"The behavioral response of eiders to aircraft overflights is unknown; some spectacled eiders nest and rear broods near the Deadhorse airport indicating that some individuals tolerate frequent aircraft noise. Individual tolerances are expected to vary, however, and the intensity of disturbance associated with the proposed action would, in most cases, be less than that experienced by birds at the Deadhorse airport. Some birds may be displaced, with unknown physiological and reproductive consequences." BE at 38 (emphases added).

"Collision-related mortality to eiders on the North Slope is not known and is difficult to estimate ..." BE at 44.

Ledyard Bay Critical Habitat Areas: "The loss of seafloor habitats due to exploration or delineation drilling cannot be quantified at this time, but could be in important staging or molt migration areas. The importance of these areas relative to the timing of molt, survival during the molting period, and condition after molting is unknown, however, the availability and quality of key resources in those areas during the prolonged migration period ultimately may influence the survival of the spectacled eiders (Petersen et al. 1999)." BE at 47.

"The disturbance radius from the drilling operation is unknown. Temporal and spatial use patterns for eiders within the Critical Habitat Area are also largely unknown." BE Addendum at 1.

C. Impacts to Kittlitz's Murrelets⁵

"Clearly, there is cause for concern regarding the long-term survival of the [Kittlitz's Murrelet] and the potential negative impacts of offshore oil and gas development; however, management decisions are difficult given the lack of available information." BE at 36-37.

"Though impacts of oil spills [on Kittlitz's murrelets] have been documented (van Vliet and McAllister 1994, Carter and Kuletz 1995), little is known of potential impacts of disturbance on courtship behavior, foraging ecology and feeding, or energetics (Day et al. 1999)." BE at 37.

⁴ See note 1.

⁵ See note 1.

Exhibit 129, Page 39 of 40

37

III. MARINE AND COASTAL BIRDS

A. Impacts Generally

"Several areas historically documented to be important to marine and coastal birds in Sale 193 area, as well as the entire proposed lease sale area, lack site-specific data on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data is between 15 and 30 years old, making accurate analysis difficult. Overall, several species or species-groups have a high probability of experiencing substantial negative impacts. The risk that several regional bird populations could experience significant adverse impacts is high." EIS at II-37.

"The current distribution and abundance of [bird] predators along the Chukchi Sea coast are unknown." EIS at IV-132.

"Marine and coastal birds could be exposed to a variety of potential negative effects during seismic surveys, exploration drilling, and production including disturbances, collisions, habitat loss, petroleum exposure, and exposure to toxic contamination. The greatest potential for substantial adverse impacts typically would arise from collisions, aircraft disturbance, and large and chronic low-volume spills in important coastal bird habitats. These areas are Kasegaluk Lagoon, Ledyard Bay, Peard Bay, barrier islands, the spring open-water lead system, and the seabird-nesting colonies at Cape Lisburne and Cape Thompson. Despite the importance of these areas, as well as the entire Chukchi Sea within the proposed lease-sale area, little recent site-specific data are available on habitat-use patterns, routes, and timing to assess impacts. For many species, the most recent data are between 15 and 30 years old, making accurate analysis difficult. Because of this long data gap, it is unknown if population abundance or distribution of many species have changed." EIS at IV-145.

1. Noise impacts on marine and coastal birds

"Seismic airgun pulses have the potential to physically harm or kill diving birds. The threshold for physiological damage, namely to the auditory system, for marine birds is unknown." EIS at IV-127.

"Few studies have assessed the effects of seismic surveys on marine birds and waterfowl." EIS at IV-127.

2. Oil impacts on marine and coastal birds

"There are several areas historically documented to be important to marine and coastal birds in the proposed lease sale area. These areas, as well as the entire proposed lease sale area, lack site-specific data on habitat use patterns, routes and timing to assess impacts. For many species, the most recent data is between 15 and 30 years old, making accurate analysis difficult." EIS IV-126.

Exhibit 129, Page 3 of 40

36

"Additional information on the response of diving birds to approaching seismic survey vessels is essential to verify assumptions that there is a low potential for seabirds, including Kittlitz's murrelets, to be harmed by airgun noises." BE at 41.

D. Impacts on Waterfowl1. Impacts on Yellow-Billed Loons

"Yellow-billed loons in the Chukchi Sea are at particular risk [from environmental perturbations such as disturbance, habitat alterations, and oil spills] due to their low numbers and low reproductive rate. The species is little studied and basic biological information (such as the seasonal distribution of immature and non-breeding yellow-billed loons) is unknown. Additional research could improve our understanding of the vulnerabilities of the yellow-billed and other loons using nearshore areas of the Chukchi Sea and western Beaufort Sea." EIS at IV-140-41.

2. Impacts on Common Eiders

"The number of [common eiders] that could be affected [by oil spill] at sea during spring or fall migration is unknown." EIS at IV-142.

E. Impacts on Shorebirds

"Dunlins are another prominent species in Kasegaluk Lagoon and Peard Bay in late summer and fall. As with other species of shorebirds and waterfowl, a spill during periods of peak abundance could impact large numbers of dunlins. Less is known about the numbers, timing, and patterns of habitat use of Kasegaluk Lagoon and Peard Bay by bar-tailed godwits but, given their recent population declines, effects of an oil spill could be particularly important." EIS at IV-144.

Exhibit 129, Page 40 of 40

38

DRAFT DRAFT DRAFT
FEBRUARY 2010Attachment 3
Major Problems with Oil Spill Models

The Lease Sale 193 (Chukchi) and 2003 Multi-Sale (Beaufort 186, 195, 202) environmental impacts statements use the same primitive model to estimate how spilled oil might travel in the marine environment. This model, which was developed in 1982, forms the basis for the evaluation of potential impacts from a spill. Because the environmental assessments for the exploration drilling proposed for the Beaufort and Chukchi Seas in 2010 assume that no large spill will occur, they do not contain any additional modeling of, or evaluation of potential effects from, a spill. The model used in the environmental impact statements suffers from substantial deficiencies:

- The model assumes that spilled oil is a point—it does not account for spreading of spilled oil, for the possibility that different parcels of a spreading oil slick may travel along different trajectories, or that these parcels may re-converge at locations distant from the spill origin, all of which are important aspects of the behavior of actual oil spills.
- Much of the environmental data input to the model is old—particularly current and wind information, which is from 1979-1996. Much has changed in the Arctic since then, and better information should be available.
- The model cannot account for the presence of sea ice. It assumes that shorefast ice exists for part of the year and that the ice “masks” the shore, which means that no oil could reach the shore.
- The model divides the leased area into a series of quadrants. Within each quadrant, it predicts that a spill could occur from a number of locations. It treats a spill from each location as equally likely and then provides an estimate of likelihood that a spill from each quadrant would reach land. This method biases the calculation in two ways. Some of the locations are further from land than others, so the model understates the likelihood of spilled oil from one of the closer locations reaching shore. Also, a spill is not equally likely from each location—Shell only wants to drill at some of them.
- The SINTEF model used to evaluate weathering effects on spilled oil is independent of the model used to estimate trajectories, making it impossible to evaluate effects related to, for example, the increasing propensity of oil to sink as it weathers.
- The model does not consider interactions with suspended particulate matter, which is crucial for determining the propensity of spilled oil to sink, thereby affecting the benthic community which is especially important in Arctic coastal marine ecosystems.
- More sophisticated and appropriate models that address the defects listed above have been available for over a decade.

Hello. My name is Lois Epstein and I am the Arctic Program Director for The Wilderness Society or TWS. I am a licensed engineer in Alaska and I have spent over 20 years working on oil and gas technical and policy issues as a consultant and as an employee of non-profit organizations. I've served on federal advisory committees for U.S. DOT on pipeline safety and for U.S. EPA on petroleum refining, and I was a technical advisor on the report to the President in May 2010 which contained recommendations on increasing offshore drilling safety. I am not opposed to oil and gas production in Alaska -- my role at TWS is to ensure that oil and gas drilling is done well and in appropriate locations.

In September I served on a BOEM panel in Houston on safety. My message was that “business as usual” is unacceptable to the public and that significant regulatory, inspection and enforcement changes are needed, as well as transparent performance reporting by industry and government. With respect to the Arctic, I noted that one key safety concern is related to human factors, a major cause of accidents. Because of cold and darkness in the Arctic, human factors likely would be a greater concern than elsewhere. Moreover, frontier and pristine areas always require extra precautions and safety factors. You've heard from others today about response limitations in the Arctic including limited biodegradation capabilities, the difficulties of cleanup in broken ice, and how darkness, adverse weather, and lack of infrastructure would impede cleanup so I won't go into detail on those concerns.

TWS' position is that BOEM needs to take the time needed to make scientifically-justified decisions before allowing drilling in the Chukchi. This includes reassessing which scientific information in Appendix A of the Draft SEIS is obtainable at a cost that is not exorbitant, rather than BOEM dismissing the need to gather such information. In effect, BOEM states in the draft SEIS that it has decided to allow drilling regardless of the impacts. The public needs to know those impacts in as specific detail as possible for rational decision-making.

If there is any doubt about blowouts and other offshore problems in the Arctic, consider the following events which also occurred in Alaska's shallow offshore areas in Cook Inlet:

1985. Gas blowout at Grayling offshore platform which shut down production.

1987-88. Gas blowout at Steelhead offshore platform occurred while drilling an oil production well in December 1987. Fire burned for one week. While drilling the relief well, another blowout occurred in June 1988. The relief well was completed in August 1988.

1989. A frozen valve on Amoco's Anna offshore platform caused a spill of over 20,000 gallons of crude. Cleanup was not attempted due to 80-90% moving ice floes in Cook Inlet.

As some of you also may have done, I woke up at 5 am yesterday and today to watch the Oil Spill Commission's two days of hearings in DC on the causes of the BP *Deepwater Horizon* tragedy. BOEM Director Bromwich today noted the extreme sensitivity of the Arctic environment and its marine resources and their importance to subsistence, as well as the region's spill cleanup challenges. On a technical level, the two days of hearings made clear how well-financed drilling companies nevertheless could:

1. Misinterpret data from a key well integrity test,
2. Decide not to utilize potentially critical well components known as centralizers because they would take too long to arrive, a delivery situation that would be much worse in the Arctic, and
3. Not take actions that would have mitigated much of the tragedy, e.g., using the platform's diverter system.

What these hearings demonstrate is that no matter how good the regulatory oversight – and everyone acknowledges that BOEM needs regulatory improvements – there will be infrequent but highly tragic spill events. This information, combined with a clear need for collection and analysis of scientific data on the Arctic's natural resources, demonstrate that BOEM is not ready at this time to proceed with offshore drilling in the Chukchi. BOEM should not rush through this EIS process like a student rushing to complete a term paper...

Lease Sale 193 - Comments of 11-29-10

The hard fact is that oil will be the number one energy source in the world for some time into the future. The time line on any "alternative" energy source replacing oil is unforeseeable at the present. Responsible energy development, on many levels, has the very shallow OCS of the Chukchi and Beaufort Seas topping the list of best places to develop America's oil resources.

Points of view which have encouraged the existing drilling moratorium tend to place all OCS drilling in the same category. However, the differences between the deepwater drilling conditions encountered in the Gulf of Mexico and the very shallow water drilling in the Chukchi Sea are critical in well head working pressures, well design and well maintenance; all placing the shallow Chukchi Sea drilling in a very positive light.

The environmentally concerned citizen should rather see the oil resources developed under the stringent scrutiny you find on the North Slope of Alaska than in a third world country that has few, if any, environmental policies. The Beaufort and Chukchi Seas are perhaps the most studied offshore fields in the world. The worlds' highest safety and environmental standards; an industry commitment for unprecedented spill prevention and spill response provisions; along with an extremely high bar for obtaining permits to operate all combine to provide a high level of confidence in the oil industry in Alaska.

Finally, the existing TAP is 70% empty now. This oil reservoir could refill the pipeline and revitalize the search for additional energy sources in the area. The development of Lease Sale 193 would not only bolster the US domestic energy supply but it would provide an annual average of 35,000 good paying jobs over the next 50 years in Alaska. Plus add thousands of new high-paying jobs in the energy industry's collateral support network throughout all 50 states.

The Lease Sale 193 should be affirmed as held in 2008. Additional costs for obtaining information are exorbitant and unnecessary. Additional information will likely be found to be not essential or relevant to a decision. The nation needs the domestic energy for long term security and Alaska needs the resource development for its' economic future. We need to build strength with our policies not weakness. Let's move forward with a strong energy plan that includes the responsible development of the Chukchi and Beaufort OCS.

Attn: Chukchi Sea Draft SEIS

Dear Sirs,

We encourage you to reaffirm Lease Sale 193. We are confident that the SEIS is adequate and the oil and gas production from Sale 193 will be done pursuant to adequate environmental safeguards.

Alaska and our nation need the employment and economic benefit that this Lease Sale will provide. Further, our nation will benefit from the oil and gas that is produced.

Sincerely,

Owen Graham

RE: Chukchi Sea Draft SEIS

Dear Sir,

We are writing to urge that Lease Sale 193 go forward as it was held in 2008. Alaska and America need the oil and gas that is in this area.

The Alaska Miners Association is a non-profit membership organization established in 1939 to represent the mining industry in Alaska. The AMA is composed of more than 1200 individual prospectors, geologists and engineers, vendors, suction dredge miners, small family mines, junior mining companies, and major mining companies. Our members look for and produce gold, silver, platinum, diamonds, lead, zinc, copper, coal, limestone, sand and gravel, crushed stone, armor rock, and other materials. Our members depend on a stable source of petroleum products to operate their businesses and provide the minerals needed for our society.

The potential environmental impacts and economic benefits of developing oil and gas in this area have been thoroughly evaluated and show that this is in the best interest of the United States. The Supplemental Environmental Impact Statement provides comprehensive data, analysis and support to make a decision affirming Lease Sale 193. **Given the level of analysis already completed and the needs of our country for domestic sources of oil and gas, to delay this development in any way by some form of indirect moratorium or further delay must not be allowed.**

The Bureau of Ocean Energy Management, Regulation and Enforcement needs to find ways to encourage investments in finding domestic sources of oil and gas. Further delays will do just the opposite. With an estimated 29 billion barrels of oil and 209 trillion cubic feet of natural gas, the Chukchi Sea and Lease Sale 193 can be a major factor to improve our nation's long-term energy security. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.

Oil and gas development in Alaska would be done under the world's highest safety and environmental standards. All activity will be governed by stringent lease stipulations identified in the FEIS and SEIS. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.

Alaska Miners Association, Inc. Comment

Oil and gas development proposed in Arctic waters is much different than deepwater exploration in the Gulf of Mexico. The pressures encountered in deepwater drilling are many times greater than in Alaska where wells would be in very shallow water.

There has never been a blowout in the Alaska or the Canadian Arctic that resulted in an oil spill. Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled more than two decades ago and utilized older technology than what would be used now.

A University of Alaska study estimates that new OCS development in Alaska would provide an average of 35,000 jobs in Alaska. It would also create thousands of new high-paying jobs throughout all 50 states and it would decrease our dependence on foreign sources of oil and gas.

Given our current extreme dependence on foreign sources of energy, the U.S. has a moral obligation to develop the resources in the Beaufort and Chukchi seas. **We urge that you move forward with Lease Sale 193 immediately.**

Sincerely,

Steven C. Borell, P.E.
Executive Director

Anchorage, AK 99503-5820

Attn: Chukchi Sea Draft SEIS

Dear Regional Director:

The Alaska Oil and Gas Association ("AOGA") appreciates this opportunity to submit comments on the Draft Supplemental Environmental Impact Statement ("SEIS") for Chukchi Sea Lease Sale 193. AOGA is a private, nonprofit trade association whose member companies account for the majority of oil and gas exploration, development, production, transportation, refining and marketing activities in Alaska.

AOGA endorses the comments on the SEIS for Lease Sale 193 being submitted by the American Petroleum Institute ("API") and the National Ocean Industries Association ("NOIA") and encourages the Bureau of Ocean Energy Management, Regulation and Enforcement ("BOEM") to consider and incorporate the suggestions contained therein. AOGA offers the following additional comments on the SEIS.

The purpose of the SEIS is for the BOEM to provide new National Environmental Policy Act ("NEPA") analysis as directed by the U.S. District Court for Alaska in a July 2010 order. This order instructed BOEM to address three specific concerns: (1) the environmental impact of natural gas development; (2) whether missing information identified in the original EIS was essential or relevant under the federal regulations; and (3) whether the cost of obtaining the missing information was exorbitant, or the means of obtaining it unknown. The SEIS addresses those concerns, concludes that the missing information was not essential and recommends that Lease Sale 193 be affirmed as held. AOGA believes the Secretary should accept the conclusions of the SEIS and expeditiously affirm the sale so exploration and development in the Chukchi Sea Outer Continental Shelf ("OCS") is not delayed any longer.

Alaska Oil and Gas Association Comment

November 30, 2010

The SEIS considers the most viable natural gas development and production scenario for Chukchi leases – including use and potential expansion of existing (due to oil development and production) infrastructure and an overland gas pipeline transportation system – in the context of the alternatives analyzed (and evaluated to the satisfaction of the Court) in the Final EIS for Lease Sale 193. On this point, the SEIS correctly assumes that first commercial gas production would only follow the oil exploration, development and production activities already analyzed in the Final EIS. Furthermore, for each resource category – including water quality, air quality, fish, essential fish habitat, whales, polar bears, other marine mammals, terrestrial mammals, vegetation and habitat, subsistence harvest patterns and sociocultural systems – the SEIS determines that natural gas development and production would have no significant adverse impacts. For resource categories such as marine and coastal birds and archaeological resources, potential impacts would be avoidable or reduced through avoidance and mitigation and compliance with existing construction protocols and laws.

Also important is the fact that what is at issue is a lease sale. The OCS Lands Act establishes a four-stage process for planning, leasing, exploration and production of oil and gas resources in Federal waters. Under this process, an OCS lease authorizes a lessee to engage only in "ancillary activities" that do not harm the environment pending further review and approvals. BOEM approval is required prior to any exploration, development or production activities within a lease block. Lessees seeking to engage in such actions must submit for BOEM review an exploration or development and production plan, as appropriate. BOEM is then required under NEPA to prepare an Environmental Assessment ("EA") and/or an EIS. Proposed plans are evaluated for compliance with applicable regulations, lease stipulations and other requirements, including the adequacy of the related oil-spill response plan. Prior to conducting any drilling operations, the lessee is also required to submit and obtain approval for an Application for Permit to Drill ("APD").

AOGA agrees with BOEM's conclusion that new information regarding the Deepwater Horizon incident is not relevant to the analysis of natural gas development and production in the Chukchi Sea OCS, and that analysis of such an oil spill is not within the scope of the District Court's order. Since the natural gas development and production scenario assumes that natural gas development would take place after oil development is substantially complete, the risk of an oil spill occurring is unlikely. In addition, even if the Court's order required reconsideration of potential impacts related to production of oil, the information available on the Deepwater Horizon spill would not require any analysis in the SEIS because of the differences between the Gulf of Mexico and the Chukchi Sea cited in the SEIS, including the fact that the Chukchi Sea Planning Area is predominantly shallow water.

Alaska Oil and Gas Association Comment

November 30, 2010

Sale 193 is the most successful oil and gas lease sale in Alaska's history (and at the time, in U.S. history). BOEM received approximately \$2.7 billion in high bids and issued 487 leases. The time required to get from lease sale to first production is estimated to be 20 years, yet to date, not even one exploratory well associated with Sale 193 has been drilled.

Development of Alaska's OCS is vital not only to Alaska's economy, but the nation's energy independence. In the past, Alaska's oil resources accounted for 20 percent of the nation's domestic production (1980-2000). Today, that number has declined to 9 percent. According to conservative Department of Interior ("DOI") estimates, Alaska's OCS holds 25 billion barrels of oil and 122 trillion cubic feet of natural gas – one-third of the nation's technically recoverable OCS reserves. By comparison, the U.S. has 22 billion barrels of proved oil reserves, annual U.S. production of oil is 1.6 billion barrels and total production to date from the North Slope is about 16 billion barrels of oil.

With global demand for oil and natural gas expected to increase 50 percent by 2030, it is critical that energy companies have access to domestic hydrocarbons. Today, about 65 percent of the nation's oil supply and nearly 20 percent of its natural gas supply is imported. The current trend threatens to undermine our economy and national security. Clearly, Alaska's OCS has the potential to make a significant contribution to the domestic supply of oil and gas and help eliminate this threat.

Access to Alaska's OCS resources is critical to the continued operation of the Trans-Alaska Pipeline System ("TAPS"), which is currently operating at about one-third of its capacity, and could be uneconomic to operate after 2020 without additional throughput. Access is also a key component to the economic feasibility of the proposed natural gas pipeline from the North Slope to the Lower 48. Additionally, OCS oil and gas development would benefit Alaska's economy by providing thousands of high-paying jobs over a long-term period. A study by the University of Alaska's Institute of Social and Economic Research ("ISER") and Northern Economics found that new offshore energy production in Alaska would create an annual average of 35,000 new jobs in the state, with a total payroll of approximately \$72 billion over the 50-year life of the projects. New offshore development in Alaska would also generate thousands of new high-paying jobs throughout the country across a wide-variety of industries. Further, these numbers do not even take into account the royalties and tax revenues directly tied to offshore oil and gas development and production that would flow to the federal government and state and local economies in Alaska.

Exploring for oil and gas offshore in Alaska is not a new concept. A total of 30 wells have been drilled in the Beaufort Sea and five wells drilled in the Chukchi Sea. These wells were drilled over 20 years ago using older technology. Today's technology has resulted in reduced

environmental impacts and footprints for infrastructure for oil and gas development projects. Advancements in 3-D and 4-D seismic technology allow industry to focus their "targets," reducing impacts even more. Moreover, there has never been an oil spill caused by a blowout from offshore exploration and production drilling in state and federal waters off Alaska or the Canadian Arctic.

Finally, Alaska's North Slope and OCS are now perhaps the most studied energy basins in the U.S. In the past decade alone, over 250 scientific studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas. All told, at least \$500 million has been spent on more than 5,000 independent studies since 1973.

AOGA strongly urges the Secretary to affirm Chukchi Sea Lease Sale 193, as recommended by the SEIS. The leases issued under Sale 193 were sold only after an exhaustive environmental analysis, and the specific concerns the District Court raised about the Final EIS for the sale are adequately addressed by the SEIS. Failure to affirm Lease Sale 193 would allow the moratorium on exploration and development of Alaska's OCS to continue, harming Alaska's economy and the nation's energy security, without a corresponding benefit to the environment.

If you have any questions on these comments, please do not hesitate to contact me.

Sincerely,

KATE WILLIAMS

RE: Chukchi Sea Draft SEIS – Allow Responsible Access to Alaska's Resources

Dear Mr. Goll:

I am writing to express my support for the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska.

The draft Supplemental Environmental Impact Statement (SEIS) recently released by the federal government properly addresses all concerns expressed by the U.S. District Court in Alaska. Thus, it is my hope that the federal government will finally approve the responsible development of the Chukchi's abundant oil and natural gas resources.

It is important that the federal government brings Alaska's vast oil and natural gas reserves back online. Jobs in Alaska and across the nation depend on the opportunities that offshore oil and gas production can and will provide. In fact, a study by the University of Alaska found that new offshore energy production in the state of Alaska would produce an annual average of 35,000 jobs – both directly and indirectly generated by increased offshore production – over the next 50 years for the state of Alaska alone, with a total payroll of \$72 billion (2007) over the 50-year period.

Further, new offshore oil and gas development in Alaska will stimulate America's economic recovery by generating thousands of new, high-paying jobs throughout the 50 states, from steel and pipe manufacturers in the Midwest, to shipping on the coasts, to advanced computer technology in California and Seattle, to Union Labor for pipeline construction and maintenance.

In conclusion, I strongly believe that the federal government should move forward with the SEIS process and the development of Lease Sale 193 in the Chukchi, as well as pave the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing.

Now is the time to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

Sincerely,

Daniel J. Blackmore

Anchorage, Alaska 99503

RE: Chukchi Sea Draft SEIS Comment – Support Access to Alaska's OCS Oil and Gas Resources

Dear Mr. Goll:

We are writing collectively to support OCS drilling in the Chukchi Sea, specifically in the area of Lease Sale 193 and to encourage BOEMRE to uphold the sale as held in 2008. We encourage BOEMRE to affirm the Draft SEIS and move forward with responsible development of the Chukchi Sea.

The federal government has a tremendous opportunity at hand in terms of economic revitalization, re-forging national security, and job creation for everyday Americans. Today's economic outlook is bleak; with many state governments and our federal government going into debt, it's time for these entities to partner with the private sector to generate revenue and begin the process of freeing ourselves from financial chains that hold us back from success. Resource development is one of the solutions to this problem.

Recently, the University of Alaska conducted a study concluding that new OCS development in Alaska could generate an annual average of 35,000 jobs both directly and indirectly. This translates into a payroll approximately to the tune of \$72 billion over the next 50 years. This helps not only Alaska, but all 50 states; jobs and revenue are not strictly limited to Alaska.

Supporting Alaska supports our entire country, and this issue is proof that we are a key component to building a better America. Oil and gas development in Alaska is one of the steps our country can take to assure national and energy security.

Sincerely,

Benjamin Mohr

API AND NOIA COMMENTS

November 29, 2010

Regional Director, Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500,
Anchorage, Alaska 99503-5820
Attn: Chukchi Sea Draft SEIS (OCS EIS/EA BOEMRE 2010-034)

Comments submitted via e-mail to : BOEMRE-AKPublicComments@boemre.gov

Dear Sir or Madam:

This letter provides the comments of the American Petroleum Institute ("API") and National Ocean Industries Association ("NOIA") (the "Associations") in response to the supplemental environmental impact statement ("SEIS") published by the Bureau of Ocean Energy Management, Regulation and Enforcement ("BOEMRE"), October 15, 2010 for Chukchi Sea Lease Sale 193. See 75 Fed. Reg. 63504-05.

API is a national trade association that represents all aspects of America's oil and natural gas industry. API has approximately 400 members, from the largest major oil company to the smallest of independents; from all segments of the industry, including producers, refiners, suppliers, pipeline operators and marine transporters, as well as service and supply companies that support all segments of the industry. NOIA is the only national trade association that represents all companies engaged in the exploration for, and production of, traditional and alternative energy on the nation's Outer Continental Shelf. The NOIA membership comprises more than 270 companies engaged in activities ranging from producing to drilling, engineering to marine and air transport, offshore construction to equipment manufacture and supply, shipyards to communications, and geophysical surveying to diving operations. Many of the members of API and NOIA are engaged in operations or support of operations for the exploration and production of oil and natural gas resources in U.S. Arctic regions. In Alaska, the oil and natural gas industry has proven itself to be a critical partner in the development of the Arctic, and in expanding our knowledge of an Arctic environment that is as fragile as it is remote and challenging.

The SEIS is intended to fulfill the requirement imposed by the U.S. District Court for Alaska to provide new analysis in accordance with the court's July 2010 order remanding the BOEMRE's Chukchi Sea Lease Sale 193 Final EIS (FEIS). This order directed BOEMRE to address three concerns: (1) Analyze

API AND NOIA COMMENTS

Regional Director, Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
November 23, 2010

the environmental impact of natural gas development to supplement what was held to be too limited a focus of the FEIS on crude oil development; (2) determine whether missing information identified by BOEMRE in the FEIS for Chukchi Sea Lease Sale 193 was essential or relevant under 40 CFR 1.502.22; and (3) to determine whether the cost of obtaining the missing information was exorbitant, or the means of doing so unknown.

We believe that the SEIS achieves the purposes set forth by the Court. It documents extensive consultation with various federal agencies and the State of Alaska in the course of pursuing environmental review. It examines the most viable natural gas development scenario that could result from development of oil and gas leases offered in Sale 193. It considers the impacts from natural gas development in the context of the oil resource development alternatives that were evaluated to the satisfaction of the Court in the FEIS for Sale 193. It makes the logical assumption that foreseeable natural gas development and production in the Sale 193 area would make use of offshore facilities considered in terms of crude oil development scenarios for Sale 193. The SEIS considers natural gas development scenarios that identify deferral areas along the coastward edge of the Chukchi Planning Area. These deferral areas, were they to be implemented, would affect the type and severity of potential impacts to the offshore and shoreline environments from development based upon the size and location of the deferral areas.

In the course of examining each impact category - including water quality, air quality, fish resources and habitat, threatened, endangered and other marine mammals and marine and coastal birds, wetlands and shoreline vegetation, subsistence resources and impacts to native communities - it finds impacts from natural gas development to be incremental to those from development of crude oil resources, and capable of being addressed by carefully designed mitigation measures. The SEIS properly recognizes that the risk of impacts from oil spills can be controlled by prevention measures that BOEMRE will scrutinize in its review of operational safety and pollution-prevention measures described in a lease operator's permit application, and that the effects of small oil spills are likely to be localized. This does not discount the risk of spills, but it places that risk in an operational and regulatory context appropriate for review under the National Environmental Policy Act ("NEPA"). The SEIS notes the authority of other regulatory agencies over exploration, production and transportation facilities that may be utilized for development of oil and natural gas resources on the OCS. The SEIS also notes the requirements for best available and safest technologies, for technical and safety review and inspections, and for detailed oil spill contingency plans.

In sum, the SEIS supports a determination that impacts to the environment from development of natural gas resources in the Sale 193 area are capable of being prevented by a combination of sound operating practices, compliance with regulations, and appropriate regulatory oversight, and/or capable of being mitigated to insignificance. The SEIS supports a determination that the effects on Arctic communities from potential development of resources on the Sale 193 leases would have direct and indirect consequences on social and institutional organization and cultural practices for those communities but would not tend to displace social systems overall. In recent decades the communities of the Alaskan Arctic have experienced significant social change and can expect to continue to do so, but they are not without capability and leadership to address the challenge of social change for the benefit of the residents and their traditions. Development of the oil and natural gas resources of the region, will not only provide important benefits to the economies of the United States and the State of Alaska, but it can also provide jobs, revenues and benefits to the Arctic communities as well.

API AND NOIA COMMENTS

Regional Director, Alaska OCS Region
Bureau of Ocean Energy Management, Regulation and Enforcement
November 23, 2010

Alaskan oil and gas operations have been a proving ground for technologies that have steadily reduced both the footprint and the impacts of exploration and production activities the industry undertakes. In over 30 years of oil production at Prudhoe Bay and other fields on the Alaska North Slope, producers have significantly advanced technology in drilling, Arctic engineering, waste disposal and environmental management, and have developed better tools to locate the underground structures that contain oil. Together, these advancements and the commitment to environmental performance by the men and women who work on the Slope have greatly reduced the effects of oil development on the wildlife and surface resources surrounding the production operations, and have reduced the footprint that these operations occupy.

Our nation's long term energy security will depend upon diversity of sources of supply. It is important to remember that U.S. domestic production is mostly made up of modest amounts from hundreds of thousands of wells in thousands of oil and gas fields, both onshore and offshore. With the exception of a few very large fields discovered many decades ago, all of our current production comes from fields that can be characterized as only a few weeks or months of supply. Thus, each discovery makes a proportional contribution to supplies over 10, 20, or in some cases, 50 or more years. The U.S. needs a constant supply of new discoveries to replace declining production from existing and end-of-life wells to meet our nation's growing demand for energy. Otherwise production will eventually fall, creating a potential supply/demand imbalance that could have adverse impacts on imports and prices for American businesses, consumers and homeowners.

The resource potential available in Alaskan OCS is first order world class. The oil and natural gas resource potential represented by the Chukchi and Beaufort Seas exceeds the combined resource estimates for the Atlantic and Pacific OCS, holding an estimated 25 billion barrels of oil and 122 trillion cubic feet of natural gas. Exploring for oil and gas offshore Alaska is not new. A total of 30 wells have been drilled in the Beaufort Sea and five wells drilled in the Chukchi Sea. Although some discoveries of oil and natural gas were made, development of these discoveries was not economically viable at that time.

Since 2005, the federal government has held several OCS lease sales in Alaska, and bonus payments to the federal treasury have exceeded \$3 billion for ten-year leases in the Beaufort and Chukchi Sea. Industry's ability to operate safely and in an environmentally responsible manner in the Arctic has been demonstrated for five decades.

This SEIS has found that environmental impacts from natural gas development scenarios are incremental to those from development of crude oil resources in the Sale 193 area. It has found that these impacts are capable of being managed in a manner that will allow environmentally responsible development of those resources, appropriate management and protection of habitat, wildlife, and subsistence resources, and respect for the way of life of the people of the region and their communities. We believe that this balance is achievable in the Arctic, where crude oil and natural gas resources of national and strategic significance are believed to occur, and we believe that the long record of our industry's exploration and production operations in the region supports this assertion.

API and NOIA encourage timely completion of this EIS, to allow holders of oil and gas leases issued on Sale 193 to secure permits and approvals needed to proceed with orderly exploration of those leases, as well as development of those leases should exploration prove successful. Further delays will only serve to jeopardize jobs and the future development of US oil and gas reserves critical to our Nation's energy security.

RE: Support for Chukchi Sea Draft SEIS & Lease Sale 193

Dear Mr. Goll:

On behalf of Consumer Energy Alliance (CEA), I appreciate the opportunity to submit the following comments to the Bureau of Ocean Energy Management, Regulation & Enforcement (BOEMRE) in support of the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska.

CEA is a non-profit, non-partisan organization committed to working with elected leaders, affected stakeholders and consumers to help create sound energy policy and maintain stable energy prices. We support improved domestic and global energy security and provide information on expanding the use of all energy resources, including oil, natural gas and alternative energy, as well as increasing energy efficiency. CEA has more than 150 affiliated organizations, including energy suppliers and producers, manufacturers, small businesses, and community organizations, as well as a nationwide network of almost 300,000 consumer-advocates.

The draft supplemental Environmental Impact Statement (SEIS) recently released by the federal government properly addresses all concerns expressed by the U.S. District Court in Alaska. Therefore, CEA urges the federal government to carefully weigh any environmental considerations against the need to ensure our domestic energy security as well as boost U.S. economic growth and swiftly approve the responsible development of the Chukchi's abundant oil and natural gas resources by moving forward with Lease Sale 193.

It is important that the federal government brings Alaska's vast oil and natural gas reserves back online. Jobs in Alaska and across the nation depend on the opportunities that offshore oil and gas production can and will provide. In fact, approximately 43,454 jobs are supported by the industry in the state already - jobs that add \$6.1 billion to Alaska's gross state product, or 16.6 percent of its wealth. With the unemployment rate currently up to 7.6 percent, encouraging offshore development will only help boost the state's economy. A study by the University of Alaska found that new offshore energy production in the state of Alaska would produce an annual average of 35,000 jobs - both directly and indirectly generated by increased offshore production - over the next 50 years for the state of Alaska alone, with a total payroll of \$72 billion (2007) over the 50-year period.

Furthermore, new offshore oil and gas development in Alaska will stimulate America's economic recovery by generating thousands of new, high-paying jobs throughout the 50 states, from steel and pipe manufacturers in the Midwest, to shipping on the coasts, to advanced computer technology in California and Seattle, to Union Labor for pipeline construction and maintenance.

In conclusion, CEA urges the BOEMRE to proceed with the SEIS process and the development of Lease Sale 193 in the Chukchi, as well as help the federal government pave the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing. The time has come for the federal government to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

CEA appreciates this opportunity to provide comments to the BOEMRE. If you have any questions, or if CEA can provide additional information, please feel free to contact me directly at 713-337-8800.

Very sincerely yours,

David E. Holt
President

ConocoPhillips Alaska, Inc. Comment

based upon its expertise and knowledge (see Appendix A at 1-4). We also agree with BOEMRE's findings in Appendix A. As detailed in Appendix A, all of the incomplete and missing information is either not relevant or not essential to a reasoned choice among alternatives in the context of this oil and gas lease sale stage of the multi-step Outer Continental Shelf Lands Act process and in light of other available information.

While BOEMRE is to be genuinely commended for its DSEIS analysis, ConocoPhillips has the following suggestions:

1. BOEMRE should more explicitly acknowledge that there is a very substantial body of data and information that exists regarding baseline conditions, and the impacts of oil and gas activity in the Chukchi Sea. The appellants in the appeal leading to the remand ("Appellants") have mischaracterized the record for purposes of litigation and to mold public perception. The Appellants argue that the Chukchi Sea is an area about which almost nothing is known, and into which there is an unprincipled rush to engage in oil and gas resource development. In this context, while it is appropriate for BOEMRE to acknowledge and address information gaps, in the interest of fair and balanced public discourse and agency decision-making, it is also responsible for BOEMRE to expressly acknowledge the full extent of the data that is available.

The DSEIS does not address a number of studies available from many federal agencies, the University of Alaska Coastal Marine Institute, State of Alaska agencies, the North Slope Borough, and the National Science Foundation. Further, in addition to research conducted by SINTEF, the oil and gas industry has conducted or funded ecosystem-based baseline studies on physical oceanography and water quality, biological oceanography such as the benthic and planktonic communities, water chemistry (ocean acidification), coastal and marine birds, marine mammals, fisheries, sensitive biological resources, chemical characterization of sediment and biota, and the acoustic environment. The oil and gas industry has provided funding to local governments and marine mammal commissions to collect additional data, including tagging studies on ice seals, beluga whales, and walrus, and to compile traditional ecological knowledge from hunters and elders on bowhead whales and polar bears. The Chukchi Sea Offshore Monitoring in Drilling Area ("COMIDA") program is funded by BOEMRE and collects baseline data for environmental effects analyses and monitoring. The BOEMRE database for the Chukchi Sea area lists over 900 citations for studies in the Chukchi Sea.

2. BOEMRE should more explicitly acknowledge that there is a very substantial body of highly reliable data and information that exists regarding the reasonably foreseeable probable environmental impacts of oil and gas activities in the Alaska Arctic OCS. In addition to the studies described above, the decades of closely monitored and reported oil and gas activity on the North Slope of Alaska and in the adjacent Beaufort Sea provide a huge body of information, knowledge and expertise regarding the probable environmental effects of oil and gas activities in the Alaskan Arctic. Monitoring activities by entities such as the Alaska Department of Fish & Game, the BLM, the NSB and oil and gas lessees have included caribou (since the 1970's), shore, water and upland birds (Colville River Delta since 1992; NPR-A since 1999), tundra swans (since the 1980's in the Kuparuk River Unit area), and numerous fish and lakes (Colville River Delta and NPR-A). This information provides significant support for sound scientific

Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, AK 99503-5820

Re: Comments of ConocoPhillips Company on the Draft Supplemental Environmental Impact Statement for Chukchi Sea Planning Area Oil and Gas Lease Sale 193

Dear Sir or Madam:

This letter provides the comments of ConocoPhillips Company ("ConocoPhillips") in response to the Federal Register notice of the Bureau of Ocean Energy Management, Regulation and Enforcement ("BOEMRE") requesting public comment on the agency's draft Supplemental Environmental Impact Statement ("DSEIS") concerning Lease Sale 193 in the Chukchi Sea. See 75 Fed. Reg. 63504-63505 (October 15, 2010).¹

ConocoPhillips commends BOEMRE for its thoughtful, timely and complete DSEIS in response to the limited remand ordered in *Native Village of Point Hope v. Salazar*, No. 1:08-cv-00004-RRB (D. Alaska). The Court directed BOEMRE to address three concerns, and it has done so in the DSEIS in a thorough manner. In particular, we commend BOEMRE for addressing in a reasonable and thoughtful manner (i) new information (see, e.g., DSEIS § I.F (but also identified and discussed throughout the DSEIS)), (ii) issues considered but not addressed in detail (see DSEIS § II.C.3) and (iii) the incomplete or unavailable information pursuant to 40 C.F.R. § 1502.22 (DSEIS - Appendix A).

Regarding BOEMRE's comprehensive analysis of incomplete or unavailable information, ConocoPhillips concurs with the reasonable and thorough methodology selected by BOEMRE

¹ The BOEMRE announced at the public meeting in Anchorage that comments would be accepted until November 30, 2010.

judgments and reasoned agency decisions in the Chukchi Sea, particularly at the lease sale stage. Again, in the context of arguments being made by the Appellants, the interests of fair and balanced public discussion and agency decision-making are best served by express acknowledgement of this reality by BOEMRE.

3. In light of the inevitable arguments of Appellants, among other advocacy groups, BOEMRE should elaborate on its existing discussion of the 2010 *Deepwater Horizon* event in the Gulf of Mexico, and why this event does not materially alter the analysis in the original Lease Sale 193 EIS and the DSEIS. Upon issuance of the final SEIS, the Appellants, or other similar advocacy groups, will likely renew their legal challenge to Lease Sale 193, including claims that the *Deepwater Horizon* event warrants a more detailed supplemental analysis. There are many sound reasons why this is not the case, as described in the DSEIS and as otherwise well-documented to and by BOEMRE. Given that BOEMRE's Lease Sale 193 decision remains subject to legal challenge, given the reasonable certainty of new *Deepwater Horizon* contentions, and given the ready accessibility of much useful information, ConocoPhillips encourages BOEMRE to elaborate on the discussion of the *Deepwater Horizon* incident in the DSEIS as it may or may not relate to the potential environmental impacts of Lease Sale 193.

Finally, for purposes of this DSEIS, ConocoPhillips supports Alternative IV, which is identified as "equivalent to affirming Sale 193 as held." DSEIS at 13. For the reasons detailed in ConocoPhillips' public comments at the time of the original Lease Sale 193 decision, ConocoPhillips believed that the better original course in this frontier area would have been selection of Alternative I (i.e., the "Proposed Action") because it establishes fewer exclusion areas from leasing. However, the current DSEIS does not arise in the context of an original lease sale decision. Under the present circumstances, the least disruptive alternative course of action – and one that is well-supported by the record – would be for BOEMRE to reaffirm Lease Sale 193.

In addition to the above broad-scale comments, attached are a few more detailed comments on some aspects of the DSEIS. Thank you for your time and attention to our comments. Please do not hesitate to contact me if you have any questions.

Sincerely,

Geoffrey A. Haddad

ConocoPhillips Company Supplemental Detailed Comments - Sale 193 DSEIS

Acronyms and Abbreviations (page ii)

Comment:

- Final SEIS – insert "Supplemental" after "Final"
- FMC & NPFMC – Fisheries Management Council & North Pacific Fisheries Management Council - are these supposed to be the same?
- NPFMC – should this be NPFMC for North Pacific Fisheries Management Council?
- ISC – this should be Ice Seal *Committee*
- IUCN/SSG – should this be IUCN/SSC?
- NC – should be *Nanuuq* Commission (<http://www.nanuuq.info>)
- TLH – Teshekpuk Lake Caribou Herd. Should this be TCH to avoid inconsistency between this acronyms table and the text in document?

I.C.5 Notices and Information Provided to Lessees (page 7)

Comment: No. 15 ("Possible listing of Polar Bear under ESA") should be revised to update this reference to current species status. The Polar Bear was listed under the ESA as of May 2008, and critical habitat will have been designated by the time of the Final SEIS.

II.E.2 Exploration Plans, and Development and Production Plans (page 8, ¶ 1)

Comment: The word "archaeological" is inconsistently spelled. In this paragraph, it differs from previous section under Ancillary Activities. See also misspelling of "archaeological" at bullet 14 in Section IV.D. The document should be checked to ensure consistency throughout.

II.E.6 Oil-Spill Response Plans (page 9)

Comment: There is a strong emphasis in the DSEIS on oil spill response. It should be noted that the operators are required to submit an oil spill response and prevention plan. BOEMRE needs to recognize that strong emphasis is placed on the prevention requirements needed to obtain a C-Plan approval.

II.D.1 Summary of Impacts: Alternative 1 – Proposed Action (page 19)

Comment: It is not clear what impacts are being referred to in the first sentence of the last paragraph. Are the impacts from noise during construction and operation?

II.D.1 Summary of Impacts: Alternative 1 – Proposed Action (page 20, ¶ 2)

Comment: The assumption that oil and gas development could have significant impacts to beluga whales and/or walrus is not provided in or supported by the DSEIS. The DSEIS should also recognize that during the exploration phases, which would be conducted during open water periods, the beluga whales are north of the lease area or, in cases of the Eastern Beaufort Stock, in the Canadian arctic. See, e.g., Suydam, et al, 2001. Satellite Tracking of Eastern Chukchi Sea Beluga Whales into the Arctic Ocean. Arctic 543:237-243 (citation in the DSEIS at page 137).

Comment: Under the Threatened and Endangered Marine and Coastal Birds subsection, and other TES sections, there is no mention of the Yellow-Billed loon. Like the Kittlitz murrelet, the Yellow-Billed loon is listed as a candidate species under the ESA. In the last chapter under Consultation, BOEMRE does include consultation for Yellow-Billed Loons.

II.D.1 Terrestrial Mammals (page 21)

Comment: It is important to mention that terrestrial-mammal population potential impacts are tied primarily to the development and production stages of oil and gas activity. Exploration efforts are conducted offshore and do not include pipeline construction, ice road, gravel roads, and permanent onshore facilities.

Comment: The statement that terrestrial mammals will be displaced by 4 km of pipelines and roads is unsupported in the DSEIS. It appears that the distance identified in literature for avoidance of roads by caribou cows with calves (by Cameron in 2005) has been applied more broadly than the scientific data and literature support.

Comment: In the last paragraph on this page, BOEMRE should reference the ADF&G census of caribou herds, and in particular the Central Arctic Herd, to support this statement. Since the beginning of tracking these animals in the 1970s, their numbers have been up and down, most recently on the up-trend, to 60,000 animals in 2008. This is the main herd that occupies and migrates through the North Slope oilfields annually.

II.D.1 Subsistence-Harvest Patterns (page 22, last ¶)

Comment: ConocoPhillips suggests that the community of Kotzebue should be added to the list of communities because, although Kotzebue is located at a greater distance, its residents rely on the same animals that move through the areas of focus.

II.D.1 Sociocultural Systems (page 23)

Comment: Much emphasis is placed on social disruption. Very little is said about the social benefits that oil and gas activities will bring to a community. Jobs, a tax base, and local economic improvement are examples of how activity will improve the rural quality of life. In other words, the DSEIS appears to only address "adverse effects from OCS activities." To ensure a balanced impact analysis, BOEMRE should also address the beneficial effects and positive impacts resulting from OCS activities.

II.D.1 Environmental Justice (page 24)

In the last sentence of 1st paragraph, the word "could" is misspelled.

III.A.5 Water Quality (page 35)

Comment: Treated wastewater discharges to the nearshore from village wastewater treatment systems are a source of water quality impacts that are not, but should be, mentioned in this discussion.

III.B.2 Diadromous Assemblages (page 38, ¶ 2)

Comment: At the end of the last sentence, the word should be "nearshore" instead of "nearshor."

III.B.6 Other Marine Mammals (page 48)

Comment: Under the subheading of Pacific Walrus, in the 13th line of the paragraph, the word should be "Lagoon" instead of "Logoon."

Comment: BOEMRE should update this section with the recent haulout data outside of Point Lay in 2010. Although it may not be a historic haulout site, the walrus may use it again in the future if ice retreat continues as in past years.

III.C.1 Economy (page 54)

Comment: The second sentence on page 54 states that "Very few North Slope residents have been employed by the oil and gas industry or supporting industries in and near Prudhoe Bay since production started in the 1970's." This statement should be qualified to recognize that the tax base for the NSB relies in the greatest part on ad valorem taxes on oil and gas operations, which pay for the NSB infrastructure and ultimately the payroll of more than 90 percent of the NSB jobs. Benefits to the economy are discussed on page 94 under section IV.C.13.

IV.B.2 Infrastructure (page 63)

Comment: Figure 3 and the discussion of possible oil development in the Chukchi Sea OCS is overly optimistic (i.e., not realistic) under the present circumstances. For example, Figure 3 projects the drilling of exploration wells in 2009 and 2010. No exploration wells were drilled in 2009 and none will be drilled in 2010. The absence of exploration drilling due to regulatory actions of BOEMRE and due to litigation by advocacy groups is a significant and certain difference from the projected scenario.

Section IV.C.6 – Threatened and Endangered (page 79, ¶ 1)

Comment: The DSEIS states: "Sometimes even relatively low levels of noise not directly harmful to a whale itself can "mask" naturally-occurring noises upon which whales rely in order to perform basic functions such as communication, echolocation, and feeding." This statement is

not supported. The references for such an assertion should be given or the statement should be deleted.

Section IV.C.6 – Threatened and Endangered (page 80, last ¶)

Comment: The DSEIS refers to use of fixed wing aircraft to support OCS pipeline construction as “whale spotters.” Fixed wing aircraft support would be used for personnel and/or materials transport to the onshore logistics center, but not to offshore locations. It has not been proposed to use fixed wing aircraft as spotter planes. Moreover, the risks involved in sending manned aircraft at a distance offshore to monitor marine mammals will most likely result in other approaches being used. It is recommended that BOEMRE remove this reference from the document as it is speculative and contrary to anticipated activities.

IV.C.17 Environmental Justice (page 101, ¶ 4)

Comment: The DSEIS states: “Metabolic health effects may accrue if subsistence resources became unavailable or undesirable for use, if subsistence foods were displaced from the diet by increased availability or affordability of store-bought foods, or if subsistence were displaced as a primary source of nutrition because of cultural change.” Linking availability and affordability of store-bought food sources to negative metabolic health effects appears to presume that alternative food sources would necessarily result in unhealthy dietary choices. However, the availability of affordable non-subsistence foods does not equate to poor health. On the contrary, availability of fresh produce which could result in the incorporation of fruits and vegetables into the local diet would likely improve overall health. We are not suggesting that the unavailability of subsistence foods is desirable. What we are indicating here is that the statement made in the DSEIS – that diversification of diet would result in adverse health effects – is premised upon an assumption that is not warranted by the facts.

IV.C.17 Environmental Justice (page 101, ¶ 5)

Comment: The DSEIS states: “Sale 193 natural gas development and production could contribute to various ambient and ongoing localized and regional effects on social pathology (assault, alcohol and drug abuse, domestic violence, suicide, and homicide).” The elements of social pathology listed above are well documented elements of NSB village life (i.e., these social issues already exist). The connection drawn between oil and gas activities as the source of the stated effects, or as a source of worsening effects, is neither supported by existing facts nor a fair assessment of the complex causes of social pathology in North Slope communities.

Comment: The DSEIS states: “The most important sources of impacts would include: Influx of temporary personnel into Inupiat villages, leading to cultural conflict and the potential for alcohol and drug importation.” Alcohol and drug issues already exist, and are not the result of oil and gas exploration or development workers being present. Villages in other areas of Alaska where no oil or gas exploration or development has occurred suffer from these social issues as well. The supposition that influx of industry personnel will increase importation is not supported by fact. The oil industry has a zero tolerance for drugs and alcohol and monitors compliance to

this standard rigidly, with funding and personnel. It is possible, that an industrial presence would decrease the availability of drugs and alcohol as employment opportunities with oil and gas industry companies would only be available to alcohol-free and drug-free applicants.

Comment: The DSEIS states: “The most important sources of impacts would include: . . . Potential local and region wide increases in income and employment, leading to a general stabilization of social pathology. An important caveat is that increased income disparity, to the extent that it occurs, may tend to increase community tension and may thus worsen these problems.” The apparent underlying assumption that community tension does not exist in a subsistence culture is not supported by fact. Moreover, employment opportunities as a result of industrial development could provide opportunities for equalization not currently available. Any employer, whether oil and gas industry related or not, would bring about the same tension, and other tensions already exist as exemplified by social issues in villages.

IV.C.17 Environmental Justice (page 102, ¶ 2)

Comment: The DSEIS states: “Injury rates could be affected by Sale 193 natural gas development and production through three pathways: . . . Social pathology leading to increased rates of alcohol and substance abuse and, hence increasing the risk of accidents, as discussed above.” Social pathology which leads to substance abuse is a complicated issue. Placing responsibility for this solely with industry is not supported by fact.

Comment: The DSEIS states: “The degree to which injury rates change as a result of the Sale 193 natural gas development and production will depend on the degree to which the potential impacts on socio-cultural characteristics, subsistence, and drug and alcohol importation into the villages occur.” We strongly reject to the assertion that increases in drug and alcohol importation into the villages are likely to occur as a result of Sale 193 activities. Oil industry companies have a zero tolerance for drug or alcohol abuse.

Comment: The DSEIS states: “Increased travel, the introduction of new populations, and the influx of visitors and temporary workers from outside the North Slope region related to Sale 193 natural gas development and production represents a potential source of infectious disease transmission, including sexually transmitted diseases, respiratory diseases, and other infections, to local residents.” The assumption that industrial workers bring an increased threat of sexually transmitted and respiratory diseases is not supported by fact in the DSEIS. For example, the incidence of respiratory disease is actually higher among the indigenous population of the North Slope than the typical industrial population.

IV.C.17 Environmental Justice – Conclusions (page 103)

Comment: The DSEIS states: “However, one can expect several forms of minor impacts related to potential effects on subsistence resources and practices, human health, and perhaps socio-cultural systems.” The statement that negative impacts to human health can be expected is not supported by fact in the DSEIS.

V.B.2 Air Quality (page 108)

Comment: Recent air quality data has been collected in Wainwright and Pt. Lay and submitted to the EPA. BOEMRE should reference this data in the first paragraph.

Subject: attn: Chukchi Sea Draft SEIS

Regional Director, Alaska OCS Bureau
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503-5820

Dear Director:

I am sending this comment in support of exploration and development on the North Slope – NPRA, ANWR, Beaufort Sea, and specifically the Chukchi sea. A robust oil & gas industry is vital to the state of Alaska as well as the United States of America.

Energy is the engine of the entire US economy and Alaska holds abundant reserves, to which we simply need access. Opponents of resource development try to create unrealistic requirements in which development can only occur if any and all risks – both real and imaginary – are overcome. With this misguided thinking and mindset, nothing would ever get accomplished. We would have never has such things such as the trans-continental railroad, the Hoover dam, the Brooklyn bridge, etc.

Development should be allowed to proceed in a timely and in a responsible manner. America has the highest environmental standards on the planet, yet projects continue to be delayed through litigation and governmental bureaucracy. Like the off shore drilling moratorium, that supposedly did not include Alaska, and yet drilling permits were and still are still being withheld for activity in Alaskan waters.

The federal Bureau of Ocean Energy Management, Regulation and Enforcement should be protecting the oceans and the environment by working together with industry, not by killing the industry through regulatory delays, retroactive rule changes, and continued permit withholding.

The Alaskan oil & gas development industry is on life-support due to the unfair governmental practice of raising the hurdles each time compliance is achieved and the hurdles are crossed. It is like trying to finish a race in which the judges keep moving the finish line as the runners come close to crossing it. The lease sale took place, and the next step of development on the leased property should be allowed and even encouraged to proceed. Politics is pushing an entire industry away from the country in which the best environmental safeguards exist into countries where

Dowland-Bach Comment

little to no such environmental laws are enforced.

How long will the State of Alaska continue to be a net consumer of federal money from the national treasury? For as long as these same federal officials continue to prevent access to the very resources that made it possible for the territory to become a state at all.

Attn: Chukchi Sea Draft SEIS

I am writing in support of affirming the Chukchi Sea Lease Sale 193 as originally field in 2008. In light of the tragic events in the Gulf of Mexico in April 2010, it is understandable that exploration in all American waters should be done only after thoughtful deliberation. But care should also be taken when comparing conditions that led to the blowout of the Deep Water Horizon with conditions that exist in the Chukchi Sea. The first and most obvious difference is depth. Lease 193 will occur at relatively shallow depths, without the incredible pressures associated with extreme deep water drilling. Fundamental differences in the geology of the two regions make comparisons problematic.

There is a history of 30 years or more of safe drilling in the Alaskan and Canadian Arctic. Additionally, wells drilled in the Beaufort and Chukchi Seas over 20 years ago have proven safety records. As the Business Manager for Laborers' Local 341, I have a unique perspective on safety. Alaska has one of the highest union densities in the nation and the major concern for all labor unions is worker safety. Alaska's strong union presence helps to ensure a culture of safety. The unions involved with the oil and gas industry work cooperatively with the producers to make exploration in Alaska as safe as possible, not only for workers, but for the environment our families live and play in; the record proves it.

It cannot be overstated how important oil and gas exploration is to the well-being of the Arctic North Slope, Alaska, and the nation. Stable domestic energy sources are a matter of national security. Effective means of decreasing dependence on foreign oil bolsters the U.S. world position. New resource development would add literally billions of dollars to the Alaskan economy over the next 50 years. The benefit to the continental 48 states is tremendous, generating thousands of new jobs in manufacturing, computer technology, construction and maintenance.

On behalf of the 2100 members of Laborers' Local 341 and their families, I urge the Bureau to proceed with the Lease Sale. The many benefits far outweigh the relative risks.

Thank You,

From: Mary Ann Pease [maryann.pease.map@gmail.com]
Sent: Monday, November 29, 2010 6:20 PM
To: BOEMRE AK Public Comments
Subject: Comments on ALASKA OCS issues

Regional Director, Alaska OCS Bureau
Bureau of Ocean Energy Management, Regulation and Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, Alaska 99503-5820
("Attn: Chukchi Sea Draft SEIS")

- First and foremost - Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193. Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- Do NOT Rescind the leases. Doing so would allow a de facto moratorium on exploration and drilling. This action will greatly harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations identified in the FEIS and SEIS. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.
- There has never been a blowout in the Alaska or the Canadian Arctic that resulted in an oil spill. Thirty wells have been drilled in the Beaufort and five in the Chukchi - all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- According to a University of Alaska study, new OCS production in Alaska would provide an annual average of 35,000 jobs in Alaska with a total payroll of more than

1/11/2011

MAP Consulting, LLC Comment

- \$72 billion over the next 50 years.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states - in manufacturing, computer technology, construction and maintenance.
- Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.
- Given the impact of high energy prices on Americans and their economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore.

Thanks

RE: Chukchi Sea Draft SEIS – Allow Responsible Access to Alaska’s Resources

Dear Mr. Goll:

As a former Alaskan, I support the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska.

I believe the draft supplemental EIS released by the federal government addresses all concerns expressed by the U.S. District Court in Alaska, and I hope the federal government will approve the responsible development of the Chukchi’s abundant oil and natural gas resources.

It is important that the federal government allows access to Alaska’s vast oil and natural gas resources. Doing so provides jobs for Alaskans at a time when the economy needs help. A study by the University of Alaska found that new offshore energy production in the state of Alaska would produce an annual average of 35,000 jobs – both directly and indirectly generated by increased offshore production – over the next 50 years for the state of Alaska. Total payroll is estimated to be \$72 billion (2007) over the 50-year period.

In addition, new offshore oil and gas development in Alaska will stimulate America’s economic recovery by generating thousands of new, high-paying jobs throughout the Lower 48. Some examples would be the steel and pipe manufacturers in the Midwest, coastal shippers, companies that produce advanced computer technology in California and Seattle and the skilled labor force for pipeline construction and maintenance.

Please move forward with the SEIS process and the development of Lease Sale 193 in the Chukchi. By doing so, you are paving the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing, which is desperately needed as the amount of oil running through TAPS is declining.

Sincerely,

Hillary McIntosh
President

RE: Chukchi Sea Draft SEIS Comment – Support Access to Alaska’s OCS Oil and Gas Resources

Dear Mr. Goll,

I’m writing to express my full support and the full support of my board of directors of North Pole Economic Development Corporation for the oil and gas development of Lease Sale 193 in Alaska’s Chukchi Sea.

The U.S. District Court in Alaska has raised concerns about the development of Alaska’s Chukchi Sea that have been adequately addressed in the draft supplemental Environmental Impact Statement that was released by the federal government. The court raised valid concerns on behalf of Alaskans, and now that those concerns have been answered, it’s time that we do the right thing and allow the lease holders an opportunity to develop their leases.

Tens of thousands of jobs and billions of dollars in payroll over the next generation are at stake. Boosting oil and gas development in Alaska will not only help the Alaskan economy but will help to

North Pole Economic Development Corporation Comment

improve economic conditions all over our country. During a time when our country is struggling to keep everyday Americans’ heads above water financially, why wouldn’t our nation invest in job creation? Whether developing the oil and gas fields directly or working in a support capacity, people in Alaska and across the United States are looking for opportunities to improve their lives. Oil and gas development creates good paying jobs, period.

Closer to home in North Pole, our two local refineries, Flint Hills Resources and Petro Star, Inc. rely on a supply of crude through the Trans Alaska pipeline to keep their refineries running. Today’s crude oil comes out of the pipe at around 40 degrees Fahrenheit and must be heated significantly to even refine the crude oil. This is caused by a line running at less than 60% capacity. Responsible development of the Alaska’s Chukchi Sea will give us an opportunity to put more crude oil in the pipeline which will deliver a warmer crude to our North Pole Alaska refineries thereby saving significant energy that is expended today heating our crude oil so it may be refined.

I hope to see the beginning of responsible oil and gas development in the Chukchi Sea that will allow Alaska and our nation to move forward towards energy independence and away from a deeper reliance on foreign oil. My children and all future generations are depending on us to make the right decisions now to give them the gift of abundant and clean energy, creating good jobs, which will produce a stronger United States and an Alaska that is able to take better care of itself without further reliance on the federal government.

Sincerely,

Howard “Buzz” Otis

Anchorage, Alaska 99503-5820

Attention: Regional Director, Alaska OCS Bureau

Reference: Chukchi Sea Draft SEIS

Subject: Support for Alaska OCS Development / OCS Lease Sale 193

Gentlemen:

Price-Gregory International supports the exploration and development of Alaska's Beaufort and Chukchi Sea Outer Continental Shelf energy resources - specifically Chukchi Lease Sale 193. We offer the following points for your consideration:

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations identified in the FEIS and SEIS. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.

PRICE-GREGORY INTERNATIONAL, INC. COMMENT

- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.
- There has never been a blowout in the Alaska or the Canadian Arctic that resulted in an oil spill. Thirty wells have been drilled in the Beaufort and five in the Chukchi - all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- According to a University of Alaska study, new OCS production in Alaska would provide an annual average of 35,000 jobs in Alaska with a total payroll of more than \$72 billion over the next 50 years.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states - in manufacturing, computer technology, construction and maintenance.
- Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future.
- Given the impact of high energy prices on Americans and their economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore.

Without question we need to focus our energy production, conservation and efficiency efforts inside our own country. We also need to transition to alternative energy sources and reduce our dependence on foreign oil. This transition, however, will take time, and domestic resources offer us the best opportunity to bridge that gap. They will allow us to increase our energy independence and national security and decrease the amount of money we transfer to foreign economies. Development of Alaska's OCS and North Slope Gas resources offer us the best opportunity to realize this goal.

Very truly yours,

Anchorage, AK 99503-5820

Re: Lease Sale 193

Dear Mr. Goll:

The Resource Development Council (RDC) appreciates the opportunity to submit comments on the Draft Supplemental Environmental Impact Statement (SEIS) for Lease Sale 193. RDC urges the Bureau of Ocean Energy Management, Regulation & Enforcement (BOEM) to affirm Lease Sale 193 as held in 2008. We believe the SEIS provides sufficient information and analysis to support a decision affirming the sale.

RDC is a statewide membership-funded organization founded in 1975. Our Alaskan membership is comprised of individuals and companies from Alaska's oil and gas, mining, timber, tourism, and fisheries industries, as well as Alaska Native corporations, local communities, organized labor, and industry support firms. RDC's purpose is to link these diverse interests together to encourage a strong, diversified private sector in Alaska and expand the state's economic base through the responsible development of our natural resources.

RDC has a high level of confidence that exploration and development can occur safely in the Arctic and that mitigation measures can be put in place to address most concerns and minimize impacts to the environment, polar bears and other species, as well as subsistence. However, since recent events in the Gulf of Mexico, opponents of offshore drilling are calling for an indefinite ban on new exploration and development in Alaska. RDC sharply disagrees. Operating conditions in these waters are categorically different than those in the deep waters of the Gulf of Mexico and pose much lower risk. Moreover, the processes and safeguards in place today in Alaska should allow leasing and exploration activity to resume in the Alaska OCS.

Drilling in the Arctic offers distinct difference than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in

121 West Fireweed Lane, Suite 250, Anchorage, Alaska 99503-2035
Phone: 907-276-0700 Fax: 907-276-3887 Email: resources@akrdc.org Website: www.akrdc.org

deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. In addition, the relatively shallow water depth in the Chukchi Sea would allow blowout preventers to close much more rapidly than those in deep water. The blowout preventers would also be directly accessible to dive teams, unlike the Gulf where any maintenance or repairs had to be accomplished by remote control vehicles. Another distinction is that many Alaskan offshore operations are seasonal in nature. For example, Shell has proposed conducting its exploratory drilling during the summer and fall open water season. Ice management vessels will be positioned on site to deflect any ice flows that could potentially approach a rig. There are also major differences between state and federal oversight and regulatory frameworks, as well as fundamental differences in the geology of the regions. All of these contrasts warrant special consideration in public policy decisions and should lead the BOEM to conclude that exploration should move forward in the area covered by Lease Sale 193.

Advances in technology provide an additional measure of confidence in Alaska drilling. Energy development in Alaska is subject to in-depth analysis by federal law, a stringent permitting process, and oversight by state and federal agencies. In every instance, development is preceded by extensive studies. The North Slope and the offshore are now perhaps the most studied energy basins in America. The federal government has spent more than \$500 million on studies in Alaska and in the past decade the agency has funded over 250 studies here, with the majority of those focused on the Beaufort and Chukchi Seas.

RDC recognizes that subsistence whaling is vitally important, both economically and culturally to North Slope villages. Industry and government working together have the ability to protect subsistence resources while producing needed domestic energy for the nation. Strong regulatory oversight, combined with other mitigation measures, can be employed to protect all resource and subsistence users.

While the Chukchi and Beaufort Seas are considered frontier areas, exploration activity has occurred there before. In fact, thirty wells have been drilled in the Beaufort and five in the Chukchi - all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today. Moreover, there has never been a blowout in the Alaska or the Canadian Arctic that has resulted in an oil spill.

Opponents of oil exploration have cited the lack of infrastructure in the Arctic as a reason not to drill in the region. However, it is important to note that additional infrastructure will be built to accommodate future needs once exploration and development activities move forward. The lack of infrastructure today is due directly to the fact that there has been virtually no ongoing development or commercial activity of any kind offshore in the Arctic. However, Shell has committed to stage extensive resources onsite to immediately respond to any incident. The company has also committed to building and staging in the region a pre-fabricated dome to place over a troubled well. Moreover, virtually all functions of Shell's operations will be monitored at remote sites off the rig, giving industry and government critical "real-time" data and allowing for early detection of potential problems. In addition, the Alaska Clean Seas consortium has substantial resources and experience in the Arctic and has done extensive mapping to identify sensitive areas. The consortium has also conducted extensive safety and oil spill drills in the Arctic and has active research programs dating back into the early 1980s.

It is important to note that not all questions and concerns regarding oil and gas exploration and development can possibly be answered and met. Not all risks can be eliminated. If the federal government insists that every concern and risk be eliminated, then it must be prepared to import virtually all the oil the nation requires to meet future needs. It must then also accept the consequences of a much heavier reliance on foreign oil, including soaring trade deficits, a weaker and more vulnerable economy, and compromised national security. Put another way, failure to move forward with OCS development in Alaska will put the state economy at risk, as well as the nation's security.

OCS oil and gas development is absolutely critical to Alaska's future economy. With the Trans-Alaska Pipeline System (TAPS) now running at one-third capacity, exploration blocked in the Arctic National Wildlife Refuge (ANWR), and non-development activists working toward Wilderness designations in the National Petroleum Reserve (NPR-A), nothing less than Alaska's future economy is at stake.

The responsible development of potentially immense oil and gas deposits in the Chukchi Sea would significantly boost the economy and extend the life of TAPS. Without new federal oil production, TAPS could be uneconomic to operate at some point in the next decade.

Between ANWR, NPR-A and the Alaska OCS, there could be nearly 40 billion barrels of oil in place. By comparison, 16 billion barrels of oil have been produced on state lands across the North Slope in 33 years. The sustainability of TAPS and Alaska's economy will largely depend on some combination of oil production from these federal areas, which represent the nation's best onshore and offshore prospects for major discoveries.

If there is no oil and gas development in ANWR or in the Chukchi Sea, and the best prospects in NPR-A are ultimately taken off the table, the federal government must then accept the consequences, as outlined earlier in these comments. For Alaskans, our future will be bleak with the state losing 90 percent of its revenue base.

Not developing federal oil in Alaska makes no sense from an economic and energy security stand point, especially given the fact that America imports over 60 percent of its oil, and at a great cost. American oil production is projected to decrease by 9.9 billion barrels within the next 20 years, nearly a 15 percent annual decrease from current levels. Meanwhile, imports of oil from OPEC are projected to increase by 4.1 billion barrels, nearly 19 percent - and at a cost of \$607 billion.

New production in the Alaska OCS would reduce America's reliance on foreign energy. The Alaska OCS is an important future source of U.S. energy supply with up to 29 billion barrels and over 200 trillion cubic feet of natural gas potentially in place. The potential recoverable reserves offshore Alaska is more than all the current total proven U.S. oil reserves of approximately 21 billion barrels. Alaska could have the ninth largest oil resources in the world ahead of Nigeria and Libya - if access is granted to these potential reserves. Moreover, OCS gas reserves would significantly improve the long-term economic viability of the proposed gas pipeline from the North Slope to the Lower 48 - a clean energy priority of the Obama administration. To become a reality, the pipeline requires additional gas reserves beyond what has already been discovered onshore.

Given its potential for immense recoverable reserves and enormous economic benefits to the state and nation, the Alaska OCS should be opened to responsible development. OCS development would generate hundreds of billions of dollars in royalty and tax revenues to the state and federal governments and aid the nation's economic recovery by reducing the trade deficit and creating tens of thousands of new jobs. Indeed, OCS leases off Alaska's coast have already generated billions of dollars to the federal treasury.

The OCS can sustain Alaska's economy for generations. Currently there are more than 108,000 Alaskan jobs tied to the discovery, production and shipment of Alaskan oil and natural gas, accounting for more than 15 percent of Alaska's population. According to a University of Alaska study, OCS production could provide an annual average of 35,000 additional jobs within the state for 50 years and \$72 billion in new payroll.

RDC and many Alaskans share President Obama's view that America needs to conserve more and put new emphasis on renewable and alternative energy. By doing so, the nation can ultimately break its reliance on foreign oil. Yet while America must conserve more and move toward renewable energy, it still needs to pursue new oil and gas production, given the fact it will take decades before renewable energy becomes a dominant energy source. Even with the Obama administration's goal to decrease dependence on oil, it is projected that fossil fuels will still account for two-thirds of this nation's energy consumption in 2025. Meanwhile, every barrel of oil that is not produced in the U.S. will be imported from abroad to meet our needs. Given economic, environmental and geopolitical concerns, America must produce more of the oil it consumes - under American laws, regulations and oversight, and by American workers.

It is vital that our nation's abundant energy resources be fully utilized for compelling economic and energy security reasons. RDC encourages BOEM to re-affirm Lease Sale 193 as held in 2008. Thank you for the opportunity to provide comments.

Sincerely,

RE: Comments on Lease Sale 193 Draft Supplemental Environmental Impact Statement

Dear Regional Director,

Shell Exploration & Production Company ("Shell"), on behalf of its affiliate, Shell Gulf of Mexico Inc. ("SGOMI"), a successful bidder in Oil and Gas Lease Sale 193, is pleased to have the opportunity to comment on the Bureau of Ocean Energy Management, Regulation, and Enforcement's ("BOEMRE's") Chukchi Sea Planning Area Oil and Gas Lease Sale 193 Draft Supplemental Environmental Impact Statement ("Draft SEIS"). Shell commends BOEMRE on its thorough and efficient response to the remand instructions issued by the U.S. District Court for the District of Alaska.

The court instructed BOEMRE to supplement its review of Lease Sale 193 under the National Environmental Policy Act ("NEPA") by analyzing three issues: (i) the environmental impact of natural gas development; (ii) whether missing information identified in the Final Environmental Impact Statement for Oil and Gas Lease Sale 193 and Seismic-Surveying Activities in the Chukchi Sea ("193 FEIS") was essential or relevant under 40 C.F.R. § 1502.22; and (iii) whether the cost of obtaining the missing information was exorbitant, or the means of doing so was unknown. Shell believes that BOEMRE properly restricted its analysis to these three issues, both because of the court's specific instructions to conduct a narrow remand analysis, and because BOEMRE properly determined that additional information identified by BOEMRE does not warrant re-opening its earlier findings.

These comments first address the issues identified for remand, the natural gas development and production scenario and the missing information identified in the 193 FEIS. Then these comments will address BOEMRE's decision to restrict its review on remand only to those issues, which is entirely consistent with the court's order.

I. Natural Gas Exploration and Production Scenario

Shell supports BOEMRE's determination of the most likely natural gas development and production scenario in the Draft SEIS. BOEMRE is correct that it is reasonable to expect economic considerations will restrict any natural gas exploration and production to projects coincident with and subsequent to oil exploration and development.

The Draft SEIS undertakes an analysis of the impacts to be expected from the natural gas development and production scenario, comparing those impacts to those already analyzed for the oil production scenario. Shell believes the analytical framework used is proper and careful, enabling BOEMRE to identify all reasonably foreseeable impacts associated with the natural gas development and production scenario.

To assist BOEMRE with preparation of the Final Supplemental Environmental Impact Statement, Shell offers the following comments on the analysis of the natural gas development and production scenario:

- In the Description of the Environment, BOEMRE often states that analysts reviewed "additional information" for natural gas development and production and concluded that, for the given resource under discussion, "this information" would not change the analysis or alter the conclusions discussed under environmental consequences in Chapter 4. See, e.g., Draft SEIS at 36 (addressing new information related to water quality). In light of the court's remand instructions regarding unknown information, Shell is concerned that BOEMRE's conclusions about additional information, when formatted in this way, are unnecessarily vague. In other cases, BOEMRE specifically identifies the new information analyzed. See, e.g., Draft SEIS at 35 (describing new information related to sea ice analyzed for natural gas production). Shell suggests that BOEMRE identify the new information reviewed in all cases, or where there is no new information available, state that no new information is available.
- The Draft SEIS could be read to be inconsistent in its treatment of well control events. In Section II.C.3, discussing issues considered but not analyzed, BOEMRE determines that information regarding the Deepwater Horizon incident is not relevant to the Draft SEIS because, *inter alia*, "any change in the likelihood of an oil spill from a blowout" during exploration drilling would not alter the potential effects of the oil spill already analyzed. Draft SEIS at 16. Shell agrees with BOEMRE's analysis on this point, as discussed below in Section III of these comments. However, as drafted, this sentence could be read to indicate that the Deepwater Horizon incident could affect or change prior analysis of the likelihood of a well control event in the Arctic. In Section IV.B.5, the Draft SEIS addresses the potential for natural gas releases, including the potential for a loss of well control. This section does not reference the Deepwater Horizon incident, either to adjust the analysis of the likelihood of a loss of well control event, or to explain why the analysis done in the 193 FEIS remains valid. Shell suggests that BOEMRE address this issue, which affects the natural gas development and production scenario and is therefore properly within the scope of the remand.
- On page 41 there is a broken cross-reference.

- On page 43 it is unclear what new information regarding whales (sightings of fin whales, humpback whales, or both) resulted in reinitiation of Endangered Species Act consultation with the National Marine Fisheries Service for Outer Continental Shelf activities.
- In Section IV.C.2, discussing the air quality impacts of natural gas exploration and production, the Draft SEIS does not specify why it forecasts emissions and impacts for some pollutants (VOCs, ozone, greenhouse gases and visibility), but not others. Specifically, the basis for the comment "any increase in the concentrations of criteria pollutants from these activities would be small, local, and temporary" is unclear. Shell suggests BOEMRE clarify the scope of the air analysis performed for the natural gas development and production scenario and provide a basis for the conclusion that increases in pollutants due to natural gas development and production are likely to be small, local, and temporary. Further BOEMRE should identify the applicable air quality standards against which it measured the anticipated air quality impacts and provide the basis for its determination of the applicable air quality standard.
- On page 82, the second paragraph in the section titled, "Potential Effects from a Natural Gas Release," appears to be missing introductory text.

II. Unknown Information

Shell supports the rigorous analytical process by which BOEMRE complied with the second and third issues on remand. The explanation of the agency's methodology in Appendix A, including the flowchart on page 2 of Appendix A, clearly demonstrate the legal analysis required by 40 C.F.R. § 1502.22. The "1502.22 Analysis" at the conclusion of Appendix A fully responds to the court's instructions and satisfies the agency's obligation under the regulation to (i) identify whether missing information is "relevant to reasonably foreseeable significant adverse effects on the human environment," (ii) identify whether missing information is "essential to a reasoned choice among alternatives," and (iii) identify whether the missing information is "obtainable."

Shell agrees with BOEMRE's well-reasoned analysis for the various "missing information" from the 193 FEIS. The Chukchi Sea is a frontier area. Nevertheless many studies already have been conducted and substantial base line data gathered on the region. While there remains more to be learned about the Chukchi, as BOEMRE ably summarized in pages 3-4 of Appendix A, those gaps in knowledge do not preclude the agency from making a reasoned choice among alternatives.

Shell is concerned about BOEMRE's treatment of missing information pertaining to natural gas development and production within the text of the Draft SEIS. On page 4 of Appendix A, BOEMRE states "no incomplete or unavailable information pertaining to natural gas development and production was considered essential for a reasoned choice among DSEIS alternatives." SGOMI argued in litigation, and continues to agree, that such an approach is sufficient under the regulation. Nevertheless, Shell is concerned about the appearance of inconsistency between the treatment of "missing information" from the 193 FEIS and missing information in the Draft SEIS. Shell urges BOEMRE to consider bolstering its analysis of the "missing information" from the Draft SEIS by undertaking the same rigorous analysis of that information that it did for the "missing information" from the 193 FEIS.

III. Limited Remand Is Proper

Shell supports BOEMRE's decision to restrict its review on remand to only those topics identified by the court. Shell also believes it was proper for BOEMRE to consider whether information from the Deepwater Horizon incident could or should impact the remand analysis. Shell concurs with BOEMRE's conclusion that, because the natural gas development and production scenario assumes that natural gas development would take place after oil development is substantially complete, the risk of an oil spill occurring during the natural gas development and production scenario is unlikely. Draft SEIS at 16. Thus, Shell believes that BOEMRE reasonably did not include current information from the Deepwater Horizon oil spill incident in its remand analysis of the natural gas production scenario.

Shell further agrees with BOEMRE that, even if the remand were broad enough to include analysis of potential impacts related to the production of oil, current information from the Deepwater Horizon incident does not warrant additional analysis of those issues on remand. Draft SEIS at 16. Shell agrees with BOEMRE that the differences between the Gulf of Mexico and the Chukchi Sea cited in the Draft SEIS make it unlikely that current information from the Deepwater Horizon would be relevant to impacts from a potential oil spill in the Chukchi Sea. In particular, Shell notes that the impacts of a catastrophic spill have already been analyzed in the Arctic. See Final Environmental Impact Statement - Beaufort Sea Planning Area Oil and Gas Lease Sales 186, 195, and 202. Thus, supplemental analysis to review the potential impacts of a spill such as the Deepwater Horizon is unnecessary because the analysis already exists.

IV. Timely Issuance of Final SEIS

Earlier this year, President Obama announced the Administration's renewed intention that oil and gas exploration at existing Beaufort and Chukchi Sea leases move aggressively forward, stating that "we'll continue to support development of leased areas off the North Slope of Alaska," among other areas, and noting that, "given our energy needs, in order to sustain economic growth and produce jobs, and keep our businesses competitive, we're going to need to harness traditional sources of fuel even as we ramp up production of new sources of renewable, homegrown energy."¹ In an announcement the same day, Interior Secretary Salazar amplified that "[t]he Administration strategy supports exploratory drilling in the Chukchi and Beaufort Seas in the Arctic Ocean."² Here, BOEMRE undertook a thorough evaluation of all the relevant issues pursuant to its obligations under the Outer Continental Shelf Lands Act and NEPA, and it should issue its final finding without further delay.

As BOEMRE is aware, successful exploration is a prerequisite to further oil and gas development projects. Every delay in the exploration of these leases therefore reduces industry's opportunity to find other viable oil deposits and to bring its leases into production. Delay will also jeopardize

¹ Remarks by the President available at: <http://www.whitehouse.gov/the-press-office/remarks-president-energy-security-andrews-air-force-base-3312010> (March 31, 2010).

Shell Exploration & Production Company Comment

hundreds of jobs and contracts for local Alaskans who have been engaged to support industry activities. For example, for its 2010 season, SGOMI and its affiliate Shell Offshore Inc. ("SOI"), which holds leases in the Beaufort Sea, contracted with approximately 80 local Alaskan businesses, including many native-owned businesses, to provide a wide range of services associated with its 2010 Chukchi and Beaufort Sea Exploration Plans ("2010 EPs") such as engineering, consulting, communications, inspection and testing, emergency response, transportation, catering, information technology, and related services. These businesses collectively earned more than \$127 million before the 2010 season was shut down.

SGOMI and SOI invested a substantial amount of time and money in its 2010 EPs. But their ability to continue to invest in drilling plans for 2011, as well as future seasons, is significantly hampered by the present uncertainty regarding oil and gas exploration activities in the Arctic Outer Continental Shelf. In fact, if certainty on whether such activities will be allowed to occur in 2011 is not achieved very soon, I do not believe that SOI or SGOMI will incur the additional substantial costs necessary to prepare for a 2011 season that ultimately may not be allowed. I therefore urge prompt agency action to close-out this remand.

Sincerely,

Peter E. Slaiby
Vice President, Shell Alaska

Attn: Chukchi Sea Draft SEIS

Dear Director Goll:

Statoil USA E&P Inc. ("Statoil") appreciates this opportunity to provide comments to the Bureau of Ocean Energy Management, Regulation and Enforcement ("BOEMRE") on the Draft Supplemental Environmental Impact Statement ("SEIS") for the Chukchi Sea Planning Area Oil and Gas Lease Sale 193 ("Lease Sale 193").

Statoil ASA and its affiliates (collectively, "Statoil ASA") comprise an international energy company with operations in 34 countries. We have more than 35 years of experience from oil and gas production on the Norwegian Continental Shelf, where we operate 80% of the production. Statoil ASA is the largest deepwater operator in the world, and we are committed to accommodating the world's energy needs in a responsible manner, applying technology and creating innovative business solutions. Statoil ASA entered the U.S. market in 1987, and we are now one of the largest leaseholders in the deepwater Gulf of Mexico and the designated operator on 181 leases.

Statoil's move into Alaska is part of a corporate-wide initiative focused on exploration and development in the Arctic. Statoil ASA is one of the world's leading explorers in the Arctic. In the Norwegian part of the Barents Sea, Statoil ASA has been the operator on 63 of the 83 wells that have been drilled. We operate the Snohvit LNG project – the first offshore development in the Barents Sea without any surface installations. In Russia, Statoil ASA has a 24% working interest in the Shokman gas and condensate field in the Barents Sea. We are also partners in the Terra Nova, Hibernia, and Hebron assets in Newfoundland and in exploration acreage off Canada's Grand Banks.

In early 2007, Statoil ASA began an evaluation of Arctic Alaska as a potential place to do business. This evaluation was part of a larger internal project called the "Arctic Initiative," which was an appraisal of all the Arctic oil and gas basins in the world. In Alaska, the focus was on the federal OCS, especially the Chukchi Sea. In 2008, Statoil acquired 16 leases during Lease Sale 193. Statoil also has a 25% ownership stake in ConocoPhillips' Devil's Paw prospect in the Chukchi Sea, which ConocoPhillips acquired under Lease Sale 193. Statoil is pursuing investments in the Chukchi Sea because of the area's significant hydrocarbon potential.

Statoil recently completed a seismic program over its leasehold and surrounding areas in the Chukchi Sea. We are actively planning programs in support of exploratory drilling activities in

the Chukchi Sea. However, overcoming the challenges to exploration in the Chukchi Sea requires significant investment and a regulatory environment that is predictable, stable, and transparent. To ensure continuing investment, it is critically important that BOEMRE expeditiously resolve the uncertainty concerning Lease Sale 193 as well as the continuing uncertainty concerning the Outer Continental Shelf Oil and Gas Leasing Program for 2007-2012.

Statoil has reviewed the Sale 193 Draft SEIS and believe it fully addresses the concerns identified by the District Court of Alaska. We encourage BOEMRE to expeditiously finalize the SEIS and adopt Alternative IV as the agency's preferred alternative.

In closing, we commend BOEMRE for developing the draft SEIS on a quick timeframe and look forward to BOEMRE's timely adoption of the preferred alternative. The preferred action is a solid step towards fostering a predictable regulatory climate that encourages responsible oil and gas investment in the Chukchi Sea, while ensuring a balanced and environmentally responsible approach to management of Arctic resources.

Thank you for consideration of our comments.

Very truly yours,

Martin Cohen

RE: Chukchi Sea Draft SEIS – Allow Responsible Access to Alaska's Resources

Dear Mr. Goll:

Texplotre is a small independent exploration company based in Texas and operating primarily in the Gulf Coast region. I have been personally involved in offshore exploration and development, and in spite of recent anomalies, offshore activities can be conducted in a safe and prudent manner. I am writing to express my support for the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska, even though I have no direct benefit from this activity, other than the belief that it is beneficial to the citizens of the United States to develop energy resources domestically and reduce our dependence on foreign supplies for strategic and economic reasons.

It is my hope that the federal government will approve the responsible development of the Chukchi's abundant oil and natural gas resources, since the draft supplemental Environmental Impact Statement (SEIS) recently released by the federal government properly addresses all concerns expressed by the U.S. District Court in Alaska.

It is important that the federal government brings Alaska's vast oil and natural gas reserves back into play. Jobs, in Alaska and across the nation, depend on the opportunities that offshore oil and gas production can and will provide. In fact, a study by the University of Alaska found that new offshore energy production in the state of Alaska would produce an annual average of 35,000 jobs – both directly and indirectly generated by increased offshore production – over the next 50 years for the state of Alaska alone, with a total payroll of \$72 billion (2007) over the 50-year period.

New offshore oil and gas development in Alaska will stimulate America's economic recovery by generating thousands of new, high-paying jobs throughout the 50 states, from steel and pipe manufacturers in the Midwest, to shipping on the coasts, advanced computer technology in California and Seattle, and Union Labor for pipeline construction and maintenance.

I strongly urge that the federal government move forward with the SEIS process and the development of Lease Sale 193 in the Chukchi, as well as pave the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing.

Now is the time to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

Sincerely,

Paul W. Britt,
President

Subject: Public Comment on Chukchi lease sales and drilling.

Good day to you all. My name is Ransom G. Agnasagga, Agiusin my inupiaqsi name, husband of Linda Lee, Sunnauravik, father of six and grandfather of two, I live in Ulguniq, Wainwright Alaska on the Arctic coast, I have lived here in Wainwright since 1982, before that I lived in Kali, Pt. Lay Alaska which is further down the coast from here, and between the villages is Icy Cape, Qayaqsiqvik, Nannugvik, are the Inupiat names that I know this place as. This is the area of my ancestors the Uttuqagmiut, named after the river that flows down from the Brooks Range to the Kasegealik Lagoon then into the Arctic Ocean, into the area that will be directly affected by all the activity is bound to take place due to the quest for fuel that drives our nation. I have hunted this region since I was able to walk, from Cape Sabine through the Delong Mountains and through the headwaters of the Colville, Utuqqaq, Qaqalik, Kuukpaagruk, Kaolik, Ketik, Avvalliig Ivisurak rivers, I have also hunted on the Arctic ocean off the coasts in the area to be affected, I have seen how the climate has changed over the past 20 to 25 yrs, and already a challenge that we as people and also animals that inhabit the region are facing. This is probably a most challenging dilemma that we are all faced with now. All of the Mammals, migratory birds, fish, and "we" the "Minority" as commented in the draft plan that was drafted, the Inupiat people all up and down the coast and beyond our own shores, and also the food chain, will be exposed to an activity not seen in the region ever before. We all do not know where this will lead, or even if we have a choice, but it is said, we all have a right to voice our opinions, even if it might not be deemed as important. I for one will not say whether or not that his will all be good for the region and the Inupiat people or not, as I wrote earlier this has not been done here before. We probably all, at a point in some time in our lives thought twice about something that will directly affect the way we live our daily lives, or what can occur if we do not prepare, I believe that if the exploratory drilling does occur and if the projected amount of oil and gas is really there, there will be a frenzy of more activity, with other oil and gas companies, and also other countries that are also in need of oil, will be very interested in the findings of the exploratory drilling wells. And that will bring a whole new perspective to the table that definitely might be out of our control unless we prepare for it. We need to have concerns addressed, and answers and solutions in place before the proposed activity can occur. Thank you for your time in reading this.

To: BOEMRE AK Public Comments
Subject: Comments on the Chukchi Lease Sale Draft SEIS

The Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) has determined that despite huge gaps in information about bowhead whales, polar bears, walrus and pretty much all living things in the Arctic, it was not a mistake to sell the Chukchi Sea off to the highest bidders in 2008.

This conclusion is simply wrong. Drilling in the Arctic is too risky. The Arctic is already weakened and fragile because of the warming climate. What's more, there is simply no technology to clean up oil in broken ice conditions. There is no way to mobilize even a fraction of the response required for the Gulf disaster in the remote Arctic. And a large oil spill could mean the difference between survival and extinction for struggling Arctic species.

Unfortunately, your draft supplemental EIS does not come anywhere near addressing these problems of critical importance. Your draft supplemental EIS does not satisfy your obligation to protect America's Arctic, and it does not comply with the law. In order to comply with the law, you must analyze the substantial gaps in scientific information in the current EIS and make a good-faith effort at obtaining information that is realistically attainable. And most importantly, you must not allow drilling to go forward unless you have the scientific knowledge to say that drilling in the Arctic is safe.

I am geology major at FAU in Boca Raton. I also minor in GIS. I am aware of the steps that could have been taken (in relation to the gulf spill) to lessen the impact of an accidental spill on the local environment.

It is wrong and irresponsible to treat the Earth's resources like they belong to this generation only. It is irresponsible to act recklessly with the future health of the planet and leave future generations with a mess much like the financial mess we are in now only it will be environmental and resource related. Oil does not even have a department devoted to analyzing possible accidents and responses to those accidents, researching and experimentation of how to deal with all possible problems and doing things before they drill for the "just in case" spills. Safety is being ignored and it is the least oil can do since they are taking oil out of PUBLIC lands and are giving back very little. America is tired of greed oriented actions and policies.

Nothing was learned from the BP disaster. America watched those people lose their businesses, the jobs, their homes, their boats, and in some cases their families. We watched the children struggle to understand why their parents separated or why their lives were turned upside down. America watched the SUFFERING of so many good, hard-working Americans. We watched grown men cry.

If this is not enough to cause you some pause, then I would feel that you have no heart or compassion or love for fellow Americans. BP will happen again because no changes have been enacted, no pause to drilling has been ordered until they make some changes, this means that nothing has changed and no one cares who is getting paid enough to ignore such horrible tragedies.

Please, I urge you to demand a pause in drilling until ALL oil companies form a REAL department with REAL engineers, scientists, ecologists, and geologists that do nothing but research, analyze, and come up with solutions to all possible accidents. Not only must they form this department, but it must be properly funded and their findings must be taken seriously, and their solutions must be followed.

I do not think this is unreasonable. I think this is a smart beginning; it would improve

1

their public image, and promote safety while preparing them for accident and response efforts. Let us not EXPERIMENT with dealing with a spill in the Arctic now. BP may have learned by Exxon's failures, but still they respond ineptly and like a bunch of clumsy undergraduates in the lab for the first time.

It is time to enact some rules here and stop allowing oil companies to worry about accidents only when they happen, and then experiment on the unlucky AMERICAN citizen that happens to be affected by the next spill that will happen because nothing has changed.

Although I consider myself leaning more towards environment, I am realistic that oil will always be needed. However, that does not mean we can be irresponsible with the lives of Americans. Saying one doesn't believe in the climate crisis is not a license to be irresponsible with the resources of the planet. We have a responsibility to future generations and that has nothing to do with believing in what the climate is or is not doing.

The problem is greed, refusals to change and implement change, leaders that are out of touch with mainstream Americans, leaders that do not care about regular Americans that cannot buy representation, and a large amount of irresponsible attitudes of our leaders.

We really need a leader. We really need a leader to come forth and say, ENOUGH! It is time to return to basic American values, honor, loyalty, respect, and working to do things for THE COMMON GOOD OF ALL. Somewhere that ideal has been lost and trampled with several other purely and uniquely American values. THE COMMON GOOD OF ALL. Lastly, it is wrong to destroy the Arctic that belongs to the next generations of America. There seems to be too much arrogance, egotistical ideals, self-service and self-serving practices, that HONOR AND DUTY have become punch lines for election campaigns. These words used to represent things that are very American.

It should be no surprise that many Americans find it hard to be a Proud America, or proud of their country, or proud of its leaders. It is becoming increasingly embarrassing to think of one's self as American. Lately the only thing we represent is the embodiment of Greed, Irresponsibility, Drunk with Power, Lacking Human Compassion, no Fairness, no commitment to solutions, attitudes childish in nature refusing to compromise to reach meaningful solutions because it is our way or no way leading to an out of control spin downwards.

Can you please restore some honor by enacting some demand for safety by requiring the creation of this department that deals with these issues? Let us pause, regroup, make changes, and learn from mistakes rather than living in a loop that never ends. Can you be that leader? Can you stop this endless loop, this loop of destruction and failure.

RE: Chukchi Sea Draft SEIS – Allow Responsible Access to Alaska’s Resources

Subject: Chukchi Sea Draft EIS

Dear Mr. Goll:

Dear Mr. LaBelle:

I am writing to express my support for the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska.

Please cancel Chukchi Sea lease sale 193. I have been involved with onshore oil and gas development for the past ten years and have been to the Arctic coast. Oil and gas development does not belong in such a sensitive and fragile ecosystem as the Arctic Ocean. The time to prevent an environmental tragedy is now, prior to leasing. Once leases are issued it is too late despite all the stipulations, mitigation, and good intentions of regulators when permitting development. Believe me, I've spent the last four years participating in an effort to prepare an environmentally responsible oil and gas management plan in another fragile ecosystem, that should not have been leased, it cannot be done.

The draft supplemental Environmental Impact Statement (SEIS) recently released by the federal government properly addresses all concerns expressed by the U.S. District Court in Alaska. Thus, it is my hope that the federal government will finally approve the responsible development of the Chukchi's abundant oil and natural gas resources.

One of the reasons that the Alaska District Court remanded the original EIS was for more information. The supplemental EIS still lacks sufficient information for making an informed decision.

It is important that the federal government brings Alaska's vast oil and natural gas reserves back online. Jobs in Alaska and across the nation depend on the opportunities that offshore oil and gas production can and will provide. In fact, a study by the University of Alaska found that new offshore energy production in the state of Alaska would produce an annual average of 35,000 jobs – both directly and indirectly generated by increased offshore production – over the next 50 years for the state of Alaska alone, with a total payroll of \$72 billion (2007) over the 50-year period.

The recoverable reserve is unknown and speculative. The purpose and need statement makes it clear that the recoverable reserve is unknown; "offer for lease areas in the Chukchi Sea Planning Area of the Alaska Outer Continental Shelf (OCS) that might contain economically recoverable oil and gas resources." The extent of the reservoir should be known before determining the lease sale area. Don't make a large geographic area available for oil and gas simply because it may avoid political controversy, i.e. not precluding a potential use. I've seen this happen too many times, and once an area is leased it is too late. This is exactly what has happened in my region. An entire intermountain basin was made available for oil and gas as the managers were certain development would remain in the traditional conventional oil fields. Low and behold, new technologies made previously overlooked reservoirs economically feasible for development. Now they're dealing with development proposals in some extremely fragile ecosystems which cannot be reclaimed. These fragile ecosystems never should have been leased, please do not repeat this mistake.

Further, new offshore oil and gas development in Alaska will stimulate America's economic recovery by generating thousands of new, high-paying jobs throughout the 50 states, from steel and pipe manufacturers in the Midwest, to shipping on the coasts, to advanced computer technology in California and Seattle, to Union Labor for pipeline construction and maintenance.

Polar bear critical habitat was designated by the U.S. Fish and Wildlife Service on November 24, which includes the lease sale area. The EIS essentially postpones polar bear consultation until time of development. Impacts to polar bears must be considered now, at leasing, waiting until development is too late. The EIS promises that consultation will be reinitiated when critical habitat is defined. Now that critical habitat has been defined, the EIS should be put on hold (or better yet cancelled) and full formal consultation reinitiated, not incremental consultation.

In conclusion, I strongly believe that the federal government should move forward with the SEIS process and the development of Lease Sale 193 in the Chukchi, as well as pave the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing.

Now is the time to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

Sincerely,

JRF BERTZ

Thomas E and Patricia Bills Comment

Thomas E and Patricia Bills Comment

Page nine states that Best Available and Safest Technology will be required but provides insufficient information as to what these best and safest technologies are. How can an informed decision be made if these technologies are not identified? The specific technologies to be required should be listed not broad categories. Similar terminology is used in the onshore world and it provides little if any environmental safeguards. The companies determine what they feel is technologically and economically feasible with little dispute from the federal regulators. Therefore proven feasible technologies are not utilized.

The summary of impacts (pgs. 18-24) is too generic and subjective providing insufficient information for an informed decision. As a decision maker is unlikely to read the entire EIS and will instead concentrate on the summary it is imperative that the summary is sufficient for making an informed decision. Impacts are discussed in subjective terms such as "moderate" but there is no definition of the impact categories; i.e. "risk of a large oil spill is low". What is low? "Any increase in concentrations of criteria pollutants would be small, local, and temporary." Please define small, local, and temporary. These are all subjective terms, which unless defined, are left open for interpretation. Even when impacts are identified as significant there is no or little quantification of the impact. "A large oil spill or chronic small-volume oil spills impacting intertidal or estuarine habitats used by early life-history stages of Pacific salmon would be likely to result in significant adverse effects on local populations. These would require three or more generations to recover to their former status." How many more generations for full recovery, one or two more or several more generations? Impacts lasting multiple generations can increase exponentially with each generation lost to the point populations may never be able to recover. Temporary and nonlethal effects to ESA listed marine mammals should be explained better. Will these temporary and nonlethal effects interfere with foraging, breeding, or other activities that could have long-term population level impacts? What is the difference between substantial impacts and significant impacts? These are just a few examples of the insufficient information, the pattern continues throughout the document.

An oil spill response plan is not required until a facility is put into use (pg. 9). This is ludicrous, has the Deepwater Horizon disaster taught us nothing? British Petroleum and the federal government were caught totally off-guard and acknowledged their plans were inadequate. An oil spill plan should be prepared prior to leasing to determine the feasibility of controlling a spill in the Arctic environment. If there is any probability that a spill could not be contained (i.e. oil spilling out beneath the winter ice pack) then the area should not be leased.

The sociocultural discussion on pg. 23 is an example of an appropriate analysis summary; impacts are defined, quantified, duration identified, and adequately explained. All resources should be discussed to a similar level of detail in order to make an informed decision.

I don't understand how BOEMRE can make the following statement on pg. 16: "The BOEMRE concludes that new information regarding the Deepwater Horizon incident is not relevant." The cause of the Deepwater incident was insufficient attention paid to safety practices (or blatant disregard) by the operators and insufficient oversight by BOEMRE's predecessor (MMS), followed by not having a sufficient response plan in place and therefore an incompetent initial response. Regressing, this is exactly why best available technologies need to be identified and an oil spill response plan in place before even considering leasing.

The supplemental EIS fails to adequately analyze effects to ESA listed species instead relying on the following statement (pg. 20): "additional Section 7, ESA consultation would be required before BOEM approves any Development and Production Plan that could follow from a lease sale." A similar tactic is taken with non-listed marine and coastal birds on page 21: "As marine and coastal bird use presence is quite variable by season and location, an accurate assessment of impacts at this early stage is difficult. Additional NEPA and other environmental review processes occurring at later stages of the OCS Lands Act program (i.e. exploration, development and production) will have site-specific plans to focus an analysis. Significant adverse impacts to marine and coastal birds would be avoided and mitigated through restriction and measures implemented during those later review processes."

It is inappropriate not to analyze potential impacts related to the consumption/burning of the oil and natural gas produced from the lease sale area (pg. 16). I agree BOEMRE has no control over where the product resulting from the Chukchi leases is consumed and therefore cannot perform a site-specific effects analysis. However, BOEMRE should have a reasonable estimate of the amount of oil and gas that will be produced and consumed and therefore could calculate greenhouse gas emissions and contributions to global climate change. This is crucial given the Arctic environment of the proposed lease sale where climate change impacts have some of the greatest adverse effects; i.e. declining ice pack and resulting effects on marine mammals, shore erosion (including constructed islands for drill platforms and production), subsistence, pipelines and other infrastructure, etc.

As identified earlier, once leases are issued it is too late. Environmental effects of exploration, development, and production must be considered prior to leasing to make an informed decision. Leases are a binding contract which come with a right to develop; once a lease is issued, appropriate environmental mitigation may not be possible. It is not reasonable to presume that development of additional, site-specific mitigation measures during later environmental review processes would produce only minor impacts to Threatened and Endangered species. Mitigation measures must be identified and analyzed prior to leasing in order to make an informed decision. Leasing and development are connected actions, development impacts must be considered prior to leasing.

The EIS identifies that the community of Wainwright would like to use some of the produced gas (pg. 16). The EIS should have provided additional information on this issue, has a formal request by Wainwright been made? Are they in negotiation discussions with the potential producers? etc. From the information provided it is unclear whether Wainwright consuming a portion of the natural gas is reasonably foreseeable or not. If it is a reasonably foreseeable action resulting from the proposed lease sale, then BOEMRE is obligated under NEPA to analyze the environmental effects resulting from Wainwright's consumption. Similarly, a portion of the production is to be consumed to fuel the production operations. Would local natural gas burning have different local effects than consumption elsewhere? I do not know and the EIS certainly does not inform a potential decision maker.

Thomas E and Patricia Bills Comment

Differences between the alternatives should also be quantified, not merely generalized in terms of "greater or lesser", in order to make an informed decision. How much greater or lesser?

The Affected Environment section does a decent job about discussing recent and projected climate and meteorological changes (p. 32). Similar level of detail should be included in other sections of the Affected Environment such as physiography (p. 32) where increased shore erosion should be discussed as it would likely affect onshore pipelines, constructed islands, and other features of the oil and gas development.

I do not know much about ice gouging, but from the affected environment discussion (pg. 35) it sounds like it is an important issue. Therefore the site-specific surveys identified to be completed before decisions are made on specific proposed activities should be completed for sale area 193 prior to leasing.

The following sentence (pg. 36) is too subjective: "The main rivers that flow into the Arctic marine environment remain relatively unpolluted by human activities." Please define relatively. The sale area is off the coast of the National Petroleum Reserve, are the local rivers "relatively" unpolluted or do they contain more pollutants from the onshore development compared to Arctic rivers away from petroleum development?

Essential habitat is not known for the most sensitive early life stages of all three commercial fisheries species (p. 39). This is essential information to have before deciding to lease an area for oil and gas development. Surveys must be done of the lease area to determine if the species utilize the lease area in their early life stages. Unlike the boom and bust cycling of oil and gas development, commercial fishing done properly is a sustainable revenue source. Therefore an accurate analysis of the environmental and economic impacts to essential fish habitat and commercial fisheries is essential. Industry supporters tout the economic returns of oil and gas development, but the sustainable revenue of commercial fisheries is much more important. Leases should not be sold without this vital information. I find it interesting that in my situation the oil and gas companies and their supporters are advocating maximizing drilling opportunities in order to maximize economic returns while the state and affected counties place greater importance on ensuring that the fragile environment is adequately protected first allowing for the long-term sustainable economic benefits.

A generic significance threshold for biological resources of three generations or less for population recovery is too generic (pg. 60). For long lived species such as whales and other marine mammals three generations may be decades in length, this is much too long for recovery. It would also likely take several years, potentially generations, for population reductions related to oil and gas activities to become evident. Significance thresholds should be species or guild specific. A better measure may be use patterns. How does each species use the lease sale area and do they continue to use the same areas in the same fashion following leasing and during oil and gas activities? The threatened and endangered species thresholds (pg. 60) approach on what I'm proposing. One or more generations for recovery may be adequate for short-lived species but is still too long for long lived species especially if they are ESA listed.

Thomas E and Patricia Bills Comment

The development scenario (pg. 61) anticipates oil development to begin in 2020, 10 years from today. This is too long, too speculative, and therefore too risky. The natural gas discussion identifies the need for a transportation mechanism, without a defined transportation mechanism, the project is incomplete and should not be considered. Gas development and transportation to market are connected actions and must be considered together. BOEMRE must cancel the lease sale at least until a transportation pipeline proposal has been received so that the cumulative impacts of leasing, development, productions, and transportation can be analyzed together.

The development scenario description is not clear. Will drilling and production be accomplished from a single platform (pg. 62) within each lease? That is what the description seems to indicate, but how large are the lease parcels? what is the total number of lease parcels? and therefore what is the total number of platforms, wells, and pipeline length anticipated?

The ruptured pipeline risk is based upon the Gulf of Mexico (offshore) and U.S. Dept. of Transportation (onshore) regulations. These regulations were written for much different environments than the Chukchi Sea. I doubt these regulations are applicable to the harsh Arctic climate with its sub-zero temperatures, ice gouging, etc.

The Chapter 4 environmental analysis section provides no more detail than the summaries provided in Chapter 2. Most of the discussion is very generic with little detail mostly in subjective terms which are not defined. This EIS lacks sufficient information to make a reasoned informed decision.

In summary, please accept alternative 2 and cancel lease sale 193. The Arctic climate is too harsh and the ecosystem too fragile to risk another environmental catastrophe. It is too bad that the federal legislators and executive agencies do not have the political will power to adapt from preventable disasters such as the Exxon Valdez and the Deepwater Horizon. Ten years for production is too long, too speculative. America must move away from its dependence on carbon based energy, not prolong it. We have the capacity to embrace cleaner, renewable energy sources in the next decade. Ten years for production is too long and too speculative and is not worth the environmental risk.

The impacts to the local human environment (sociocultural systems, subsistence economy, and commercial fisheries), physical environment (air quality, water quality, and acoustic environment), and biological environment (essential fish habitat, marine mammals, marine and coastal birds, and ESA listed species) that are disclosed are too great and not worth the limited economic benefit from the proposed lease sale.

An EIS is required to provide sufficient information to make a reasoned, well informed decision; this EIS does not. Many of the impact analyses are considered too speculative and postponed until time of development, including ESA consultation. Waiting until development is too late, the impacts must be analyzed and disclosed prior to leasing. Leases are contracts, once issued, access must be granted, and development will occur. A complete environmental impact analysis must be conducted prior to leasing.

Thomas E and Patricia Bills Comment

The analyses that are included are too subjective; impact thresholds should be defined and quantified. For example, biological impacts are measured in terms of generations, but the EIS does not define the term or disclose how long generations are for the multitude of species affected. A generation for a bowhead whale is much longer than that of an Arctic fox; three generations for Arctic fox population recovery may be reasonable but three generations for bowhead whale (a subsistence resource and cultural foundation) recovery is certainly not. Basic biologic information such as what species are present within the lease sale area, during what times of the year, and at what population levels is lacking. Biologic inventories and surveys should have been completed, prior to initiating the EIS, to acquire the base information on which to support an EIS.

It is clear from this EIS that the federal offshore oil and gas regulations are as environmentally ineffective as those onshore. As the federal regulator, BOEMRE should apply the environmental safeguards that have been incorporated into federal coal permitting. Resource surveys are initiated several years prior to leasing to acquire the appropriate baseline information. The surveys continue through permitting and development to monitor impacts. Complete emergency response plans and reclamation plans are required prior to leasing. ESA consultation takes place during the lease analysis. Please incorporate these important steps so that BOEMRE has the appropriate and sufficient information upon which to base its decision.

We took our daughter to the Arctic coast to see wild polar bears, in 2007, when she was five years old. We would like her to have the ability to take her children there someday too. I'd like to go back also, not only to watch polar bears again but to observe the Inupiat bowhead whale hunt. Please cancel Chukchi Sea Lease Sale 193, the EIS is deficient and the limited economic benefit is not worth the foreseeable environmental impacts.

Sincerely,

Thomas E. and Patricia L. Bills

Subject: Attn: Chukchi Sea Draft SEIS

Nov 22, 2010

Mr. John Goll
Alaska Regional Office, 3801 Centerpoint Drive, Suite 500 Anchorage, AL 995035820

Dear Mr. Goll,

I urge the Bureau of Ocean Energy Management, Regulation and Enforcement to ensure that any decision on drilling in the Chukchi Sea be based on sound science and demonstrates how oil and gas activities can be conducted safely - especially in light of last summer's Deepwater Horizon blowout. The current draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193 completely dismisses the need to collect missing science and discounts potential negative impacts to polar bears, walrus, seals, whales and many other species already threatened by climate change.

I am concerned that the decision to release the draft SEIS in its current form may expedite oil drilling plans in the Chukchi Sea and could lead to permanently destructive consequences for the wildlife and Alaska Natives who depend on this region for survival.

In the original analysis, the agency noted hundreds of areas in which they lacked information about species, and yet failed to explain how this missing information might affect their decision process. In response to the court mandate, the Alaska regional office's draft SEIS made the unwise determination that none of the missing information was essential to a reasoned choice and that, no matter the impacts, it would allow drilling to proceed.

The draft SEIS goes against the Obama Administration's commitment to science-based decision-making, especially in light of the systemic failures made evident by the Deepwater Horizon accident, which are still not addressed. The determination that we should drill at any cost undercuts sound science and environmental stewardship for our oceans.

Instead of proceeding with the current draft SEIS, your agency should first put a priority on collecting essential missing information. This information should be based in part on the data generated by the ongoing United States Geological Survey analysis of the Arctic due out in spring 2011. The agency should then prepare a revised draft SEIS, followed by public review and comment, before making any final decisions.

BOEMRE's first priority must be protecting the wildlife and people whose survival is linked to the Arctic Ocean. It is critical that all necessary science and lessons learned from the Gulf of Mexico spill are incorporated into any final decision about whether and where to allow oil drilling in the Chukchi Sea.

Sincerely,

Ms. B Bohlen

Subject: OCS Lease Sale 193

Please consider this when making a decision:

- Lease Sale 193 should be affirmed as held in 2008. The SEIS provides sufficient information and analysis to support an informed decision affirming Sale 193.
- Rescinding the leases and allowing a de facto moratorium to continue will harm Alaska's economy and discourage future industry investment, without a corresponding benefit to the environment.
- Sale 193 is critical to Alaska's future economy and the nation's long-term energy security.
- The Chukchi OCS is an important future source of U.S. energy supply with up to 29 billion barrels of oil and 209 trillion cubic feet of natural gas potentially in place. The Chukchi Sea is considered the most prospective unexplored offshore basin in the country.
- The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow.
- Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations identified in the FEIS and SEIS. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities.
- Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species.
- Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.
- There has never been a blowout in the Alaska or the Canadian Arctic that resulted in an oil spill. Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today.
- The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas.
- According to a University of Alaska study, new OCS production in Alaska would provide an annual average of 35,000 jobs in Alaska with a total payroll of more than \$72 billion over the next 50 years.
- New offshore oil and gas development in Alaska would also generate thousands of new high-paying jobs throughout all 50 states – in manufacturing, computer technology, construction and maintenance.
- Demand for energy is continuing to rise and the U.S. requires continued development of America's

Subject: Bring Science to the Arctic

Thank you for this opportunity to comment on the draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193.

I strongly encourage you to ensure that decisions about oil and gas activities in the U.S. Arctic Ocean are based on an adequate understanding of the marine ecosystems and the potential impacts of proposed industrial activities. The current draft SEIS for Lease Sale 193 wrongly dismisses the need to collect missing science, does not comport with the spirit or letter of the law, and should be rejected.

We need to conduct the necessary baseline scientific research and monitoring to provide an understanding of the Arctic ecosystem before making decisions that would allow oil and gas activities, including leasing, to occur. There is an acknowledged lack of scientific information about the Arctic food web and the ongoing effects of climate change, as well as an even more egregious lack of knowledge about the abundance and distribution of almost all species of marine mammals, seabirds, and fish.

The Administration should remain committed to science-based decision making by conducting the science necessary to fill the acknowledged missing information for the Chukchi Sea and to reevaluate its decisions based on the new information gathered.

As the tragedy in the Gulf of Mexico taught us, not having adequate scientific knowledge of the ecosystem or a working oil spill response plan can have tragic and irreversible consequences.

Please commit to making management decisions based on adequate science, not politics or profits. We must learn from the mistakes that were made in the Gulf of Mexico to avoid a similar tragedy from occurring in the fragile waters of America's Arctic Ocean.

The oil spill in Valdez, the oil gusher in the Gulf of Mexico teach that oil cannot be cleaned up once it hits the ocean. Approximately 3% of the Gulf oil has been recovered according to news releases. This is totally unacceptable in oceans prone to seas of ice. There are no Coast Guard bases within an hour or two reach of the proposed Chukchi and Beaufort seas extraction activity. Kodiak Coast Guard base is a couple days by ship to reach the North Seas, weather permitting. Haven't the days of the Whaling Ships caught in the sea ice a lesson to carry forward into today's plans. I'm not aware of anyone willing to go rescue anyone from a burning platform when there is a snow storm, ice storm, wind storm in the North seas. That would be called a suicide mission in my book. The oil would go to the bottom, it would travel in layers of currents, and where it would show up could have devastating effects on marine life in many areas of the North Seas.

There are children that are not able to return to their Villages on the North Slope as the air is toxic to their lungs. The flaring that is allowed to continue day and night has had devastating consequences on the lungs of elders, parents, youth and babies. No one is immune to the toxins being burned into the air...with no unit of scrubbers to assure that nothing is escaping into the air. This is called genocide, killing off communities of First Nations and peoples, either one by one or by mass poisoning of the air

1/11/2011

which eventually is in the tundra and water resources. The toxins in the air must be affecting the marine and other cell life on the North Slope construction and extraction areas. Where are those studies? The EVOS studies seems to be missing from all the explosions and leaks over the years on the Alyeska Pipeline and drilling units spread across the North Slope traditional lands and territories.

The Clean Water ACT and the Clean Air ACT charge the government with a Public Trust Doctrine and a Tribal Trust Doctrine. It is a shame that the Tribal Governments are spending very limited and cherished resources on going into the United States Courts to force the federal and state governments to uphold the laws and sacred duties to protect and promote our full rights that are acknowledged in the 1945 United Nations Charter Article 73, Resolution 66(I) et al.

Thank you for your time and attention on this matter.
 I reserve and preserve all my rights.

RE: Draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193

Thank you for this opportunity to comment on the draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193.

I strongly encourage you to ensure that decisions about oil and gas activities in the U.S. Arctic Ocean are based on an adequate understanding of the marine ecosystems and the potential impacts of proposed industrial activities.

The current draft SEIS for Lease Sale 193 wrongly dismisses the need to collect missing science, does not comport with the spirit or letter of the law, and should be rejected.

We need to conduct the necessary baseline scientific research and monitoring to provide an understanding of the Arctic ecosystem before making decisions that would allow oil and gas activities, including leasing, to occur.

There is an acknowledged lack of scientific information about the Arctic food web and the ongoing effects of climate change, as well as an even more egregious lack of knowledge about the abundance and distribution of almost all species of marine mammals, seabirds, and fish.

The Administration should remain committed to science-based decision making by conducting the science necessary to fill the acknowledged missing information for the Chukchi Sea and to reevaluate its decisions based on the new information gathered.

As the tragedy in the Gulf of Mexico taught us, not having adequate scientific knowledge of the ecosystem or a working oil spill response plan can have tragic and irreversible consequences.

Frozen Arctic seas. Subzero temperatures. Massive waves. Over 1,000 miles away from the closest Coast Guard response center. These harsh inhospitable conditions are what make the Chukchi Sea perfect for polar bears, whales, walrus, seals, and other Arctic marine animals that call it home. These same conditions are also a recipe for disaster in the inevitable event of an offshore drilling accident.

Please commit to making management decisions based on adequate science, not politics or profits. We must learn from the mistakes that were made in the Gulf of Mexico to avoid a similar tragedy from occurring in the fragile waters of America's Arctic Ocean.

RE: Chukchi Sea Draft SEIS

I am writing because the recent draft supplemental environmental impact statement for the Chukchi Sea Lease Sale 193 is an unnecessarily hurried attempt to paper over, rather than obtain, essential missing information about the Chukchi Sea. The Bureau readily admits that without missing information about the basic ecology of the area, it is in many cases not possible to judge the impacts of oil and gas activities resulting from the lease sale.

Nevertheless, the Bureau has determined in its draft supplement that it will obtain none of the missing information before making its leasing decision. This decision is unsupported and irresponsible.

The draft supplement fails to assess the true impacts of oil and gas drilling and other lease activities in this fragile region. Simply stating that the agency does not know the impacts is not acceptable. For example, a catastrophic oil spill in the harsh, remote waters of the Arctic Ocean will devastate that region. Twenty-foot ocean swells, frozen seas, subzero temperatures and a lack of infrastructure will make an oil spill nearly impossible to clean up.

The Bureau also must more meaningfully assess the potential impacts of natural gas development in the Chukchi Sea as a result of the lease sale. Simply assuming they will be similar to impacts from oil development alone is not enough.

The Bureau's actions here represent a business-as-usual approach to rush through Arctic offshore oil leasing even in light of the major failures at the agency recently brought to light by the Gulf spill. There should not be a rush to lease the Chukchi Sea and open it to oil and gas drilling. As the Gulf spill has taught us, allowing oil and gas development in the offshore before fully analyzing and preparing for its potential impacts can have tragic and irreversible consequences.

Just five months ago, an oil spill erupted in the Gulf of Mexico, dumping millions of gallons of oil into ocean waters. Government officials are still piecing the puzzle together to determine the systemic failures that led to the spill and to ensure a spill like the Deepwater Horizon never happens again. But even though those studies have not been completed, the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE), is moving forward with oil and gas drilling in the Arctic Ocean as if the spill had never occurred.

This summer, a Federal court directed BOEMRE to redo its analysis of the environmental impacts of a massive Bush-era oil and gas lease sale in the Chukchi Sea off the northwest coast of Alaska. But just two months later, BOEMRE has now issued a draft document that leaves unanswered hundreds of questions about the impacts of drilling in the Arctic Ocean and the potential threat of a spill in those waters.

I urge you to ensure that decisions about Chukchi Sea Lease Sale 193 are made with adequate scientific information and analysis. President Obama has made a commitment to policy decision-making that relies on science, not politics or profits. Your agency must comply with this mandate and recognize the need for more scientific analysis of Arctic Ocean drilling before you proceed with Lease Sale 193.

Please rely on sound science and learn from mistakes made in the Gulf before you allow oil and gas leasing in the fragile waters of America's Arctic Ocean. Thank you for your help.

Yours truly,
J. Capozzelli
New York

November 12, 2010

Mr. John Goll, OCS Director
BOEMRE Alaska
3801 Centerpoint Drive
Anchorage, AK 99503

RE: Chukchi Sea Draft SEIS

I am writing to urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to ensure that any decision on oil and gas drilling in the Chukchi Sea is based on sound science and a basic respect for Arctic wildlife.

The current draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193 dismisses the need to collect missing science and discounts potential negative impacts on entire species of Arctic wildlife.

On October 12, the Alaska region BOEMRE released the draft SEIS in response to a June ruling by the Alaska District Court that their environmental analysis was inadequate. In the original analysis, the agency noted hundreds of areas in which they lacked information about species, and yet failed to explain how this missing information might affect their decision process.

In response to the court mandate, the Alaska regional office's draft SEIS made an across the board determination that none of the missing information was essential to a reasoned choice and that, no matter the impacts, it would allow drilling to proceed.

Alaska's BOEMRE's decision to release the draft SEIS goes against the Obama administration's commitment to science-based decision-making, especially in light of the systemic failures made evident by the Deepwater Horizon accident, which are still not addressed.

It also seems to directly disregard Secretary Salazar's September statement that "we must be thoughtful and responsible in developing... [Alaska's] resources so that we protect Alaska's fisheries, wildlife, and remarkable beauty for generations to come... In the Arctic, we must continue to be guided by caution, science, and the voices of North Slope communities, including Alaska Natives, as we chart a wise path forward."

In determining that we should accept any cost for drilling, the draft SEIS undercuts sound environmental stewardship and decision making for our oceans.

Instead of proceeding with the current draft SEIS, the agency should first put a priority on collecting essential missing information. This information should be based in part on the data generated by the ongoing United States Geological Survey analysis of the Arctic due out in spring 2011. The agency should then prepare a revised draft SEIS, followed by public review and comment, before making any final decisions.

BOEMRE's first priority must be protecting the wildlife and people whose survival is linked to the Arctic Ocean. It is critical that all necessary science and lessons learned from the Gulf of Mexico spill are incorporated into any final decision about where to allow oil drilling in the Chukchi Sea.

Thank you for considering my comments in this important matter.

Jefferson Childs Comment

Jeff Childs – LS 193 Draft SEIS Comments

After quickly reviewing BOEMRE's Chukchi Sea Draft SEIS and parts of the Lease Sale 193 EIS from which it is tiered, I note the following deficiencies, analytical flaws, and noncompliance with federal regulations:

1. Incomplete Analysis of Gas Development Activities
 - a. Section IV.B.5. discusses the potential for an (accidental) natural gas release, citing loss of well control or ruptured pipeline as potential sources in offshore waters. BOEMRE, in describing the scenario of potential natural gas release from a ruptured pipeline, states "Offshore, from a subsea pipeline release, the gas would bubble to the surface and continue into the atmosphere, where it would dissipate." The scenario and subsequent analyses, do not consider what would happen if natural gas was released during colder months when the sea surface is covered with ice! Natural gas released during colder months when ice covers the Chukchi Sea would not necessarily "bubble to the surface and continue into the atmosphere, where it would dissipate." (DSEIS IV.B.5.; p. 67). It is more likely to become trapped beneath the sea surface-ice interface, where juvenile arctic cod, ice seals, beluga whales, and bowhead whales may breathe in pockets of trapped natural gas. BOEMRE describes the fate of a gas release thusly (p. 68):

"The primary component of natural gas is methane, a colorless, odorless, and tasteless gas. It is not toxic in the atmosphere, but is classified as a simple asphyxiate, possessing an inhalation hazard. As with all gases, if inhaled in high enough concentration, oxygen deficiency could occur and result in suffocation. The specific gravity of methane is 0.58. Being lighter than air it has the tendency to rise and dissipate into the atmosphere."

The impact analysis is incomplete until BOEMRE analyzes the impacts of natural gas trapped beneath sea ice on pagophilic species such as the bowhead whale, beluga whale, ice seals, and arctic cod. Please note that contaminated breathing gases can be serious; (human) divers breathing contaminated breathing gases have passed out and/or died. We might anticipate similar lethal or sublethal impacts to pagophilic species breathing natural gas trapped beneath the sea ice. Further expanded analysis would also consider possible escapement of trapped natural gas at breathing holes used by ice seals or visited by hunting polar bears.

- b. There are a number of rare fish species documented occurring in the Chukchi Sea Planning Area; some species are known only based on one or several specimens collected in the Planning Area. Data available in Mecklenburg et. al. (2002) indicates such species are demersal in nature. BOEMRE has not conducted an analysis investigating adverse impacts associated with leasing blocks where rare fish species occur (i.e., have been collected). Without doing the analysis for BOEMRE, consider the impacts associated with leasing a block where an endemic demersal fish was collected in the Chukchi Sea Planning Area; the only known site in all of Alaska's waters. What is the population size and distribution of the

Jefferson Childs Comment

species? What are the habitat parameters? What impacts might occur should BOEMRE allow exploratory drilling, installation of a production platform, or trenching of a pipeline through the only known area where the species was collected in the Chukchi Sea? What impacts might there be if there are two separate sites where a rare demersal species are known to occur in the leasing area? Consideration of such rare animals, their distributions, abundance, and habitat requirements are necessary to avoid extirpating them from the region. BOEMRE should conduct an analysis, block by block, in the Chukchi Sea Planning Area, for rare fish occurrences, and consider potential impacts to these fish species. In fact, consider removing lease blocks where rare fish are documented occurring from past surveys, from the lease sale (of course, this may involve generating a new Alternative in the SEIS).

2. Incomplete Analysis of Oil & Gas Leasing Activities (LS 193 EIS & DSEIS)

- a. The MMS noted the following in its LS 193 EIS: "While we expect no regionwide losses to fish resources at the population level,..." However, MMS did not perform a thorough analysis since there exists potentially significant impacts to rare fish species in the Chukchi Sea Lease Sale 193 area. As noted above in 1.b., BOEMRE need analyze leasing blocks inhabited by rare fish species, where impacts of placing exploratory drilling operations, production platforms, seafloor structures, and pipelines may result in the only known regional population occurs. For example, construction activities on the seafloor in areas where a rare marine fish species inhabits may adversely threaten their population or habitat leading to their extirpation from the Planning Area. MMS-Alaska Region (now BOEMRE-Alaska Region) has previously been advised to analyze offshore oil & gas industry activity impacts on rare marine fish species in the Beaufort and Chukchi seas, though the agency managers chose to disregard such concerns expressed by their agency subject matter expert (me, at the time)!
- b. The former MMS-Alaska Region notes the potential for significant adverse impacts to some local fish populations, but assumes impacted local fish populations would recover due to recruitment from adjacent fish populations. In the scientific arena, this is metapopulation ecology, and BOEMRE needs more information to accurately assume/assess such recruitment recovery. In instances that BOEMRE finds significant adverse impacts to local populations, it is then necessary for them to conduct a metapopulation analysis that examines "source/sink" population relationships, pathways of recruitment (as well as barriers), availability of habitats, and importantly, abundances of adjacent populations! Without considering such parameters and conducting a detailed metapopulation analysis, they are left with flawed assumptions of recovery.

3. Incomplete and Inconsistent Use of New Information in the SEIS

- a. There are many newly published scientific reports and peer-reviewed scientific papers available with new information relevant to lease sale activities in the Chukchi Sea Planning Area and the environmental analyses of the Lease Sale 193 EIS and this DSEIS. Much of this newly published information (since 2007) comes from NOAA, USGS, faculty of the University of Alaska-Fairbanks, and even BOEMRE. Additionally, the Oil & Gas Industry (e.g., SEPCO, Conoco-Phillips) have published recent reports of offshore surveys or monitoring efforts in

Jefferson Childs Comment

the Chukchi Sea Planning Area. The DSEIS does not cite or consider such newly published information, including some studies funded or published by BOEMRE! Moreover, the BOEMRE-Alaska Region has a number of ongoing studies that it receives progress reports on; these ongoing studies and progress reports are not considered in the DSEIS environmental analyses. It's striking and embarrassing that BOEMRE would prepare an SEIS that does not make better use of newly available scientific information (e.g., published since 2007), in light of recent transgressions at the MMS. At the end of my comments, I've provided a partial list of newly published studies that BOEMRE should examine and incorporate in their environmental analyses for the SEIS and future lease sale analyses!

4. Underestimating the Importance of Incomplete or Missing Information

- a. BOEMRE underestimates the importance of incomplete or missing information in the Lease Sale 193 EIS and DSEIS (see pp 8 -15 of 143; Appdx A of DSEIS). BOEMRE (in the DSEIS) often uses "canned" statements dismissing why incomplete or missing information is not essential to making a reasoned choice regarding the Alternatives considered in the EIS. However, there are many gaps in knowledge regarding the distribution, abundance, ecology and behavior of many fish resources, (particularly so for some rare demersal fish species) occurring in the Chukchi Sea Planning Area, that with more thorough analysis (not done in the LS 193 EIS) suggest significant adverse impacts may occur if certain lease blocks are made available to or modified by offshore oil and gas activities. As noted earlier, some rare fish species are known occurring in the Lease Sale area from one to several locations, and only by one to several specimens! One rare species is endemic to the eastern Chukchi Sea! As such, the best available information suggests these animals are concentrated where collected and may represent one or several populations in the region (at least without further information). Should BOEMRE lease a block for offshore oil & gas exploration and development where the only known population of a rare fish species occurs in the region (or say one of two locations), industry activities pose a substantial threat to that population or its habitat and may inadvertently extirpate the population via normal or accidental activities (e.g., exploratory drilling, installation of production platform or trenching of a pipeline). BOEMRE has NOT done the requisite hard look at how leasing such blocks to industry may adversely impact such rare fish species. Such lease sale blocks should not be leaseable or their seafloors modified (e.g. via pipeline right-of-ways) unless more information is gathered indicating the species (1) has more populations in the Chukchi Sea Planning Area, (2) is more abundant than previous data indicate, (3) a broader distribution than several point sampling sites, and (4) known habitat requirements are not unique to that block. Indeed, the BOEMRE needs much more information than it currently has to confidently determine that its leasing activities will NOT cause a significant adverse impact to a rare fish species/population, such as extirpating it from the planning area.

5. Noncompliant Listing of Preparers.

- a. Chapter VI.D. Authors, Reviewers, and Supporting Staff (p.122) does not comply with and fulfill CEQ Regulations (Section Sec. 1502.17) (List of preparers). These regulations specify:

Jefferson Childs Comment

"The environmental impact statement shall list the names, together with their qualifications (expertise, experience, professional disciplines), of the persons who were primarily responsible for preparing the environmental impact statement or significant background papers, including basic components of the statement (Secs. 1502.6 and 1502.8). Where possible the persons who are responsible for a particular analysis, including analyses in background papers, shall be identified. Normally the list will not exceed two pages."

There is good reason to properly comply with CEQ Regulations Sec. 1502.17, chiefly that the public and decision-makers should know who conducted and authored the environmental analyses for various resources, and what their qualifications are making them experts suitable for conducting such analyses. Whereas BOEMRE's Alaska Region has not been forthright concerning some past scientific/environmental analyses conducted by agency subject matter experts in lease sale EA's/EIS's, the public has good reason for continued distrust of BOEMRE's NEPA documents. The public should be confident that, for example, the agency expert conducting and writing water quality impact assessment is indeed a water quality expert. Similarly, BOEMRE should demonstrate that a person responsible for a particular analysis (e.g., Arctic marine mammals) has the expertise and experiences regarding Arctic marine mammals, instead of, say, Gulf of Mexico marine mammals. Finally, I recommend specifying each person's experience with offshore oil & gas activities, to give the public an accurate picture of what their expertise and experiences are concerning the industry activities they are tasked with analyzing, writing, or reviewing information on. I mention this in light of the fact that no analyst discussed or analyzed the impacts of a pipeline gas release during colder months when ice covers the Chukchi Sea, and a natural gas leak is more likely to become trapped under ice than bubble to the surface and dissipate into the atmosphere.

- b. As an example, I suggest providing the requisite information for each author, reviewer, and supporting staff person along these lines:

John Doe, Wildlife Biologist, PhD., Univ. of Alaska-Fairbanks, Wildlife Ecology (2007). M.S., Univ. of Washington, Zoology (1999). B.S., Oregon State Univ., Biology (1996). John recently joined BOEMRE-Alaska Region (2007), after having completed his dissertation investigating polar bear denning behavior along the Beaufort and Chukchi Sea coasts. John authored all sections of the FEIS concerning polar bears, non-listed marine mammals, and terrestrial mammals. John's has limited experience with the offshore oil & gas industry, having one day toured the NorthStar facility off the North Slope.

A Sample List of Newly Published Information BOEMRE Should Consider in the DSEIS.

("Attn: Chukchi Sea Draft SEIS")

Oil and gas production resulting from Sale 193 will occur under the world's highest safety and environmental standards. Activities will be governed by stringent lease stipulations identified in the FEIS and SEIS. Numerous mitigation measures, including seasonal operating restrictions, will minimize potential impacts, and conflicts avoidance mechanisms will protect subsistence whaling and other harvest activities. I support OCS production in Alaska.

Subject: Stop Arctic Drilling from Harming Polar Bears

To whom it may concern:

The Arctic is already in trouble. The ecosystems have been weakened by climate warming, making them very vulnerable and stressed; we know this much about the Chukchi Sea ecosystem. However, even the U.S. government admits that there is little more known about the Arctic species and the effects of offshore oil and gas on them. So it doesn't make sense to begin offshore drilling in the Arctic if organisms there are already on the brink of extinction, drilling could make it worse—we simply don't know.

The problems of drilling have already been made widely known, especially in light of the recent BP oil spill in the Gulf of Mexico. If anything near that scale happened in the Arctic, we would see a large rise in number of extinctions in the North. In the Arctic Ocean, there would be no way to clean up the oil. No huge number of volunteers could be mobilized to the North to help, which could determine the survival or extinction of species. And this is only one of the risks of offshore drilling.

The presence of machinery and humans in the North could do a lot of damage to Chukchi species. Scientists simply don't know enough about the ecosystems to know fully understand the impacts of offshore drilling. Therefore, it only makes sense for drilling to wait until we have better knowledge of the Chukchi Region, a better plan in case of disaster, and a way to make sure our fragile ecosystems aren't hurt in the process. Please take this into consideration as you decide whether drilling should commence in the Arctic.

Sincerely,

Melissa Connolly

John Goll
OCS Director, BOEMRE Alaska

Dear John Goll:

I urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to ensure that any decision on oil and gas drilling in the Chukchi Sea is based on sound science and a basic respect for Arctic wildlife. The current draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193 dismisses the need to collect missing science and discounts potential negative impacts on entire species of Arctic wildlife.

On October 12, the Alaska region BOEMRE released the draft SEIS in response to a June ruling by the Alaska District Court that their environmental analysis was inadequate. In the original analysis, the agency noted hundreds of areas in which they lacked information about species, and yet failed to explain how this missing information might affect their decision process. In response to the court mandate, the Alaska regional office's draft SEIS made an across the board determination that none of the missing information was essential to a reasoned choice and that, no matter the impacts, it would allow drilling to proceed.

Alaska's BOEMRE's decision to release the draft SEIS goes against the Obama administration's commitment to science-based decision-making, especially in light of the systemic failures made evident by the Deepwater Horizon accident, which are still not addressed. Furthermore, it seems to directly disregard Secretary Salazar's September statement that "we must be thoughtful and responsible in developing... [Alaska's] resources so that we protect Alaska's fisheries, wildlife, and remarkable beauty for generations to come... In the Arctic, we must continue to be guided by caution, science, and the voices of North Slope communities, including Alaska Natives, as we chart a wise path forward."

In determining that we should accept any cost for drilling, the draft SEIS undercuts sound environmental stewardship and decision making for our oceans.

Instead of proceeding with the current draft SEIS, your agency should first put a priority on collecting essential missing information. This information should be based in part on the data generated by the ongoing United States Geological Survey analysis of the Arctic due out in spring 2011. The agency should then prepare a revised draft SEIS, followed by public review and comment, before making any final decisions.

BOEMRE's first priority must be protecting the wildlife and people whose survival is linked to the Arctic Ocean. It is critical that all necessary science and lessons learned from the Gulf of Mexico spill are incorporated into any final decision about where to allow oil drilling in the Chukchi Sea.

Thank you for considering my comments.

Sincerely,

G Allen Daily

John Goll
OCS Director
BOEMRE Alaska
November 22, 2010

Dear John Goll, OCS Director, BOEMRE Alaska,

The Bureau of Ocean Energy Management, Regulation and Enforcement should not move forward with any oil drilling plans for the Chukchi Sea until all necessary science is collected and lessons are learned from the BP oil disaster.

The current draft SEIS for Chukchi Sea Lease 193 does not sufficiently address the risks to the Arctic Ocean's ecosystem. It is critical that all necessary science is collected and the BP oil spill is analyzed and incorporated into any decisions dealing with oil drilling in the Chukchi Sea.

It is imperative that all necessary steps are taken to prevent another catastrophic oil spill from happening.

Sincerely,

Regis DiGiacomo

New offshore oil and gas development in Alaska would generate thousands of new high-paying jobs throughout all 50 states – in manufacturing, computer technology, construction and maintenance. I support OCS drilling and production in Alaska.

Over the last four years Shell has dedicated a great deal of resources to acquiring 3D seismic data and baseline science near its Chukchi and Beaufort leases. Shell dominated the largest lease sale in Alaska history and the second most successful oil and gas lease sale in the history of the nation, picking up 275 lease blocks in the Chukchi Sea for \$2.1 billion. Shell pioneered the Cook Inlet and throughout the 1980s and early 1990s, drilled the majority of the exploratory wells in the Alaska OCS - including wells in the Beaufort and Chukchi seas as well as the St. George Basin, Bering Sea and the Gulf of Alaska. Shell's exploration program in the Beaufort led to the Northstar and Liberty fields. I support development of OCS production in Alaska.

Attn: Chukchi Sea Draft SEIS

Dear Bureau of Ocean Energy, Management, Regulation, and Enforcement,

Your recent draft supplemental environmental impact statement for the Chukchi Sea Lease Sale 193 is an unnecessarily hurried attempt to paper over, rather than obtain, essential missing information about the Chukchi Sea. The Bureau readily admits that without missing information about the basic ecology of the area, it is in many cases not possible to judge the impacts of oil and gas activities resulting from the lease sale. Nevertheless, the Bureau has determined in its draft supplement that it will obtain none of the missing information before making its leasing decision. This decision is unsupportable.

The draft supplement utterly fails to assess the true impacts of oil and gas drilling and other lease activities in this fragile region. Simply stating that the agency does not know the impacts is not acceptable. For example, a catastrophic oil spill in the harsh, remote waters of the Arctic Ocean will devastate that region. Twenty-foot ocean swells, frozen seas, subzero temperatures and a lack of infrastructure will make an oil spill nearly impossible to clean up.

The Bureau also must more meaningfully assess the potential impacts of natural gas development in the Chukchi Sea as a result of the lease sale. Simply assuming they will be similar to impacts from oil development alone is not enough.

The Bureau's actions here represent a business-as-usual approach to rush through Arctic offshore oil leasing even in light of the major failures at the agency recently brought to light by the Gulf spill. There should not be a rush to lease the Chukchi Sea and open it to oil and gas drilling. As the Gulf spill has taught us, allowing oil and gas development in the offshore before fully analyzing and preparing for its potential impacts can have tragic and irreversible consequences.

I urge you to ensure that decisions about Chukchi Sea Lease Sale 193 are made with adequate scientific information and analysis. President Obama has made a commitment to policy decision-making that relies on science, not politics or profits. Your agency must comply with this mandate and recognize the need for more scientific analysis of Arctic Ocean drilling before you proceed with Lease Sale 193.

Please rely on sound science and learn from mistakes made in the Gulf before you allow oil and gas leasing in the fragile waters of America's Arctic Ocean.

Sincerely,

Christine Favilla

RE: Chukchi Sea Draft SEIS Comment – Support Access to Alaska's OCS Oil and Gas Resources

Dear Mr. Goll,

I'm writing to express my full support of oil and gas development of Lease Sale 193 in Alaska's Chukchi Sea.

Many barrels of oil and gas has been successfully and safely harvested from the North Atlantic providing jobs for locals and funds for the Government with little or any disruption to the local environment. Developing the Chukchi Sea oil and gas reserves will provide the next generation necessary resources to meet the challenges they will inevitably face without taking unnecessary environmental risks. Boosting oil and gas development in Alaska is a way to improve economic conditions all over our country during a time when our country is struggling to keep everyday Americans' heads above water financially. Local oil and gas development reduces our trade deficit, creates jobs in America and puts money into local, state and federal treasuries.

There is no better time to start fixing America's financial troubles by putting ourselves to work. I believe that the federal government should move forward with the process of developing Lease Sale 193.

Sincerely,

Bradley J. Fluetsch, CFA

ATTN: Chukchi Sea Draft SEIS Comment – Support Access to Alaska's OCS Oil and Gas Resources

Dear Mr. Goll:

I write in support of oil and gas development enabled by Lease Sale 193 in the Chukchi Sea and the draft Supplemental Environmental Impact Statement (SEIS) recently released by your agency to address concerns expressed by the U.S. District Court in Alaska.

The federal government should expedite development of Alaska's vast oil and natural gas reserves to support America's economic recovery. Jobs in Alaska and across the nation depend on the opportunities that offshore oil and gas production can and will provide. In fact, a study by the University of Alaska found that new Alaska offshore energy production could produce an annual average of 35,000 jobs over the next 50 years for the state of Alaska alone, with a total payroll of \$7.2 billion.

I urge the federal government to move forward with a robust development of Lease Sale 193 in the Chukchi Sea (and similar development of the Beaufort Sea), and to provide Alaska with revenue-sharing benefits. The public interest requires you to promote such a policy that encourages job creation, supports national security while growing the economy and providing the nation with much needed domestic energy supplies and less dependence on foreign energy imports.

Sincerely,

Regional Director Alaska OCS Region Bureau of Ocean Energy Management, Regulation and Enforcement

Dear Regional Director Bureau of Ocean Energy Management, Regulation and Enforcement,
As someone who cares about wildlife, I am deeply concerned about the Draft Supplemental Environmental Impact Statement for Chukchi Sea Lease Sale 193.

Drilling in the Chukchi could be disastrous for the wildlife that depends on the Chukchi to survive.

There is still no effective, proven technology to clean up oil spills in broken sea ice conditions in Arctic waters such as those found in the Chukchi Sea.

Oil can coat polar bear fur, causing even these Arctic sea-ice dwellers to freeze to death. And increased drilling activities can disrupt the feeding habits of walruses, seals and other animals that depend on the sea ice of the Chukchi to hunt and survive.

Because the risks to wildlife are so great, I urge your agency to await the results of the President's Spill Commission, due out in January, and a U.S. Geological Survey analysis of the Arctic, due out in April.

Once that critical information is in hand, then the agency should put out a new Draft Environmental Impact Statement for public comment. We simply should not move forward with drilling in this fragile environment until we have collected and fully analyzed all relevant information.

Thank you for considering my comments.

Sincerely

Ms. Heidi Grassberger

Subject: Urgent Action Needed: Protect the Arctic's Chukchi Sea for People and Wildlife

Nov 21, 2010

Regional Director, Alaska OCS Region, BOEMRE John Goll
3801 Centerpoint Drive, Suite 500
Anchorage, AK 99503

Dear Regional Director, Alaska OCS Region, BOEMRE Goll,

The draft Supplemental Environmental Impact Statement (SEIS) for the Chukchi Sea Lease Sale 193 represents a rushed decision by the Alaska Region of BOEMRE to ignore, rather than obtain, essential missing information about the Chukchi Sea.

The draft SEIS acknowledges that, without the missing information about the basic ecology of the area, it may not be possible to judge the impacts of oil and gas activities resulting from the lease sale. Yet BOEMRE has determined that it will obtain none of the missing information before allowing activity on the leases, including drilling, to go forward.

The decision undercuts sound environmental stewardship and decision making for our oceans. It goes against the administration's commitment to science-based decision making, especially in light of the systemic failures made evident by the Gulf of Mexico accident.

BOEMRE should prioritize the collection of essential missing information. This information should be based, in part, on the data generated by the U.S. Geological Survey analysis of the Arctic due out in the spring of 2011. BOEMRE should then prepare a revised draft SEIS, followed by public review and comment, before making any final decisions.

BOEMRE's first priority must be protecting the wildlife and people whose survival is linked to the Arctic Ocean. It is critical that all necessary science -- and lessons learned from the Gulf of Mexico spill -- are incorporated into any final decision about where to allow oil drilling in the Chukchi Sea.

Sincerely,

Ms. Heidi Grassberger

("Attn: Chukchi Sea Draft SEIS")

The goal of Lease Sale 193 was to produce oil from the Alaska OCS and boost domestic production from potential world-class energy deposits. OCS production has the potential to refill the Alaska oil pipeline, which is now operating at one-third of its 1988 peak flow. I support OCS production in Alaska.

Dear BOEMRE,

Sincere thanks for taking local opinions concerning OCS development. This is a difficult and important issue. Let me give you my demographic. My name is Tom Homza, I am an ardent democrat who proudly supported President Obama's candidacy and I believe his programs are generally prudent and wise. I was the first kid on the block to drive a hybrid out of principle. I came to Alaska 21 years ago primarily to practice geology and to experience the wilderness. My wife and I are raising an Alaskan family with what we believe are strong environmental principles.

I am also a Petroleum geologist. An explorer. I'm one of the folks who use the seismic data to find new oil and gas fields. I have worked for several multinational oil companies and I have worked throughout the region – in the North Aleutian Basin, Cook Inlet, ANWR, the Nenana Basin, the North Slope, the Canadian Beaufort, the Chukchi Sea, the Beaufort Sea – and I have a reasonably sound understanding of Alaska's hydrocarbon potential. It is my personal opinion that the Alaskan OCS, especially in the north, has the best potential for large, economically viable reserves in the state and very likely, in the nation. But I don't *know* that because the wells have not been drilled to prove it.

Back to my demographic: I acknowledge global climate change and the role of humans in it. The infamous hockey-stick Carbon curve and its correlation to industrial activity is, in my opinion, incontrovertible. I believe that we need to wean ourselves from our over-consumption of fossil fuels. But we must do this in the context of our very real current dependence upon oil – largely from an unstable supply of foreign oil. An economically weakened nation will not tread lightly on the environment. Thus, I believe that the essential transition to alternative energy sources will take time (especially for transportation energies) and that in the meantime, we need to keep domestic supply viable, first by knowing what we have through exploration. I believe it is a capital blunder to not even seek to know what our resource base is and that continued dismantling of Alaska's oil industry will surely decimate Alaska's economy.

The companies have not degraded Alaska's environment (which, again, I personally value very highly) beyond what I believe is acceptable to deliver the vibrant economy we enjoy here. Alaskan operations, including in the Chukchi and Beaufort, are proven to be clean and safe – the environmental record of

1/11/2011

Alaskan offshore exploration and production speaks for itself.

In conclusion, to me it is very unwise to curtail exploration by an industry with a strong environmental track record. It is unwise to do this in one of our nation's most prospective areas, precisely when we need more domestic supply, precisely when we need an economic boost, and well before we are ready to switch to alternative energy sources.

So, I urge you, as an environmentally concerned Alaskan and as a petroleum geologist, to help expedite both exploration and production in Alaska's OCS and the development of viable energy alternatives.

Again, thanks for making the commendable effort to hear our opinions. I empathize with your struggle and I hope this helps.

Tom Homza

John Goll
 OCS Director, BOEMRE Alaska

Dear John Goll:

I urge the Bureau of Ocean Energy Management, Regulation and Enforcement (BOEMRE) to ensure that any decision on oil and gas drilling in the Chukchi Sea is based on sound science and a basic respect for Arctic wildlife. The current draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193 dismisses the need to collect missing science and discounts potential negative impacts on entire species of Arctic wildlife.

On October 12, the Alaska region BOEMRE released the draft SEIS in response to a June ruling by the Alaska District Court that their environmental analysis was inadequate. In the original analysis, the agency noted hundreds of areas in which they lacked information about species, and yet failed to explain how this missing information might affect their decision process. In response to the court mandate, the Alaska regional office's draft SEIS made an across the board determination that none of the missing information was essential to a reasoned choice and that, no matter the impacts, it would allow drilling to proceed.

Alaska's BOEMRE's decision to release the draft SEIS goes against the Obama administration's commitment to science-based decision-making, especially in light of the systemic failures made evident by the Deepwater Horizon accident, which are still not addressed. Furthermore, it seems to directly disregard Secretary Salazar's September statement that "we must be thoughtful and responsible in developing... [Alaska's] resources so that we protect Alaska's fisheries, wildlife, and remarkable beauty for generations to come... In the Arctic, we must continue to be guided by caution, science, and the voices of North Slope communities, including Alaska Natives, as we chart a wise path forward."

In determining that we should accept any cost for drilling, the draft SEIS undercuts sound environmental stewardship and decision making for our oceans.

Instead of proceeding with the current draft SEIS, your agency should first put a priority on collecting essential missing information. This information should be based in part on the data generated by the ongoing United States Geological Survey analysis of the Arctic due out in spring 2011. The agency should then prepare a revised draft SEIS, followed by public review and comment, before making any final decisions.

BOEMRE's first priority must be protecting the wildlife and people whose survival is linked to the Arctic Ocean. It is critical that all necessary science and lessons learned from the Gulf of Mexico spill are incorporated into any final decision about where to allow oil drilling in the Chukchi Sea.

I am an Alaskan by birth and have lived in Barrow, Alaska for 51 years, my wife and I have four children, 14 grandchildren and 4 great-grandchildren, most of whom were born in Barrow

1

Irving Igtanloc Comment

with some in Anchorage.

I have a great and grave concern with regards to the present oil spill response equipment, tools, materials, etc., that are currently used in oil spill response work.

I have seen the clean up operations on the Exxon Valdez Oil Spill on local TV and have seen on TV the residual oil still under the surfaces of some beaches.

I have seen and heard of the impacts on the lives and lively hoods of Alaska residents who have been impacted. I have heard of Alaskan's that have had to move away from the birthplaces and homes BECAUSE THEY WERE NOT ABLE TO LIVE in those locations due to drastic losses to the subsistence foods needed to sustain their living in those areas.

I have witnessed the impacts on the residents of the North Slope the Oil Industry has had for over 30 years and see their actual levels of employment obtained by our residents and it is pitiful when one looks at the numbers and job positions. This does not help support off shore oil drilling in the Arctic when residents feel that employment will not be meaningful for them and therefore they must rely on traditional and subsistence way of lively hood while drilling and operations are in progress.

Then one considers, what can and will the Oil Industry do in response to an Oil Spill in the Arctic?

What will they do in the Fall Season when the storms commence and they have a major oil spill on the Arctic oceans? Are they going to be able to provide adequate Oil Spill Response work to capture all if not most of the oil? Will they be able to continue Oil Spill recovery when a Fall storm comes upon the oil spill recovery operations. Do they have Oil Spill equipment, tools, materials that make

What will they do in the Winter Months when the oceans are frozen over with ice and they have a major Oil Spill? Are they capable of recovering the oil from the ocean that is covered with ice?

In the Spring, is the Oil Industry capable of recovering oil from the Arctic oceans when the ice pack is loose and moving? What equipment, tools and materials do they have that is capable of picking up the oil in the water when the ice pack is loose and moving?

The Inupiat people of the Arctic learned to live in the Arctic and learned what the weather and winds bring with them, they knew when they could hunt and travel and when they should not hunt and travel.

When I look at the Exxon Valdez Oil Spill and its impacts on our residents and then look at the Gulf of Mexico Oil Spill and see the impacts the oil spill has on their marsh lands I have great and grave concerns regarding any off-shore drilling in the Arctic.

I am greatly concerned with the use of dispersants should an oil spill happen in the Arctic. My concern is that should the dispersed oil get in the food chain, the krell, clams, crabs, fish and then into the seals, ogorook, walrus, beluga, whales, the land where the caribou, ducks, geese, swans, bears, etc., the carcinogens from the oil is cancerous.

The Inupiat people of the Arctic already have the highest rate of cancer per population than anywhere else in the United State of America!

Who is to pay for the health problems caused by an Arctic Oil Spill?

What about the compensation for those who become incapacitated and can no longer hunt to feed their family?

The North Slope region is the ONLY Arctic area in the United State of America. There is no other area in the United States of America that is in the Arctic.

Thank you for considering my comments.

Sincerely, with great and grave concerns,

2

("Attn: Chukchi Sea Draft SEIS")

Industry has committed to unprecedented provisions for prevention and spill response that go above and beyond what is required by law. These provisions, combined with a stringent permitting process, give Alaskans a high level of confidence that exploration and development can occur safely and without harm to polar bears and other species. I support OCS production in Alaska.

14 November 2010

Regional Director, Alaska OCS Region
Bureau of Ocean Energy Management,
Regulation & Enforcement
3801 Centerpoint Drive, Suite 500
Anchorage, AK 99503-5820

Dear Sir:

The Bureau of Ocean Energy Management, Regulation and Enforcement has determined that despite huge gaps in information about bowhead whales, polar bears, walrus and pretty much all living things in the Arctic, it was not a mistake to sell the Chukchi Sea off to the highest bidders in 2008.

This conclusion is simply wrong. Drilling in the Arctic is too risky. The Arctic is already weakened and fragile because of the warming climate. What's more, there is simply no technology to clean up oil in broken ice conditions. There is no way to mobilize even a fraction of the response required for the Gulf disaster in the remote Arctic. And a large oil spill could mean the difference between survival and extinction for struggling Arctic species.

Unfortunately, your draft supplemental EIS does not come anywhere near addressing these problems of critical importance. Your draft supplemental EIS does not satisfy your obligation to protect America's Arctic, and it does not comply with the law. In order to comply with the law, you must analyze the substantial gaps in scientific information in the current EIS and make a good-faith effort at obtaining information that is realistically attainable. And most importantly, you must not allow drilling to go forward unless you have the scientific knowledge to say that drilling in the Arctic is safe.

Respectfully,

Mike & Kathy Kevany
Mike & Kathy Kevany

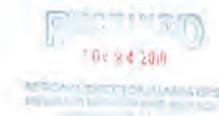

REGIONAL DIRECTOR, ALASKA OCS
BUREAU OF OCEAN ENERGY MANAGEMENT & SERVICE
ANCHORAGE, ALASKA

Drilling in the Arctic offers distinct differences than deepwater exploration and development in the Gulf of Mexico. The pressure encountered in deepwater drilling is multiple times greater than in Alaska where wells would be in very shallow water. There are also major differences in well designs, as well as fundamental differences in the geology of the regions. All of these contrasts should lead BOEM to conclude that exploration should move forward in the Chukchi.

I support OCS production in Alaska.

MELVIN JOHNSON

Dear Regional Director, Alaska OCS Region
Re: Chukchi Lease
Sale Draft
SEIS.

The arctic is in trouble, its warming at twice the rate of the rest of the world! Chukchi Sea Species, including Polar bears and Pacific Walrus are already showing signs of stress from the unprecedented loss of their sea ice habitat - this is their home they have nowhere else to go! - This fall tens of thousands of Pacific walrus were on the shore near Point Lay Alaska an un-heard-of number because there was no suitable ice for them! If there is one thing we do know about

Page 1 of 1

The arctic ocean is that there is no way to clean an oil spill in its wild + icy seas - Struggling Polar bears + walrus simply cannot survive dirty industrial drilling in their melting Chukchi sea! A large spill like the one in the Gulf of Mexico could mean the difference between survival and extinction for Alaska's endangered species - We still do not know the real outcome of the Gulf of Mexico oil spill - Drilling in the Arctic is too risky! I would be most grateful + would appreciate a kind reply.

Sincerely

Subject: Bring Science to the Arctic

Thank you for this opportunity to comment on the draft Supplemental Environmental Impact Statement (SEIS) for Chukchi Sea Lease Sale 193.

I strongly encourage you to ensure that decisions about oil and gas activities in the U.S. Arctic Ocean are based on an adequate understanding of the marine ecosystems and the potential impacts of proposed industrial activities. The current draft SEIS for Lease Sale 193 wrongly dismisses the need to collect missing science, does not comport with the spirit or letter of the law, and should be rejected.

We need to conduct the necessary baseline scientific research and monitoring to provide an understanding of the Arctic ecosystem before making decisions that would allow oil and gas activities, including leasing, to occur. There is an acknowledged lack of scientific information about the Arctic food web and the ongoing effects of climate change, as well as an even more egregious lack of knowledge about the abundance and distribution of almost all species of marine mammals, seabirds, and fish.

The Administration should remain committed to science-based decision making by conducting the science necessary to fill the acknowledged missing information for the Chukchi Sea and to reevaluate its decisions based on the new information gathered.

As the tragedy in the Gulf of Mexico taught us, not having adequate scientific knowledge of the ecosystem or a working oil spill response plan can have tragic and irreversible consequences.

Please commit to making management decisions based on adequate science, not politics or profits. We must learn from the mistakes that were made in the Gulf of Mexico to avoid a similar tragedy from occurring in the fragile waters of America's Arctic Ocean.

ATTN: Chukchi Sea Draft SEIS

Dear Mr. Goff:

In response to your request for comments on the captioned document, I offer the following:

1. The gas development section should include a discussion of the emergence of shale gas production in the lower 48 and the likelihood that shale gas production will keep natural gas prices low enough to render Alaska gas exports to the lower 48 uneconomic for several decades. The Energy Information Administration forecasts that gas prices will not reach \$7-8/mcf until 2035 with domestic production of 22-24 TCF annually, up from ~20 TCF annually today.
2. Given #1 above, the only economic gas development option would be exporting gas to Asia; however, exports are currently prohibited under Section 28 of OSLA and the cost of arctic LNG export systems are likely to be very costly. The combination of #1 and #2 would make gas development in the Chukchi Sea extremely unlikely.

With respect to the 1502.22 analysis contained in Appendix A, I offer the following comments. These comments will refer to the EIS page number references used in the 1502.22 analysis. First, I would like to make two general comments.

1. There is a lot of discussion about the impacts of oil spills. It should be made clear that this EIS is addressing leasing and exploration, not development. BOEMRE's thorough environmental assessment of oil spills related to exploration drilling in Shell's Beaufort Sea exploration plan makes it clear that there has never been a significant oil spill from exploration drilling in the U.S. OCS. There have been over 17,000 exploration wells drilled on the U.S. OCS since 1953 without a significant oil spill. The Macondo oil spill on April 20, 2010, was related to well completion operations, after exploration operations on the well were finished. The Macondo oil spill was attributable to setting production casing, a bad cement job and displacing drilling mud with seawater. None of these actions will occur during the drilling of exploration or appraisal wells in the Alaska OCS. The operations which led to the Macondo oil spill will not take place in the Alaska OCS until a production structure is in place, which would not be expected to happen until

approximately 10 years after an exploration well discovers oil and appraisal drilling determines sufficient volumes are in place to warrant development. There will be significant improvements in oil spill prevention, detection and response by the time development operations create even a remote risk of an oil spill in the Alaska OCS. The many years between now and first oil production provides ample time to fill any remaining data gaps.

2. Many of the statements related to lacking information in the Sale 193 EIS revolve around understanding bowhead whales and other marine mammals. It should be made clear that there has never been a documented case of a cetacean death from OCS oil and gas operations in the U.S. and possibly in the world. Furthermore, in the Chukchi and Beaufort Seas of the U.S. and Canada, there has been approximately 300,000 line miles of seismic acquired and 134 wells drilled since the 1970's (all within or in close proximity to primary bowhead whale migration and feeding habitat) and the bowhead whale population has grown from approximately 3,000 in the 1970's to approximately 10,500 today. If there were any population level cumulative impacts from these operations over the past 35 years, they would surely have manifested themselves by now. Additionally, nearly one billion barrels of oil has been produced from five man-made gravel islands in the Beaufort Sea state waters without any discernable impacts to any fauna or flora. While there is much that is not known about all aspects of each species living in the Chukchi Sea, it is clear that decades of exploration and development have not had a material impact on any species, nor on the ability of local residents to hunt these species for subsistence.
3. II-37: Many of the bird species discussed as having data gaps are described as "coastal" birds. It should be noted that a 25 mile coastal leasing deferral was implemented for Sale 193 and no leases were purchased within 50 miles of the coastline. In the very unlikely event of an oil spill in a development scenario, the prevailing currents in the Chukchi sea move westward, further diminishing the potential impact to coastal bird species.
4. III-32, III-33, III-34, III-35, III-36, III-39, III-40, III-41 & III-42: While there may be aspects of the Chukchi Sea fish populations which are not known today, it should be noted that other areas where oil and gas operations occur near fisheries, negative impacts to fisheries have not been experienced. These areas include the Cook Inlet, Norway, Newfoundland and the Gulf of Mexico. Since the Sale 193 action has nothing to do with commercial fishing, this missing information is irrelevant; however, much information about fish stocks in the Chukchi Sea will be obtained if leasing and exploration is allowed to move forward. The area has been closed to commercial fishing by the North Pacific Fisheries Management Council. Finally, coastal fish species are unlikely to be impacted in any scenario due to the 25 mile coastal deferral, the fact that no leases were purchased within 50 miles of the coastline, and the prevailing westerly currents in the Chukchi Sea.
5. III-45: While there may be uncertainty about the exact bowhead population (and there always will be), the bowhead whale has been intensely studied and the migration pathways and key feeding areas are well understood. No key feeding areas have been documented in the Sale 193 area.

6. III-45: The work of Professor John Bickham has documented that the BCB stock of bowhead whales are a single genetic stock.
7. III-45: The recent BOEMRE 2010-033 study of Satellite Tracking of Western Arctic Bowhead Whales should be referenced which has confirmed what has been observed for many years. Bowhead whales use the eastern Chukchi Sea in the Sale 193 area as a migration pathway and there is very little lingering or feeding. Key feeding areas for bowhead whales are in the Amundsen Gulf of Canada, east of Barrow, on the Russian side of the Bering Straits and in the Bering Sea.
8. III-48: Refer to Professor Bickham's work as noted in #6 above.
9. III-51: Reference BOEMRE 2010-033 which confirms previously thought migration pathways.
10. III-53: Reference BOEMRE 2010-033.
11. III-56: According to NMFS, the fin whale range is south of the Bering Straits; therefore, this statement is not pertinent to the proposed action.
12. III-57: Same comment as #11 above.
13. III-58: According to NMFS, the humpback whale range is south of the Bering Straits; therefore, this statement is not pertinent to the proposed action.
14. III-62: See comment #3 above.
15. IV-82: The statement, "Lastly, and importantly, data are not available sufficient to characterize the current seasonal and temporal use of the Chukchi Sea Planning Area by bowheads and other whales, or to fully understand the importance of parts of the Beaufort Sea to bowhead whales", is not accurate. See comment #7 above.
16. IV-86: The concern stated about increasing levels of noise in the oceans and the cumulative impacts on whales should acknowledge that the oceans were much noisier prior to commercial whaling when whale populations were much greater. Whale vocalizations create significant noise. While anthropogenic sounds will increase with oil and gas development, there is nothing to suggest this will be at a level which will have a negative population level impact on whales. Perhaps the greatest impact on noise in the Arctic Oceans will be from the increasing whale populations and the related noise from vocalizations.
17. IV-89: While long-term impacts of seismic survey sound on whale hearing is unknown, it is well known that extensive activity has occurred in this region since the 1970's and the bowhead whale population is robust and growing, in spite of a significant subsistence harvest. See comment #2 regarding the levels of industry activity.
18. IV-121: An oil spill in the polynya zone described in this statement could only occur from a pipeline which could only occur during development which is not part of the proposed action and which could not occur for at least 10 years after successful exploration and appraisal.
19. IV-125: Please include support for the statement "There are, in some years and in some locations, relatively large aggregations of feeding bowhead whales within the proposed lease-sale area." The results of BOEMRE 2010-033 would not support this statement.
20. IV-140: See comment #3 above.
21. IV-145: Please provide support for the statement "However, the effects of full-scale industrial development of the waters of the Chukchi Sea likely would accumulate through displacement of marine mammals from their preferred habitats, increased mortality, and

- decreased reproductive success." See comment #2 above. There is no basis to suggest that there would be increased mortality or decreased reproductive success in the Chukchi Sea. The statement regarding increase ship traffic in the Northwest Passage may be true, but since there is no evidence of any adverse impacts from oil and gas development, there is no additional cumulative impact from oil and gas development. "Full scale industrial development" in this statement should also be defined.
22. IV-154: See comment #2 above. While impacts to individual animals are very difficult to assess, it is clear from a population level view that oil and gas development will not have a material negative impact on whales or polar bears.
 23. IV-163: The statement "Much information is already known on the general habits of the many species of birds that use the Chukchi Sea" should be changed to read "Much information is already known on the general habits of beluga whales that use the Chukchi Sea."
 24. IV-32 on page 105 through IV-97 on page 126 appear to be repeated from earlier in the document.
 25. V-16: It should be noted that air quality will be protected by air emissions permits issued by EPA.
 26. V-20: These statements are clearly inaccurate. Refer to comment #2 above.
 27. V-25: These statements are clearly inaccurate. Refer to comment #2 above.
 28. V-48: An explanation is needed to understand why the statement is not essential to making a reasoned choice.
 29. V-49: See comment #2 above.
 30. V-68: It should be noted that many positive sociocultural benefits would result from oil and gas development, such as shared infrastructure available to local communities, platforms acting as safe harbors for other ocean users, availability of search and rescue assets, tax base to provide revenue for local investments in schools and other public services and improved science and understanding of the marine ecosystem.
 31. Pages 141-143 should be deleted.

In addition to the foregoing SEIS specific comments, it is imperative that exploration drilling be pursued as quickly as possible. DOI/BOEMRE is charged with implementing the OCS Lands Act which provides in part, "the outer Continental Shelf is a vital national resource reserve held by the Federal Government for the public, which should be made available for expeditious and orderly development, subject to environmental safeguards, in a manner which is consistent with the maintenance of competition and other national needs;". It is clear that the current "suspension" of arctic exploration drilling is uncalled for and contrary to law. It is a disservice to the American taxpayer to further delay the possible receipt of billions of dollars in royalties and additional lease bonus. This revenue funds 90% of the Land and Water Conservation Fund which is used to implement park projects across the U.S. and 100% of the Historic Preservation Fund. OCS revenue is also the second largest revenue source to the U.S. Treasury, second only to the IRS. The potential for oil production from the Chukchi Sea will reduce our 80% dependence on foreign oil imports, improve our balance of trade deficit, add thousands of jobs, keep the Trans Alaska Pipeline System viable, add tax base for local indigenous peoples of the North Slope and add vast amounts of scientific research on these arctic ecosystems.

Thank you for the opportunity to submit these comments.

Yours very truly,

Gregg Nady

Subject: Attn: Chukchi Sea Draft SEIS

Nov 10, 2010

Alaska OCS Region BOEMRE

Bureau of Ocean Energy, Management, Regulation, and Enforcement, 1849 C Street, N.W.
Washington, DC 20240

Dear BOEMRE,

Your recent draft supplemental environmental impact statement for the Chukchi Sea Lease Sale 193 is an unnecessarily hurried attempt to paper over, rather than obtain, essential missing information about the Chukchi Sea. The Bureau readily admits that without missing information about the basic ecology of the area, it is in many cases not possible to judge the impacts of oil and gas activities resulting from the lease sale. Nevertheless, the Bureau has determined in its draft supplement that it will obtain none of the missing information before making its leasing decision. This decision is unsupportable.

The draft supplement utterly fails to assess the true impacts of oil and gas drilling and other lease activities in this fragile region. Simply stating that the agency does not know the impacts is not acceptable. For example, a catastrophic oil spill in the harsh, remote waters of the Arctic Ocean will devastate that region. Twenty-foot ocean swells, frozen seas, subzero temperatures and a lack of infrastructure will make an oil spill nearly impossible to clean up.

The Bureau also must more meaningfully assess the potential impacts of natural gas development in the Chukchi Sea as a result of the lease sale. Simply assuming they will be similar to impacts from oil development alone is not enough.

The Bureau's actions here represent a business-as-usual approach to rush through Arctic offshore oil leasing even in light of the major failures at the agency recently brought to light by the Gulf spill. There should not be a rush to lease the Chukchi Sea and open it to oil and gas drilling. As the Gulf spill has taught us, allowing oil and gas development in the offshore before fully analyzing and preparing for its potential impacts can have tragic and irreversible consequences.

I urge you to ensure that decisions about Chukchi Sea Lease Sale 193 are made with adequate scientific information and analysis. President Obama has made a commitment to policy decision-making that relies on science, not politics or profits. Your agency must comply with this mandate and recognize the need for more scientific analysis of Arctic Ocean drilling before you proceed with Lease Sale 193.

Please rely on sound science and learn from mistakes made in the Gulf before you allow oil and gas leasing in the fragile waters of America's Arctic Ocean.

Sincerely,

Ms. Colleen O'Donnell

RE: Chukchi Sea Draft SEIS - Allow Responsible Access to Alaska's Resources

Dear Mr. Goll:

I am writing to express my support for the planned oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska.

The draft supplemental Environmental Impact Statement (SEIS) recently released by the federal government properly addresses all concerns expressed by the U.S. District Court in Alaska. Thus, it is my hope that the federal government will finally approve the responsible development of the Chukchi's abundant oil and natural gas resources.

It is important that the federal government brings Alaska's vast oil and natural gas reserves back online. Jobs in Alaska and across the nation depend on the opportunities that offshore oil and gas production can and will provide. In fact, a study by the University of Alaska found that new offshore energy production in the state of Alaska would produce an annual average of 35,000 jobs - both directly and indirectly generated by increased offshore production - over the next 50 years for the state of Alaska alone, with a total payroll of \$72 billion (2007) over the 50-year period.

Further, new offshore oil and gas development in Alaska will stimulate America's economic recovery by generating thousands of new, high-paying jobs throughout the 50 states, from steel and pipe manufacturers in the Midwest, to shipping on the coasts, to advanced computer technology in California and Seattle, to Union Labor for pipeline construction and maintenance.

In conclusion, I strongly believe that the federal government should move forward with the SEIS process and the development of Lease Sale 193 in the Chukchi, as well as pave the way for the State of Alaska to receive a portion of the proceeds from such development through revenue sharing.

Now is the time to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

Sincerely,
Roy Palmer

("Attn: Chukchi Sea Draft SEIS")

I urge the BOEM to allow the development of Alaska OCS to continue. Of the 30 wells that have been drilled in the Chukchi and Beaufort seas, there has never been a blow out that has resulted in an oil spill. Many of these wells were drilled in the 1980's with technology that is significantly less stringent than the technology that exists today. Given the distinct differences in deepwater drilling in the Gulf of Mexico, and relatively shallow depth of drilling in Alaska; I believe the FEIS and SEIS will safely and adequately address any safety and environmental concerns.

I write in support of oil and gas development enabled by Lease 193 in the Chukchi Sea.

Regards,

Kevin Pomeroy

The long-term outlook for oil production on the North Slope is one of gradual decline supplemented with smaller field-size oil development with gas field development in or near existing infrastructure. The state expects average daily production in fiscal year 2010 to drop to 650,000 barrels per day and 619,000 barrels per day in fiscal year 2011.

I support development of OCS production in Alaska.

The North Slope and the offshore are now perhaps the most studied energy basins in America. In the past decade, over 250 studies have been funded in the Arctic, with the majority focused on the Beaufort and Chukchi Seas. I support OCS drilling and production in Alaska. Stop doing more studies, let's get to work!

I support OCS drilling and production in Alaska. The OCS in Alaska holds more potential than Prudhoe Bay, with the possibility of surpassing the reserves of Prudhoe Bay. With declining through-put in TAPS; Alaskans as well as the entire nation, need to develop this valuable resource.

Subject: I support responsible access to Alaska's Resources: Chukchi Sea Draft SEIS

Dear Mr. Goll:

I strongly support oil and gas development of Lease Sale 193 in the Chukchi Sea off the coast of Alaska.

Following a recent decision by the federal courts, the Department of Interior has issued a draft supplemental Environmental Impact Statement (SEIS). Following conclusion of this regulatory process, it is my hope that the federal government will move quickly and finally approve the responsible development of the Chukchi's abundant oil and natural gas resources.

With Alaska and national unemployment at record levels, it is important that we develop Alaska's vast oil and natural gas reserves. In fact, a 2009 study by the University of Alaska found that new offshore energy in Alaska would produce an annual average of 35,000 jobs - both directly and indirectly generated by increased offshore production - over the next 50 years for the state of Alaska alone, with a total payroll of \$72 billion (2007) over the 50-year period.

Further, because energy is such a vital part of our domestic economy, new offshore development in Alaska's Chukchi Sea will help stimulate America's economic recovery by generating thousands of new, high-paying jobs throughout the 50 states.

Now is the time to move forward in support of thoughtful, safe and efficient energy production.

Now is the time to promote policies that encourage job creation while growing the economy and providing the nation with much needed U.S. energy supplies.

Sincerely,

Destin Singleton

Anchorage, Alaska 99503-5820

Dear Mr. Goll,

I write to urge you to **reconsider your proposal to open the Chukchi Seas to oil and gas drilling**. This fossil fuel production is contrary to the Administration's stated goals of moving America toward cleaner energy sources, and places at grave risk one of the most pristine Arctic Ocean ecosystems under American jurisdiction.

The lease sale 193 penetrates too deeply into some of the last refuges for endangered sea mammals, including bowhead and beluga whales. Far from the compromise position that BOEMRE has implied, this lease of oil and gas actually represents absolute and complete exploitation of fossil fuels wherever they may exist, regardless of the ecological consequences. BOEMRE has not struck a reasonable balance between values of ecological integrity and values of energy consumption. More than four million acres of the Arctic Ocean waters have already been leased during the Bush Administration. This seems a sufficient short-term compromise of wilderness and wildlife values.

Moreover, neither lease sale 193 nor other offshore oil and gas drilling, in any sense, represents any "bridge" or "transition" to a cleaner energy future. Rather, this oil and gas drilling will only frustrate and retard America's efforts to shift toward renewable energy. **Our ability to shift away from oil and gas will only be hampered by federal policies that place more oil and gas on the national or world markets**, and depress the important price signals that encourage energy conservation and efficiency.

While the removal of Bristol Bay from the Interior Department's proposed program of Arctic oil and gas exploitation is commendable, the protection of Chukchi Sea is equally and critically important. The previous Administration and America in decades prior have already sacrificed enough of our Arctic frontier, and there is no "compromise" in further slicing, between destruction and temporary reprieve, the Arctic ecosystems that remain. Chukchi Sea is a national treasure that must be protected. There is no amount of energy or profit that would offset or justify the ecological impact, particularly when the global warming liability of the oil and gas is considered.

Again, please reverse your proposal, on lease sale 193, to permit oil and gas drilling in the Chukchi Sea, and instead **protect this ecosystem while forcing America toward renewable energy**. Thank you for your consideration.

Sincerely,

Jim Steitz

Given the impact of high energy prices on Americans and their economy, the U.S. has a moral obligation to develop domestic energy sources, both onshore and offshore. I support the development of OCS production in Alaska.

There has never been a blowout in the Alaska or the Canadian Arctic that resulted in an oil spill. Thirty wells have been drilled in the Beaufort and five in the Chukchi – all without incident. These wells were drilled in the 1980s, utilizing older technology compared to what exists today. I support OCS production in Alaska.

RE: Chukchi Sea Draft SEIS Comment - Support Access to Alaska's OCS Oil and Gas Resources

Dear Mr. Goll,

I respectfully write in strong support of development under Lease Sale 193.

Alaskans are in a dangerous place: America faces a financial recession that has cut off many at the knees – home foreclosures, job layoffs, and the mental stress that comes with financial troubles are taking their toll on the country. It won't be long before the full force reaches Alaska.

In order to survive, Alaska needs a real self-sustaining economy to not only support itself and its residents, but to also support our nation. As you well know, Alaska occupies a key strategic location, not only for Arctic trade routes, but also as the primary home for America's missile defense sites protecting our country and our valued allies. In order to support the infrastructure that makes carrying out these important tasks possible, a grounded population base rooted with good-paying jobs and a stable economy is absolutely necessary.

Please support development of Lease Sale 193 in the Chukchi Sea. Both America and Alaska will benefit by a positive, and responsible decision.

Sincerely,

Gary Wilken

Shell returned to Alaska in 2005 to participate in Beaufort Lease Sale 202, signaling the first major offshore activity in Alaska in decades and a new era of exploration in the Arctic. As a result of that sale and subsequent partnerships, Shell now owns outright or holds an equity position in 137 leases in the Beaufort Sea - stretching east from Harrison Bay to an area north of ANWR. The leases Shell picked up in 2005 included Unocal's Hammerhead discovery and Arco's Kuvlum discovery. I support development of OCS production in Alaska.

Demand for energy is continuing to rise and the U.S. requires continued development of America's oil and gas resources as the nation transitions to the new energy sources of the future. I support OCS drilling in Alaska.

As throughput in the Trans-Alaska Pipeline continues to decline, many look to the Alaska OCS as a critical new source of oil. A recent economic study completed by Northern Economics and the Institute of Social and Economic Research estimates the oil and gas reserves in the Alaska offshore could exceed those of Prudhoe Bay.

I support development of OCS production in Alaska.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally-owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interest of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. Administration.
